Sun. Jul 12, 2020

[E] Oral | U (Union)：Union

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | Ch.1

[U-11] Planetary Metabolism: The Science of Living Worlds

convener:Anbar Ariel D(Arizona State University), John W Hernlund(Earth-Life Science Institute), Hilairy Ellen Hartnett(Arizona State University), ryuhei nakamura(Tokyo Institute of Technology, Earth-Life Science Institute), Chairperson:Ariel D Anbar(Arizona State University), Hilairy Ellen Hartnett(Arizona State University), John W Hernlund(Earth-Life Science Institute), ryuhei nakamura(Tokyo Institute of Technology, Earth-Life Science Institute)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[U11-01] Syngeosis: Application of the Principles of Symbiosis to Geological Processes

*John W Hernlund[1] (1.Earth-Life Science Institute)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[U11-02] Redox Revolutions on Earth and Beyond

*Ariel D Anbar[1] (1.Arizona State University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[U11-03] The future life span of Earth's oxygenated biosphere and its controlling factors

★Invited Papers

*Kazumi Ozaki[1], Christopher Reinhard[2] (1.Toho University, 2.Georgia Institute of Technology)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[U11-04] Water worlds may be habitable, but not detectable

*Hilairy Ellen Hartnett[1], ASU NExSS Team (1.Arizona State University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[U11-05] CHALLENGES TO PREDICTING PLANETARY DIVERSITY

★Invited Papers

*Steven J Desch[1], Hilairy Ellen Hartnett[1], Cayman T Unterborn[1] (1.Arizona State University/CSPO)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[U11-06] Planetary Dyspepsia: Finding Planets that work by understanding the planets that don’t

★Invited Papers

*Cayman T Unterborn[1], Steven J Desch[1] (1.Arizona State University/CSPO)

Mon. Jul 13, 2020

[E] Oral | U (Union)：Union

2:15 PM - 3:45 PM JST | 5:15 AM - 6:45 AM UTC | Ch.2

[U-13] Open Colloquium-NASA/JAXA: Our advance and future load in Heliophysics

convener:Yusuke Iida(Niigata University), Mariko Teramoto(Kyushu Institute of Technology), Chun Ming Mark Cheung(Lockheed Martin Advanced Technology Center), Chairperson:Yusuke Iida(Niigata University), Mariko Teramoto(Kyushu Institute of Technology), Chun Ming Mark Cheung(Lockheed Martin Advanced Technology Center)

2:15 PM - 2:40 PM JST | 5:15 AM - 5:40 AM UTC

[U13-01] Geospace Explorations: Toward cycle 25

★Invited Papers

*Yoshizumi Miyoshi[1] (1.Institute for Space-Earth Environmental Research, Nagoya University)

2:40 PM - 3:05 PM JST | 5:40 AM - 6:05 AM UTC

[U13-02] **The State and Vision for the Future of Heliophysics at NASA**

★Invited Papers

*James F Spann[1] (1.NASA Headquarters)

3:05 PM - 3:30 PM JST | 6:05 AM - 6:30 AM UTC

[U13-03] The Solar-C_EUVST Mission and Solar Observations in 2020s

★Invited Papers

*Toshifumi Shimizu[1] (1.Institute of Space and Astronautical Science, JAXA)

[E] Oral | U (Union)：Union

2:15 PM - 3:45 PM JST | 5:15 AM - 6:45 AM UTC | Ch.3

[U-21] Frontiers of Antarctic Environmental Research

convener:Kenji Kawamura(National Institute of Polar Research, Research Organization of Information and Systems), Carol Finn(USGS), Osamu Seki(Institute of Low Temperature Science, Hokkaido University), Yusuke Suganuma(National institute of Polar Research), Chairperson:Kenji Kawamura(National Institute of Polar Research, Research Organization of Information and Systems), Carol Finn(USGS), Osamu Seki(Institute of Low Temperature Science, Hokkaido University), Yusuke Suganuma(National institute of Polar Research)

2:17 PM - 2:39 PM JST | 5:17 AM - 5:39 AM UTC

[U21-01] Oceanographic and geophysical observation campaign off Sabrina Coast, East Antarctica, in 2019/2020

★Invited Papers

*Shigeru Aoki[1], Takeshi Tamura[2], Yoshihiro Nakayama[1], Kazuya Ono[1], Pat Wongpan[1], Kaihe Yamazaki[1], Takuya Itaki[3], Yuki Tokuda[4], Satoshi Sasaki[5], Daisuke Hirano[1], Yuichi Aoyama[2] (1.Hokkaido University, 2.NIPR, 3.AIST, 4.Tottori University of Environmental Studies, 5.Shimane University)

2:39 PM - 3:01 PM JST | 5:39 AM - 6:01 AM UTC

[U21-02] Hot-water drilling for exploring subglacial environment of the Antarctic ice sheet

★Invited Papers

*Shin Sugiyama[1], Masahiro Minowa[2] (1.Institute of Low Temperature Science, Hokkaido University, 2.Instituto de Ciencias Físicas y Matemáticas, Universidad Austral de Chile)

3:01 PM - 3:23 PM JST | 6:01 AM - 6:23 AM UTC

[U21-03] **Modelling the Stability of Antarctic ice sheet in the past interglacials and its implication on future projection.**

★Invited Papers

*Ayako Abe-Ouchi[1], Takashi Obase[1], Ralf Greve[4], Sam Sheriff-Tadano[1], Fuyuki SAITO[2], Kenji Kawamura[3] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.JAMSTEC, 3.NIPR, 4.Hokkaido University)

3:23 PM - 3:45 PM JST | 6:23 AM - 6:45 AM UTC

[U21-04] **Looking to the Future Collaborative Antarctic Science with Global Impacts**

★Invited Papers

*Robin Elizabeth Bell[1], Terry Wilson[2] (1.Lamont Doherty Earth Observatory, 2.Ohio State University, Columbus ,OH, USA)

[E] Oral | U (Union)：Union

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | Ch.1

[U-22] Environmental drivers and impacts of the evolving COVID-19 pandemic

convener:Benjamin F Zaitchik(Johns Hopkins University), Teppei J Yasunari(Arctic Research Center, Hokkaido University), Chairperson:Teppei J Yasunari(Arctic Research Center, Hokkaido University), Chairperson:Benjamin F Zaitchik(Johns Hopkins University)

9:00 AM - 9:20 AM JST | 12:00 AM - 12:20 AM UTC

[U22-01] Lessons learned from emission fluctuation of greenhouse gases and air pollutants due to restrictions associated with the COVID-19 pandemic

★Invited Papers

*Toshihiko Takemura[1] (1.Research Institute for Applied Mechanics, Kyushu University)

9:20 AM - 9:40 AM JST | 12:20 AM - 12:40 AM UTC

[U22-02] **Satellite Observations of Aerosols during COVID-19 Pandemic**

★Invited Papers

*Pawan Gupta[1,2], Robert C. Levy[3] (1.Universities Space Research Association Greenbelt, 2.MSFC, 3.GSFC)

9:40 AM - 10:00 AM JST | 12:40 AM - 1:00 AM UTC

[U22-03] Seasonal sensitivity of COVID-19: perspectives from viral-host interactions

★Invited Papers

*Miyu Moriyama[1], Akiko Iwasaki[1] (1.Yale University)

10:00 AM - 10:20 AM JST | 1:00 AM - 1:20 AM UTC

[U22-04] Air pollution, COVID-19, and public health: What we know and don’t know

★Invited Papers

*Susan Anenberg[1] (1.George Washington University)

[E] Oral | U (Union)：Union

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | Ch.1

[U-23] New challenges to diversity, equality and inclusion under COVID-19

convener:Chiaki T. Oguchi(Institute for Environmental Science and Technology, Graduate School of Science and Engineering, Saitama University), Rie Hori, S.(Department of Earth Science, Faculty of Science, Ehime University), Claudia Jesus-Rydin(European Research Council), Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Chairperson:Chiaki T. Oguchi(Institute for Environmental Science and Technology, Graduate School of Science and Engineering, Saitama University)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[U23-01] Large-scale survey of work and life in scientific and technological profession in Japan under Emergency Declaration caused due to COVID-19 and requests to Japanese government

★Invited Papers

*Noriko Hirata-Kohno[1], Misa Shimuta[2,3] (1.Nihon University, 2.EPMEWSE, 3.The Jikei University School of Medicine)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[U23-02] The impacts of COVID-19 and how racism is hindering our diversity and inclusion efforts

★Invited Papers

*Robin E Bell[1,2] (1.American Geophysical Union, 2.Lamont-Doherty Earth Observatory)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[U23-03] New challenges and opportunities for equality, diversity and inclusivity under COVID-19 and beyond

★Invited Papers

*Alberto Montanari[1] (1.University of Bologna)

[E] Oral | U (Union)：Union

4:00 PM - 5:30 PM JST | 7:00 AM - 8:30 AM UTC | Ch.1

[U-25] Special session for a Borderless World of Geoscience after COVID-19 (Challenges for the future)

convener:Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Robin Elizabeth Bell(Lamont Doherty Earth Observatory), Alberto Montanari(University of Bologna), David Laurence Higgitt(Lancaster University College at Beijing Jiaotong University, Weihai, China), Chairperson:Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo)

4:03 PM - 4:20 PM JST | 7:03 AM - 7:20 AM UTC

[U25-01] Collaborative, Inclusive, Connected Earth and Space Science for our Future

★Invited Papers

*Robin E Bell[1] (1.American Geophysical Union)

4:20 PM - 4:37 PM JST | 7:20 AM - 7:37 AM UTC

[U25-02] A new mission for the geosciences in an age of pandemics and beyond

★Invited Papers

*Alberto Montanari[1], Helen Glaves[2] (1.University of Bologna, 2.British Geological Survey, Environmental Science Centre)

4:37 PM - 4:54 PM JST | 7:37 AM - 7:54 AM UTC

[U25-03] A Borderless World of Geoscience in Asia after COVID-19… for Asia and the World

★Invited Papers

*David Laurence Higgitt[1] (1.Lancaster University College at Beijing Jiaotong University, Weihai, China)

4:54 PM - 5:09 PM JST | 7:54 AM - 8:09 AM UTC

[U25-04] Borderless World of Geoscience after COVID-19 (Challenges for the future)

★Invited Papers

*Yue-Gau Chen[1] (1.Research Center for Environmental Changes, Academia Sinica)

5:09 PM - 5:24 PM JST | 8:09 AM - 8:24 AM UTC

[U25-05] Contribution by JpGU to the future global development of Earth and Planetary Science – by overcoming COVID-19 -

*Hodaka Kawahata[1] (1.Atmosphere Ocean Research Institute, the University of Tokyo)

Tue. Jul 14, 2020

[E] Oral | U (Union)：Union

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | Ch.1

[U-02] Assessment and Accountability of Scientific Knowledge Creation

convener:Michiyo SHIMAMURA(Japan Agency for Marine-Earth Science and Technology), Yasuhiro Yamanaka(Faculty of Environmental Earth Science, Hokkaido University), Kiyoshi Suyehiro(Japan Agency for Marine-Earth Science and Technology), Brooks Hanson(American Geophysical Union), Chairperson:Michiyo SHIMAMURA(Japan Agency for Marine-Earth Science and Technology)

10:50 AM - 11:10 AM JST | 1:50 AM - 2:10 AM UTC

[U02-01] Research Evaluation in Japan: Basic and Solution-Oriented Science, Their Perceptions and Realities, and a Future Vision

★Invited Papers

*Tateo Arimoto[1] (1.Japan Science and Technology Agency)

11:10 AM - 11:30 AM JST | 2:10 AM - 2:30 AM UTC

[U02-02] The Critical Importance of Earth and Space Science, Public Perceptions, Global Funding, and What Societies and the Global ESS Community Can Do

★Invited Papers

Robin Elizabeth Bell[2], *Brooks Hanson[1] (1.American Geophysical Union, 2.Lamont-Doherty Earth Observatory of Columbia University)

11:30 AM - 12:15 PM JST | 2:30 AM - 3:15 AM UTC

[U02-03] Panel Discussion of the Session

*Michiyo SHIMAMURA[1], Yasuhiro Yamanaka[2], Kiyoshi Suyehiro[1], Brooks Hanson[3] (1.Japan Agency for Marine-Earth Science and Technology, 2.Hokkaido University, 3.AGU)

[E] Oral | U (Union)：Union

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | Ch.2

[U-15] Open Colloquium-NASA/JAXA: Earth Science focusing on Climate Change

convener:Yamaji Moeka(Japan Aerospace Exploration Agency), Kosuke Yamamoto(Japan Aerospace Exploration Agency), Paula S Bontempi(NASA Headquarters), Sandra Alba Cauffman(NASA Headquarters), Chairperson:Riko Oki(Japan Aerospace Exploration Agency), Sandra Alba Cauffman(NASA Headquarters), Paula S Bontempi(NASA Headquarters), Yamaji Moeka(Japan Aerospace Exploration Agency), Kosuke Yamamoto(Japan Aerospace Exploration Agency)

9:05 AM - 9:25 AM JST | 12:05 AM - 12:25 AM UTC

[U15-01] Past, Current and Future NASA-JAXA Partnership in Earth System Observations from Space

★Invited Papers

*Arlindo da SIlva[1] (1.NASA Goddard Space Flight Center)

9:25 AM - 9:45 AM JST | 12:25 AM - 12:45 AM UTC

[U15-02] US-Japan collaboration toward accurate flux estimation of greenhouse gases from space: Intercomparison between US OCO and Japanese GOSAT

★Invited Papers

*Akihiko Kuze[1], David Crisp[2], Carol Bruegge[2], Laura Iraci[3], Florian Schwandner[3], Fumie Kataoka[4], Kei Shiomi[1], Nobuhiro Kikuchi[1], Hiroshi Suto[1] (1.Japan Aerospace Exploration Agency, 2.JPL CALTECH, 3.NASA AMES, 4.RESTEC)

9:45 AM - 10:05 AM JST | 12:45 AM - 1:05 AM UTC

[U15-03] JAXA-NASA collaborations toward a better understanding of the global water and energy cycle: From TRMM and GPM to ACCP

★Invited Papers

*Hirohiko Masunaga[1], Riko Oki[2], Moeka Yamaji[2], Kosuke Yamamoto[2] (1.Nagoya University, 2.Japan Aerospace Exploration Agency (JAXA))

10:05 AM - 10:30 AM JST | 1:05 AM - 1:30 AM UTC

[U15-04] Open Discussion

★Invited Papers

*Yamaji Moeka[1] (1.Japan Aerospace Exploration Agency)

[E] Oral | U (Union)：Union

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | Ch.2

[U-19] A deep dive into planetary habitability as related to subsurface architecture, energy, and water.

convener:Graham Heather Valeah, Vlada Stamenkovic(Jet Propulsion Laboratory), Shino Suzuki(Japan Agency for Marine-Earth Science and Technology), Atsuko Kobayashi(Earth-Life Science Institute), Chairperson: Heather Valeah

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[U19-01] Recurring slope lineae on Earth: Implications for hydrological cycles and potential habitability on Mars

★Invited Papers

*Yasuhito Sekine[1], Maya Nakamura[1], Davaasuren Davaadorj[2], Daigo Shoji[1], Koki Morida[3], Keisuke Fukushi[3], Noriko Hasebe[3], Shawn E McGlynn[1] (1.Tokyo Institute of Technology, 2.National University of Mongolia, 3.Kanazawa University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[U19-02] **Prospects for Subsurface Energy, Water, and Life on Mars**

★Invited Papers

*Joseph Michalski[1,2] (1.Division of Earth and Planetary Science, University of Hong Kong, Hong Kong, 2.CIFAR, Toronto, Canada)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[U19-03] Life on serpentinized setting on the Earth and beyond

★Invited Papers

*Shino Suzuki[1] (1.Japan Agency for Marine-Earth Science and Technology)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[U19-04] Subseafloor biosphere in the ancient Earth: constraint from multiple S isotopes records

★Invited Papers

*Aoyama Shinnosuke[1] (1.Yokohama National University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[U19-05] **International Center for Deep Life Investigation: A global platform for the entire deep life community**

★Invited Papers

*FengPing Wang[1,2] (1.School of Oceanography, Shanghai Jiao Tong University, Shanghai, China, 2.State Key Laboratory of Microbial Metabolism, School of Life Sciences and Biotechnology, Shanghai JiaoTong University, Shanghai, China)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[U19-06] Opportunities and Exploration: A Panel Discussion on Planetary Subsurface Science

*Heather Valeah Graham[1], Vlada Stamenkovic[2], Shino Suzuki[3], Ken Takai[3], Tomohiro Usui[4] (1.NASA Goddard Space Flight Center, 2.NASA Jet Propulsion Laboratory, 3.Japan Agency for Marine-Earth Science and Technology, 4.Japan Aerospace Exploration Agency)

[E] Oral | U (Union)：Union

2:15 PM - 3:45 PM JST | 5:15 AM - 6:45 AM UTC | Ch.2

[U-20] "Open Colloquium" Exploring the Earth's interior using cutting edge science and technology

convener:Hiroko Watanabe(Research Center for Neutrino Science, Tohoku University), William F McDonough(Department of Earth Science and Research Center for Neutrino Science, Tohoku University, Sendai, Miyagi 980-8578, Japan), Kenta Ueki(Japan Agency for Marine-Earth Science and Technology), Eiichiro Araki(Japan Agency for Marine-Earth Science and Technology), Chairperson:Hiroko Watanabe(Research Center for Neutrino Science, Tohoku University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[U20-01] Undestanding the Earth's deep interior with geo-neutrino measurements

★Invited Papers

*Hiroko Watanabe[1] (1.Research Center for Neutrino Science, Tohoku University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[U20-02] Deep seafloor cable observation technologies towards future ocean bottom neutrino detector experiment.

★Invited Papers

*Eiichiro Araki[1], Taichi Sakai[2], Hiroko Watanabe[2], Takashi Yokobiki[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.RCNS, Tohoku Univ.)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[U20-03] Direct sampling and measurement at deep crust through scientific ocean drilling

★Invited Papers

*Shin'ichi Kuramoto[1] (1.Japan Agency for Marine-Earth Science and Technology)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[U20-04] Hadean geodynamo origin and Ediacaran inner core growth preserved Earth’s habitability

★Invited Papers

*John Anthony Tarduno[1,2], Rory D Cottrell[1], Francis Nimmo[3], Hirokuni Oda[4], Axel Hofmann[5] (1.University of Rochester, Department of Earth and Environmental Sciences, Rochester, New York, United States, 2.University of Rochester, Department of Physics and Astronomy, Rochester, New York, United States, 3.University of California – Santa Cruz, Department of Earth and Planetary Sciences, Santa Cruz, California, United States, 4.National Institute of Advanced Science and Technology, Geological Survey of Japan, Tsukuba, Ibaraki, 305-8567, Japan, 5.University of Johannesburg, Department of Geology, Johannesburg, South Africa)

3:15 PM - 3:30 PM JST | 6:15 AM - 6:30 AM UTC

[U20-05] Earth's deep interior revealed by high-pressure experiments

★Invited Papers

*Kei Hirose[1,2] (1.Earth-Life Science Institute, Tokyo Institute of Technology, 2.Dept. Earth and Planetary Science, The University of Tokyo)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[U20-06] **Imaging subducted slabs in the mantle through inversion of seismic waveforms**

★Invited Papers

*Kenji Kawai[1], Anselme F. E. Borgeaud[1,2], Yuki Suzuki[1], Robert J. Geller[1] (1.Department of Earth and Planetary Science, School of Science, University of Tokyo, 2.Academia Sinica)

Wed. Jul 15, 2020

[E] Oral | U (Union)：Union

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | Ch.1

[U-01] Great Debate: Geoscience and societal leadership in support of planetary stewardship

convener:Fumio Inagaki(Japan Agency for Marine-Earth Science and Technology), William F McDonough(Department of Earth Science and Research Center for Neutrino Science, Tohoku University, Sendai, Miyagi 980-8578, Japan), Susanne Buiter(Geological Survey of Norway), Chairperson:Fumio Inagaki(Japan Agency for Marine-Earth Science and Technology), William F McDonough(Department of Earth Science and Research Center for Neutrino Science, Tohoku University, Sendai, Miyagi 980-8578, Japan)

9:00 AM - 9:30 AM JST | 12:00 AM - 12:30 AM UTC

[U01-01] Challenges of the Anthropocene

*Will Steffen[1] (1.Climate Council of Australia)

9:30 AM - 9:40 AM JST | 12:30 AM - 12:40 AM UTC

[U01-02] Climate change: from security perspectives

*Yasuko Kameyama[1] (1.National Institute for Environmental Studies, Japan)

9:40 AM - 9:50 AM JST | 12:40 AM - 12:50 AM UTC

[U01-03] Multiscale stewardship for water-food-energy nexus

*Makoto Taniguchi[1] (1.Research Institute for Humanity and Nature)

9:50 AM - 10:00 AM JST | 12:50 AM - 1:00 AM UTC

[U01-04] Planetary Stewardship in AGU

*Robin E Bell[1] (1.American Geophysical Union)

10:00 AM - 10:30 AM JST | 1:00 AM - 1:30 AM UTC

[U01-05] Great Debate: Geoscience and societal leadership in support of planetary stewardship

*Fumio Inagaki[1], William F. McDonough[1], Susanne Buiter[2], Guy Brasseur[3], Fumiko Kasuga[4], William Steffen[5], Makoto Taniguchi[6], Yasuko Kameyama[7], Robin E. Belll[8], Alberto Montanari[9], Hodaka Kawahata[10] (1.JpGU-AGU Joint Meeting 2020 Program Committee Chair, 2.EGU General Assembly 2020 Program Committee Chair, 3.AGU Fall Meeting 2020 Program Committee Chair, 4.Future Earth Japan Global Hub, 5.Australian National University, 6.Research Institute for Humanity and Nature, 7.National Institute for Environmental Studies, 8.AGU President, 9.EGU President, 10.JpGU President)

On demand

[E] Oral | U (Union)：Union

[U-03] Sustainable global groundwater management for human security

convener:Yoshihide Wada(International Institute for Applied Systems Analysis), Makoto Taniguchi(Research Institute for Humanity and Nature), Chairperson:Yoshihide Wada(International Institute for Applied Systems Analysis), Chairperson:Makoto Taniguchi(Research Institute for Humanity and Nature)

[U03-01] Groundwater governance for global sustainability

★Invited Papers

*Makoto Taniguchi[1], Sanghyun Lee[1], Naoki Masuhara[1] (1.Research Institute for Humanity and Nature)

[U03-02] **Global Economic Limits of Groundwater used for Irrigation**

★Invited Papers

*Marc FP Bierkens[1,2], Inge E.M de Graaf[3], Scott Jasechko[4], Debra Perrone[4], Rens L.P.H van Beek[1] (1.Utrecht University, 2.Deltares, 3.University of Freiburg, 4.University of California at Santa Barbara)

[U03-03] Net inflow – a key quantity for defining pathways towards sustainability in heavily stressed aquifers

★Invited Papers

*James J Butler[1], Geoffrey C Bohling[1], Donald O Whittemore[1], Blake B Wilson[1] (1.Kansas Geological Survey, University of Kansas, Lawrence, KS USA)

[U03-04] **Human-groundwater interactions in a changing environment: modeling stressed global aquifer systems**

★Invited Papers

*Yadu Pokhrel[1], Farshid Felfelani[1], Sanghoon Shin[1], Tamanna Kabir[1] (1.Michigan State University)

[U03-05] Global salinization risk in irrigated areas

*Sayaka Yoshikawa[1], Kota Higashiyama[1], Shinjiro Kanae[1] (1.Tokyo Institute of Technology)

[U03-06] Gender differences in water insecurity

*Kaoru Kakinuma[1,2], Yoshihide Wada[3] (1.Shanghai University, 2.Tohoku University, 3.International Institute for Applied Systems Analysis)

[E] Oral | U (Union)：Union

[U-03] Sustainable global groundwater management for human security

convener:Yoshihide Wada(International Institute for Applied Systems Analysis), Makoto Taniguchi(Research Institute for Humanity and Nature), Chairperson:Yoshihide Wada(International Institute for Applied Systems Analysis), Chairperson:Makoto Taniguchi(Research Institute for Humanity and Nature)

[U03-07] Development and enhancement of a global hydrological model to better contribute to the sustainable groundwater management and human water security

★Invited Papers

*Naota Hanasaki[1], Julien Eric Boulange[1], Zhipin Ai[1], SARITHA PADIYEDATH GOPALAN[1], Kumiko TAKATA[1] (1.NIES National Institute of Environmental Studies)

[U03-08] **Impacts of Global Groundwater Depletion to Regional Hydroclimatology in 37 Major Aquifers**

★Invited Papers

*Pat J.-F. Yeh[1], Chong Zhang[2], MinHui Lo[3], Yoshihide Wada[4], James S. Famiglietti[5] (1.School of Engineering, Monash University, Malaysia, 2.Beijing Normal University, China, 3.Department of Atmospheric Sciences, National Taiwan University, Taipei, Taiwan, 4.International Institute for Applied Systems Analysis, Laxenburg, Austria, 5.School of Environment and Sustainability and Global Institute for Water Security, University of Saskatchewan, Saskatoon, Canada)

[U03-09] **Divergent effects of climate change on future groundwater availability in key mid-latitude aquifers**

★Invited Papers

*Min-Hui Lo[1], Wen-Ying Wu (1.National Taiwan University)

[U03-10] Uncertainty of global hydrologic simulations: associated with data and physics including groundwater capillary flux

★Invited Papers

*Hyungjun Kim[1], Sujan Koirala[2] (1.The Univ. of Tokyo, 2.Max Planck Institute for Biogeochemistry)

[U03-11] Higher-resolution mapping of regional aquifer storage parameters using a GRACE spherical harmonic inversion method

*Yun Pan[1], Yalin Ma[1], Pat J.-F. Yeh[2], Huili Gong[1] (1.Capital Normal Univ., 2.Monash Univ. Malaysia)

[U03-12] Potential misrepresentation of hydrological extremes using transient climate rather than stabilized climate given identical levels of global warming

*Julien Eric Boulange[1], Naota Hanasaki[1] (1.National Institute for Environmental Studies)

[E] Oral | U (Union)：Union

[U-04] International Efforts Supporting Global Navigation Satellite System-Enhanced Tsunami Early Warning

convener:Rundle John B(University of California Davis), Kazuyoshi Nanjo(University of Shizuoka), Eiichi Fukuyama(Kyoto University / National Research Institute for Earth Science and Disaster Resilience), Chairperson:Kazuyoshi Nanjo(University of Shizuoka), Chairperson:John B Rundle(University of California Davis), Chairperson:Eiichi Fukuyama(Kyoto University / National Research Institute for Earth Science and Disaster Resilience)

[U04-01] Operation of REGARD: Real-Time GNSS analysis system in Japan

*Hiroki MURAMATSU[1], Satoshi ABE[1], Satoshi KAWAMOTO[2], Yusaku Ohta[3] (1.GSI of Japan, 2.Cabinet Office of Japan, 3.Research Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University,)

[U04-02] Tsunami early warning system in Japan and plans towards practical uses of GNSS data to tsunami warning operation of the JMA

★Invited Papers

*NISHIMAE Yuji[1], ISHIKAWA Norihiko[2] (1.Japan Meteorological Agency, 2.Geospatial Information Authority of Japan)

[U04-03] **GNSS Tsunami Early Warning: Implementing the Sendai Framework for Disaster Risk Reduction**

★Invited Papers

*John L LaBrecque[1], Diego Arcas[2], Gerald Bawden[3], Allison B. Craddock[4], Lorraine Hwang[5], Shunichi Koshimura[6], Basara Miyahara[7], Yasuku Ohta[8], John Rundle[9] (1.Chair, IUGG Commission on Geophysical Risk and Sustainability (GeoRisk Commission), 2.NOAA Center for Tsunami Research , 3.NASA Headquarters, Natural Hazards Research and GNSS Science Team, 4.Director, Central Bureau IGS & Jet Propulsion Laboratory, 5.Director Computational Infrastructure for Geodynamics, Univ. Califorinia, Davis, 6.International Research Institute of Disaster Science, Tohoku University, 7.President, Global Geodetic Observing System & Director, Space Geodesy Div. , Geospatial Information Authority of Japan , 8.Graduate School of Science, Tohoku University, 9.Professor, Univ. California, Davis)

[U04-04] Coupled Earthquake-Tsunami-TEC Simulator in a Parallel HPC Environment

*John B Rundle[1], David Grzan[1], John Wilson[1], Kasey Schultz[1], Steven Ward[2] (1.University of California Davis, 2.University of California Santa Cruz)

[U04-05] GNSS Total Electronics Contents tsunami measurements and tsunami height inversions.

*Philippe Henri Lognonné[1], Lucie Rolland[2], Giovanni Occhinpinti[1], Elvira Astafeyva[1], Mala Bagiya[3], Khaled Khelfi[4], Virgile Rakoto[4] (1.Université de Paris, Institut de physique du globe de Paris, CNRS, 2.Laboratoire Géoazur - Université de Nice Côte d'Azur Bureau 208 - Bâtiment 4 250 rue Albert Einstein 06560 Valbonne - France, 3.Indian Institute of Geomagnetism, Sector 18, Near Kalamboli Highway New Panvel(W), Navi Mumbai, 410218 India , 4.formerly at Université de Paris, Institut de physique du globe de Paris, CNRS)

[U04-06] GNSS-TEC-based tsunami early warning system: Tsunami ionospheric hole identification, 2D initial tsunami height estimation, and tsunami simulation

★Invited Papers

*Masashi Kamogawa[1], Toshiyasu Nagao[2] (1.Global Center for Asian and Regional Research, University of Shizuoka, 2.Institute of Oceanic Research and Development, Tokai University)

[E] Oral | U (Union)：Union

[U-05] Advanced understanding of Quaternary and Anthropocene hydroclimate changes in East Asia

convener:Chuan-Chou Shen(High-Precision Mass Spectrometry and Environment Change Laboratory, Department of Geosciences, National Taiwan University), Yusuke Yokoyama(Atmosphere and Ocean Research Institute, University of Tokyo), Kaoru Kubota(Graduate School of Human Development and Environment, Kobe University), Li Lo(Department of Geosciences, National Taiwan University), Chairperson:Chuan-Chou Shen(High-Precision Mass Spectrometry and Environment Change Laboratory, Department of Geosciences, National Taiwan University), Chairperson:Yusuke Yokoyama(Atmosphere and Ocean Research Institute, University of Tokyo), Chairperson:Kaoru Kubota(Kochi Institute for Core Sample Research, JAMSTEC), Chairperson:Li Lo(Department of Geosciences, National Taiwan University)

[U05-01] Meaning of stalagmite oxygen isotopes

★Invited Papers

*Akihiro Kano[1] (1.Graduate School of Science, The University of Tokyo)

[U05-02] **Late-Holocene anthropogenic impact on tropical climate**

★Invited Papers

*Yair Rosenthal[1], Samantha Claudia Bova[1], Zhengyu Liu[2], Mi Yan[3] (1.Rutgers University, 2.Ohio State University, 3.Nanjing Normal University)

[U05-03] Evolution of meridional and zonal sea surface temperature gradients in the Pacific Ocean during the Quaternary period

★Invited Papers

*Takuya Sagawa[1], Risako Makino[2], Yukimi Kubota[2], Yoshimi Kubota[3], Yair Rosenthal[4] (1.Institute of Science and Engineering, Kanazawa University, 2.School of Science and Engineering, Kanazawa University, 3.National Museum of Nature and Science, 4.Rutgers University)

[U05-04] How do marine microplankton survive during global warming?

★Invited Papers

*Yurika Ujiie[1], Kyoko Hagino[1], Tatsuhiko Hoshino[2], Jeremy R. Young[3], Ian Probert[4], Richard Jordan[5] (1.CMCR, Kochi University, 2.JAMSTEC, 3.University College London, 4.Roscoff Biological Station, 5.Yamagata University)

[U05-05] Periodical enhancements of multi-decadal hydroclimate variations in central Japan and its implication for the 2600-year East Asian history

★Invited Papers

*Takeshi Nakatsuka[1] (1.Nagoya University)

[U05-06] Benthic biotic response to Quaternary climate changes in the Sea of Japan and other Asian regions

★Invited Papers

*Moriaki Yasuhara[1] (1.University of Hong Kong)

[E] Oral | U (Union)：Union

[U-06] Open Access, Open Data, and FAIR Data in Geosciences

convener:Hirokuni Oda(Institute of Geology and Geoinformation, Geological Survey of Japan, AIST), Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Brooks Hanson(American Geophysical Union)

[U06-01] Open access and open data: the publisher perspective

★Invited Papers

*Paola Teti[1], Toby Charkin[1], Samuel Winthrop[1] (1.Springer Nature)

[U06-02] Enabling FAIR Data in the Earth, Space, and Environmental Sciences: Encouraging all Researchers to Document, Share, and Cite Scientific Data

★Invited Papers

*Shelley Stall[1] (1.American Geophysical Union)

[U06-03] Preprint is ready, data sharing is still difficult, what scholarly community should do in 2020's?

★Invited Papers

*Kazuhiro Hayashi[1] (1.National Institute of Science and Technology Policy)

[U06-04] An Attempt to Discuss Scientific Outputs including papers and digital data in the Open Science scene

★Invited Papers

*Yasuhiro Murayama[1] (1.Strategic Program Produce Office, National Institute of Information and Communications Technology)

[E] Oral | U (Union)：Union

[U-07] Diversity and equality - Where do we stand on gender equality or equity in the geosciences?

convener:Chiaki T. Oguchi(Institute for Environmental Science and Technology, Graduate School of Science and Engineering, Saitama University), Rie Hori, S.(Department of Earth Science, Faculty of Science, Ehime University), Claudia Jesus-Rydin(European Research Council), Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Chairperson:Rie Hori, S.(Department of Earth Science, Faculty of Science, Ehime University), Chairperson:Claudia Jesus-Rydin(European Research Council)

[E] Oral | U (Union)：Union

[U-08] Special session for a borderless World of Geoscience (GEOethics)

convener:Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Brooks Hanson(American Geophysical Union), Takashi Furumura(Earthquake Research Institute The University of Tokyo), Eiichi Tajika(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Chairperson:Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Chairperson:Takashi Furumura(Earthquake Research Institute The University of Tokyo)

[U08-01] The key role of Scientific Societies

★Invited Papers

*Brooks Hanson[1] (1.American Geophysical Union)

[U08-02] Climate science and social values

★Invited Papers

*Seita Emori[1] (1.National Institute for Environmental Studies)

[U08-03] How can we effectively utilize atmospheric forecasts that include uncertainties?

★Invited Papers

*Hisashi Nakamura[1] (1.Research Center for Advanced Science and Technology, University of Tokyo)

[U08-04] Communicating uncertainty of geoscience for the disaster risk reduction -Geoscience, the ambiguous, and ourselves-

★Invited Papers

*Satoko Oki[1] (1.Faculty of Environment and information Studies)

[U08-05] Transdisciplinary research on geoscience in society

★Invited Papers

*Makoto Taniguchi[1] (1.Research Institute for Humanity and Nature)

[U08-06] Geodiversity and its conservation as a framing guideline for Geoethics in 21st Century

★Invited Papers

*Abhik Chakraborty[1] (1.Wakayama University)

[U08-07] The AGU GeoHealth and Thriving Earth Exchange Programs: Engaging our Geoscience Community for a Sustainable Future

★Invited Papers

Brooks Hanson[1], Janice Lachance[1], *Billy M Williams[1] (1.American Geophysical Union)

[E] Oral | U (Union)：Union

[U-09] Special session For a Borderless World of Geoscience (Challenges for the future)

convener:Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Robin Elizabeth Bell(Lamont Doherty Earth Observatory), Alberto Montanari(University of Bologna), David Laurence Higgitt(Lancaster University College at Beijing Jiaotong University, Weihai, China), Chairperson:Brooks Hanson(American Geophysical Union), Chairperson:Simon Richard Wallis(The University of Tokyo)

[E] Oral | U (Union)：Union

[U-10] Linking Education and Research Communities in Geosciences: Engaging the Public and Local Communities

convener:Vincent Tong(University College London), Takashi Oguchi(Center for Spatial Information Science, The University of Tokyo), Renee M Clary(Mississippi State University), Keiko Kuge(Department of Geophysics, Graduate School of Science, Kyoto University), Chairperson:Vincent Tong(University College London), Chairperson:Takashi Oguchi(Center for Spatial Information Science, The University of Tokyo), Chairperson:Keiko Kuge(Department of Geophysics, Graduate School of Science, Kyoto University), Chairperson:Renee M Clary(Mississippi State University)

[U10-01] Resilience and public engagement for advancing sustainability policy, research and education

★Invited Papers

*Mika Shimizu[1] (1.Kyoto University)

[U10-02] Japanese Activity in collaboration with the international ocean literacy survey

★Invited Papers

*Hiroshi Ichikawa[1], Noriko Imamiya[2], Akiko Tsuzuki[2], Geraldine Fauville[3], Craig Strang[4] (1.Ocean Literacy and Education Panel, Oceanographic Society of Japan, 2.Marine Learning Center, 3.Stanford University, 4.University of California, Berkeley)

[U10-03] Digital story-telling and video briefs as an approach to enhanced international collaboration and impact

★Invited Papers

*Brendan Francis Dominic Barrett[1] (1.Osaka University)

[U10-04] The International Geography Olympiad and Geography Education in Japan

★Invited Papers

*Yoshiyasu Ida[1] (1.Faculty of Human Sciences,University of Tsukuba)

[U10-05] Open Dialogue in Geoscience-based Policy Process: Linking Stakeholders and Researchers

★Invited Papers

*Hidenroi Nakamura[1] (1.Toyama Prefectural University)

[U10-06] A few points to be considered when we engaging with a local community for research and practice for sustainability

★Invited Papers

*Fumiko Noguchi[1] (1.United Nations University)

[E] Oral | U (Union)：Union

[U-14] Open Colloquium-NASA/JAXA: Planetary science on Mars driving current and future missions

convener:Shunichi Kamata(Faculty of Science, Hokkaido University), Go Murakami(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Mitchell D Schulte(NASA Headquarters), Michael S Kelley(NASA Headquarters), Chairperson:Shunichi Kamata(Faculty of Science, Hokkaido University), Chairperson:Go Murakami(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Chairperson:Mitchell D Schulte(NASA Headquarters), Chairperson:Michael S Kelley(NASA Headquarters)

[U14-01] 50 Years of Mars Exploration: Past and Ongoing NASA Missions Pave the Way for Determining Whether There Was Life on Mars

★Invited Papers

*John A Grant[1] (1.Smithsonian National Air and Space Museum, Center for Earth and Planetary Studies, Washington DC)

[U14-02] MARS SAMPLE RETURN: A MISSION CAMPAIGN OF INTENSE SCIENTIFIC INTEREST

★Invited Papers

*David Beaty[1], Brandi L Carrier[1], Michael A Meyer[2], Elliot Sefton-Nash[3] (1.Jet Propulsion Laboratory/California Institute of Technology, 2.NASA Headquarters, 3.ESA ESTEC)

[U14-03] JAXA's Strategic Mars Exploration Program (JSMEP) for Understanding Origin, Evolution, Inventory of Water on Mars

★Invited Papers

*Tomohiro Usui[1] (1.Japan Aerospace Exploration Agency)

[U14-04] Open discussion

*Go Murakami[1] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

[E] Oral | U (Union)：Union

[U-16] OC:Research Advances in Recent Disaster Studies Using Remote Sensing and Computational Methodologies

convener:Jun Matsumoto(Deaprtment of Geography, Tokyo Metropolitan University), Guido Cervone(Pennsylvania State University Main Campus), Chairperson:Jun Matsumoto(Deaprtment of Geography, Tokyo Metropolitan University), Chairperson:Guido Cervone(Pennsylvania State University Main Campus)

[U16-01] Expanded Dimensionality Image Spectroscopy Via Machine Learning

★Invited Papers

*Guido Cervone[1], Mark Salvador, Fangcao Xu[1] (1.Pennsylvania State University Main Campus)

[U16-02] Detection of landslides and vegetation recovery from multitemporal UAV and satellite images

★Invited Papers

*Hitoshi SAITO[1,2], Shoichiro Uchiyama[2], Yuichi S. Hayakawa[3], Hiroyuki Obanawa[4] (1.Kanto Gakuin University, 2.National Research Institute for Earth Science and Disaster Resilience, 3.Hokkaido University, 4.National Agriculture and Food Research Organization)

[U16-03] Next-generation alerting system for natural disasters using ground network and micro-satellites

★Invited Papers

*Yukihiro Takahashi[1,2], Mitsuteru Sato[1,2], Hisayuki Kubota[1,2], Kozo Yamashita[3], Tetsuro Ishida[1,2] (1.Department of Cosmosciences, Graduate School of Science, Hokkaido University, 2.Faculty of Science, Hokkaido University, 3.Faculty of Engineering, Ashikaga University)

[U16-04] The Rise of the Crowd: An Assessment of Crowdsourced Data during Disasters

★Invited Papers

*Carolynne Hultquist[1] (1.Columbia University)

[E] Oral | U (Union)：Union

[U-17] Open Colloquium: What will we expect from Ryugu and Bennu samples?

convener:Satoshi Kasahara(The university of Tokyo), Aki Takigawa(Department of Earth and Planetary Science, The University of Tokyo)

[U17-01] What will we expect from Ryugu and Bennu samples?

*Shogo Tachibana[1,2], Harold C. Connolly Jr.[3] (1.UTokyo Organization for Planetary and Space Science, University of Tokyo , 2.Institute of Space and Astronautical Science, 3.Department of Geology, School of Earth and Environment, Rowan University)

[U17-02] Open discussion: What we expect from Ryugu and Bennu samples

*Satoshi Kasahara[1], Aki Takigawa[2], Shogo Tachibana[1,3], Harold C. Connolly Jr.[4] (1.The university of Tokyo, 2.Kyoto University, 3.Institute of Space and Astronautical Science, 4.Rowan University)

[E] Oral | U (Union)：Union

[U-18] Open Colloquium: Recent advances in atmospheric and hydrospheric sciences

convener:Kazuaki Nishii(Graduate School of Bioresources, Mie University), Hong Liao(Nanjing University of Information Science and Technology), Masahiro Hori(University of Toyama School of Sustainable Design), Kazuhiro Misumi(Environmental Science Research Laboratory, Central Research Institute of Electric Power Industry), Chairperson:Kazuaki Nishii(Graduate School of Bioresources, Mie University)

[U18-01] Seasonally dependent impact of cloud longwave scattering on the polar climate: why it is a necessity in polar climate modeling?

★Invited Papers

*Xianglei Huang[1], Yi-Hsuan Chen[1], Ping Yang[2], Chia-Pang Kuo[3], Xiuhong Chen[1] (1.Univ. Michigan Ann Arbor, 2.Texas A&M Univ., 3.Florida State Univ.)

[U18-04] **Overview of OMIX project “Ocean mixing processes: impact on biogeochemistry, climate and ecosystems”**

★Invited Papers

*Ichiro Yasuda[1] (1.Atmosphere and Ocean Research Institute, The University of Tokyo)

[U18-05] **Typhoon observations using an aircraft from the upper troposphere in the T-PARCII project**

★Invited Papers

*Taro Shinoda[1], Kazuhisa Tsuboki[1], Hiroyuki Yamada[2], Tadayasu Ohigashi[3], Kosuke Ito[2], Munehiko Yamaguchi[4], Tetsuo Nakazawa[4], Hisayuki Kubota[5], Yukihiro Takahashi[5], Norio Nagahama[6], Kensaku Shimizu[6], Nobuhiro Takahashi[1] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.Faculty of Science, University of the Ryukyus, 3.National Research Institute for Earth Science and Disaster Resilience, 4.Meteorological Research Institute, Japan Meteorological Agency, 5.School of Science, Hokkaido University, 6.Meisei Electric Co. Ltd.)

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS01] Outer Solar System Exploration Today, and Tomorrow

convener:Jun Kimura(Osaka University), Kunio M. Sayanagi(Hampton University), Fuminori Tsuchiya(Planetary Plasma and Atmospheric Research Center, Graduate School of Science, Tohoku University), Steven Douglas Vance(NASA Jet Propulsion Laboratory, California Institute of Technology)

[PPS01-01] Dynamics in Jupiter's magnetosphere revealed by time variation of plasma densities and temperature in the Io plasma torus coincident with volcanic activations on Io

★Invited Papers

*Reina Hikida[1], Kazuo Yoshioka[1], Fuminori Tsuchiya[2], Masato Kagitani[2], Tomoki Kimura[2], Fran Bagenal[3], Nick Schneider[3], Go Murakami[4], Atsushi Yamazaki[4], Hajime Kita[4], Edward Nerney[3], Seiya Nishimura[1], Hidetaka Kuniyoshi[1], Ichiro Yoshikawa[1] (1.the University of Tokyo, 2.Tohoku University, 3.University of Colorado, 4.JAXA)

[PPS01-02] Identifying the particle responsible for energy supply during the IPT brightening event.

*Seiya Nishimura[1], Fumiharu Suzuki[1], Kazuo Yoshioka[1], Reina Hikida[1], Hidetaka Kuniyoshi[1], Fuminori Tsuchiya[3], Go Murakami[2], Ichiro Yoshikawa[1] (1.The university of tokyo, 2.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 3.Planetary Plasma and Atmospheric Research Center, Graduate School of Science, Tohoku University)

[PPS01-03] **Origin of delayed rotational periodicity in the inner magnetosphere of Jupiter**

*Fuminori Tsuchiya[1], Hiroaki Misawa[1], Masato Kagitani[1], Ryoichi Koga[1], Reina Hikida[2], Kazuo Yoshioka[2], Nick Schneider[5], Peter A Delamere[6], Fran Bagenal[5], Andrew Steffl[4], Tomoki Kimura[1], Yasumasa Kasaba[1], Go Murakami[3], Ichiro Yoshikawa[2], Atsushi Yamazaki[3] (1.Tohoku University, 2.The University of Tokyo, 3.ISAS/JAXA, 4.SwRI, 5.University of Colorado, 6.University of Alaska Fairbanks)

[PPS01-04] Observations of tenuous atmospheres and plumes at the icy Galilean moons: HST and future missions

★Invited Papers

*Lorenz Roth[1] (1.KTH Royal Institute of Technology, Stockholm, Sweden)

[PPS01-05] Performance, Operation and their Feasibilities for Jupiter and Icy Moons: High Frequency Receiver of Radio & Plasma Wave Investigation (RPWI) aboard JUICE

*Yasumasa Kasaba[1], Hiroaki Misawa[1], Fuminori Tsuchiya[1], Tomoki Kimura[1], Hajime Kita[3], Atsushi Kumamoto[1], Yuto Katoh[1], Yoshizumi Miyoshi[4], Yoshiya Kasahara[5], Satoshi Yagitani[4], Hirotsugu Kojima[8], Baptiste Cecconi[2], Lukas Wiśniewski[6], Walter Puccio[7], Jan Bergman[7], Jan-Erik Wahlund[7] (1.Tohoku University, 2.Observatoire de Paris, 3.Japan Aerospace Exploration Agency, 4.Nagoya University, 5.Kanazawa University, 6.Astronika, 7.IRF Uppsala, 8.Kyoto University)

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS01] Outer Solar System Exploration Today, and Tomorrow

convener:Jun Kimura(Osaka University), Kunio M. Sayanagi(Hampton University), Fuminori Tsuchiya(Planetary Plasma and Atmospheric Research Center, Graduate School of Science, Tohoku University), Steven Douglas Vance(NASA Jet Propulsion Laboratory, California Institute of Technology)

[PPS01-07] Uranus and Neptune are key to understand planets with hydrogen atmospheres

*Tristan Guillot[1,2] (1.Observatoire de la Cote d Azur, 2.JSPS/University of Tokyo)

[PPS01-08] A Possible Formation Scenario of Saturn-Titan System

*Yuri Fujii[1], Masahiro Ogihara[2] (1.Institute for Advanced Research, Nagoya University, 2.Division of Science, National Astronomical Observatory of Japan)

[PPS01-09] Variation in Titan's polar sea distribution due to orbital forcing simulated by a sea balance model

*Tetsuya Tokano[1] (1.University of Cologne)

[PPS01-12] Forced libration of Ganymede: including visco-elastic tidal deformations

*Shinichiro Kojima[1], Jun Kimura[1], Shunichi Kamata[2] (1.Department of Earth and Space Science, Graduate School of Science, Osaka University, 2.Department of Earth and Planetary Science, Faculty of Science, Hokkaido University)

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS01] Outer Solar System Exploration Today, and Tomorrow

convener:Jun Kimura(Osaka University), Kunio M. Sayanagi(Hampton University), Fuminori Tsuchiya(Planetary Plasma and Atmospheric Research Center, Graduate School of Science, Tohoku University), Steven Douglas Vance(NASA Jet Propulsion Laboratory, California Institute of Technology)

[PPS01-13] **CHARISMA: A space telescope for planetary science**

*Cindy Young[1], Kunio M. Sayanagi[2], Michael Wong[3] (1.NASA Langley Research Center, 2.Hampton University, 3.University of California, Berkeley)

[PPS01-14] Future ultraviolet observation for monitoring Europa and outer planetary systems

*Go Murakami[1], Fuminori Tsuchiya[2], Ryoichi Koga[2], Kazuo Yoshioka[3], Masato Kagitani[2], Tomoki Kimura[4], Atsushi Yamazaki[1], Yudai Suzuki[3], Hajime Kita[1], Masaki Kuwabara[1], Reina Hikida[3], Chihiro Tao[5], Yasumasa Kasaba[2], Ichiro Yoshikawa[3] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2.Planetary Plasma and Atmospheric Research Center, Graduate School of Science, Tohoku University, 3.Graduate School of Frontier Sciences, The University of Tokyo, 4.Frontier Research Institute for Interdisciplinary Sciences, Tohoku University, 5.National Institute of Information and Communications Technology)

[PPS01-15] **The Europa Clipper Mission: Investigating an Ocean World's Habitability**

*Steven Douglas Vance[1], Robert T Pappalardo[1], David A Senske[1], Haje Korth[2], Kate Craft[2], Sam Howell[1], Rachel L Klima[2], Erin J Leonard[1], Cynthia B Phillips[1], Christina Richey[1] (1.NASA Jet Propulsion Laboratory, California Institute of Technology, 2.The Johns Hopkins University Applied Physics Laboratory)

[PPS01-16] Geophysical and astrobiological perspectives for future spacecraft missions to Jovian icy moons

*Yasuhito Sekine[1], Shunichi Kamata[3], Shuya Tan[1], Shintaro Azuma[1], Ikuo Katayama[6], Yoshifumi Saito[2], Kazushi Asamura[2], Keigo Enya[2], Junichi Haruyama[2], Yasumasa Kasaba[4], YASUKO KASAI[5], Ayako Matsuoka[2] (1.Tokyo Institute of Technology, 2.JAXA, 3.Hokkaido University, 4.Tohoku University, 5.NICT, 6.Hiroshima University)

[PPS01-18] The Io Volcano Observer (IVO): Investigating the Interior of a Tidally Heated World

★Invited Papers

*Christopher W. Hamilton[1], Alfred S. McEwen[1], Xianzhe Jia[2], and the IVO Science Team (1.University of Arizona, 2.University of Michigan)

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS02] Lunar Science and Exploration

convener:Masaki N Nishino(Japan Aerospace Exploration Agency, Institute of Space and Astronautical Science), Masahiro KAYAMA(Department of General Systems Studies, Graduate School of Arts and Sciences, The University of Tokyo), Hiroshi Nagaoka(Japan Aerospace Exploration Agency), Yusuke Nakauchi(Japan Aerospace Exploration Agency)

[PPS02-01] Energetic Neutral Atom Imaging for Lunar science: Interactions between space plasma, exosphere, and surface

★Invited Papers

*Yoshifumi Futaana[1] (1.Swedish Institute of Space Physics)

[PPS02-02] Development of a detection system for new craters using feature-based image registration

*Emi Morikawa[1], Keisuke Onodera[2,3], Kei Shirai[4], Mitsuo Yamamoto[5], Satoshi Tanaka[5] (1.The University of Tokyo, 2.University of Paris / Institut de Physique du Globe de Paris, 3.The Graduate University for Advanced Studies (SOKENDAI), 4.Kobe University, 5.Institute of Space and Astronautical Science (ISAS) / Japan Aerospace Exploration Agency)

[PPS02-03] Are old continental crusts of the Earth Theia-origin?: Implications for the origin of the Moon

*Masaki Ogawa[1] (1.Division of General Systems Studies, Graduate School of Arts and Sciences, University of Tokyo)

[PPS02-04] **High-pressure and -temperature experiments simulating the lunar KREEP layer and constraint on its water content**

Miki Muranushi[1], *Masahiro KAYAMA[2], Tsuyoshi MIYAMOTO[3], Seiji Kamada[5], Hiroshi Nagaoka[4], Akio Suzuki[1] (1.Department of Earth Science, Graduate School of Science, Tohoku University, 2.Department of General Systems Studies, Graduate School of Arts and Sciences, The University of Tokyo, 3.Center for Northeast Asian Studies, Tohoku University, 4.Japan Aerospace Exploration Agency, 5.Frontier Research Institute for Interdisciplinary Sciences, Tohoku University)

[PPS02-06] SLIM (Smart Lander for Investigating Moon) project for pin-point landing demonstration

★Invited Papers

*Shin-ichiro Sakai[1], Kenichi Kushiki[1], Syujiro Sawai[1], Seisuke Fukuda[1], Tetsuhito Arakawa[1], Hiroo Saito[1], Haruhiko Shimoji[2], Project Team SLIM[1] (1.Japan Aerospace Exploration Agency, 2.Mitsubishi Electric Corporation)

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS02] Lunar Science and Exploration

convener:Masaki N Nishino(Japan Aerospace Exploration Agency, Institute of Space and Astronautical Science), Masahiro KAYAMA(Department of General Systems Studies, Graduate School of Arts and Sciences, The University of Tokyo), Hiroshi Nagaoka(Japan Aerospace Exploration Agency), Yusuke Nakauchi(Japan Aerospace Exploration Agency)

[PPS02-09] Global emissions of carbon ions from the total lunar surface

*Shoichiro Yokota[1], Kentaro Terada[1], Yoshifumi Saito[2], Kazushi Asamura[2], Masaki N Nishino[2], Hisayoshi Shimizu[3], Futoshi Takahashi[4], Hidetoshi Shibuya[5], Masaki Matsushima[6], Hideo Tsunakawa[2] (1.Osaka University, 2.ISAS/JAXA, 3.Earthquake Research Institute, The University of Tokyo, 4.Kyushu University, 5.Kumamoto University, 6.Tokyo Institute of Technology)

[PPS02-10] **Status on Japanese Lunar Polar Exploration Mission**

★Invited Papers

*Dai ASOH[1], Takeshi HOSHINO[1], Makiko OHTAKE[1], Yuzuru KAROUJI[1] (1.Japan Aerospace Exploration Agency)

[PPS02-11] Examination of water observation procedure in lunar polar exploration

*Yuzuru Karouji[1], Makiko Ohtake[1], Hiroaki Shiraishi[1], Hiroshi Kanamori[1], Inoue Hiroka[1], Takeshi Hoshino[1], Dai Asoh[1], Lunar Polar Exploration Pre-Project Team[1] (1.Japan Aerospace Exploration Agency)

[PPS02-12] The research review on the plasma and dust environment of the moon toward the participation in NASA's Artemis program

*Hideyuki Usui[1], Masaki N Nishino[2], Noriyuki Namiki[3], Yuko Inatomi[2], Makiko Ohtake[2], Tomokatsu Morota[4], Tomohiro Usui[2] (1.Graduate school of system informatics Kobe University, 2.JAXA/ISAS, 3.NAOJ, 4.School of Science The university of Tokyo)

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS04] Regolith Science

convener:Koji Wada(Planetary Exploration Research Center, Chiba Institute of Technology), Akiko Nakamura(Graduate School of Science, Kobe University), Patrick Michel(Universite Cote D Azur Observatoire De La Cote D Azur CNRS Laboratoire Lagrange), Kevin John Walsh(Southwest Research Institute Boulder)

[PPS04-01] Crater scaling laws in low speed impacts

*Onur Celik[1], Daniel J. Scheeres[2], Yasuhiro Kawakatsu[3] (1.The Graduate University for Advanced Studies (SOKENDAI), 2.University of Colorado Boulder (CU Boulder), 3.Japan Aerospace Exploration Agency (JAXA))

[PPS04-02] Impact experiments for crater scaling laws and impact-induced seismic shaking on rubble-pile asteroids

*Yuya Yamamoto[1], Masahiko Arakawa[1], Minami Yasui[1], Sunao Hasegawa[2], Ryo Sugimura[1], Yusaku Yokota[1], Hatsune Okawa[1] (1.Graduate School of Science, Kobe University, 2.Japan Aerospace Exploration Agency)

[PPS04-03] The size of ejecta particles of the artificial impact crater formed by Hayabusa2 Small Carry-on Impactor

*Koji Wada[1], Ko Ishibashi[1], Hiroshi Kimura[1], Masahiko Arakawa[2], Hirotaka Sawada[3], Kazunori Ogawa[3,2], Kei Shirai[2], Rie Honda[4], Yuichi Iijima[3], Toshihiko Kadono[5], Naoya Sakatani[3], Yuya Mimasu[3], Tomoaki Toda[3], Yuri Shimaki[3], Satoru Nakazawa[3], Hajime Hayakawa[3], Takanao Saiki[3], Yasuhiko Takagi[6], Hiroshi Imamura[3], Chisato Okamoto[2], Masahiko Hayakawa[3], Naru Hirata[7], Hajime Yano[3] (1.Planetary Exploration Research Center, Chiba Institute of Technology, 2.Kobe University, 3.JAXA, 4.Kochi University, 5.University of Occupational and Environmental Health, 6.Aichi Toho University, 7.The University of Aizu)

[PPS04-04] Space impact experiment on Ryugu: Pattern of ejecta curtain and the properties of particles in surface and subsurface layers

★Invited Papers

*Toshihiko Kadono[1], Masahiko Arakawa[2], Rie Honda[3], Ko Ishibashi[4], Kazunori Ogawa[5], Naoya Sakatani[5], Yuri Shimaki[5], Seiji Sugita[6], Koji Wada[4] (1.University of Occupational and Environmental Health, 2.Graduate School of Science, Kobe University, 3.Departiment of Scinece and Technology, System of Natural Science, Kochi University, 4.Planetary Exploration Research Center, Chiba Institute of Technology, 5.Institute of Space and Astronautical Science, 6.Graduate School of Science, The University of Tokyo)

[PPS04-05] Thermophysical property of the artificial impact crater on asteroid Ryugu

*Naoya Sakatani[1], Satoshi Tanaka[1], Tatsuaki Okada[1], Toru Kouyama[2], Akira Miura[1], Naru Hirata[3], Hiroki Senshu[4], Takehiko Arai[5], Yuri Shimaki[1], Hirohide Demura[3], Kentaro Suko[3], Tomohiko Sekiguchi[6], Jun Takita[7], Tetsuya Fukuhara[8], Makoto Taguchi[8], Thomas G. Müller[9], Axel Hagermann[10], Jens Biele[11], Matthias Grott[11], Maximilian Hamm[12,11], Marco Delbo[13], Mizuki Ito[1,19], Naoyuki Hirata[14], Masahiko Arakawa[14], Kazunori Ogawa[15,14], Koji Wada[4], Toshihiko Kadono[16], Rie Honda[17], Kei Shirai[14], Takanao Saiki[1], Hiroshi Imamura[1], Yasuhiko Takagi[18], Hajime Yano[1], Masahiko Hayakawa[1], Chisato Okamoto[14], Hirotaka Sawada[1], Satoru Nakazawa[1], Yu-ichi Iijima[1], Seiji Sugita[19], Tomokatsu Morota[19], Manabu Yamada[4], Shingo Kameda[8], Eri Tatsumi[20], Yasuhiro Yokota[1], Hidehiko Suzuki[21], Chikatoshi Honda[3], Kazuo Yoshioka[19], Moe Matsuoka[1], Yuichiro Cho[19] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2.National Institute of Advanced Industrial Science and Technology, 3.University of Aizu, 4.Chiba Institute of Technology, 5.Ashikaga University, 6.Hokkaido University of Education, 7.Hokkaido Kitami Hokuto High School, 8.Rikkyo University, 9.Max-Planck Institute for Extraterrestrial Physics, 10.University of Stirling, 11.German Aerospace Center, 12.University of Potsdam, 13.Observatoire de la Côte d'Azur, CNRS, 14.Kobe University, 15.JAXA Space Exploration Center, Japan Aerospace Exploration Agency, 16.University of Occupational and Environmental Health, 17.Kochi University, 18.Aichi Toho University, 19.University of Tokyo, 20.Instituto de Astrofisica de Canarias, 21.Meiji University)

[PPS04-06] Experimental study on the relaxation of slope terrain due to small-scale impact

*Tomomi Omura[1], Shinta Takizawa[1], Hiroaki Katsuragi[1] (1.Department of Earth and Environmental Sciences, Nagoya University)

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS04] Regolith Science

convener:Koji Wada(Planetary Exploration Research Center, Chiba Institute of Technology), Akiko Nakamura(Graduate School of Science, Kobe University), Patrick Michel(Universite Cote D Azur Observatoire De La Cote D Azur CNRS Laboratoire Lagrange), Kevin John Walsh(Southwest Research Institute Boulder)

[PPS04-07] Investigation into the characteristics of granular materials in low gravitational environment (Introduction of Hourglass mission)

★Invited Papers

*Masatsugu Otsuki[1], Shingo Ozaki[2], Genya Ishigami[3], Takao Maeda[4], Masataku Sutoh[1], Taizo Kobayashi[5], Hideaki Miyamoto[6], Koji Wada[7], Chihiro Kurosawa[1], Yuta Kawai[1], Haruo Kasahara[1], Tetsuya Sakashita[1], Shinobu Doi[1], Hideaki Uchikawa[1], Terumitsu Mano[1] (1.Japan Aerospace Exploration Agency, 2.Yokohama National University, 3.Keio University, 4.Chuo University, 5.Ritsumeikan University, 6.The University of Tokyo, 7.Chiba Institute of Technology)

[PPS04-08] Surface Flow Analysis Based on Spectral Distributions around Larger Boulders on Ryugu

*Naofumi Takaki[1], ERI TATSUMI[1,2], Tomokatsu Morota[1], Yuichiro Cho[1], Kazuo Yoshioka[1], Hirotaka Sawada[3], yokota yasuhiro[3,4], Naoya Sakatani[3], Masahiko Hayakawa[3], Rie Honda[4], Shingo Kameda[5], Moe Matsuoka[3], Manabu Yamada[6], Chikatoshi Honda[7], Toru Kouyama[8], Hidehiko Suzuki[9], Kazunori Ogawa[3,10], Hideaki Miyamoto[1], Naru Hirata[7], Naoyuki Hirata[10], Seiji Sugita[1] (1.The University of Tokyo, 2.Instituto de Astrofísica de Canarias, 3.Japan Aerospace Exploration Agency, 4.Kochi University, 5.Rikkyo University, 6.Planetary Exploration Research Center Chiba Institute of Technology, 7.The University of Aizu, 8.National Institute of Advanced Industrial Science and Technology, 9.Meiji University, 10.Kobe University)

[PPS04-09] Global Geology of Bennu from NASA's OSIRIS-REx Space Mission

*Kevin John Walsh[1], Erica R Jawin[2], Timothy McCoy[2], Harold Connolly[3], Dante S Lauretta[4], Ronald-Louis Ballouz[4], Olivier S Barnouin[5], Chloe Beddingfield[6], Carina Bennet[4], Edward Bierhaus[7], Keara Burke[4], Benton Clark[8], Michael Daly[9], Marco Delbo[10], Daniella DellaGiustina[4], Jason Dworkin[11], Christine Hartzell[12], John Marshall[6], Patrick Michel[10], Jamie Molaro[13], Michael Nolan[4], Maurizio Pajola[14], Michael Perry[5], Bashar Rizk[4], Scott Sandford[15], Daniel Scheeres[16], Steven Schwartz[4], David Trang[17] (1.Southwest Research Institute Boulder, 2.Smithsonian National Institute, 3.Dept. of Geology, Rowan University, 4.Lunar and Planetary Laboratory, University of Arizona, 5.Johns Hopkins University Applied Physics Laboratory, 6.SETI Institute, 7.Lockheed Martin Space, 8.Space Science Institute, 9.York University, 10.Laboratoire Lagrange, Université Côte d'Azur, 11.NASA Goddard Space Flight Center, 12.Department of Aerospace Engineering, University of Maryland, 13.Planetary Science Institute, 14.INAF - Astronomical Observatory of Padova, 15.NASA Ames Research Center, 16.Smead Dept. of Aerospace Engineering Sciences, University of Colorado, 17.HIGP/University of Hawaii at Manoa)

[PPS04-10] Equatorial features on asteroid (101955) Bennu support mass loss by fission

*Alan R Hildebrand[1], Lincoln TJ Hanton[1], Fabio Ciceri[1], Olivier S Barnouin[2], Michael G Daly[3], Jeff A Seabrook[3], Benjamin Rozitis[4], Joshua P Emery[5], Daniella N DellaGiustina[6], Bashar Rizk[6], Michael C Nolan[6], Dante S Lauretta[6], Catherine Johnson[10], Daniel J Scheeres[7], Edward B Bierhaus[8], Paul Sanchez[9] (1.Department of Geoscience, University of Calgary, Calgary, AB, Canada, 2.The Johns Hopkins University Applied Physics Laboratory, Laurel, MD, USA, 3.The Centre for Research in Earth and Space Science, York University, Toronto, ON, Canada, 4.The Open University, Milton Keynes, UK, 5.Northern Arizona University, Flagstaff, AZ, USA, 6.Lunar and Planetary Laboratory, University of Arizona, Tucson, AZ, USA, 7.Smead Department of Aerospace Engineering, University of Colorado, Boulder, CO, USA, 8.Lockheed Martin Space, Littleton, CO, USA, 9.Colorado Center for Astrodynamics Research, University of Colorado, Boulder, CO, USA, 10.Department of Earth, Ocean and Atmospheric Sciences, University of British Columbia, Vancouver, BC, Canada)

[PPS04-12] The Morphological, Elastic, and Electric Properties of Dust Aggregates in Comets: A Close Look at COSIMA/Rosetta's Data on Dust in Comet 67P/Churyumov-Gerasimenko

*Hiroshi Kimura[1], Martin Hilchenbach[2], Sihane Merouane[2], John Paquette[2], Oliver Stenzel[2] (1.Planetary Exploration Research Center (PERC), 2.Max Planck Institute for Solar System Research)

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS05] Planetary Seismic Exploration-From InSight and Apollo to Future Missions-

convener:Taichi Kawamura(Institut de Physique du Globe de Paris), Takeshi Tsuji(Department of Earth Resources Engineering, Kyushu University), Ralph Lorenz(Johns Hopkins University Applied Physics Laboratory), William Bruce Banerdt(Jet Propulsion Laboratory)

[PPS05-01] SEIS-InSight on Mars: results and first constrains on Mars's seismic noise, seismicity and crust/subsurface structure after one year of operation

★Invited Papers

*Philippe Henri Lognonné[1], Domenico Giardini[2], W. Bruce Banerdt[3], W. Tom Pike[4], Maren Böse[5,2], Savas Ceylan[2], Ullrich Christensen[6], John Clinton[2], Martin van Driel[2], Raphael F. Garcia[7], Taichi Kawamura[1], Sharon Kedar[3], Amir Khan[2,8], Brigitte Knapmeyer-Endrun[9], Ludovic Margerin[10], Francis Nimmo[11], Mark Panning[3], Clément Perrin[1], Sue Smrekar[3], Simon Stähler[2], Benoit Tauzin[12], John-Robert Schloz[6], InSight SEIS science team (1.Université de Paris, Institut de physique du globe de Paris, CNRS, 2.Institute of Geophysics, ETH Zurich, Sonneggstr. 5, 8092 Zurich, Switzerland, 3.Jet Propulsion Laboratory, California Institute of Technology, Pasadena, CA 91109, USA, 4.Department of Electrical and Electronic Engineering, Imperial College London, South Kensington Campus, London SW7 2AZ, UK, 5.Swiss Seismological Service (SED), ETH Zurich Zurich Switzerland, 6.Max Planck Institute for Solar System Research, Justus-von-Liebig-Weg 3, 37077 Göttingen, Germany, 7.Institut Supérieur de l'Aéronautique et de l'Espace SUPAERO, 10 Avenue Edouard Belin, 31400 Toulouse, France, 8.Institute of Theoretical Physics, University of Zurich Zurich Switzerland, 9.Bensberg Observatory, University of Cologne, Vinzenz-Pallotti-Str. 26, 51429 Bergisch Gladbach, Germany, 10.Institut de Recherche en Astrophysique et Planétologie, Université Toulouse III Paul Sabatier, CNRS, CNES, 14 Av. E. Belin, 31400, Toulouse, France, 11.Dept. of Earth and Planetary Sciences, University of California Santa Cruz, Santa Cruz, CA 95064, USA, 12.Université de Lyon, Université Claude Bernard Lyon 1, ENS, CNRS, Laboratoire de Géologie de Lyon : Terre, Planètes, Environnement, 69622 Villeurbanne, France)

[PPS05-03] "Time-reversal" inversion of InSight seismogram for quake estimation

*Nobuaki Fuji[1], Alice Jacob[1], Clément Perrin[1], Éléonore Stutzmann[1], Philippe Lognonné[1], Mark Panning[3], Bruce Banerdt[3], Simon Stähler[2], Martin van Driel[2], Savas Ceylan[2], Mélanie Drilleau[1], Taichi Kawamura[1] (1.Université de Paris, Institut de physique du globe de Paris, 2.ETH Zürich, 3.NASA Jet Propulsion Laboratory)

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS05] Planetary Seismic Exploration-From InSight and Apollo to Future Missions-

convener:Taichi Kawamura(Institut de Physique du Globe de Paris), Takeshi Tsuji(Department of Earth Resources Engineering, Kyushu University), Ralph Lorenz(Johns Hopkins University Applied Physics Laboratory), William Bruce Banerdt(Jet Propulsion Laboratory)

[PPS05-06] Seismic investigation of the Moon: Past, Present, and Future

★Invited Papers

*Renee C Weber[1], Clive Neal[2], Bruce Banerdt[3], Sharon Kedar[3], Nicholas Schmerr[4], Mark Panning[3], Philippe Lognonne[5], Taichi Kawamura[5], Ceri Nunn[3], Angela Marusiak[4], Deanna Phillips[9], Yosio Nakamura[7], Caroline Beghein[6], Raphael Garcia[8] (1.NASA Marshall Space Flight Center, 2.Universtiy of Notre Dame, 3.NASA JPL, 4.University of Maryland, 5.IPGP Paris, 6.University of California, Los Angeles, 7.University of Texas, Austin, 8.ISAE SUPAERO, 9.University of Alabama, Huntsville)

[PPS05-07] VBB on the Moon: Expected performances and science return

*Tanguy Nebut[1,2,3], Philippe Lognonne[1,3], Sébastien de Raucourt[1,3], Taichi Kawamura[1,3], Gabriel Pont[4], Taoufik Gabsi[1,2,3], Sylvain Tillier[1,2,3], Olivier Robert[1,2,3], Michel Parise[1,2,3] (1.Institut de Physique du Globe de Paris, 2.CNRS, 3.Université de Paris, 4.CNES)

[PPS05-09] Seismic wave propagation on asteroid Ryugu induced by the impact experiment of the Hayabusa2 mission

*Gaku Nishiyama[1], Taichi Kawamura[2], Noriyuki Namiki[3], Benjamin Fernando[4], Kuangdai Leng[4], Takanao Saiki[5], Hiroshi Imamura[5], Yasuhiko Takagi[6], Kei Shirai[5], Masahiko Hayakawa[5], Chisato Okamoto[7], Hirotaka Sawada[5], Yuichi Tsuda[5], Kazunori Ogawa[5], Masahiko Arakawa[7] (1.University of Tokyo, 2.Institut de Physique du Globe de Paris, 3. RISE Project, National Astronomical Observatory of Japan, 4.University of Oxford, 5.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 6.Aichi Toho University, 7.Kobe University)

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS06] Science of Venus: Venus Express, Akatsuki, and beyond

convener:Takehiko Satoh(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Kevin McGouldrick(University of Colorado Boulder), Hideo Sagawa(Kyoto Sangyo University), Thomas Widemann(Observatoire De Paris)

[PPS06-01] Next generation Japan's Venus Exploration in 2020s

★Invited Papers

*Masato Nakamura[1], Atsushi Yamazaki[1], Ryoma Yamashiro[2], Nobuaki Ishii[1], Tomoaki Toda[1], Yoshifumi Futaana[4], Sanjay S. Limaye[3], Naoki Terada[5], Hiroki Ando[6], Toru Kouyama[7], Takehiko Satoh[1], Takeshi Imamura[8], Makoto Taguchi[9], Yoshi-Yuki Hayashi[10], Takeshi Horinouchi[11], Yeon Joo Lee[12], Masahiro Takagi[6], Masataka Imai[7], Tetsuya Fukuhara[9], Norihiko Sugimoto[13], Hiroki Kashimura[10], Shigeto Watanabe[14], Takao M. Sato[14], George L. Hashimoto[15], Shin-ya Murakami[1], Kevin McGouldrick[16], Takumi Abe[1], Chikako Hirose[2], Manabu Yamada[17], Kazunori Ogohara[18], Ko-ichiro Sugiyama[19], Shoko Ohtsuki[20], Javier Peralta[1], Seiko Takagi[11], Naomoto Iwagami, Munetaka Ueno[2], Takeshi Sakanoi[5], Shingo Kameda[9], Yasumasa Kasaba[5], Yukihiro Takahashi[11], Mitsuteru Sato[11], Yoshihisa Matsuda[21], Masaru Yamamoto[22] (1.Institute of Space and Astronautical Science of Japan Aerospace Exploration Agency, 2.Japan Aerospace Exploration Agency, 3.Univ. of Wisconsin, 4.IRF, 5.Tohoku Univ., 6.Kyoto Sangyo Univ., 7.AIST, 8.Univ. of Tokyo, 9.Rikkyo Univ., 10.Kobe Univ., 11.Hokkaido Univ., 12.TU Berlin, 13.Keio Univ., 14.Hokkaido Joho Univ., 15.Okayama Univ., 16.Colorado Univ., 17.Chiba Institute of Technology, 18.Univ. of Shiga prefecture, 19.National Institute of Technologuy, Matsue college, 20.Senshu Univ., 21.Tokyo Gakugei Univ., 22.Kyusyu Univ.)

[PPS06-02] EnVision M5 Venus Orbiter Proposal

*Thomas Widemann[1], Colin Wilson[2], Richard Ghail[3], Dmitri Titov[4] (1.Observatoire de Paris, F, 2.Oxford University, UK, 3.Royal Holloway London, UK, 4.ESTEC, NL)

[PPS06-03] Improving Venus gravity field with the Envision candidate mission

★Invited Papers

*Pascal Rosenblatt[1], Caroline Dumoulin[1], Jean-Charles Marty[2], Antonio Genova[3] (1.Laboratory of Planetology and Geodynamics, 2.CNES/GRGS, 3.Sapienza Rome University)

[PPS06-04] Crustal recycling and the history of magmatism in Venus

*Masaki Ogawa[1] (1.Division of General Systems Studies, Graduate School of Arts and Sciences, University of Tokyo)

[PPS06-05] Constraining the Formation of Venus with N-body simulations of Terrestrial Planet Formation

*Patryk Sofia Lykawka[1], Takashi Ito[2] (1.School of Interdisciplinary Social and Human Sciences, Kindai University, 2.National Astronomical Observatory of Japan)

[PPS06-06] VERITAS: Discovering the Secrets of a Lost Habitable World

★Invited Papers

*Suzanne E Smrekar[1] (1.Jet Propulsion Laboratory)

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS06] Science of Venus: Venus Express, Akatsuki, and beyond

convener:Takehiko Satoh(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Kevin McGouldrick(University of Colorado Boulder), Hideo Sagawa(Kyoto Sangyo University), Thomas Widemann(Observatoire De Paris)

[PPS06-07] Wavelet analysis of gravity wave packets in Venus' atmosphere using radio occultation temperature profiles

Ryota Mori[1], *Takeshi Imamura[1], Hiroki Ando[2], Bernd Hausler[3], Martin Patzold[4], Silvia Tellmann[4] (1.Graduate School of Frontier Sciences, The University of Tokyo, 2.Faculty of Science, Kyoto Sangyo University, 3.Universitat der Bundeswehr Munchen, Germany, 4.Universitat zu Koln, Germany)

[PPS06-08] Cross-link Radio Occultation measurements of Venus Atmosphere by using multiple small satellites

*Hiroki Ando[1], Satoshi Ikari[2], Takeshi Imamura[3], Tomotaka Yamamoto[2], Yosuke Kawabata[2], Shoko Sano[2], Norihiko Sugimoto[4], Masahiro Takagi[1], Hideo Sagawa[1], Yukiko Fujisawa[4], Mutsuko Morimoto[4], Mirai Abe[5], Asako Hosono[6], Ryu Funase[2] (1.Faculty of Science, Kyoto Sangyo University, 2.Department of Aeronautics and Astronautics, The University of Tokyo, 3.Graduate School of Frontier Science, The University of Tokyo, 4.Department of Physics, Keio University, 5.Faculty of Law, Keio University, 6.Toshimagaoka Women High School)

[PPS06-09] Determination of the homopause altitude on Venus from SOIR/VEx observations

★Invited Papers

*Arnaud Mahieux[1,2], Hiromu Nakagawa[3], Nao Yoshida[3], Ann Carine Vandaele[1], Roger Yelle[4], Séverine Robert[1], Shohei Aoki[1,5], Arianna Piccialli[1], Loïc Trompet[1], Yasumasa Kasaba[3] (1.Royal Belgian Institute for Space Aeronomy, Brussels, Belgium, 2.The University of Texas at Austin, Austin, Texas, 3.Tohoku University, Sendai, Japan, 4.University of Arizona, Tucson, Arizona, 5.Université de Liège, Liège, Belgium)

[PPS06-10] Long term monitoring of planetary scale temperature variations at the cloud top level of Venus by Akatsuki/LIR observations

★Invited Papers

*Toru Kouyama[1], Masataka Imai[1], Takeshi Horinouchi[2], Takeshi Imamura[3], Makoto Taguchi[4], Tetsuya Fukuhara[4] (1.National Institute of Advanced Industrial Science and Technology, 2.Hokkaido University, 3.University of Tokyo, 4.Rikkyo University)

[PPS06-11] Dayside cloud top structure of Venus retrieved from Akatsuki IR2 observations

*Takao M. Sato[1], Takehiko Satoh[2], Hideo Sagawa[3], Naohiro Manago[4], Yeon Joo Lee[5], Shin-ya Murakami[2], Kazunori Ogohara[6], George HASHIMOTO[7], Yasumasa Kasaba[8], Atsushi Yamazaki[2], Manabu Yamada[9], Shigeto Watanabe[1], Takeshi Imamura[10], Masato Nakamura[2] (1.Hokkaido Information University, 2.ISAS/JAXA, 3.Kyoto Sangyo University, 4.Chiba University, 5.Technische Universität Berlin, 6.The University of Shiga Prefecture, 7.Okayama Unviersity, 8.Tohoku University, 9.Chiba Institute of Technology, 10.The University of Tokyo)

[PPS06-12] Variability of UV albedo and its relation to the wind field revealed by Akatsuki UVI

*Tatsuro Iwanaka[1], Takeshi Imamura[1], Yeon Joo Lee[2], Takeshi Horinouchi[3] (1.The Univesity of Tokyo, 2.Technical University of Berlin, 3.Hokkaido University)

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS06] Science of Venus: Venus Express, Akatsuki, and beyond

convener:Takehiko Satoh(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Kevin McGouldrick(University of Colorado Boulder), Hideo Sagawa(Kyoto Sangyo University), Thomas Widemann(Observatoire De Paris)

[PPS06-13] Topographic waves in the Venus atmosphere

*Anna Suzuki[1], Masahiro Takagi[1], Yasumitsu Maejima[2], Hiroki Ando[1], Norihiko Sugimoto[3], Yoshihisa Matsuda[4] (1.Kyoto Sangyo University, 2.RIKEN Center for Computational Science, 3.Keio University, 4.Tokyo Gakugei University)

[PPS06-14] Akatsuki IR2 camera data restoration towards revealing Venus's middle cloud properties

★Invited Papers

*Choon Wei Vun[1], Takehiko Satoh[2,1], Takao M. Sato[3], Takeshi Horinouchi[4] (1.SOKENDAI, 2.ISAS/JAXA, 3.Hokkaido Information University, 4.Hokakido University)

[PPS06-15] Variations of Venus night clouds as observed by Akatsuki/IR2

*Takehiko Satoh[1,2], Choon Wei Vun[2], Takeshi Horinouchi[3], Takao M. Sato[4] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2.Department of Space and Astronautical Science, The Graduate University for Advanced Studies, SOKENDAI, 3.Faculty of Environmental Earth Science, Hokkaido University, 4.Space Information Center, Hokkaido Information University)

[PPS06-16] Effect of Insoluble Sulfur on the Microphysics of the Sulfuric Acid Clouds of Venus

*Kevin McGouldrick[1] (1.University of Colorado Boulder)

[PPS06-17] Status of lightning search in Venus

*Yukihiro Takahashi[1,2], Masataka Imai[3], Mitsuteru Sato[1,2], Ralph Lorenz[4], Tatsuharu Ono[1] (1.Department of Cosmosciences, Graduate School of Science, Hokkaido University, 2.Faculty of Science, Hokkaido University, 3.AIST, 4.Applied Physics Laboratory, Johns Hopkins University)

[PPS06-18] Searching minor species on Venus atmosphere using the high-dispersion spectra taken by IRTF/iSHELL

*Hideo Sagawa[1], Takao M. Sato[2], Hajime Kita[3] (1.Faculty of Science, Kyoto Sangyo University, 2.Hokkaido Information University, 3.Japan Aerospace Exploration Agency)

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS07] Solar System Small Bodies: Explorations of Ryugu, Bennu, and the Solar System at Large

convener:Taishi Nakamoto(Tokyo Institute of Technology), Tatsuaki Okada(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Dante S Lauretta(University of Arizona), Masateru Ishiguro(Department of Physics and Astronomy, Seoul National University)

[PPS07-01] Technological challenges and achievements in Hayabusa2 mission

*Makoto Yoshikawa[1], Yuichi Tsuda[1], Satoru Nakazawa[1], Fuyuto Terui[1], Takanao Saiki[1] (1.Japan Aerospace Exploration Agency)

[PPS07-02] Surface evolution of carbonaceous asteroid Ryugu revealed from touchdown operation of Hayabusa2

★Invited Papers

*Tomokatsu Morota[1], Seiji Sugita[1], Yuichiro Cho[1], Masanori Kanamaru[2], ERI TATSUMI[3], Naoya Sakatani[4], Rie Honda[5], Naoyuki Hirata[6], Hiroshi Kikuchi[4], Manabu Yamada[7], yokota yasuhiro[4], Shingo Kameda[8], Moe Matsuoka[4], Hirotaka Sawada[4], Chikatoshi Honda[9], Toru Kouyama[10], Kazunori Ogawa[4], Hidehiko Suzuki[11], Kazuo Yoshioka[1], Masahiko Hayakawa[4], Naru Hirata[9], Masatoshi Hirabayashi[12], Hideaki Miyamoto[1], Tatsuhiro Michikami[13], Takahiro Hiroi[14], Carolyn M. Ernst[15], Olivier S. Barnouin[15], Sei-ichiro WATANABE[16] (1.The University of Tokyo, 2.Osaka University, 3.Universidad de La Laguna, 4.JAXA, 5.Kochi University, 6.Kobe University, 7.Chiba Institute of Technology, 8.Rikkyo University, 9.The University of Aizu, 10.AIST, 11.Meiji University, 12.Auburn University, 13.Kindai University, 14.Brown University, 15.APL/JHU, 16.Nagoya University)

[PPS07-03] Thermal evolution of Ryugu inffered from spectral characterization of experimentally-heated CI carbonaceous chondrite

*Kana Amano[1], Tomoki Nakamura[1], Fumihiko Usui[2], Satoshi Okumura[1], Michael E. Zolensky[3] (1.Tohoku University, 2.Kobe University, 3.NASA Johnson Space Center)

[PPS07-04] Morphological and spectral trends among boulders on asteroid 162173 Ryugu: implication for parent body processes

*Koki Yumoto[1], Yuichiro Cho[1], Tomokatsu Morota[1], Eri Tatsumi[1,10], Yokota Yasuhiro[2,3], Naoya Sakatani[2], Kazuo Yoshioka[1], Hirotaka Sawada[2], Rie Honda[3], Shingo Kameda[4], Manabu Yamada[5], Chikatoshi Honda[6], Toru Kouyama[7], Moe Matsuoka[2], Hidehiko Suzuki[8], Kazunori Ogawa[9,11], Masahiko Hayakawa[2], Hideaki Miyamoto[1], Chiho Sugimoto[1], Seiji Sugita[1] (1.Univ. of Tokyo, 2.JAXA, 3.Kochi Univ., 4.Rikkyo Univ., 5.PERC, Chiba Institute of Technology, 6.Univ. of Aizu, 7.AIST, 8.Meiji Univ., 9.JSEC, JAXA, 10.Instituto de Astrofisica de Canarias, 11.Kobe Univ.)

[PPS07-05] Time-dependent spectroscopic and mineralogical changes by heating of Murray CM chondrite

*Yuri Fujioka[1], Tomoki Nakamura[1], Kana Amano[1], Shiho Kobayashi[1], Aki Takigawa[2] (1.Department of Earth Science, Graduate School of Science, Tohoku University, 2.Division of Earth and Planetary Science, Kyoto University)

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS07] Solar System Small Bodies: Explorations of Ryugu, Bennu, and the Solar System at Large

convener:Taishi Nakamoto(Tokyo Institute of Technology), Tatsuaki Okada(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Dante S Lauretta(University of Arizona), Masateru Ishiguro(Department of Physics and Astronomy, Seoul National University)

[PPS07-06] Artificial impact crater formed by Small Carry-on Impactor on the asteroid 162173 Ryugu in the gravity-dominated regime

★Invited Papers

*Masahiko Arakawa[1], Takanao Saiki[2], Toshihiko Kadono[3], Yasuhiko Takagi[4], Koji Wada[5], Yu-ichi Iijima[2], Hiroshi Imamura[2], Chisato Okamoto[1], Yuri Shimaki[2], Kei Shiai[1], Satoru Nakazawa[2], Masahiko Hayakawa[2], Naru Hirata[6], Hajime Yano[2], Hirotaka Sawada[2], Kazunori Ogawa[2], Rie Honda[7], Ko Ishibashi[5], Naoya Sakatani[2], Tomoaki Toda[2], Hajime Hayakawa[2], Seiji Sugita[8], Tomokatsu Morota[8], Shingo Kameda[9], ERI TATSUMI[13], Chikatoshi Honda[6], yokota yasuhiro[2], Toru Kouyama[10], Manabu Yamada[5], Hidehiko Suzuki[11], Kazuo Yoshioka[8], Yuichiro Cho[8], Moe Matsuoka[2], Patrick Michel[12] (1.Kobe University, 2.Japan Aerospace Exploration Agency, 3.University of Occupational and Environmental Health, 4.Aichi Toho University, 5.Chiba Institute of Technology, 6.University of Aizu, 7.Kochi University, 8.The University of Tokyo, 9.Rikkyo University, 10.National Institute of Advanced Industrial Science and Technology, 11.Meiji University, 12.Observatoire de la Côte d'Azur, 13.Instituto de Astrofisica de Canarias)

[PPS07-07] Assessing the Small carry-on Impactor debris operated by the Hayabusa2 mission: an evaluation by FT-IR, micro-Raman, STXM and NanoSIMS.

*Motoo Ito[1], Yoshinori Takano[2], Takuji Ohigashi[3], Hayato Yuzawa[3], Yoko Kebukawa[4], Kento Kiryu[4], Masayuki Uesugi[5], Naotaka Tomioka[1], Yu Kodama[7], Hiroshi Naraoka[6], Toru Yada[8], Masanao Abe[8] (1.Kochi Institute for Core Sample Research, JAMSTEC, 2.Biogeochemistry Program, JAMSTEC, 3.UVSOR, Institute for Molecular Science, 4.Yokohama National University, 5.JASRI, 6.Kyushu University, 7.Marine Works Japan, 8.JAXA)

[PPS07-08] Subsurface structure inferred from the relation between craters and their surrounding boulders on asteroid Ryugu

*Sei-ichiro WATANABE[1,2], Hiroki Akahane[1], Tomokatsu Morota[3,1], Tatsuhiro Michikami[4], Naru Hirata[5], Naoyuki Hirata[6], Yuri Shimaki[2], Rina Noguchi[2], Rie Honda[7], Shingo Kameda[8], Manabu Yamada[9], Naoya Sakatani[2], Kazunori Ogawa[2], ERI TATSUMI[10], Toru Kouyama[11], yokota yasuhiro[2,7], Yuichiro Cho[3], Hidehiko Suzuki[12], Masahiko Hayakawa[2], Moe Matsuoka[2], Chikatoshi Honda[5], Kazuo Yoshioka[3], Hirotaka Sawada[2], Seiji Sugita[3], Masahiko Arakawa[6], Hayabusa2 Science Team[13] (1.Nagoya University, 2.JAXA, 3.University of Tokyo, 4.Kindai University, 5.University of Aizu, 6.Kobe University, 7.Kochi University, 8.Rikyo University, 9.Chiba Institute of Technology, 10.University of La Laguna, 11.National Institute of Advanced Industrial Science and Technology, 12.Meiji University, 13.Hayabusa2 Project)

[PPS07-09] Highly Porous Asteroid 162173 Ryugu Derived from Lowest Temperatures in a Day

*Tatsuaki Okada[1,2], Tetsuya Fukuhara[3], Satoshi Tanaka[1], Takehiko Arai[4], Naoya Sakatani[1], Yuri Shimaki[1], Hiroki Senshu[5], Hirohide Demura[6], Kentaro Suko[6], Tomohiko Sekiguchi[7], Toru Kouyama[8], Ayumu Ohsugi[1,2] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2.University of Tokyo, 3.Rikkyo University, 4.Ashikaga University, 5.Chiba Institute of Technology, 6.University of Aizu, 7.Hokkaido University of Education, 8.National Institute of Advanced Industrial Science and Technology)

[PPS07-10] Thermophysical Properties of Ryugu Estimated from a Box-A Observation

*Yuri Shimaki[1], Hiroki Senshu[2], Naoya Sakatani[1], Tatsuaki Okada[1,3], Tetsuya Fukuhara[4], Satoshi Tanaka[1,5], Makoto Taguchi[4], Takehiko Arai[6], Hirohide Demura[7], Kentaro Suko[7], Tomohiko Sekiguchi[8], Toru Kouyama[9], Jun Takita[10], Sunao Hasegawa[1] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2.Chiba Institute of Technology, 3.University of Tokyo, 4.Rikkyo University, 5.The Graduate University for Advanced Studies, SOKENDAI, 6.Ashikaga University, 7.University of Aizu, 8.Hokkaido University of Education, 9.National Institute of Advanced Industrial Science and Technology (AIST), 10.Hokkaido Kitami Hokuto High School)

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS07] Solar System Small Bodies: Explorations of Ryugu, Bennu, and the Solar System at Large

convener:Taishi Nakamoto(Tokyo Institute of Technology), Tatsuaki Okada(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Dante S Lauretta(University of Arizona), Masateru Ishiguro(Department of Physics and Astronomy, Seoul National University)

[PPS07-11] Spectral heterogeneities at the surface of Ryugu as seen by the NIRS3 spectrometer

*Lucie Riu[1], NIRS3 Team, Hayabusa2 Science Team (1.Institut of Space and Astronautical Science (ISAS/JAXA))

[PPS07-12] The ESA Hera mission: rendezvous with a binary asteroid and planetary defense

★Invited Papers

*Patrick Michel[1], Tatsuaki Okada[2], Michael Kueppers[3], Ian Carnelli[4], Paolo Martino[5], Adriano Campo Bagatin[6], Benoit Carry[1], Sebastien Charnoz[7], Julia de Leon[8], Alan Fitzsimmons[9], Simon Green[10], Carsten Guettler[11], Alain Herique[12], Martin Jutzi[13], Ozgur Karatekin[14], Naomi Murdoch[15], Petr Pravec[16], Holger Sierks[11], Colin Snodgrass[17], Paolo Tortora[18], Kleomenis Tsiganis[19], Stephan Ulamec[20], Jean-Baptiste Vincent[20], Kai Wuennemann[21], Andy Cheng[22], Andy Rivkin[22], Nancy Chabot[22], Olivier S Barnouin[22], Carolyn Ernst[22], Derek C Richardson[23], Angela Stickle[22], Masahiko Arakawa[24], Akiko Nakamura[24], Hideaki Miyamoto[25], Seiji Sugita[25], Makoto Yoshikawa[2] (1.Universite Cote D Azur Observatoire De La Cote D Azur CNRS Laboratoire Lagrange, 2.ISAS JAXA, 3.ESA ESAC, 4.ESA HQ, 5.ESA ESTEC, 6.University of Alicante, 7.IPGP, 8.Instituto de Astrofisica de Canarias, 9.Queen's University, 10.The Open University, 11.Max Planck Institute, 12.IPAG, 13.University of Bern, 14.Royal Observatory of Belgium, 15.ISAE-Supaero, 16.Czech Academy of Sciences, 17.The University of Edinburgh, 18.University of Bologna, 19.University of Thessaloniki, 20.DLR, 21.Natural History Museum Berlin, 22.APL JHU, 23.University of Maryland, 24.Kobe University, 25.The University of Tokyo)

[PPS07-13] Science of DESTINY+ mission

*Tomoko Arai[1], Masanori Kobayashi[1], Ko Ishibashi[1], Fumi Yoshida[1], Hiroshi Kimura[1], Takayuki Hirai[1], Peng Hong[1], Ralf Srama[2], Harald Kruger[3], Naoya Okazaki[4], Takayuki Yamamoto[4], Hiroyuki Toyota[4], Kazutaka Nishiyama[4], Takeshi Takashima[4], DESTINY+ Science team (1.Planetary Exploration Research Center, Chiba Institute of Technology, 2.University of Stuttgart, 3.Max Planck Institute, 4.JAXA)

[PPS07-14] Multiple Asteroid Flyby Tour Design Utilizing Low-Thrust and Gravity-Assist for DESTINY+ Mission

*Ozaki Naoya[1], Takayuki Yamamoto[1], Nishanth Pushparaj[2], Diogene Alessandro Dei Tos[1], Onur Celik[2], Ferran Gonzalez-Franquesa[2], Roger Gutierrez Ramon[2], Kanako Machii[4], Takuya Chikazawa[5], Tomoko Arai[3], Yasuhiro Kawakatsu[1], Kazutaka Nishiyama[1], Takeshi Takashima[1] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2.SOKENDAI, the Graduate University for Advanced Studies, 3.Planetary Exploration Research Center, Chiba Institute of Technology, 4.University of Electro-Communications, 5.University of Tokyo)

[PPS07-15] Twinkle: a visible and near-infrared space-based observatory for exoplanet and solar system spectroscopy

*Billy Nelson Edwards[1,2], Giovanna Tinetti[1,2], Marcell Tessenyi[2,1], Giorgio Savini[1,2], Jonathan Tennyson[1,2], Richard Archer[2], Ian Stotesbury[2], Max Joshua[2], Benjamin Wilcock[2] (1.University College London , 2.Blue Skies Space Ltd.)

[P-PS07] Solar System Small Bodies: Explorations of Ryugu, Bennu, and the Solar System at Large

convener:Taishi Nakamoto(Tokyo Institute of Technology), Tatsuaki Okada(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Dante S Lauretta(University of Arizona), Masateru Ishiguro(Department of Physics and Astronomy, Seoul National University)

[PPS07-21] Evolution of thermally metamorphosed C-complex asteroids inferred from a heated CM chondrite Jbilet Winselwan

★Invited Papers

*Wataru Fujiya[1], Hisato Higashi[1], Yuki Hibiya[2], Shingo Sugawara[1], Akira Yamaguchi[3], Makoto Kimura[3], Ko Hashizume[1] (1.Ibaraki University, College of Science, 2.Japan Agency for Marine-Earth Science and Technology, 3.National Institute of Polar Research)

[PPS07-22] Aggregate structure of comet 67P/Churyumov-Gerasimenko

*Sota ARAKAWA[1,2], Kazumasa Ohno[3,2] (1.NAOJ, 2. Tokyo Tech, 3.UCSC)

[PPS07-23] Numerical Simulations of Spinup of Asteroids and the Formation of Top-Shaped Asteroids

*Keisuke Sugiura[1], Hiroshi Kobayashi[2], Sei-ichiro WATANABE[3], Hidenori Genda[1], Ryuki Hyodo[4], Shu-ichiro Inutsuka[2] (1.Tokyo Institute of Technology, Earth Life Science Institute, 2.Nagoya University, Department of Physics, 3.Nagoya University, Department of Earth and Environmental Sciences, 4.JAXA, ISAS, Department of Solar System Sciences)

[PPS07-24] YORP Effect on Asteroid Ryugu

*Masanori Kanamaru[1], Sho Sasaki[1], Tomokatsu Morota[2], Yuichiro Cho[2], Naru Hirata[3], Naoyuki Hirata[4], Hiroki Senshu[5], Yuri Shimaki[6], Satoshi Tanaka[6], Tatsuaki Okada[6], Tomohiro Usui[6], Seiji Sugita[2], Sei-ichiro WATANABE[7] (1.Osaka University, 2.The University of Tokyo, 3.The University of Aizu, 4.Kobe University, 5.Chiba Institute of Technology, 6.ISAS/JAXA, 7.Nagoya University)

[PPS07-25] Likelihood for rubble-pile near-Earth asteroids to be 1st or Nth generation: focus on Bennu and Ryugu

*Kevin John Walsh[1], Ronald Ballouz[2], William F Bottke[1], Chrysa Avdellidou[3], Harold C Connolly Jr.[4], Marco Delbo[3], Daniella N DellaGiustina[2], Erica R Jawin[5], Timothy McCoy[5], Patrick Michel[3], Tomokatsu Morota[6], Michael C Nolan[2], Steven R Schwartz[2], Seiji Sugita[6], Dante S Lauretta[2] (1.Southwest Research Institute Boulder, 2.Lunar and Planetary Laboratory, University of Arizona, 3.Laboratoire Lagrange, Université Côte d'Azur, 4.Dept. of Geology, Rowan University, 5.Smithsonian Institution National Museum of Natural History, 6.University of Tokyo)

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS08] Mars and Mars system: results from a broad spectrum of Mars studies and aspects for future missions

convener:Hideaki Miyamoto(University of Tokyo), Tomohiro Usui(Japan Aerospace Exploration Agency), Yuki Harada(Kyoto University), Sushil K Atreya(University of Michigan Ann Arbor)

[PPS08-01] On possibility of visualization of Martian space environment with diffuse aurora: Relations between magnetic field structure and solar energetic electron penetration into the upper atmosphere observed by MAVEN

*Kanako Seki[1], Takuya Hara[2], Dave A Brain[3], Rob J. Lillis[2], Naoki Terada[4], Hiromu Nakagawa[4], Darvin E. Larson[2], Dave L. Mitchell[2], Gina A. Dibraccio[5], Nicholas McCord Schneider[3], Sonal K. Jain[3], Janet G. Luhmann[2], Bruce M. Jakosky[3] (1.Graduate School of Science, University of Tokyo, 2.Space Sciences Laboratory, University of California, Berkeley, 3.LASP, University of Colorado, Boulder, 4.Graduate School of Science, Tohoku University, 5.Goddard Space Flight Center, NASA)

[PPS08-02] Low electron temperatures observed at Mars by MAVEN on dayside crustal magnetic field lines

★Invited Papers

*Shotaro Sakai[1,2], Thomas E. Cravens[3], Laila Andersson[4], Christopher M. Fowler[5], David L. Mitchell[5], Christian Mazelle[6], Edward M. B. Thiemann[4], David A. Brain[4], Kanako Seki[1] (1.Graduate School of Science, University of Tokyo, 2.Graduate School of Science, Tohoku University, 3.Department of Physics and Astronomy, University of Kansas, 4.Laboratory for Atmospheric and Space Physics, University of Colorado Boulder, 5.Space Science Laboratory, University of California, Berkeley, 6.IRAP, Université de Toulouse, CNRS, CNES, UPS-OMP)

[PPS08-03] A warm layer in the nightside mesosphere of Mars

*Hiromu Nakagawa[1], Sonal K Jain[2], Nicholas M Schneider[2], Franck Montmessin[3], Roger V Yelle[4], Fayu Jiang[4], Loic Verdier[3], Takeshi Kuroda[1], Nao Yoshida[1], Hitoshi Fujiwara[5], Takeshi Imamura[6], Kaori Terada[1], Naoki Terada[1], Kanako Seki[7], Hannes Groller[4], Justin I Deighan[2] (1.Planetary Atmosphere Physics Laboratory, Department of Geophysics, Graduate School of Science, Tohoku University, 2.Laboratory for Atmospheric and Space Physics, University of Colorado, 3.Laboratoire Atmosphères, Milieux, Observations Spatiales, 4.Lunar and Planetary Laboratory, University of Arizona, 5.Faculty of Science and Technology, Seikei University, 6.Graduate School of Frontier Sciences, The University of Toky, 7.Graduate School of Science, The University of Tokyo)

[PPS08-04] Studying martian dust storms, clouds, and associated meteorology using observations from Indian and foreign satellite missions

*JAGABANDHU PANDA [1], Bijay Kumar Guha[1] (1.National Institute of Technology Rourkela)

[PPS08-05] Greeley et al. (2006) revisited: the size distribution and frequency of dust devils at the Gale crater

*Kazunori Ogohara[1] (1.School of Engineering, University of Shiga Prefecture)

[PPS08-06] Observations of the Martian atmosphere by NOMAD on ExoMars Trace Gas Orbiter

★Invited Papers

*Ann Carine Vandaele[1], Frank Daerden[1], Ian R. Thomas[1], Shohei Aoki[1,2], Cédric Depiesse[1], Justin T. Erwin[1], Lori Neary[1], Bojan Ristic[1], Yannick Willame[1], Jean-Claude Gérard[2], Giuliano Liuzzi[3], Geronimo Villanueva[3], Jon Mason[4], Manish R. Patel[4], Francesca Altieri[5], Giancarlo Bellucci[5], Miguel Lopez-Valverde[6], Jose-Juan Lopez-Moreno[6] (1.Royal Belgian Institute for Space Aeronomy, Brussels, Belgium, 2.Laboratory for Planetary and Atmospheric Physics, University Liège, Belgium, 3.NASA Goddard Space Flight Center, Greenbelt, MD, USA, 4.School of Physical Sciences, The Open University, Milton Keynes, UK, 5.Istituto di Astrofisica e Planetologia Spaziali (IAPS/INAF), Rome, Italy, 6.Instituto de Astrofisica de Andalucia (IAA/CSIC), Granada, Spain)

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS08] Mars and Mars system: results from a broad spectrum of Mars studies and aspects for future missions

convener:Hideaki Miyamoto(University of Tokyo), Tomohiro Usui(Japan Aerospace Exploration Agency), Yuki Harada(Kyoto University), Sushil K Atreya(University of Michigan Ann Arbor)

[PPS08-07] Strong seasonal and diurnal variability of water D/H on Mars as revealed with ExoMars/NOMAD

★Invited Papers

*Geronimo Luis Villanueva[1], Giuliano Liuzzi[1,2], Matteo James Crismani[1], Shohei Aoki[3], Ann-Carine Vandaele[3], Michael Jon Mumma[1], Michael D Smith[1], Frank Daerden[3], Ian R Thomas[3], Miguel Angel Lopez-Valverde[4], Bojan Ristic[3], Manish R Patel[5], Giancarlo Bellucci[6], Jose Juan Lopez-Moreno[4] (1.NASA Goddard Space Flight Center, 2.Department of Physics, American University, USA, 3.Royal Belgian Institute for Space Aeronomy, Belgium, 4.Instituto de Astrofísica de Andalucía, Spain, 5.Open University, UK, 6.Istituto di Astrofisica e Planetologia, Italy)

[PPS08-08] Retrievals of ice clouds, dust and ozone from NOMAD/UVIS on board Exomars TGO

*Yannick Willame[1], Ann C. Vandaele[1], Arianna Piccialli[1], Cédric Depiesse[1], Frank Daerden[1], Ian R. Thomas[1], Bojan Ristic[1], Jon Mason[2], Manish R. Patel[2], Giancarlo Bellucci[3], Jose-Juan Lopez-Moreno[4], NOMAD Team (1.Royal Belgian Institute for Space Aeronomy (IASB-BIRA), av. Circulaire 3, 1180 Brussels, Belgium, 2.School of Physical Sciences, The Open University, Milton Keynes, UK, 3.Istituto di Astrofisica e Planetologia Spaziali (IAPS/INAF), Via del Fosso del Cavaliere, 00133 Rome, Italy, 4.Instituto de Astrofisica de Andalucia (IAA/CSIC), Granada, Spain)

[PPS08-09] Evolution of hydrological and glaciological activities on early Mars before late Tharsis formation

*Arihiro Kamada[1], Takeshi Kuroda[1], Yasumasa Kasaba[1], Naoki Terada[1], Hiromu Nakagawa[1], Katsushige Toriumi[1] (1.Graduate School of Science, Tohoku University)

[PPS08-10] Permittivity of subsurface on Mars and its importance for electromagnetic wave reflection method such as radar sounder and ground penetrating radar

*Makito Kobayashi[1], Takafumi Niihara[1], Hideaki Miyamoto[1], Atsushi Kumamoto[2], Toshiyuki Nishibori[3] (1.University of Tokyo, 2.Tohoku University, 3.Japan Aerospace eXploration Agency)

[PPS08-11] TIMINGS OF MARTIAN WRINKLE RIDES, A GLOBAL INVESTIGATION

*Trishit Ruj[1], KENJI KAWAI[1] (1.Department of Earth and Planetary Science, School of Science, The University of Tokyo)

[PPS08-12] Displacement-Length Ratios and Contractional Strains of Wrinkle Ridges in Thaumasia Minor and Solis Planum, Mars

DIPAYAN DASGUPTA[1], *ABHIK KUNDU[1] (1.Asutosh College, Kolkata, India)

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS08] Mars and Mars system: results from a broad spectrum of Mars studies and aspects for future missions

convener:Hideaki Miyamoto(University of Tokyo), Tomohiro Usui(Japan Aerospace Exploration Agency), Yuki Harada(Kyoto University), Sushil K Atreya(University of Michigan Ann Arbor)

[PPS08-13] **The Giant Sinkholes of Mars: Furthering our Understanding of the Red Planet's Hydrosphere**

★Invited Papers

*Alexis Palmero Rodriguez[1], Hideaki Miyamoto[2], Victor Baker[3] (1.Planetary Science Institute, 2.University of Tokyo, 3.University of Arizona)

[PPS08-15] Constraining the Formation of Mars with N-body simulations of Terrestrial Planet Formation

*Patryk Sofia Lykawka[1], Takashi Ito[2] (1.School of Interdisciplinary Social and Human Sciences, Kindai University, 2.National Astronomical Observatory of Japan)

[PPS08-16] Extensive delivery of Martian ejecta to its moons: The gateway to a time-resolved history of Mars

*Hidenori Genda[1], Ryuki Hyodo[2], Kosuke Kurosawa[3], Tomohiro Usui[2], Kazuhisa Fujita[2] (1.Earth-Life Science Institute, Tokyo Institute of Technology, 2.JAXA ISAS, 3.Planetary Exploration Research Center, Chiba Institute of Technology)

[PPS08-17] Morphological characteristics of small craters of Phobos

*Ryodo Hemmi[1], Hideaki Miyamoto[1] (1.The University of Tokyo)

[PPS08-18] The MMX Rover: objectives, science goals, and contributions to the MMX mission

*Hideaki Miyamoto[1], Patrick Mitchel[2], Stephan Ulamec[3], Ute Böttger[3], Matthias Grott[3], Naomi Murdoch[4], Pierre Vernazza[5], MMX Rover team (1.University of Tokyo, 2.Université Côte d'Azur, Observatoire de la Côte d'Azur, CNRS, 3.Deutsches Zentrum für Luft- und Raumfahrt e.V. , 4.Institut Supérieur de l'Aéronautique et de l'Espace, 5.Laboratoire d'Astrophysique de Marseille)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM11] Heliosphere and Interplanetary Space

convener:Kazumasa Iwai(Institute for Space–Earth Environmental Research (ISEE), Nagoya University), Yasuhiro Nariyuki(Faculty of Education, University of Toyama), Ken Tsubouchi(University of Electro-Communications), Masaki N(Japan Aerospace Exploration Agency, Institute of Space and Astronautical Science)

[PEM11-01] Stream Interaction Regions in the Inner Heliosphere: Insights from the First Four Orbits of Parker Solar Probe

★Invited Papers

*Robert Colby Allen[1], George Ho[1], Lan K Jian[2], David Lario[2], Dusan Odstrcil[2], Charles Nick Arge[2], Sam T Badman[4,5], Steward D Bale[4,5,7,8], John W Bonnell[5], Anthony W Case[9], Eric R Christian[2], Christina M. S. [PEM11-02] Hinode Observation of Sun's Polar Regions over a solar cycle

*Daikou Shiota[1], Masumi Shimojo[2] (1.National Institute of Information and Communications Technology (NICT), 2.National Astronomical Observatory of Japan)

[PEM11-03] Coronal radio sounding using Akatuski spacecraft: variation in the solar cycle

*Shota Chiba[1], Takeshi Imamura[1], Munetoshi Tokumaru[2], Ayumi Asai[3], Hiroaki Isobe[4], Daikou Shiota[5], Takuma Matsumoto[6], Hiroki Ando[7] (1.Graduate School of Frontier Sciences, The University of Tokyo, 2.Institute for Space-Earth Environmental Research, Nagoya University, 3.Astronomical Observatory, Kyoto University, 4.Faculty of Fine Arts, Kyoto City University of Arts, 5.National Institute of Information and Communications Technology (NICT), 6.Nagoya University, Ta Lab, 7.Kyoto Sangyo University)

[PEM11-04] Global distribution of the solar wind speed during Cycle 22-24

*Munetoshi Tokumaru[1], Ken'ichi Fujiki[1], Kazumasa Iwai[1], Nobuhiko Nishimura[1], Ryuya Maeda[1] (1.Institute for Space-Earth Environmental Research, Nagoya University)

[PEM11-05] Next generation interplanetary scintillation observation telescope using 2D phased array system

*Kazumasa Iwai[1], Munetoshi Tokumaru[1], Ken'ichi Fujiki[1] (1.Institute for Space–Earth Environmental Research (ISEE), Nagoya University)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM11] Heliosphere and Interplanetary Space

convener:Kazumasa Iwai(Institute for Space–Earth Environmental Research (ISEE), Nagoya University), Yasuhiro Nariyuki(Faculty of Education, University of Toyama), Ken Tsubouchi(University of Electro-Communications), Masaki N(Japan Aerospace Exploration Agency, Institute of Space and Astronautical Science)

[PEM11-07] **Ion scale waves and kinetic instabilities in the inner heliosphere**

*Jungjoon Seough[1], Yasuhiro Nariyuki[2], Peter Yoon[1,3,4], Kyung-Suk Cho[1] (1.KASI, 2.UT, 3.UMD, 4.KHU)

[PEM11-08] Effects of initial density fluctuations on linear and nonlinear evolution of parametric decay instabilities of circularly polarized Alfven waves

*Yasuhiro Nariyuki[1] (1.Faculty of Education, University of Toyama)

[PEM11-09] **Search of energy source of 1-16Hz Whistler Mode Waves Detected by Kaguya in the Lunar Polar Orbit**

*Tomoko Nakagawa[1], Futoshi Takahashi[2], Hisayoshi Shimizu[3], Yoshifumi Saito[4] (1.Information and Communication Engineering, Tohoku Institute of Technology, 2.Department of Earth and Planetary Sciences, Faculty of Science, Kyushu University, 3.Earthquake Research Institute, University of Tokyo, 4.Solar System Science Division, Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

[PEM11-10] Relationship between the inner heliosheath thickness and the pickup ion density

*Ken Tsubouchi[1] (1.University of Electro-Communications)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM12] Coupling Processes in the Atmosphere-Ionosphere System

convener:Huixin Liu(Earth and Planetary Science Division, Kyushu University SERC, Kyushu University), Yuichi Otsuka(Institute for Space-Earth Environmental Research, Nagoya University), Yue Deng(University of Texas at Arlington), Loren Chang(Institute of Space Science, National Central University)

[PEM12-01] Inter-hemispheric Coupling During Sudden Stratospheric Warming Events

Kristina Shizuka Yamase Skarvang[2], *Patrick J Espy[1], Robert E. Hibbins[1], Willem E. van Caspel[1] (1.Norwegian Univ. of Science and Technology, Birkeland Centre for Space Science, 2.Norwegian Univ. of Science and Technology)

[PEM12-02] Dynamical characteristics of the middle atmosphere associated with the Antarctic sudden stratospheric warming in 2019.

★Invited Papers

*Kaoru Sato[1], Yoshihiro Tomikawa[2], Dai Koshin[1] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 2.National Institute of Polar Research)

[PEM12-03] WACCMX Simulations of the 2002 and 2019 Southern Hemisphere Sudden Stratospheric Warmings

★Invited Papers

*Nicholas M Pedatella[1] (1.National Center for Atmospheric Research)

[PEM12-04] Characteristics of small-scale gravity waves in the Arctic winter mesosphere

*JING LI[1], TAO LI[2,3], QIAN WU[4], YIHUAN TANG[2], ZHAOPENG WU[1,3], JUN CUI[1] (1.Planetary Environmental and Astrobiological Research Laboratory (PEARL), School of Atmospheric Sciences, Sun Yat-sen University, Zhuhai, Guangdong, China, 2.CAS Key Laboratory of Geospace Environment, School of Earth and Space Sciences, University of Science and Technology of China, Hefei, Anhui, China, 3.CAS Center for Excellence in Comparative Planetology, Hefei, Anhui, China, 4.High Altitude Observatory, National Center for Atmospheric Research, Boulder, CO, USA)

[PEM12-05] Studying atmospheric and ionospheric variabilities in the mesopause and ionospheric F2-region during winter sudden stratospheric warmings of various types

*Irina Medvedeva[1,2], Konstantin Ratovsky[1], Alla Suvorova[3] (1.Institute of Solar-Terrestrial Physics SB RAS, Irkutsk, Russia , 2.Obukhov Institute of Atmospheric Physics RAS, Moscow, Russia , 3.GPSARC National Central University, Taoyuan, Taiwan)

[PEM12-06] Influences of migrating semidiurnal tide variabilities on the low latitude ionosphere

*Jia-Ting Lin[1], Charles Lin[1], Loren Chang[2,3], Hanli Liu[4], Nicholas M Pedatella[4,5] (1.Department of Earth Sciences, National Cheng Kung University, Taiwan, 2.Center for Astronautical Physics and Engineering, National Central University, Taoyuan, Taiwan, 3.Graduate Institute of Space Science, National Central University, Taoyuan, Taiwan, 4.High Altitude Observatory, National Center for Atmospheric Research, Boulder, CO, USA, 5.COSMIC Program Office, University Corporation for Atmospheric Research, Boulder, CO, USA)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM12] Coupling Processes in the Atmosphere-Ionosphere System

convener:Huixin Liu(Earth and Planetary Science Division, Kyushu University SERC, Kyushu University), Yuichi Otsuka(Institute for Space-Earth Environmental Research, Nagoya University), Yue Deng(University of Texas at Arlington), Loren Chang(Institute of Space Science, National Central University)

[PEM12-07] A model-data comparative study of large-scale ionospheric disturbances during the 17 March 2015 storm

★Invited Papers

*Gang Lu[1], Irina Zakharenkova[2], Iurii Cherniak[2], Tong Dang[3] (1.National Center for Atmospheric Research, 2.COSMIC Program Office, University Corporation for Atmospheric Research, 3.University of Science and Technology of China)

[PEM12-08] Evolution of mid-latitude density irregularities and scintillation during storms

★Invited Papers

*Toshi Nishimura[1], Sebastijan Mrak[1], Josh Semeter[1] (1.Boston University)

[PEM12-09] Growin: Modeling Ionospheric Instability Growth Rates and Giving Away the Code

*Jonathon Smith[1,2] (1.Catholic University of America, 2.NASA Goddard Space Flight Center)

[PEM12-10] Spatial and temporal relation among magnetic ripples, wavy structure of electron density fluctuation and GPS TEC variations

*Toshihiko Iyemori[1], Tadashi Aoyama[1], Yoshihiro Yokoyama[1], Akiyasu Yamada[1] (1.Kyoto University)

[PEM12-11] Temporal and spatial variations of the total electron content enhancement from the mid-latitude to the equator associated with a geomagnetic storm

*Atsuki Shinbori[1], Yuichi Otsuka[1], Sori Takuya[1], Takuya Tsugawa[2], Michi Nishioka[2] (1.Institute for Space-Earth Environment Research (ISEE), Nagoya University, 2.National Institute of Information and Communications Technology)

[PEM12-12] Atmospheric influence on relationship between solar and ionospheric 27-day variations

*Konstantin Ratovsky[1], Maxim Klimenko [2], Vladimir Klimenko[2], Alexei Dmitriev[3], Loren Chang[3] (1.Institute of Solar-Terrestrial Physics SB RAS, 2.West Department of Pushkov IZMIRAN, RAS, 3.National Central University)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM12] Coupling Processes in the Atmosphere-Ionosphere System

convener:Huixin Liu(Earth and Planetary Science Division, Kyushu University SERC, Kyushu University), Yuichi Otsuka(Institute for Space-Earth Environmental Research, Nagoya University), Yue Deng(University of Texas at Arlington), Loren Chang(Institute of Space Science, National Central University)

[PEM12-13] Observations of Atmospheric Waves in the Thermosphere from New Earth-Orbiting Spacecraft

★Invited Papers

*Scott England[1] (1.Virginia Tech)

[PEM12-14] Observations of the Thermosphere-Ionosphere System by the Global-scale Observations of the Limb and Disk (GOLD) Mission

★Invited Papers

*Richard Eastes[1] (1.Laboratory for Atmospheric and Space Physics/University of Colorado)

[PEM12-15] Initial result on aurora and airglow observations with the all sky 630nm imager on Shirase

*Takeshi Sakanoi[1], Naoshi Yagi[1], Yuta Hozumi[2], Takuo T. Tsuda[2], Takeshi Aoki[2], Akinori Saito[3], Takahiro Naoi[5], Takanori Nishiyama[4], Mitsumu K. Ejiri[4] (1.Planetary Plasma and Atmospheric Research Center, Graduate School of Science, Tohoku University, 2.Graduate School of Informatics and Engineering, The University of Electro-Communications, 3.Graduate School of Science, Kyoto University, 4.National Institute of Polar Research, 5.National Institute of Information and Communications Technology)

[PEM12-16] **Comparison between migrating atmospheric tides in TIMED/SABER observations and free running WACCM-X simulations**

*Yi Chung Chiu[1], Loren Chang[1], Cornelius Csar Jude Salinas[1], Qian Liying [2] (1.Graduate Institute of Space Science and Engineering, National Central University, Taiwan, 2.High Altitude Observatory, National Center for Atmospheric Research, Boulder, Colorado, USA)

[PEM12-17] Interannual Variation of Diurnal Tide Components in Tropical Lower Thermospheric Temperatures

*Cornelius Csar Jude Salinas[1], Huixin Liu[2], Loren Chang[1], Jia Yue[3], James Russell[4], Martin G Mlynczak[5] (1.National Central University, 2.Kyushu University, 3.NASA Goddard Space Flight Center, 4.Hampton University, 5.NASA Langley Research Center)

[PEM12-18] Dynamical response in the upper atmosphere: GAIA simulation with doubled CO2

*Huixin Liu[1], Chihiro Tao[2], H. Jin[2] (1.Earth and Planetary Science Division, Kyushu University SERC, Kyushu University, 2.NICT)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM12] Coupling Processes in the Atmosphere-Ionosphere System

convener:Huixin Liu(Earth and Planetary Science Division, Kyushu University SERC, Kyushu University), Yuichi Otsuka(Institute for Space-Earth Environmental Research, Nagoya University), Yue Deng(University of Texas at Arlington), Loren Chang(Institute of Space Science, National Central University)

[PEM12-19] **Energy Flux and Conductance from Meso-Scale Auroral Features**

★Invited Papers

*Christine Gabrielse[1], Toshi Nishimura[2], Margaret Chen[1], James Hecht[1], Larry Lyons[3], Yue Deng[4] (1.The Aerospace Corporation, 2.Boston University, 3.UCLA, 4.University of Texas, Arlington)

[PEM12-20] Study of latitudinal and longitudinal differences of mesospheric and ionospheric waves based on 3-dimentional FFT analysis of long-term multi-point airglow images

★Invited Papers

*Kazuo Shiokawa[1], Yuichi Otsuka[1], Takuji Nakamura[2] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.National Institute of Polar Research)

[PEM12-22] Global distribution of the mesoscale disturbances at 95km altitude detected by a space-borne airglow observation

*Akinori Saito[1], Ryota Okada[1], Takeshi Sakanoi[2], Yuta Hozumi[3] (1.Department of Geophysics, Graduate School of Science, Kyoto University, 2.Planetary Plasma and Atmospheric Research Center, Graduate School of Science, Tohoku University, 3.University of Electro-Communications)

[PEM12-23] **Recurrent high-speed solar wind co-rotating interaction region imprint on the ionosphere and atmosphere: GPS TEC variations and atmospheric gravity waves**

*Paul Prikryl[1,2], James M. Weygand[3], Reza Ghoddousi-Fard[4], Lidia Nikitina[2], Bharat S. R. Kunduri[5] (1.Physics Department University of New Brunswick, Canada , 2.Geomagnetic Laboratory Natural Resources Canada, 3.Earth Planetary and Space Sciences, University of California, USA, 4.Canadian Geodetic Survey Natural Resources Canada , 5.Bradley Dept. of Electrical and Computer Engineering, Virginia Tech, USA)

[PEM12-24] Observation of secondary gravity waves over the Southern Andes during an intense mountain wave event.

*Masaru Kogure[1], Jia Yue[2,3], Takuji Nakamura[1,4], Lars Hoffmann[5], Sharon Vadas[6], Yoshihiro Tomikawa[1,4], Mitsumu K. Ejiri[1,4], Diego Janches[2,3] (1.National Institute of Polar Research, 2.NASA Goddard Space Flight Center, 3.Catholic University of America, 4.SOKENDAI (The Graduate University for Advanced Studies), 5.Forschungszentrum Jülich, 6.NorthWest Research Associates)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM12] Coupling Processes in the Atmosphere-Ionosphere System

convener:Huixin Liu(Earth and Planetary Science Division, Kyushu University SERC, Kyushu University), Yuichi Otsuka(Institute for Space-Earth Environmental Research, Nagoya University), Yue Deng(University of Texas at Arlington), Loren Chang(Institute of Space Science, National Central University)

[PEM12-25] Importance of Realistic Auroral Precipitation, Electrical Field Variability, and Model Resolution in Resolving the Storm-Time Neutral Temperature and Density

★Invited Papers

*Xian Lu[1], Haonan Wu[1], Gang Lu[2], Xinzhao Chu[3,4], Wenbin Wang[2], Delores Delores[2,4], Yukitoshi Nishimura[5] (1.Department of Physics and Astronomy, Clemson University, Clemson, SC, USA, 2.High Altitude Observatory, National Center for Atmospheric Research, Boulder, CO, USA, 3.Cooperative Institute for Research in Environmental Sciences, University of Colorado, Boulder, CO, USA, 4.Department of Aerospace Engineering Sciences, University of Colorado, Boulder, CO, USA, 5.College of Electrical and Computer Engineering, Boston University, Boston, MA, USA)

[PEM12-26] Driver and Response Characteristics for Improved Physics-Based Simulation of the Thermosphere

★Invited Papers

*Eric K Sutton[1], Marcin Pilinski[2], Greg Lucas[2], Jeffrey P Thayer[1], Thomas E Berger[1] (1.Space Weather Technology, Research & Education Center, University of Colorado at Boulder, 2.Laboratory for Atmospheric and Space Physics, University of Colorado at Boulder)

[PEM12-27] Longitudinal Variation and Peak Time of Equatorial Electrojet Current from Ground and Satellite Measurements

*Nurul Shazana Abdul Hamid[1], Wan Nur Izzaty Ismail[1], Mardina Abdullah[1], Akimasa Yoshikawa[2], Teiji Uozumi[2], Zahira Mohd Razi[3] (1.Universiti Kebangsaan Malaysia, 2.Kyushu University, 3.Malaysia Space Agency)

[PEM12-28] Thermospheric wind acceleration in the ionospheric trough for Kp = 0+

*Shin-ichiro Oyama[1,2,3], Anita Aikio[2], Heikki Vanhamaki[2], Atsuki Shinbori[1], Mike Rietveld[5], Yasunobu Ogawa[3], Mirjam Kellinsalmi[4], Tero Raita[2], Kazuo Shiokawa[1], Ilkka Virtanen[2], Lei Cai[6], Abiyot Workayehu[2], Marcus Pedersen[2], Kirsti Kauristie[4], Boris Kozelov[7], Andrei Demekhov[7] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.Space Physics and Astronomy Research Unit, University of Oulu, Finland, 3.National Institute of Polar Research, Japan, 4.Finnish Meteorological Institute, Finland, 5.EISCAT, Norway, 6.KTH Royal Institute of Technology, Sweden, 7.Polar Geophysical Institute, Russia)

[PEM12-29] Day-to-day variation of pre-reversal enhancement in the equatorial ionosphere based on GAIA model

Priyanka Ghosh[1], *Yuichi Otsuka[1], Sivakandan Mani[1], Hiroyuki Shinagawa[2] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.National Institute of Information and Communications Technology)

[PEM12-30] Enhanced Electric Field Before Large Earthquakes

*Koichiro Oyama[1,2,3], Yoshihiro Kakinami[4], Chia-Hung Chen[5], Teiji Uozumi[2] (1.ISAPS,National Cheng Kung Univ., 2.ICSWE, Kyushu University, 3.ASERC Coltd, 4.Hokkaido Information Univ., 5.Depart. of Earth Science, National Cheng Kung Univ.)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM12] Coupling Processes in the Atmosphere-Ionosphere System

convener:Huixin Liu(Earth and Planetary Science Division, Kyushu University SERC, Kyushu University), Yuichi Otsuka(Institute for Space-Earth Environmental Research, Nagoya University), Yue Deng(University of Texas at Arlington), Loren Chang(Institute of Space Science, National Central University)

[PEM12-31] Chemical releases from the sounding rockets - old but new technique to observe thermosphere and ionosphere

*Yoshihiro Kakinami[1], Shigeto Watanabe[1], Masa-yuki Yamamoto[2], Takumi Abe[3], Hiroto Habu[3], Taro Watanabe[2], Mark Conde[4], Miguel Larsen[5] (1.Hokkaido Information University, 2.Kochi University of Technology, 3.ISAS/JAXA, 4.University of Alaska Fairbanks, 5.Clemson University)

[PEM12-32] IDEASSat: A 3U CubeSat Mission for Ionospheric Science and Expanded in-Situ Observations

*Loren Chang[1], Chi-Kuang Chao[1], Yi Duann[1], Yi-Chung Chiu[1], Rong Tsai-Lin[1], Tzu-Ya Tai[1], Wei-Hao Luo[1], Chi-Ting Liao[1], Hsin-Tzu Liu[1], Amal Chandran[2], Cheng-Ling Kuo[1], Jann-Yenq Liu[1] (1.Department of Space Science and Engineering, National Central University, 2.Satellite Research Centre, Nanyang Technological University, Singapore)

[PEM12-33] Development of new receiver for HF Doppler sounding utilized by Software-Defined Radio device

*Hiroyuki Nakata[1], Yuhei Oki[2], Kenro Nozaki[3], Keisuke Hosokawa[3], Ichiro Tomizawa[3], Ryo Matsushima[3], Kumiko K. Hashimoto[4], Toshiaki Takano[1], Hiroyo Ohya[1] (1.Graduate School of Engineering, Chiba University, 2. Department of Electrical and Electronics Engineering, Faculty of Engineering, Chiba University, 3.The University of Electro-Communications, 4.Kibi International University)

[PEM12-34] GPS radio occultation measurement for SMILES-2

*Makoto Suzuki[1], Philippe Baron[2], Satoshi Ochiai[2], Naohiro Manago[3], Josaphat Tetuko Sri Sumantyo[3], JANN-YENQ Liu[4], Akinori Saito[5], Huixin Liu[6], Masato Shiotani[7] (1.Institute for Space and Astronautical Sciences, Japan Aerospace Exploration Agency, 2.National Institute of Information and Communications Technology, 3.Center for Environmental Remote Sensing, Chiba University, 4.Center for Astronautical Space and Engineering, National Central University , 5.Kyoto University, 6.Dept. of Earth and Planetary Science Faculty of Science Kyushu University, 7.RISH, Kyoto University)

[PEM12-35] SCIntillation and IONosphere – eXtended (SCION-X) – A Small Satellite for Ionospheric and Atmospheric Science

*Pin-An Lin[1], Kai-Lun Cheng[1], Tsai-Ju Yu[1], Ruo-Yu Wang[1], Yueh-Chun Hsieh[1], Glenn Franco Gacal[1], Hsin-I Tu[1], Sittinat Denduonghatai[1], Guan-Po Ciou[1], Loren C. Chang[1], Jann-Yenq Liu[1], Cheng-Ling Kuo[1], Tang-Huang Lin[2], Amal Chandran[3] (1.Graduate Institute of Space Science and Engineering, National Central University, Taoyuan City, Taiwan, 2.Center for Space and Remote Sensing Research, National Central University, Taoyuan City, Taiwan, 3.Satellite Research Centre, Nanyang Technological University, Nanyang Avenue, Singapore)

[PEM12-36] The development and validation of a photochemical model for atomic oxygen ion retrieval from ground-based airglow observations

*YI DUANN[1,2], Loren C. Chang[1,2], Yi-Chung Chiu[1,2], Cornelius Csar Jude H. Salinas[1,2], Alexei V. Dmitriev[1], Konstantin G. Ratovsky[3], Irina V. Medvedeva[3], Roman Vasilyev[3], Alexander V. Mikhalev[3], Jann-Yenq Liu[1,2], Charles Lin[4] (1.Institute of Space Science, National Central University, Taoyuan City, Taiwan, 2.Center for Astronautical Physics and Engineering, National Central University, Taoyuan City, Taiwan, 3.Institute of Solar-Terrestrial Physics, Siberian Branch, Russian Academy of Sciences, Irkutsk, Russia, 4.Department of Earth Science, National Cheng Kung University, Tainan, Taiwan)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM13] Dynamics of Magnetosphere and Ionosphere

convener:Aoi Nakamizo(Applied Electromagnetic Research Institute, National Institute of Information and Communications Technology), Mitsunori Ozaki(Faculty of Electrical and Computer Engineering, Institute of Science and Engineering, Kanazawa University), Akiko Fujimoto(Kyushu Institute of Technology), Yuka Sato(Nippon Institute of Technology)

[PEM13-01] Effect of solar wind high-speed streams on the high-latitude ionosphere

★Invited Papers

*Anita Aikio[1], Nada Ellahouny[1], Ilkka Virtanen[1], Heikki Vanhamäki[1], Marcus Pedersen[1], Johannes Norberg[2], Kirsti Kauristie[2], Maxime Grandin[3], Alexander Kozlovsky[4], Tero Raita[4], Aurelie Marchaudon[5], Pierre-Louis Blelly[5], Shin-ichiro Oyama[6] (1.Space Physics and Astronomy Research Unit, University of Oulu, Finland, 2.Finnish Meteorological Institute, Helsinki, Finland, 3.CoE in Sustainable Space, University of Helsinki, Finland, 4.Sodankylä Geophysical Observatory, Finland, 5.IRAP, University of Toulouse, France, 6.ISEE, Nagoya University, Japan)

[PEM13-02] The relationship between F-region disappearance in the polar cap region and field-aligned currents at geosynchronous orbit during the 11 May 2019 magnetic storm

*Hyuck Jin Kwon[1], Khan-Hyuk Kim[1], Geonhwa Jee[2,3], Jongho Seon[1], Jeong-Han Kim[2], Changsup Lee[2], Young-Bae Ham[2,3], Terence Bullett[4,5], Uli Auster[6], Werner Magnes[7], Stefan Kraft[8] (1.Kyung Hee Univ., 2.Korea Polar Research Institute, 3.University of Science and Technology, 4.University of Colorado, 5.NOAA, 6.TUBS, 7.OeAW, 8.ESA)

[PEM13-03] High ion temperature events at F region altitudes in the cusp: Spatial relations to the moving electron precipitation regions

*Satoshi Taguchi[1], Yunosuke Nagafusa[1], Yasunobu Ogawa[2], Keisuke Hosokawa[3], Tomokazu Oigawa[1], Morio Tanaka[1], Hiroyuki Shinagawa[4] (1.Department of Geophysics, Graduate School of Science, Kyoto University, 2.National Institute of Polar Research, 3.Department of Communication Engineering and Informatics, University of Electro-Commnunications, 4.National Institute of Information and Communication Technology)

[PEM13-04] Ionization of the mesosphere during substorm growth phase

*Kiyoka Murase[1], Ryuho Kataoka[2], Takanori Nishiyama[2], Koji Nishimura[2], Taishi Hashimoto[2], Yoshimasa Tanaka[2], Akira Kadokura[2], Yoshihiro Tomikawa[2], Masaki Tsutsumi[2], Kaoru Sato[3], Satoshi Kasahara[3], Takefumi Mitani[4], Shoichiro Yokota[9], Tomoaki Hori[7], Kunihiro Keika[3], Nana Higashio[5], Takeshi Takashima[4], Yoshiya Kasahara[6], Shoya Matsuda[4], Masafumi Shoji[7], Ayako Matsuoka[4], Iku Shinohara[4], Yoshizumi Miyoshi[7], Tatsuhiko Sato[8] (1.The Graduate University for Advanced Studies, 2.National Institute of Polar Research, 3.University of Tokyo, 4.Japan Aerospace Exploration Agency, Institute of Space and Astronautical Science, 5.Japan Aerospace Exploration Agency, 6.Kanazawa University, 7.Nagoya University, 8.Japan Atomic Energy Agency, 9.Osaka University)

[PEM13-05] Characteristics of ion upflows from the low-altitude ionosphere observed by EISCAT

*Masayoshi Takada[1], Kanako Seki[1], Yasunobu Ogawa[2], Kunihiro Keika[1], Satoshi Kasahara[1], Shoichiro Yokota[3], Tomoaki Hori[4], Kazushi Asamura[5], Yoshizumi Miyoshi[4], Iku Shinohara[5] (1.Tokyo University, 2.National Institute of Polar Research, Japan, 3.Graduate School of Science, Osaka University, 4.Institute for Space-Earth Environmental Research, Nagoya University, 5.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

[PEM13-06] The Formation of Substorm Aurora in the Solar Wind-Magnetosphere- Ionosphere Coupling System

*Yan Song[1], Robert L Lysak[1] (1.University of Minnesota)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM13] Dynamics of Magnetosphere and Ionosphere

convener:Aoi Nakamizo(Applied Electromagnetic Research Institute, National Institute of Information and Communications Technology), Mitsunori Ozaki(Faculty of Electrical and Computer Engineering, Institute of Science and Engineering, Kanazawa University), Akiko Fujimoto(Kyushu Institute of Technology), Yuka Sato(Nippon Institute of Technology)

[PEM13-07] The Known and Unknown of Equatorial Plasma Bubbles

★Invited Papers

*Shasha Zou[1], Ercha Aa[1,2] (1.University of Michigan Ann Arbor, 2.MIT Haystack Observatory)

[PEM13-08] **Causality for formation of electromagnetic channel from Polar to Equatorial Ionosphere**

*Akimasa Yoshikawa[1], Aoi Nakamizo[2], Shinichi Ohtani[3] (1.Department of Earth and Planetary Sciences, Kyushu University, 2.National Institute of Information and Commiunications Technology , 3.APL/JHU)

[PEM13-09] **Automatic scaling of echo traces on ionogram for elucidation of a global current system**

*Moe Hayashi[1], Akimasa Yoshikawa[4], Akiko Fujimoto[3], Shinichi Ohtani[2] (1.Kyushu University, 2.The Johns Hopkins University Applied Physics Laboratory, 3.Kyushu Institute of Technology, 4.Department of Earth and Planetary Sciencse, Kyushu University)

[PEM13-10] Ion-neutral collision frequencies for calculating ionospheric conductivity

*Akimasa Ieda[1] (1.Institute for Space-Earth Environmental Research, Nagoya University)

[PEM13-11] Properties of Auroral Electron Backscatter

*John P Dombeck[1], Joshua Magnus[1], Robert Lysak[1], Cynthia Cattell[1] (1.University of Minnesota)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM13] Dynamics of Magnetosphere and Ionosphere

convener:Aoi Nakamizo(Applied Electromagnetic Research Institute, National Institute of Information and Communications Technology), Mitsunori Ozaki(Faculty of Electrical and Computer Engineering, Institute of Science and Engineering, Kanazawa University), Akiko Fujimoto(Kyushu Institute of Technology), Yuka Sato(Nippon Institute of Technology)

[PEM13-13] What is the role of repeatable meso-scale processes in the Magnetosphere-Ionosphere system?

★Invited Papers

*Jesper W Gjerloev[1], Shinichi Ohtani[1] (1.Johns Hopkins University Applied Physics Laboratory)

[PEM13-14] 3D current system of auroral vortices in the discrete arc estimated by auroral tomography and local KRM methods

*Yoshimasa Tanaka[1,2,3], Yasunobu Ogawa[1,3], Akira Kadokura[1,2,3], Takanori Nishiyama[1,3], Akimasa Yoshikawa[4], Bjorn Gustavsson[5], Kirsti Kauristie[6], Carl-fredrik Enell[7], Urban Brandstrom[8], Tima Sergienko[8], Alexander Kozlovsky[9], Tero Raita[9], Heikki Vanhamaki[10] (1.National Institute of Polar Research, 2.Polar Environment Data Science Center, 3.The Graduate University for Advanced Studies, 4.Department of Earth and Planetary Sciences, Kyushu University, 5.The Arctic University of Norway, 6.Finnish Meteorological Institute, 7.EISCAT Scientific Association, 8.Swedish Institute of Space Physics, 9.Sodankyla Geophysical Observatory, 10.University of Oulu)

[PEM13-15] Simulation on 3D structure of auroral electrojet

*Yuto Yano[1], Yusuke Ebihara[1] (1.Research Institute for Sustainable Humanosphere, Kyoto University)

[PEM13-16] Statistical characteristics of the duskside mesoscale field-aligned currents without accompanying the large-scale Region 1 current

*Yoshihiro Yokoyama[1], Satoshi Taguchi[1], Toshihiko Iyemori[2], Keisuke Hosokawa[3] (1.Department of Geophysics, Graduate School of Science, Kyoto University, 2.Kyoto University, 3. Department of Communication Engineering and Informatics, University of Electro-Communications)

[PEM13-17] Ionospheric plasma sheet isolation during northward interplanetary magnetic field periods reproduced by numerical magnetohydrodynamic modeling

*Masakazu Watanabe[1,2], Takashi Tanaka[2], Shigeru Fujita[3] (1.Graduate School of Science, Kyushu University, 2.International Center for Space Weather Science and Education, Kyushu University, 3.Meteorological College)

[PEM13-18] Impact of foreshock transients on the Earth's nightside magnetosphere and ionosphere

*Chih-Ping Wang[1], Xueyi Wang[2], Terry Z. Liu[3], Yu Lin[2], Sixue Xu[1] (1.University of California Los Angeles, 2.Auburn University, 3.University of Alaska, Fairbanks)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM13] Dynamics of Magnetosphere and Ionosphere

convener:Aoi Nakamizo(Applied Electromagnetic Research Institute, National Institute of Information and Communications Technology), Mitsunori Ozaki(Faculty of Electrical and Computer Engineering, Institute of Science and Engineering, Kanazawa University), Akiko Fujimoto(Kyushu Institute of Technology), Yuka Sato(Nippon Institute of Technology)

[PEM13-19] The main observational properties of throat aurora and their implicaitons on dayside S-M-I coupling

*Han Desheng[1] (1.School of Ocean and Earth Science, Tongji University)

[PEM13-20] A Possible Formation Scenario of the Transpolar Arcs with the Nightside End Distortions: Role of Field-Aligned Currents

*Motoharu Nowada[1], Qiu-Gang Zong[2], Benoît Hubert[3], Quan-Qi Shi[1], Yong-Fu Wang[2], Jun Yang[1], Adrian Grocott[4], Alexander William Degeling[1], An-Min Tian[1], Xu-Zhi Zhou[2], Chao Yue[2] (1.Shandong Provincial Key Laboratory of Optical Astronomy and Solar-Terrestrial Environment, Institute of Space Sciences, Shandong University, Weihai, 2.Institute of Space Physics and Applied Technology, School of Earth and Space Sciences, Peking University, 3.Space science, Technologies and Astrophysics Research (STAR) Institute, Université de Liège, Belgium, 4.Space and Planetary Physics Group, Department of Physics, Lancaster University, Lancaster, United Kingdom)

[PEM13-21] **Fade of transpolar arc and its relation to the intensification of the nightside oval**

*Takahiro Obara[1] (1.Planetary Plasma and Atmospheric Research Center,Tohoku University)

[PEM13-22] Feedback instability theory extended to the magnetosphere-ionosphere coupling with field-aligned inhomogeneity

*Tomo-Hiko Watanabe[1], Junya Hiwatari[1], Shinya Maeyama[1] (1.Graduate School of Science, Nagoya University)

[PEM13-23] Antarctic large area network observation of auroral phenomena using unmanned system: Current status of project as of early 2020

*Akira Kadokura[1], Yasunobu Ogawa[1], Yoshimasa Tanaka[1], Hisao Yamagishi[1], Masaki Okada[1], Ryuho Kataoka[1], Herbert Akihito Uchida[2], Yuichi Otsuka[3], Motoba Tetsuo[4], Natsuo Sato[1] (1.National Institute of Polar Research, 2.SOKENDAI, 3.Nagoya University, 4.Johns Hopkins University, Applied Physics Laboratory)

[PEM13-24] **Short review for recent studies of pulsating aurora in Japan during Arase era**

★Invited Papers

*Keisuke Hosokawa[1], Yoshizumi Miyoshi[2], Mitsunori Ozaki[3], Shin-ichiro Oyama[2], Yasunobu Ogawa[4], Satoshi Kurita[2], Yoshiya Kasahara[3], Yasumasa Kasaba[5], Satoshi Yagitani[3], Shoya Matsuda[7], Fuminori Tsuchiya[5], Atsushi Kumamoto[5], Ryuho Kataoka[4], Kazuo Shiokawa[2], Hiroshi Miyaoka[4], Yoshimasa Tanaka[4], Satonori Nozawa[2], Mariko Teramoto[6], Takeshi Takashima[7], Iku Shinohara[7], Ryoichi Fujii[8] (1.Univ. of Electro-Communications, 2.ISEE, Nagoya Univ., 3.Kanazawa Univ., 4.National Institute of Polar Research, 5.Tohoku Univ., 6.Kyushu Institute of Technology, 7.ISAS/JAXA, 8.Research Organization of Information and Systems)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM13] Dynamics of Magnetosphere and Ionosphere

convener:Aoi Nakamizo(Applied Electromagnetic Research Institute, National Institute of Information and Communications Technology), Mitsunori Ozaki(Faculty of Electrical and Computer Engineering, Institute of Science and Engineering, Kanazawa University), Akiko Fujimoto(Kyushu Institute of Technology), Yuka Sato(Nippon Institute of Technology)

[PEM13-25] Utilizing the Heliophysics/Geospace System Observatory to Understand Particle Injections: Their Scale Sizes and Propagation Directions

*Christine Gabrielse[1], Emma Spanswick[2], Anton Artemyev[3], Toshi Nishimura[4], Andrei Runov[3], Larry Lyons[3], Vassilis Angelopoulos[3], Drew L. Turner[5], Geoffrey D. Reeves[6], Eric Donovan[2] (1.The Aerospace Corporation, 2.Univ. of Calgary, 3.UCLA, 4.Boston University, 5.John Hopkins Applied Physics Lab., 6.LANL)

[PEM13-26] **Flux decrease of outer radiation belt electrons associated with solar wind pressure pulse: A Code coupling simulation of GEMSIS-RB and GEMSIS-GM**

*Ito Hiroki[1], Yoshizumi Miyoshi[1], Shinji Saito[2], Yosuke Matsumoto[3], Takanobu Amano[4] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.National Institute of Information and Communications Technology, 3.Gradual School of Science, Chiba University, 4.Department of Earth and Planetary Science, University of Tokyo)

[PEM13-27] Seasonal Variation in Mass and Electron Densities of the Plasmasphere in the New Zealand Meridian

*Yuki Obana[1], Akiko Fujimoto[2], Satoko Saita[3], János Lichtenberger[4,5], Tanja Petersen[6] (1.Department of Engineering Science, Faculty of Engineering, Osaka Electro-Communication University, 2.Graduate School of Computer Science and Systems Engineering, Kyushu Institute of Technology, 3.National Institute of Technology, Kitakyushu College, 4.Eötvös Loránd University, 5.Research Center for Astronomy and Earth Sciences, 6.GNS Science)

[PEM13-28] Differences in Near-Earth Magnetotail Evolution Between Pseudosubstorms and Substorms

*Yukinaga Miyashita[1], Kento Fukui[2], Shinobu Machida[2], Yoshizumi Miyoshi[2], Akimasa Ieda[2], Toshi Nishimura[3], Vassilis Angelopoulos[4] (1.Korea Astronomy and Space Science Institute, 2.Institute for Space-Earth Environmental Research, Nagoya University, 3.Boston University, 4.University of California, Los Angeles)

[PEM13-29] Geomagnetic field and energetic particle oscillations observed at geosynchronous orbit during the growth and expansion phases of a substorm

*Khan-Hyuk Kim[1], Hyuck-Jin Kwon[1], Jongho Seon[1], Uli Auster[2], Werner Magnes[3], Stefan Kraft[4] (1.School of Space Research, Kyung Hee University, Korea, 2.IGeP, TUBS, Mendelssohnstrasse, Braunschweig, Germany, 3.Space Research Institute, OeAW, Graz, Austria, 4.ESOC-ESA, Robert-Bosch-Strasse, Darmstadt, Germany)

[PEM13-30] Longitudinal propagation of thin auroral arcs

Fei Zhang[1], *Jian Yang[1], Wenrui Wang[1,2] (1.Southern University of Science and Technology, 2. Sun Yat-sen University)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM14] Frontiers in solar physics

convener:Shinsuke Imada(Institute for Space-Earth Environmental Research, Nagoya University), Alphonse Sterling(NASA/MSFC), Takaaki Yokoyama(School of Science, University of Tokyo), Toshifumi Shimizu(Institute of Space and Astronautical Science, JAXA)

[PEM14-01] Alfvenic fluctuations in the near-Sun solar wind: Measurements from Parker Solar Probe

★Invited Papers

*Stuart D Bale[1] (1.University of California Berkeley)

[PEM14-02] Contribution of the BepiColombo mission to inner heliospheric science

★Invited Papers

*Go Murakami[1], Yoshizumi Miyoshi[2], Kazumasa Iwai[2], Daikou Shiota[3], Takeshi Imamura[4], Iku Shinohara[1], Shinsuke Imada[2], Toshifumi Shimizu[1] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2.Institute for Space-Earth Environmental Research, Nagoya University, 3.National Institute of Information and Communications Technology, 4.Graduate School of Frontier Sciences, The University of Tokyo)

[PEM14-03] Instrumental design of the Solar-C_EUVST telescope

*Yoshinori Suematsu[1], Toshifumi Shimizu[2], Hirohisa Hara[1], Tomoko Kawate[2], Yukio Katsukawa[1], Kiyoshi Ichimoto[3], Shinsuke Imada[4] (1.NAOJ National Astronomical Observatory of Japan, 2.ISAS/JAXA, 3.Kyoto University, 4.Nagoya University)

[PEM14-04] Analysis of Small-scale Flares using Genetic Algorithm

*Toshiki Kawai[1], Shinsuke Imada[1] (1.Institute for Space-Earth Environmental Research, Nagoya University)

[PEM14-05] Magnetic Flux Cancellation and Associated Plasma Heating in the Upper Solar Atmosphere

*Sung-Hong Park[1], KD Leka[1,2], Kanya Kusano[1] (1.Institute for Space-Earth Environmental Research of Nagoya University, 2.NorthWest Research Associates)

[PEM14-06] Nonlinear force-free modeling of the flare-productive magnetic fields observed in the solar active region 12673

*Daiki Yamasaki[1], Satoshi Inoue[2], Shin'ichi Nagata[3], Kiyoshi Ichimoto[3] (1.Department of Astronomy, Kyoto University, 2.Institute for Space-Earth Environmental Research, Nagoya University, 3.Astronomical Observatory, Kyoto University)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM14] Frontiers in solar physics

convener:Shinsuke Imada(Institute for Space-Earth Environmental Research, Nagoya University), Alphonse Sterling(NASA/MSFC), Takaaki Yokoyama(School of Science, University of Tokyo), Toshifumi Shimizu(Institute of Space and Astronautical Science, JAXA)

[PEM14-07] The Chromospheric Layer SpectroPolarimeter (CLASP2) Mission: Introduction

★Invited Papers

*David E. McKenzie[1], Ryohko Ishikawa[2], Ryouhei Kano[2], Joten Okamoto[2], Laurel Rachmeler[1], Javier Trujillo Bueno[3], Frederic Auchere[4], Ken Kobayashi[1], Donguk Song[2], Masaki Yoshida[2] (1.NASA Marshall Space Flight Center, 2.National Astronomical Observatory of Japan, 3.Instituto Astrofísica de Canarias, 4.Institut d'Astrophysique Spatiale)

[PEM14-08] Initial results from CLASP2 rocket experiment to measure magnetic fields in the solar chromosphere

★Invited Papers

*Joten Okamoto[1], Ryoko Ishikawa[1], David McKenzie[2], Javier Trujillo Bueno[3], Frederic Auchere[4], Laurel Rachmeler[2], Ryohei Kano[1], Donguk Song[1], Christian Bethge[5], Ken Kobayashi[2], Masaki Yoshida[1], Tanausu del Pino Aleman[3], CLASP2 team (1.National Astronomical Observatory of Japan, 2.NASA Marshall Space Flight Center, 3.Instituto Astrofisica de Canarias, 4.Institut d'Astrophysique Spatiale, 5.Universities Space Research Association)

[PEM14-09] Mathematical modelling of effect of flows in magnetic flux tubes

*Samuel Joseph Skirvin[1], Viktor fedun[1], Gary Verth[1] (1.University of Sheffield)

[PEM14-10] Numerical study of fast and slow wave heating of the magnetic chromosphere

*WANG YIKANG[1], Takaaki Yokoyama[1], Haruhisa Iijima[2] (1.The University of Tokyo, 2.Nagoya University)

[PEM14-11] Solar photospheric jet-like structures formed by slow shock

*Yuji Kotani[1], Kazunari Shibata[2] (1.Department of Astronomy, Kyoto University, 2.Kwasan and Hida Observatories, Kyoto University)

[PEM14-12] Chromospheric magnetic field: A comparison of He I 10830 Å observation with nonlinear force-free field extrapolation

*Yusuke Kawabata[1], Andrés Asensio Ramos[2], Satoshi Inoue[3], Toshifumi Shimizu[4] (1.National Astronomical Observatory of Japan, 2.Instituto de Astrofísica de Canarias, 3.Institute for Space-Earth Environmental Research, Nagoya University, 4.Institute of Space and Astronautical Science, JAXA)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM15] Plasma Theory and Simulation

convener:Seiji Zenitani(Kobe University), Fan Guo(Los Alamos National Laboratory), Takayuki Umeda(Institute for Space-Earth Environmental Research, Nagoya University), Takanobu Amano(Department of Earth and Planetary Science, University of Tokyo), Yasuhiro Nariyuki(Faculty of Education, University of Toyama)

[PEM15-01] An adaptive load balancing method for particle-in-cell simulations

*Yosuke Matsumoto[1] (1.Graduate School of Science, Chiba University)

[PEM15-02] Relation between Alfven-ion-cyclotron and Weibel instabilities in the collisionless perpendicular shock transition region: Upstream plasma parameter dependence

*Takuro Nishigai[1], Takanobu Amano[1] (1.Department of Earth and Planetary Science, University of Tokyo)

[PEM15-03] Full PIC simulations of the surface charging on the night side of Phobos

*Masaki Tanabe[1], Naoki Terada[1], Yohei Miyake[2], Hideyuki Usui[2] (1.Graduate school of science, Tohoku University, 2.Graduate school of system informatics Kobe University)

[PEM15-04] An Analysis of Slow-Shock and Slow Shock-Like Structures Observed in the 2D Hybrid Magnetic Reconnection Simulations

*Nehpreet Kaur Walia[1], Kanako Seki[1], Takanobu Amano[1] (1. Department of Earth & Planetary Science, Graduate School of Science, University of Tokyo)

[PEM15-05] Outstanding issues in plasma Riemann problem

*Tohru Hada[1] (1.Interdisciplinary Graduate School of Engineering Sciences, Kyushu University)

[PEM15-06] A simple stochastic model of electron diffusion by whistler waves in a non-uniform magnetic field

*Yasuhiro Nariyuki[1] (1.Faculty of Education, University of Toyama)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM15] Plasma Theory and Simulation

convener:Seiji Zenitani(Kobe University), Fan Guo(Los Alamos National Laboratory), Takayuki Umeda(Institute for Space-Earth Environmental Research, Nagoya University), Takanobu Amano(Department of Earth and Planetary Science, University of Tokyo), Yasuhiro Nariyuki(Faculty of Education, University of Toyama)

[PEM15-07] Nonlinear Interaction of Radiation Belt Electrons with Obliquely Propagating Whistler-mode Chorus Emissions

*Yoshiharu Omura[1], Yi-Kai Hsieh[1] (1.Reserach Institute for Sustainable Humanosphere, Kyoto University)

[PEM15-08] Energy-consistent finite difference method for compressible magnetohydrodynamic simulations

*Haruhisa Iijima[1] (1.Institute for Space-Earth Environmental Research, Nagoya University)

[PEM15-09] **Implementing neural network's inference into the magnetohydrodynamic simulation code**

*Yuki Sawamura[1], Yosuke Matsumoto[1] (1.Chiba University)

[PEM15-10] Visualizing Magnetospheric Topology in Global 3D MHD Simulations

*DongSheng CAI[1] (1.University of Tsukuba)

[PEM15-12] Plasma State inside of the Super Massive Kerr Black Hole and Problem of the Gravitational Wave Source

*Hiroshi Oya[1] (1.Department of Geophysics Graduate School for Science Tohoku University)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM16] Magnetospheric Multi Scale (MMS) mission: Accomplishments and Future Plans

convener:Yoshifumi Saito(Solar System Science Division, Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), James L Burch(Southwest Research Institute), Barbara L Giles(NASA Goddard Space Flight Center), Hiroshi Hasegawa(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

[PEM16-01] Advances in Reconnection, Acceleration and Turbulence with MMS

★Invited Papers

*James L Burch[1] (1.Southwest Research Inst.)

[PEM16-02] Observations of multi-scale wave coupling and plasma mixing in the magnetotail separatrix

★Invited Papers

*Justin C. Holmes[1], Rumi Nakamura[1], Daniel Schmid[1], Owen Wyn Roberts[1], Takuma Nakamura[1], Zoltan Vörös[1] (1.Space Research Institute)

[PEM16-03] Direct measurements of energy transfer from hot protons to EMIC waves in ULF waves at the outer magnetosphere

*Naritoshi Kitamura[1], Masafumi Shoji[2], Masahiro Kitahara[3], Takanobu Amano[1], Yoshiharu Omura[4], Satoko Nakamura[2], Yoshizumi Miyoshi[2], Hiroshi Hasegawa[5], Yuto Katoh[3], Yoshifumi Saito[5], Mariko Teramoto[7], Reiko Nomura[6], Shoichiro Yokota[8], Daniel J Gershman[9], Adolfo F Vinas[9,10], Barbara L Giles[9], Scott A Boardsen[9,11], Craig J Pollock[12], Christopher T Russell[13], Robert J Strangeway[13], Narges Ahmadi[14], Per-Arne Lindqvist[15], Robert E Ergun[14], James L Burch[16] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 2.Institute for Space-Earth Environmental Research, Nagoya University, 3.Department of Geophysics, Graduate school of Science, Tohoku University, 4.Research Institute for Sustainable Humanosphere, Kyoto University, 5.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 6.National Astronomical Observatory of Japan, 7.Kyushu Institute of Technology, 8.Department of Earth and Space Science, Graduate School of Science, Osaka University, 9.NASA Goddard Space Flight Center, 10.Department of Physics, American University, 11.University of Maryland, 12.Denali Scientific, 13.Institute of Geophysics and Planetary Physics, University of California, Los Angeles, 14.Laboratory for Atmospheric and Space Physics, University of Colorado, Boulder, 15.Royal Institute of Technology, 16.Southwest Research Institute)

[PEM16-04] Electron Scattering and Acceleration by Whistler Waves at Collisionless Shocks

★Invited Papers

*Mitsuo Oka[1], Fumiko Otsuka[2], Shuichi Matsukiyo[2], Tai Phan[1], The MMS team (1.University of California Berkeley, 2.Kyushu University)

[PEM16-05] The relation between high-frequency whistler waves and energetic electrons in the quasi-perpendicular bow shock

Chika Umegaki[1], *Takanobu Amano[1], Naritoshi Kitamura[1], Olivier Le Contel[2], Narges Ahmadi[3], Barbara L Giles[4] (1.Department of Earth and Planetary Science, University of Tokyo, 2.Laboratoire de Physique des Plasmas, CNRS/Ecole Polytechnique/Sorbonne Université/Univ. Paris-Sud/Obs. de Paris, 3.Laboratory for Atmospheric and Space Physics, University of Colorado, Boulder, 4.NASA Goddard Space Flight Center)

[PEM16-06] Future Plans of the Magnetospheric Multiscale Mission

★Invited Papers

*Steven M Petrinec[1], James L Burch[2], Stephen A Fuselier[2,3], Michael Hesse[4], Roy Torbert[2,5], Tai D Phan[6], Barbara L Giles[7] (1.Lockheed Martin Advanced Technology Center, Palo Alto, CA USA, 2.Southwest Research Institute, San Antonio, TX, USA, 3.University of Texas at San Antonio, TX, USA, 4.University of Bergen, Bergen, Norway, 5.University of New Hampshire, Durham, NH, USA, 6.University of California, Berkeley, CA, USA, 7.NASA Goddard Space Flight Center, Greenbelt, MD, USA)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM17] Space Weather and Space Climate

convener:Ryuho Kataoka(National Institute of Polar Research), Antti A Pulkkinen(NASA Goddard Space Flight Center), Kanya Kusano(Institute for Space-Earth Environmental Research, Nagoya University), Kaori Sakaguchi(National Institute of Information and Communications Technology)

[PEM17-01] Thailand-Japan collaboration on the first VHF radar for plasma bubbles monitoring

★Invited Papers

*Kornyanat Hozumi[1], Takuya Tsugawa[1], Pornchai Supnithi[2], Punyawi Jamjareegulgarn[3], Yuichi Otsuka[4], Susumu Saito[5], Shinichi Hama[1], Udomsit Tangtrakunphaisan[3], Mamoru Ishii[1] (1.National Institute of Information and Communications Technology (NICT),Tokyo, Japan, 2.King Mongkut's Institute of Technology Ladkrabang, Bangkok (KMITL), Thailand, 3.King Mongkut's Institute of Technology Ladkrabang, Prince of Chumphon Campus, Chumphon, Thailand, 4.Institute for Space-Earth Environmental Research (ISEE), Nagoya University, Nagoya 464-8601, Japan, 5.National Institute of Maritime, Port and Aviation Technology, Electronic Navigation Research Institute (ENRI), Tokyo, Japan)

[PEM17-02] COSPAR/URSI International Reference Ionosphere 2020

*Dieter Bilitza[1,2] (1.George Mason University Fairfax, 2.SPDF NASA GSFC Greenbelt)

[PEM17-03] Full-scale spatial characteristics of pulsating aurora derived from color digital camera images from the International Space Station

*Sota Nanjo[1], Yuta Hozumi[1], Keisuke Hosokawa[1], Ryuho Kataoka[2,3], Yoshizumi Miyoshi[4], Shin-ichiro Oyama[2,4,5], Mitsunori Ozaki[6], Kazuo Shiokawa[4], Satoshi Kurita[4] (1.The University of Electro-Communications, 2.National Institute of Polar Research, 3.Department of Polar Science, School of Multidisciplinary Science, SOKENDAI, The Graduate University for Advanced Studies, 4.Institute for Space-Earth Environmental Research, Nagoya University, 5.Ionospheric Physics Research Unit, University of Oulu, 6.Kanazawa University)

[PEM17-04] The longterm trend of temperature in mesopause region between 1990 and 2020

*Tao Yuan[1] (1.Utah State University)

[PEM17-05] Statistical analysis of ionospheric total electron content (TEC): Estimation of extreme values in a hundred years in Japan

*Michi Nishioka[1], Susumu Saito[2], Chihiro Tao[1], Daikou Shiota[1], Takuya Tsugawa[1] (1.National Institute of Information and Communications Technology, 2.Electronic Navigation Research Institute)

[PEM17-06] Drastic time variations of transfer function of geomagnetically induced current (GIC)

*Satoko Nakamura[1,2], Yusuke Ebihara[2], Shigeru Fujita[3], Tada-nori Goto[4], Shinichi Watari[5] (1.Institute for Space-Earth Environmental Research (ISEE), Nagoya University, 2.Research Institute for Sustainable Humanosphere, Kyoto University, 3.Meteorological College, Japan Meteorological Agency/ Nationa Institute of Polar Research, 4.Graduate School of Life Science, University of Hyogo, 5.National Institute of Information and Communications Technology)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM17] Space Weather and Space Climate

convener:Ryuho Kataoka(National Institute of Polar Research), Antti A Pulkkinen(NASA Goddard Space Flight Center), Kanya Kusano(Institute for Space-Earth Environmental Research, Nagoya University), Kaori Sakaguchi(National Institute of Information and Communications Technology)

[PEM17-07] The Heliophysics Space Weather Science Application Program

★Invited Papers

*James F Spann[1], Nicola J Fox[1], James E Favors[1] (1.NASA Headquarters)

[PEM17-08] Space Weather Research Support at the National Science Foundation

★Invited Papers

*Lisa M Winter[1] (1.National Science Foundation Office of Polar Programs)

[PEM17-09] Toward cycle 25: Future perspective on space radiation environment in the inner heliopshere

★Invited Papers

*Yoshizumi Miyoshi[1], Shinsuke Imada[1], Ryuho Kataoka[2], Kanako Seki[3], Hiroko Miyahara[4], Aiko Nagamatsu[5], Daikou Shiota[6], Tatsuhiko Sato[7] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.National Institute for Polar Research, 3.The University of Tokyo, 4.Musashino Art University, 5.JAXA, 6.NICT, 7.JAEA)

[PEM17-10] Development of real-time prediction system of CME arrival and magnetic field with ensemble SUSANOO-CME simulation

*Daikou Shiota[1,4], Seiji Yashiro[2], Ryuho Kataoka[3], Kazumasa Iwai[4], Yusuke Ebihara[5] (1.National Institute of Information and Communications Technology (NICT), 2.Catholic University of America, 3.National Institute of Polar Research, 4.Institute for Space-Earth Environmental Research, Nagoya University, 5.Research Institute for Sustainable Humanosphere, Kyoto University)

[PEM17-11] A dynamical model of the heliosphere with adaptive mesh refinement

*Tomoaki Matsumoto[1], Daikou Shiota[2], Ryuho Kataoka[3], Hiroko Miyahara[4], Shoko Miyake[5] (1.Hosei University, 2.NICT, 3.National Institute of Polar Research, 4.Musashino Art University, 5.National Institute of Technology, Ibaraki College)

[PEM17-12] Validation and operation of a coronal mass ejection arrival time forecasting system using interplanetary scintillation observations

*Kazumasa Iwai[1], Daikou Shiota[2], Munetoshi Tokumaru[1], Ken'ichi Fujiki[1], Mitsue Den[2], Yuki Kubo[2] (1.Institute for Space–Earth Environmental Research (ISEE), Nagoya University, 2.National Institute of Information and Communications Technology)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM17] Space Weather and Space Climate

convener:Ryuho Kataoka(National Institute of Polar Research), Antti A Pulkkinen(NASA Goddard Space Flight Center), Kanya Kusano(Institute for Space-Earth Environmental Research, Nagoya University), Kaori Sakaguchi(National Institute of Information and Communications Technology)

[PEM17-13] ^{14}C during the ~660 BCE solar proton event from Japanese tree rings

★Invited Papers

*Hirohisa Sakurai[1], Fusa Miyake[2], Fuyuki Tokanai[1], Kazuho Horiuchi[3], Hiroko Miyahara[4], Kimiaki Masuda[2], Motonari Ooyama[5], Minoru Sakamoto[6], Takumi Mitsutani[7], Toru Moriya[1] (1.Faculty of Science, Yamagata University, 2.ISEE, Nagoya University,, 3.Hirosaki University, 4.Graduate School of Science and Technology, Hirosaki University, 5.Botanical Gardens, Tohoku University, 6.National Museum of Japanese History, 7.National Institutes for Cultural Heritage, Nara National Research Institute for Cultural Properties)

[PEM17-14] Variability of High Energy particle Environment associated with Solar Activities

★Invited Papers

*Shinsuke Imada[1], Daikou Shiota[2], Kazumasa Iwai[1], Takashi Minoshima[3], Haruhisa Iijima[1], Yoshizumi Miyoshi[1] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.NICT, 3.JAMSTEC)

[PEM17-15] MHD-SDE Hybrid Simulation of the Cosmic Ray Modulation

*Shoko Miyake[1], Tomoaki Matsumoto[2], Ryuho Kataoka[3,9], Tatsuhiko Sato[4], Daikou Shiota[5], Hiroko Miyahara[6], Shinsuke Imada[7], Haruka Ueno[8] (1.National Institute of Technology, Ibaraki College, 2.Hosei University, 3.National Institute of Polar Research, 4.Japan Atomic Energy Agency, 5.National Institute of Information and Communications Technology, 6.Musashino Art University, 7.Nagoya University, 8.Japan Aerospace Exploration Agency, 9.SOKENDAI)

[PEM17-16] Geosynchronous Energetic Particle Variations based on FY-2 Series Satellites Observations

*chunqin wang[1], guohong shen[1], shenyi zhang[1], huanxin zhang[1] (1.national space sciend center,CAS)

[PEM17-17] 10 years observation of charged pariticle flux with MAXI/RBM on the International Space Station

*Satoshi NAKAHIRA[1], Ryuho Kataoka[2], Haruka Ueno[1] (1.Japan Aerospace Exploration Agency, 2.National Institute of Polar Research)

[PEM17-18] Statistical Analysis of the Relation between Coronal Mass Ejections and Solar Energetic Particles

*Kosuke Kihara[1], Yuwei Huang[2], Nobuhiko Nishimura[3], Nariaki Nitta[4], Seiji Yashiro[5], Kiyoshi Ichimoto[2], Ayumi Asai[2] (1.Department of Astronomy, Kyoto University, 2.Astronomical Observatory, Kyoto University, 3.Institute for Space Earth Environmental Research, 4.Lockheed Martin Advanced Technology Center, 5.The Catholic University of America)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM17] Space Weather and Space Climate

convener:Ryuho Kataoka(National Institute of Polar Research), Antti A Pulkkinen(NASA Goddard Space Flight Center), Kanya Kusano(Institute for Space-Earth Environmental Research, Nagoya University), Kaori Sakaguchi(National Institute of Information and Communications Technology)

[PEM17-19] A New Parameter of Photospheric Magnetic Field to Determine Eruptive-Flare Producing Solar Active Regions

*Pei Hsuan Lin[1], Kanya Kusano[1], Daikou Shiota[2], Satoshi Inoue[1], K. D. Leka[3] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.National Institute of Information and Communications Technology (NICT), 3.NorthWest Research Associates)

[PEM17-20] Realistic MHD Modeling of delta-sunspots: How to Generate Most Violent Active Regions of the Sun

*Shin Toriumi[1], Hideyuki Hotta[2] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2.Graduate School of Science, Chiba University)

[PEM17-22] Deep Flare Net Extended to 4-Class Solar Flare Prediction

*Naoto Nishizuka[1], Komei Sugiura[1], Yuki Kubo[1], Mitsue Den[1], Mamoru Ishii[1] (1.National Institute of Information and Communications Technology)

[PEM17-23] Investigation of statistical relationships between loop structures in X-ray coronal image and CME using automatic recognition of coronal loops

*Yusuke Iida[1], Yusuke Kawabata[2], Toshifumi Shimizu[3] (1.Niigata University, 2.NAOJ, 3.JAXA/ISAS)

[PEM17-24] Determination of 3D velocity fields of disappearing and erupting solar filaments using SMART/SDDI at Hida observatory

*Nami Kimura[1], Kenichi Otsuji[1], Ayumi Asai[1], Yosuke Alexandre Yamashiki[1] (1.Kyoto University)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM18] Study of coupling processes in solar-terrestrial system

convener:Mamoru Yamamoto(Research Institute for Sustainable Humanosphere, Kyoto University), Yasunobu Ogawa(National Institute of Polar Research), Satonori Nozawa(Institute for Space-Earth Environmental Research, Nagoya University), Akimasa Yoshikawa(Department of Earth and Planetary Sciences, Kyushu University)

[PEM18-01] Study of coupling processes in the solar-terrestrial system = Current status in 2020 =

*Mamoru Yamamoto[1], Hiroyuki Hashiguchi[1], Tatsuhiro Yokoyama[1], Hiroshi Miyaoka[2], Yasunobu Ogawa[2], Kazuo Shiokawa[3], Satonori Nozawa[3], Akimasa Yoshikawa[4], Toshitaka Tsuda[1] (1.Research Institute for Sustainable Humanosphere, Kyoto University, 2.National Institute of Polar Research, 3.Institute for Space-Earth Environmental Research, 4.Graduate School of Science, Kyushu University)

[PEM18-02] Status of Equatorial MU Radar project in 2020

*Mamoru Yamamoto[1], Hiroyuki Hashiguchi[1], Tatsuhiro Yokoyama[1], Toshitaka Tsuda[1] (1.Research Institute for Sustainable Humanosphere, Kyoto University)

[PEM18-03] Current Status of the EISCAT_3D project and the Japan's contribution

*Hiroshi Miyaoka[1], Yasunobu Ogawa[1], Satonori Nozawa[2], Koji Nishimura[1], Taishi Hashimoto[1], Shin-ichiro Oyama[2], Takuji Nakamura[1], Ryoichi Fujii[2], Craig James Heinselman[3] (1.National Institute of Polar Research, 2.Institute for Space-Earth Environmental Research, Nagoya University, 3.European Incoherent Scatter Scientific Association)

[PEM18-04] Current status of the ground-based multi-point network by the PWING Project and the Optical Mesosphere Thermosphere Imagers (OMTIs)

*Kazuo Shiokawa[1], Yuichi Otsuka[1] (1.Institute for Space-Earth Environmental Research, Nagoya University)

[PEM18-05] IUGONET data analysis system for a study of coupling processes in the solar-terrestrial system

*Atsuki Shinbori[1], Yoshimasa Tanaka[2], Norio Umemura[1], Shuji Abe[3], Satoru UeNo[4] (1.Institute for Space-Earth Environment Research (ISEE), Nagoya University, 2.National Institute of Polar Research, 3.International Center for Space Weather Science and Education (ICSWSE), Kyushu University, 4.Kwasan and Hida Observatories, Graduate School of Science, Kyoto University)

[PEM18-06] Statistical study of Sporadic Sodium Layers (SSLs) above Tromsø (2)

*Satonori Nozawa[1], Takuo T. Tsuda[2], Norihito Saito[3], Takuya Kawahara[4], Satoshi Wada[3], Yasunobu Ogawa[5], Hitoshi Fujiwara[6], Toru Takahashi[7], Tetsuya Kawabata[1], Chris Hall[8], Asgeir Brekke[8] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.The University of Electro-Communications, 3.RIKEN Center for Advanced Photonics, 4.Faculty of Engineering, Shinshu University, 5.National Institute of Polar Research, 6.Faculty of Science and Technology, Seikei University, 7.Department Physics, University of Oslo, 8.UiT The Arctic University of Norway)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM18] Study of coupling processes in solar-terrestrial system

convener:Mamoru Yamamoto(Research Institute for Sustainable Humanosphere, Kyoto University), Yasunobu Ogawa(National Institute of Polar Research), Satonori Nozawa(Institute for Space-Earth Environmental Research, Nagoya University), Akimasa Yoshikawa(Department of Earth and Planetary Sciences, Kyushu University)

[PEM18-07] A journey of energy from solar wind to polar ionosphere as viewed from global MHD simulation

★Invited Papers

*Yusuke Ebihara[1], Takashi Tanaka[2] (1.Research Institute for Sustainable Humanosphere, Kyoto University, 2.International Center for Space Weather Science and Education, Kyushu University)

[PEM18-08] Review of the mid-latitude SuperDARN and the future of the SuperDARN

*Nozomu Nishitani[1] (1.Institute for Space-Earth Environmental Research, Nagoya University)

[PEM18-09] Investigation of global electromagnetic coupling from polar to equatorial ionosphere

*Akimasa Yoshikawa[1], Hideaki Kawano[1], Shuji Abe[2], Teiji Uozumi[2], Akiko Fujimoto[4], Akihiro Ikeda[5], Taisei Kabasawa[3], Satoshi Kuroki[3], Moe Hayashi[3], Takayama Kumi[3], Aoi Nakamizo[6], Shinichi Ohtani[7] (1.Department of Earth and Planetary Sciences, Kyushu University, 2.International Center for Space Weather Science and Education, Kyushu University, 3.Graduate school of Earth and Planetary Sciences, Kyushu University, 4.Faculty of Computer Science and Systems Engineering, Kyushu Institute of Technology , 5.National Institute of Technology Kagoshima College, 6.National Institute of Information and Communications Technology, 7.APL/JHU)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM18] Study of coupling processes in solar-terrestrial system

convener:Mamoru Yamamoto(Research Institute for Sustainable Humanosphere, Kyoto University), Yasunobu Ogawa(National Institute of Polar Research), Satonori Nozawa(Institute for Space-Earth Environmental Research, Nagoya University), Akimasa Yoshikawa(Department of Earth and Planetary Sciences, Kyushu University)

[PEM18-11] Comparison of FM-CW Ionosonde and MAGDAS observations with S4 index in Peru during 15-18 March 2019

*Akiko Fujimoto[1], Akimasa Yoshikawa[2], Akihiro Ikeda[3], Shuji Abe[2], Moe Hayashi[2] (1.Kyushu Institute of Technology, 2.Kyushu University, 3.National Institute of Technology, Kagoshima College)

[PEM18-12] **Complimenting regional GPS-TEC computerized ionospheric tomography (CIT) with ionosonde data assimilation**

*Nicholas Ssessanga[1], Mamoru Yamamoto [1], Susumu Saito[2], Akinori Saito[3], Michi Nishioka[4] (1.RISH , 2.ENRI, 3.Kyoto Univ., 4.NICT)

[PEM18-13] A study of equatorial plasma bubble structure using VHF radar and GNSS scintillations over the low-latitude region

*Acharaporn Bumrungkit[1], Susumu Saito[2], Pornchai Supnithi[1] (1.King Mongkut's Institute of Technology Ladkrabang (KMITL), 2.Electronic Navigation Research Institute (ENRI), National Institute of Maritime, Port, and Aviation Technology (MPAT))

[PEM18-14] **Evolution of a Mesospheric Bore in a Duct Observed by Ground-Based Double-Layer Imagers and Satellite Observations Over the Tibetan Plateau Region**

*Qinzeng Li[1], Jiyao Xu[1], Jia Yue[2], Xiao Liu[3], Wei Yuan[1] (1.State Key Laboratory of Space Weather, National Space Science Center, Chinese Academy of Sciences, Beijing, China, 2.Department of Atmospheric and Planetary Sciences, Hampton University, Hampton, Virginia, USA, 3.School of Mathematics and Information Science, Henan Normal University, Xinxiang, China)

[PEM18-15] Discussion 1

*Mamoru Yamamoto[1] (1.Research Institute for Sustainable Humanosphere, Kyoto University)

[PEM18-16] Discussion 2

*Mamoru Yamamoto[1] (1.Research Institute for Sustainable Humanosphere, Kyoto University)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM19] Dynamics of the Inner Magnetospheric System

convener:Kunihiro Keika(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Aleksandr Y Ukhorskiy(Johns Hopkins University Applied Physics Laboratory), Yoshizumi Miyoshi(Institute for Space-Earth Environmental Research, Nagoya University), Lynn M Kistler(University of New Hampshire Main Campus)

[PEM19-01] Solar wind as a Source of Magnetospheric Plasma

★Invited Papers

*Robert Colby Allen[1], Sarah K Vines[1], Stefano A Livi[2], Don G Mitchell[1], Chris P Paranicas[1], Kareem Sorathia[1], Sam Bingham[1] (1.Johns Hopkins University Applied Physics Laboratory, 2.Southwest Research Institute)

[PEM19-02] Magnetic field dipolarization and low-energy O^+ ion flux variations in the inner magnetosphere observed by Arase

*Masahito Nose[1], Ayako Matsuoka[2], Yoshizumi Miyoshi[1], Kazushi Asamura[2], Mariko Teramoto[3], Tomoaki Hori[1], Iku Shinohara[2] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.Research Division for Space Plasma, Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 3.Kyushu Institute of Technology)

[PEM19-03] Jupiter's plasma circulation and particle precipitation associated with the inner magnetosphere probed with the Hisaki satellite

★Invited Papers

*Tomoki Kimura[1], Fuminori Tsuchiya[1], Chihiro Tao[2], Kazuo Yoshioka[3], Hajime Kita[4], Go Murakami[4], Atsushi Yamazaki[4], Reina Hikida[3], Fumiharu Suzuki[3], Ryoichi Koga[1], George Clark[5], Zhonghua Yao[6], Yasutaka Hiraki[7], Fran Bagenal[8], Peter Delamere[9], Keiichiro Fukazawa[10], Ichiro Yoshikawa[3], Masaki Fujimoto[4], Hisaki Science team (1.Tohoku University, 2.NICT, 3.University of Tokyo, 4.JAXA/ISAS, 5.Johns Hopkins University / Applied Physics Laboratory, 6.Liege University , 7.Advanced Knowledge Laboratory, Inc., 8.University of Colorado Boulder, 9.University of Alaska Fairbanks, 10.Kyoto University)

[PEM19-04] Cold ions perpendicularly heated by fast magnetosonic waves in the inner magnetosphere observed by Arase (ERG) satellite

*Kazushi Asamura[1], Masafumi Shoji[2], Yoshizumi Miyoshi[2], Ryosuke Fujii[2], Atsushi Miyazaki[2], Yasumasa Kasaba[3], Yoshiya Kasahara[4], Ayako Matsuoka[1], Vania Koleva Jordanova[5] (1.ISAS/JAXA, 2.Nagoya U., 3.Tohoku U., 4.Kanazawa U., 5.LANL)

[PEM19-05] Magnetosonic waves driven by proton ring distributions in the Martian magnetosphere

★Invited Papers

*Yuki Harada[1], Suranga Ruhunusiri[2], Jasper S Halekas[2], Jared R Espley[3], Gina A DiBraccio[3], James P McFadden[4], David L Mitchell[4], Christian Mazelle[5], Glyn Collinson[3], David A Brain[6], Takuya Hara[4], Masahito Nose[7], Oimatsu Satoshi[1], Kazuhiro Yamamoto[1], Bruce M Jakosky[6] (1.Graduate School of Science, Kyoto University, 2.Department of Physics and Astronomy, University of Iowa, 3.NASA Goddard Space Flight Center, 4.Space Sciences Laboratory, University of California, Berkeley, 5.IRAP, University of Toulouse, CNRS, UPS, CNES, 6.LASP, University of Colorado at Boulder, 7.ISEE, Nagoya Univ)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM19] Dynamics of the Inner Magnetospheric System

convener:Kunihiro Keika(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Aleksandr Y Ukhorskiy(Johns Hopkins University Applied Physics Laboratory), Yoshizumi Miyoshi(Institute for Space-Earth Environmental Research, Nagoya University), Lynn M Kistler(University of New Hampshire Main Campus)

[PEM19-06] **Formation of Energy-Dispersed Narrow band structure in the Plasmaspheric Region**

*Junhyun Lee[1], Ensang Lee[1], Khan-huk Kim[1] (1.Kyung Hee University)

[PEM19-07] Statistical characteristics and forming mechanisms of trunk structure of ring current ions: Arase ion observations

*Ryosuke Fujii[1], Yoshizumi Miyoshi[1], Masafumi Shoji[1], Kazushi Asamura[2], Lynn M Kistler[1,3], Vania Jordanova[4], Tomoaki Hori[1], Shoichiro Yokota[5], Satoshi Kasahara[6], Kunihiro Keika[6], Ayako Matsuoka[2], Iku Shinohara[2] (1.Nagoya University, 2.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 3.University of New Hampshire, 4.Los Alamos National Laboratory, 5.Osaka University, 6.The university of Tokyo)

[PEM19-08] Excitation of poloidal Pc 5 waves associated with the substorm nose structure: Arase observation

*Kazuhiro Yamamoto[1], Masahito Nose[2], Ayako Matsuoka[3], Mariko Teramoto[4], Reiko Nomura[5], Satoshi Kasahara[6], Shoichiro Yokota[7], Kunihiro Keika[6], Kazushi Asamura[3], Yoshiya Kasahara[8], Atsushi Kumamoto[9], Fuminori Tsuchiya[9], Masafumi Shoji[2], Yoshizumi Miyoshi[2] (1.Graduate School of Science, Kyoto University, 2.Institute for Space-Earth Environmental Research, Nagoya University, 3.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 4.Kyushu Institute of Technology, 5.National Astronomical Observatory of Japan, 6.Graduate School of Science, The University of Tokyo, 7.Graduate School of Science, Osaka University, 8.Graduate School of Natural Science and Technology, Kanazawa University, 9.Graduate School of Science, Tohoku University)

[PEM19-09] Study of the excitation mechanism of storm-time Pc5 ULF waves by ring current ions based on the drift-kinetic simulation

*Tomotsugu Yamakawa[1], Kanako Seki[1], Takanobu Amano[1], Naoko Takahashi[1], Yoshizumi Miyoshi[2] (1.Department of Earth and Planetary Science, School of Science, The University of Tokyo, 2.ISEE, Nagoya University)

[PEM19-10] Recent Progress in ULF Wave's Interaction with Cold Electrons and Ions in the Earth's Inner Magnetosphere

★Invited Papers

*Jie Ren[1], Qiugang Zong[1], Xuzhi Zhou[1], Chao Yue[1], Robert Rankin[2] (1.Peking University, 2.University of Alaska)

[PEM19-11] Nonlinear drift resonance between electrons and ULF waves under the convection electric field

*Li Li[1,2], Yoshiharu Omura[2], Xuzhi Zhou[1] (1.Peking Univ., 2.Kyoto Univ.)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM19] Dynamics of the Inner Magnetospheric System

convener:Kunihiro Keika(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Aleksandr Y Ukhorskiy(Johns Hopkins University Applied Physics Laboratory), Yoshizumi Miyoshi(Institute for Space-Earth Environmental Research, Nagoya University), Lynn M Kistler(University of New Hampshire Main Campus)

[PEM19-12] **An Empirical Model of Electron Flux from the Seven-Year Van Allen Probe Mission**

★Invited Papers

*Christine Gabrielse[1], James Roeder[1], Justin Lee[1], Seth Claudepierre[1,2], Drew L. Turner[3], T. Paul O'Brien[1], Joseph Fennell[1], J. Bernard Blake[1] (1.The Aerospace Corporation, 2.UCLA, 3.John Hopkins Applied Physics Lab.)

[PEM19-13] **Comparison of storm-time electron dynamics observed by Arase/ERG and POES missions**

*ALEXEI DMITRIEV[1,2], Shoichiro Yokota[3], Kunihiro Keika[4], Tomoaki Hori[5], Yoshizumi Miyoshi[5] (1.Institute of Space Science and Engineering, National Central University, Jungli City, Taiwan, 2.Skobeltsyn Institute of Nuclear Physics, Lomonosov Moscow State University, Moscow, Russia, 3.Univesity Osaka, Japan, 4.Univesity Tokyo, Japan, 5.Univesity Nagoya, Japan)

[PEM19-14] Comprehensive Observations of Substorm-Enhanced Plasmaspheric Hiss Generation, Propagation, and Dissipation

*Nigang Liu[1], Zhenpeng Su[1], Zhonglei Gao[2], Huinan Zheng[1], Yuming Wang[1], Shui Wang[1], Yoshizumi Miyoshi[3], Iku Shinohara[4], Yoshiya Kasahara[5], Fuminori Tsuchiya[6], Atsushi Kumamoto[6], Shoya Matsuda[4], Masafumi Shoji[3], Takefumi Mitani[4], Takeshi Takashima[4], Yoichi Kazama[7], Bo-Jhou Wang[7], Shiang-Yu Wang[7], Chae-Woo Jun[3], Tzu-Fang Chang[8], Sunny W. Y. Tam[8], Satoshi Kasahara[9], Shoichiro Yokota[10], Kunihiro Keika[9], Tomoaki Hori[3], Ayako Matsuoka[4] (1.University of Science and Technology of China, Hefei, China, 2.Harbin Institute of Technology, Shenzhen, China, 3.Nagoya University, Nagoya, Japan, 4.Japan Aerospace Exploration Agency, Kanagawa, Japan, 5.Kanazawa University, Kanazawa, Japan, 6.Tohoku University, Sendai, Japan, 7.Academia Sinica Institute of Astronomy and Astrophysics, Taiwan, 8.National Cheng Kung University, Taiwan, 9.University of Tokyo, Tokyo, Japan, 10.Osaka University, Osaka, Japan)

[PEM19-15] Propagation characteristics of whistler-mode chorus waves in the outer radiation belt deduced from the Arase PWE observation

*Satoshi Kurita[1], Yoshizumi Miyoshi[1], Yoshiya Kasahara[2], Hirotsugu Kojima[3], Shoya Matsuda[4], Ayako Matsuoka[4], Iku Shinohara[4] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.Information Media Center, Kanazawa University, 3.Research Institute for Sustainable Humanosphere, Kyoto University, 4.ISAS/JAXA)

[PEM19-16] **EMIC (ElectroMagnetic Ion Cyclotron) waves during the Van Allen Probes and ERG era: EMIC wave properties depending on geomagnetic conditions**

*Chae-Woo Jun[1], Yoshizumi Miyoshi[1], Chao Yue[2], Jacob Bortnik[3], Larry Lyons[3], Toshi Nishimura[5], Craig Kletzing[4], Satoshi Kasahara[6], Yasumasa Kasaba[7], Shoya Matsuda[8], Masafumi Shoji[1], Fuminori Tsuchiya[6], Atsushi Kumamoto[6], Ayako Matsuoka[8], Iku Shinohara[8] (1.Institute for Space-Earth Environmental Research, Nagoya University, Nagoya, Japan, 2.Department of Earth and Space Science, Peking University, Beijing, China, 3.Atmospheric and Oceanic Sciences, University of California Los Angeles, Los Angeles, USA, 4.Department of Physics and Astronomy, University of Iowa, Iowa City, USA, 5.Boston University, Boston, USA, 6.Kanazawa University, Kakuma, Japan., 7.Tohoku University, Sendai, Japan. , 8.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, Sagamihara, Japan.)

[PEM19-17] Statistical error estimation of the WPIA method and its application for nonlinear EMIC-proton interactions

*Masafumi Shoji[1], Yoshizumi Miyoshi[1], Kazushi Asamura[2], Atsushi Miyazaki[1], Yasumasa Kasaba[3], Yoshiya Kasahara[4], Shoya Matsuda[2], Ayako Matsuoka[2], Lynn M Kistler[5,1] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.ISAS, 3.Tohoku University, 4.Kanazawa University, 5.The University of New Hampshire)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM19] Dynamics of the Inner Magnetospheric System

convener:Kunihiro Keika(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Aleksandr Y Ukhorskiy(Johns Hopkins University Applied Physics Laboratory), Yoshizumi Miyoshi(Institute for Space-Earth Environmental Research, Nagoya University), Lynn M Kistler(University of New Hampshire Main Campus)

[PEM19-18] Comprehensive Study of the Response of Outer Radiation Belt and Inner Magnetosphere to Sheath Regions of Coronal Mass Ejections

*Milla Kalliokoski[1], Emilia Kilpua[1], Drew Turner[2], Allison Jaynes[3], Adnane Osmane[1], Lucile Turc[1], Harriet George[1], Minna Palmroth[1,4] (1.University of Helsinki, 2.Johns Hopkins University Applied Physics Laboratory, 3.University of Iowa, 4.Finnish Meteorological Institute)

[PEM19-19] Electron fluxes interacting with localized oblique whistler mode waves in the Earth's outer radiation belt

*Yikai Hsieh[1], Yuko Kubota[1], Yoshiharu Omura[1] (1.Reserach Institute for Sustainable Humanosphere, Kyoto University)

[PEM19-20] Deformation of electron pitch angle distributions by Upper Band Chorus: Numerical verification for Arase observations

*Shinji Saito[1], Satoshi Kurita[2], Yoshizumi Miyoshi[2] (1.National Institute of Information and Communications Technology, 2.ISEE, Nagoya Univ.)

[PEM19-21] Relative contribution of ULF and whistler-mode chorus waves to the radiation belt variation

*Naoko Takahashi[1], Kanako Seki[1], Mei-Ching Fok[2], Yihua Zheng[2], Yoshizumi Miyoshi[3], Satoshi Kasahara[1], Kunihiro Keika[1], David Hartley[4], Yoshiya Kasahara[5], Yasumasa Kasaba[6], Nana Higashio[1], Ayako Matsuoka[7], Shoichiro Yokota[8], Tomoaki Hori[3], Iku Shinohara[7] (1.Graduate School of Science, The University of Tokyo, 2.NASA Goddard Space Flight Center, 3.Institute for Space-Earth Environmental Research, Nagoya University, 4.The University of Iowa, 5.Information Media Center, Kanazawa University, 6.Planetary Plasma and Atmospheric Research Center, Tohoku University, 7.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 8.Graduate School of Science, Osaka University)

[PEM19-22] Energetic electron variations during magnetic storms: Comparative study between Arase observations and code coupling simulations

*Yoshizumi Miyoshi[1], Vania Jordanova[2], Yuto Katoh[3], Shinji Saito[4], Satoshi Kurita[5], Sandeep Kumar[1], Yoshiya Kasahara[6], Shoya Matsuda[7], Masafumi Shoji[1], Fuminori Tsuchiya[3], Atsushi Kumamoto[3], Ayako Matsuoka[5], Satoshi Kasahara[8], Shoichiro Yokota[9], Tomoaki Hori[1], Kunihiro Keika[8], Yoichi Kazama[10], Shiang-Yu Wang[10], Chae-Woo Jun[1], Takefumi Mitani[7], Takeshi Takashima[7], Nana Higashio[7], Iku Shinohara[7] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.Los Alamos National Laboratory, 3.Tohoku University, 4.NICT, 5.Kyoto University, 6.Kanazawa University, 7.JAXA, 8.The University of Tokyo, 9.Osaka University, 10.ASIAA)

[PEM19-23] Electric Field Effect on Proton Flux Response in South Atlantic Anomaly during Geomagnetic Storms

*Kirolosse Mina GIRGIS[1,2], Tohru Hada[3,4], Shuichi Matsukiyo[3,4] (1.Department of Earth System Science and Technology (ESST), Interdisciplinary Graduate School of Engineering Sciences (IGSES), Kyushu University, Japan , 2.Aerospace Engineering Department, Faculty of Engineering, Cairo University, Egypt, 3.Department of Advanced Environmental Science and Engineering, Faculty of Engineering Sciences, Kyushu University, Japan, 4.International Center for Space Weather Science and Education (ICSWSE), Kyushu University, Japan)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM20] Recent Advances in Ionosphere Observation and Modeling through New Observation Opportunities

convener:CHIYEN LIN(Center for Astronautical Physics and Engineering, National Central University, TAIWAN), Yen-Jung Wu(Space Sciences Laboratory, University of California, Berkeley), Yang-Yi Sun(China University of Geosciences), Charles Lin(Department of Earth Sciences, National Cheng Kung University)

[PEM20-01] Ionospheric Variability during the September 2019 Southern Hemisphere Sudden Stratospheric Warming

★Invited Papers

*Yosuke Yamazaki[1], Vivien Matthias[2], Yasunobu Miyoshi[3], Claudia Stolle[1,4], Tarique Siddiqui[1], Guram Kervalishvili[1], Jan Laštovička[5], Michal Kozubek[5], William Ward[6], David Themens[6], Samuel Kristoffersen[6], Patrick Alken[7,8] (1.GFZ Potsdam, 2.PIK Potsdam, 3.Kyushu Univ., 4.Univ. of Potsdam, 5.CAS Prague, 6.Univ. of New Brunswick, 7.Colorado Univ., 8.NOAA)

[PEM20-02] Recent Insights into the Thermosphere-Ionosphere Response to External Forcing from the Global-scale Observations of the Limb and Disk (GOLD) Mission

★Invited Papers

*Richard Eastes[1] (1.Laboratory for Atmospheric and Space Physics)

[PEM20-03] Comparing Equatorial Plasma Irregularities across Scale Sizes with GOLD and COSMIC

*Jeffrey Klenzing[1], Alexa Jean Halford[1], Jonathon Smith[1,2], Carlos Martinis[3] (1.NASA Goddard Space Flight Center, 2.Catholic University of America, 3.Boston University)

[PEM20-04] Multi-scale Ion Composition and Plasma Density Irregularities: Swarm-E Observations in the Topside Ionosphere

*Andrew W Yau[1] (1.University of Calgary)

[PEM20-05] The variation of the ionospheric electron density associated with active lightning

Yu-Cheng Lin[1], *Alfred Bing-Chih Chen[1], Chiawen Chuang[1] (1.National Cheng Kung University)

[PEM20-06] Global distribution of persistence of total electron content anomaly

*Yang-Yi Sun[1], Chieh-Hung Chen[1], JANN-YENQ Liu[2] (1.China University of Geosciences (Wuhan), 2.National Central University)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM20] Recent Advances in Ionosphere Observation and Modeling through New Observation Opportunities

convener:CHIYEN LIN(Center for Astronautical Physics and Engineering, National Central University, TAIWAN), Yen-Jung Wu(Space Sciences Laboratory, University of California, Berkeley), Yang-Yi Sun(China University of Geosciences), Charles Lin(Department of Earth Sciences, National Cheng Kung University)

[PEM20-07] Assimilation of Ground- and Space-Based Ionosphere Observations in WACCMX+DART

★Invited Papers

*Nicholas M Pedatella[1], Jeffrey Anderson[1], Chia-Hung Chen[2], Charles Lin[2], Jing Liu[1], Hanli Liu[1], Kevin Raeder[1] (1.National Center for Atmospheric Research, 2.National Cheng Kung University)

[PEM20-08] COSMIC 2 Observation of Topside Ionosphere and Plasmasphere During A Substorm Event

*Qian Wu[1], William Schreiner[2], John Braun[2], Iurii Cherniak[2], Irina Zakharenkova[2], Nick Pedatella[1,2], Min-yang Chou[2] (1.National Center for Atmospheric Research, 2.COSMIC Program/UCP)

[PEM20-09] **Extreme Ionospheric Response to a Minor Magnetic Storm in Deep Solar Minimum Revealed by Data Assimilation Results of FORMOSAT-7/COSMIC-2 and GNSS Total Electron Content**

*Charles Lin[1], P. K. Rajesh[1], CHIYEN LIN[2], JANN-YENQ Liu[3], Chia-Hung Chen[1] (1.Department of Earth Sciences, National Cheng Kung University, 2.Center for Astronautical Physics and Engineering, National Central University, 3.Graduate Institute of Space Science and Engineering, National Central University)

[PEM20-10] Near real-time plasma irregularity monitoring by FORMOSAT-7/COSMIC-2

*Shih-Ping Chen[1], Charles Lin[1], Rajesh Panthalingal Krishnanunni[1], Richard Eastes[2], Jong-Min Choi[1] (1.Department of Earth Sciences, National Cheng-Kung University, 2.Laboratory for Atmospheric and Space Physics, University of Colorado)

[PEM20-11] **Behavior of the low-latitude ionospheric plasma observed by FORMOSAT-7/COSMIC-2**

*FU-YUAN CHANG[1,2], JANN-YENQ Liu[1,2,3], CHI-YEN LIN[1,2], Charles Lin[4] (1.Center for Astronautical Physics and Engineering, National Central University, Taoyuan City, Taiwan, 2.Institute of Space Science, National Central University, Taoyuan City, Taiwan, 3.Center for Space and Remote Sensing Research, National Central University, Taoyuan City, Taiwan, 4.Department of Earth Sciences, National Cheng Kung University, Tainan City, Taiwan)

[PEM20-12] Space Weather Products of FORMOSAT-7/COSMIC-2: Global Ionospheric Specification and Aided Abel Electron Density Profile

*CHIYEN LIN[1,2], Charles Lin[3], JANN-YENQ Liu[1,2], P. K. Rajesh[3], MINYANG CHOU[4], Ho-Fang Tsai[3] (1.Center for Astronautical Physics and Engineering, National Central University, 2.Institute of Space Science and Engineering, National Central University, 3.Department of Earth Sciences, National Cheng Kung University, 4.University Corporation for Atmospheric Research)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM20] Recent Advances in Ionosphere Observation and Modeling through New Observation Opportunities

convener:CHIYEN LIN(Center for Astronautical Physics and Engineering, National Central University, TAIWAN), Yen-Jung Wu(Space Sciences Laboratory, University of California, Berkeley), Yang-Yi Sun(China University of Geosciences), Charles Lin(Department of Earth Sciences, National Cheng Kung University)

[PEM20-13] First Results from the NASA Ionospheric Connection Explorer Mission

★Invited Papers

*Thomas J Immel[1], Scott L. England[4], Roderick A. Heelis[3], Christoph R. Englert[2], Stephen B. Mende[1], Jerry E. Edelstein[1] (1.University of California Berkeley, 2.U.S. Naval Research Laboratory, 3.University of Texas at Dallas, 4.Virginia Institute of Technology)

[PEM20-14] First results from the ICON Far-Ultra-Violet (FUV) Instrument

*Harald U Frey[1], Stephen B Mende[1], Scott L England[5], Robert R Meier[2], Andrew W Stephan[3], Farzad Kamalabadi[4], Ulas Kamaci[4], Thomas J Immel[1] (1.University of California Berkeley, 2.George Mason University, 3.Naval Research Laboratory, 4.University of Illionois, 5.Virgina Technical University)

[PEM20-15] Spatial-structure of mid-latitude sporadic-E episodes revealed by L-band ALOS/PALSAR InSAR observations

*Masato Furuya[1], Natsu Takaki (1.Department of Earth and Planetary Sciences Hokkaido University)

[PEM20-16] Global Rate of TEC Index (ROTI) Observed by Ground-Based GPS TEC in 2009 and 2013

*Shih An Wu[1], JANN-YENQ Liu[1] (1.Institute of Space Science, National Central University, Taiwan)

[PEM20-17] **Design and Preliminary Results for Ionosphere Photometer on FengYun-3(D) Meteorological Satellite**

*Liping Fu[1], Fang Jiang[1], Tian Mao[2], Nan Jia[1], Tianfang Wang[1], Ruyi Peng[1] (1.National Space Science Center,Chinese Academy of Sciences, 2.National Satellite Meteorological Centre)

[PEM20-18] Errors from asymmetric emission rate in spaceborne, limb sounding Doppler interferometry: A correction algorithm with application to ICON/MIGHTI

*Yen-Jung Wu[1], Brian J. Harding[1], Colin C. Triplett[1], Jonathan J. Makela[2], Kenneth D. Marr[3], Christoph R. Englert[3], John M. Harlander[4], Thomas J. Immel[1] (1.Space Sciences Laboratory, University of California, Berkeley, CA, USA, 2.Department of Electrical and Computer Engineering, University of Illinois, Urbana-Champaign, IL, USA, 3.Space Science Division, U.S. Naval Research Laboratory, Washington, DC, USA, 4.Space Systems Research Corporation, Alexandria, VA, USA)

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM21] Surprises from the Subauroral Zone: Synthesizing Ground and Space-Based Observations and Theory

convener:Connors Martin G(Athabasca University), Kazuo Shiokawa(Institute for Space-Earth Environmental Research, Nagoya University)

[PEM21-01] Magnetospheric-ionosphere dynamics associated with STEVE

★Invited Papers

*Toshi Nishimura[1], Jian Yang[2], Eric Donovan[3], Vassilis Angelopoulos[4], Nozomu Nishitani[5] (1.Boston University, 2.Southern University of Science and Technology, 3.University of Calgary, 4.University of California, Los Angeles, 5.Nagoya University)

[PEM21-02] Magnetosphere-Ionosphere Coupling by Alfvén Waves at Sub-Auroral Latitudes

★Invited Papers

*Robert L Lysak[1], Yan Song[1], Colin L Waters[2], Murray D Sciffer[2], Yuki Obana[3] (1.University of Minnesota, 2.University of Newcastle, 3.Osaka Electrocommunication University)

[PEM21-03] Multi-wavelength imaging observations of STEVE at Athabasca, Canada

*Sneha Yadav[1,2], Kazuo Shiokawa[1], Yuichi Otsuka[1], Martin G Connors[3], Jean-Pierre St. Maurice[4,5] (1.Institute for Space-Earth Environmental Research, 2.Space Physics Laboratory, Vikram Sarabhai Space Centre, Trivandrum, India, 3.Athabasca University Observatories, Athabasca University, Athabasca, Alberta, Canada, 4.Department of Physics and Engineering Physics, University of Saskatchewan, Saskatoon, Saskatchewan, Canada, 5.Department of Physics and Astronomy, University of Western Ontario, London, Ontario, Canada)

[PEM21-04] Pi2 ULF modulation of energetic electron precipitations observed by using VLF/LF transmitter signals

*Hiroyo Ohya[1], Miyashita Takuya[1], Fuminori Tsuchiya[2], Asuka Hirai[2], Mitsunori Ozaki[3], Kazuo Shiokawa[4], Yoshizumi Miyoshi[4], Nozomu Nishitani[4], Tomoaki Hori[4], Mariko Teramoto[5], Martin G Connors[6], Simon G Shepherd[7], Yoshiya Kasahara[3], Atsushi Kumamoto[2], Masafumi Shoji[4], Iku Shinohara[8], Hiroyuki Nakata[1], Toshiaki Takano[1] (1.Graduate School of Engineering, Chiba University, 2.Tohoku University, 3.Kanazawa University, 4.Nagoya University, 5.Kyushu Institute of Technology, 6.Athabasca University, 7.Dartmouth College, 8.Japan Aerospace Exploration Agency)

[PEM21-05] Subauroral GPS TEC and phase variations during geomagnetic storms

*Paul Prikryl[1,2], James M. Weygand[3], Reza Ghoddousi-Fard[4], Bharat S. R. Kunduri[5], P. T. Jayachandran[1], Knut S. Jacobsen[6], Yngvild L. Andalsvik[6], Tibor Durgonics[7], Kjerrmar Oksavik[8,9] (1.Physics Department University of New Brunswick, Canada, 2. Geomagnetic Laboratory Natural Resources Canada, 3.Earth Planetary and Space Sciences, University of California, USA, 4.Canadian Geodetic Survey Natural Resources Canada , 5.Bradley Dept. of Electrical and Computer Engineering, Virginia Tech, USA, 6.Norwegian Mapping Authority, Norway, 7.National Space Institute, Technical University of Denmark, Denmark, 8.Department of Physics and Technology, University of Bergen, Norway, 9.Arctic Geophysics, University Centre in Svalbard, Norway)

[E] Oral | P (Space and Planetary Sciences)：P-AE Astronomy & Extrasolar Bodies

[P-AE22] Exoplanets

convener:Masahiro Ikoma(Department of Earth and Planetary Science, The University of Tokyo), Norio Narita(The University of Tokyo), Yuka Fujii(National Astronomical Observatory of Japan)

[PAE22-01] Population studies of exoplanetary atmospheres with next generation of space and ground telescopes

*Giovanna Tinetti[1] (1.UCL)

[PAE22-02] Solving atmospheric retrievals with deep learning.

★Invited Papers

*Ingo Waldmann[1] (1.University College London)

[PAE22-03] Condensates and Clouds in Exoplanetary Atmospheres: Some Lessons from our Solar System

★Invited Papers

*Tristan Guillot[1,2] (1.Observatoire de la Cote d Azur, 2.JSPS/University of Tokyo)

[PAE22-04] **Twinkle: a visible and near-infrared space-based observatory for exoplanet and solar system spectroscopy**

*Billy Nelson Edwards[1,2], Giovanna Tinetti[1,2], Marcell Tessenyi[2,1], Giorgio Savini[1,2], Jonathan Tennyson[1,2], Richard Archer[2], Ian Stotesbury[2], Max Joshua[2], Benjamin Wilcock[2] (1.University College London , 2.Blue Skies Space Ltd)

[PAE22-05] Detecting molecular lines in thermal emission spectra of temperate planets with SPICA/SMI

*Yuka Fujii[1], Taro Matsuo[2], Yui Kawashima[3], Kazumasa Ohno[4], Ayaka Okuya[4], Teruyuki Hirano[4] (1.Earth-Life Science Institute, Tokyo Institute of Technology, 2.Nagoya University, 3.Netherlands Institute for Space Research, 4.Tokyo Institute of Technology)

[PAE22-06] FUV-driven atmospheric escape from hot Jupiters

*Hiroto Mitani[1], Riouhei Nakatani[2], Naoki Yoshida[1] (1.The University of Tokyo, 2.RIKEN)

[E] Oral | P (Space and Planetary Sciences)：P-AE Astronomy & Extrasolar Bodies

[P-AE22] Exoplanets

convener:Masahiro Ikoma(Department of Earth and Planetary Science, The University of Tokyo), Norio Narita(The University of Tokyo), Yuka Fujii(National Astronomical Observatory of Japan)

[PAE22-07] Pebble Accretion by Planets on Eccentric Orbits and the Mass Ratios of Exoplanets

*Steven J Desch[1], Alan Jackson[1], Chuhong Mai[1], Jessica Noviello[1] (1.Arizona State University, School of Earth and Space Exploration)

[PAE22-08] Theoretical prediction of water contents of terrestrial planets with effects of water production in primordial atmospheres

*Tadahiro Kimura[1], Masahiro Ikoma[1] (1.The University of Tokyo)

[PAE22-09] Water Storage Capacity of Rocky Exoplanet Interiors

*Christine Houser[1], Cayman T Unterborn[2], Jun Tsuchiya[3] (1.Earth-Life Science Institute, Tokyo Institute of Technology, 2.Arizona State University, 3.Geodynamics Research Center, Ehime University)

[PAE22-10] Thermal and magnetic evolution of exoplanetary cores

*Irene Bonati[1], Marine Lasbleis[2,1], Lena Noack[3] (1.Earth-Life Science Institute, Tokyo Institute of Technology, 2.Laboratoire de Planétologie et Géodynamique, Université de Nantes, 3.Freie Universität Berlin)

[PAE22-11] The Coupled Roles of Host Star Age, Exoplanet Radiogenic Heat Budget and Climatic Evolution

*Cayman T Unterborn[1], Steven Desch[1], Patrick Young[1], Greg Vance[1], Lee Chieffle[1], Bradford Foley[2] (1.Arizona State University, 2.Pennsylvania State University)

[PAE22-12] Impact of Stellar Superflares on Planetary Habitability

*Yosuke Alexandre Yamashiki[1], Hiroyuki Maehara[2], Vladimir Airapetian[3,4], Yuta Notsu[5], Tatsuhiko Sato[7], Takanori Sasaki[6] (1.Earth & Planetary Water Resources Assessment Laboratory Graduate School of Advanced Integrated Studies in Human Survivability Kyoto University, 2.Okayama Branch Office, Subaru Telescope, National Astronomical Observatory of Japan, 3.NASA/GSFC/SEEC, 4.American University, 5.Laboratory for Atmospheric and Space Physics, University of Colorado Boulder, 6.Department of Astronomy, Kyoto University, 7.Nuclear Science and Engineering Center, Japan Atomic Energy Agency (JAEA))

[E] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

[P-CG23] Shock responses of planetary materials elucidated from meteorites and laboratory experiments

convener:Takuo Okuchi(Institute for Planetary Materials, Okayama University), Toshimori Sekine(Center for High Pressure Science and Technology Advanced Research), Naotaka Tomioka(Kochi Institute for Core Sample Research, Japan Agency for Marine-Earth Science and Technology)

[PCG23-01] Shock heating origin of anomalous achondrite NWA 6704 from infrared spectroscopy and modal mineralogy

*Matthew Izawa[1], Sean Yokoyama[2], Shigeru Yamashita[1], Takuo Okuchi[1], Takuya Moriguti[1], Andrew P Jephcoat[1], Vishnu Reddy[3], Allison M McGraw[3], Lucille Le Corre[4], Edward A Cloutis[5] (1.Institute for Planetary Materials, Okayama University, 827 Yamada, Misasa, Tottori 682-0193, Japan, 2.University of Toronto, 27 King's College Cir, Toronto, ON M5S, Canada , 3.Lunar and Planetary Laboratory, University of Arizona, 1629 E University Blvd Tucson AZ 85721-0092 USA, 4.Planetary Science Institute, 1700 East Fort Lowell, Suite 106, Tucson, AZ, USA, 5.Center for Terrestrial and Planetary Exploration, University of Winnipeg, 515 Portage Avenue, Winnipeg, Manitoba, R3B 2E9 Canada)

[PCG23-02] A new Mg2SiO4 polymorph “poirierite” in shocked meteorites and its possible high-pressure synthesis conditions

*Naotaka Tomioka[1], Takuo Okuchi[2], Luca Bindi[3], Masaaki Miyahara[4], Toshiaki Iitaka[5], Zhi Li[6], Xiande Xie[7], Narangoo Purevjav[2,8], Kiyoshi Fujino[9], Tetsuo Irifune[9], Riho Tani[4,1], Yu Kodama[10] (1.Kochi Institute for Core Sample Research, Japan Agency for Marine-Earth Science and Technology, 2.Institute for Planetary Materials, Okayama University, 3.Università degli Studi di Firenze, 4.Hiroshima University, 5.RIKEN, 6.Nanjing University of Science and Technology, 7.Guangzhou Institute of Geochemistry, 8.Bayerisches Geoinstitut, University of Bayreuth, 9.Geodynamics Research Center, Ehime University, 10.Marine Works Japan Ltd)

[PCG23-03] Shock degrees of eucrites from petrographic and XRD analyses

*Rei Kanemaru[1], Naoya Imae[1,2], Akira Yamaguchi[1,2], Hirotsugu Nishido[3] (1.the Graduate University for Advanced Studies (SOKENDAI), 2.National Institute of Polar Research (NIPR), 3.Okayama University of Science (OUS))

[PCG23-04] Shock conditions for shergottites: A comparison between Asuka 12325 and other shergottites

★Invited Papers

*Atsushi Takenouchi[1], Akira Yamaguchi[1], Takashi Mikouchi[2] (1.National Institute of Polar Research, 2.The University Museum, The University of Tokyo)

[PCG23-05] Shock and recovery experiments of petrologic type 3 ordinary chondrite

*Masaaki Miyahara[1], Junnosuke Edanaga[1], Akira Yamaguchi[2], Takamichi Kobayashi[3], Toshimori Sekine[4,5] (1.Department of Earth and Planetary Systems Science, Graduate School of Science, Hiroshima University, 2.National Institute of Polar Research, 3.National Institute for Materials Science, 4.Center for High-Pressure Science and Technology Advanced Research, 5.Graduate School of Engineering, Osaka University)

[PCG23-06] An overlooked heat source in impact events and its effect on the degree of devolatilization of natural calcite carbonates

★Invited Papers

*Kosuke Kurosawa[1], Hidenori Genda[2], Shintaro Azuma[3], Keishi Okazaki[4] (1.Planetary Exploration Research Center, Chiba Institute of Technology, 2.Earth-Life Science Institute, Tokyo Institute of Technology, 3.Department of Earth and Planetary Sciences, School of Science, Tokyo Institute of Technology , 4.Kochi Institute for Core Sample Research, JAMSTEC)

[E] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

[P-CG23] Shock responses of planetary materials elucidated from meteorites and laboratory experiments

convener:Takuo Okuchi(Institute for Planetary Materials, Okayama University), Toshimori Sekine(Center for High Pressure Science and Technology Advanced Research), Naotaka Tomioka(Kochi Institute for Core Sample Research, Japan Agency for Marine-Earth Science and Technology)

[PCG23-08] Reproducing the high-pressure metallic, oxide and silicate minerals found in meteorites using novel shock-recovery experiments

★Invited Papers

*Jinping Hu[1], Paul D. Asimow[1] (1.Division of Geological and Planetary Sciences, California Institute of Technology)

[PCG23-09] **Shock-induced melting of iron and the melting temperature at Earth's inner-core boundary revisited**

*Youjun Zhang[1], Jun Li[2], Toshimori Sekine[3] (1.Sichuan University, China, 2.Institute of Fluid Physics, China, 3.Center for High Pressure Science and Technology Advanced Research, China)

[PCG23-10] **Ramp compressed Iron at Super-Earth interior conditions**

*Liang Sun[1], Xiaoxi Duan[1], Liping Peng[1], Yulong Li[1], Youjun Zhang[2], Toshimori Sekine[3], Zhebin Wang[1], Jiamin Yang[1], Shaoen Jiang[1] (1.Laser Fusion Research Center, China Academy of Engineering Physics (CAEP), Mianyang,621900,P. R. China, 2.Sichuan University, Chengdu, P.R. China, 3.Center for High Pressure Science and Technology Advanced Research (HPSTAR), Shanghai, 201203, P. R. China.)

[PCG23-11] Experimental platform using high-power laser with X-ray free-electron laser at SACLA and its capabilities for shock experiments

*Kohei Miyanishi[1], Yuichi Inubushi[1,2], Toshinori Yabuuchi[1,2], Keiichi Sueda[1], Tadashi Togashi[1,2], Norimasa Ozaki[3], Michel Koenig[4], Yoshinori Tange[2], Kensuke Tono[1,2], Makina Yabashi[1,2] (1.RIKEN SPring-8 Center, 2.Japan Synchrotron Radiation Research Institute, 3.Osaka University, 4.LULI, CNRS, CEA, Ecole Polytechnique, UPMC, Univ Paris 06)

[E] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

[P-CG24] Future missions and instrumentation for space and planetary science

convener:Kazuo Yoshioka(Graduate School of frontier Science, The University of Tokyo), Satoshi Kasahara(The university of Tokyo), Kazunori Ogawa(Japan Aerospace Exploration Agency), Mitsunori Ozaki(Faculty of Electrical and Computer Engineering, Institute of Science and Engineering, Kanazawa University)

[PCG24-01] Overview of Smart Lander for Investigating Moon and Scientific Instrument

★Invited Papers

*Makiko Ohtake[1] (1.Department of Planetary Science, Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

[PCG24-03] Development of an Ion Source for Future Solar System Explorations

*Naho yanase[1], Satoshi Kasahara[1], Yoshifumi Saito[2], Shoichiro Yokota[3], Masafumi Hirahara[4], Oya Kawashima[1] (1.The University of Tokyo, 2.ISAS/JAXA, 3.Osaka University, 4.Nagoya University)

[PCG24-04] Overview of DESTINY$^+$ mission

★Invited Papers

*Takeshi Takashima[1], Kazutaka Nishiyama[1], Hiroyuki Toyota[1], Tomoko Arai[2], Takayuki Yamamoto[1] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2.Chiba Inst. of Technology)

[PCG24-05] Breadboard model of asteroid tracking system for DESTINY$^+$ mission: concept design and initial performance test

*Peng Hong[1], Ko Ishibashi[1], Shunsuke Sato[2], Kotaro Fujiwara[3], Kanako Machii[4], Hiroyuki Toyota[2], Kazutaka Nishiyama[2], Masatsugu Otsuki[2], Osamu Okudaira[1], Takeshi Takashima[2] (1.Planetary Exploration Research Center, Chiba Institute of Technology, 2.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 3.Division of Mechanical and Space Engineering, Graduate School of Engineering, Hokkaido University, 4.Department of Mechanical Engineering and Intelligent Systems, Faculty of Informatics and Engineering, The University of Electro-Communications)

[PCG24-06] Development of gravity gradiometer for the interior investigation of the solar system small body

*Reiko Nomura[1], Akito Araya[2], Noriyuki Namiki[1], Koji Matsumoto[1], Hiroshi Araki[1], Kazuyoshi Asari[1], Kazushi Asamura[3], Hiroaki Shiraishi[3] (1.National Astronomical Observatory of Japan, 2.Earthquake Research Institute, the University of Tokyo, 3.Insititute of Space and Astronautical Science, JAXA)

[E] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

[P-CG24] Future missions and instrumentation for space and planetary science

convener:Kazuo Yoshioka(Graduate School of frontier Science, The University of Tokyo), Satoshi Kasahara(The university of Tokyo), Kazunori Ogawa(Japan Aerospace Exploration Agency), Mitsunori Ozaki(Faculty of Electrical and Computer Engineering, Institute of Science and Engineering, Kanazawa University)

[PCG24-07] Updated status and future plans of BepiColombo

★Invited Papers

*Go Murakami[1], Johannes Benkhoff[2] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2.European Space Agency)

[PCG24-08] Current Status of Japanese Participation in JUICE (Jupiter Icy Moons Explorer)

★Invited Papers

*Yoshifumi Saito[1], Yasuhito Sekine[2], Yasumasa Kasaba[3], Keigo Enya[1], Kazushi Asamura[1], YASUKO KASAI[4], Junichi Haruyama[1], Ayako Matsuoka[1], Shoya Matsuda[1] (1.Solar System Science Division, Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2.Earth-Life Science Insitute, Tokyo Institute of Technology, 3.Planetary Plasma and Atmospheric Research Center, Tohoku University, 4.National Institute of Information and Communications Technology (NICT))

[PCG24-09] Scientific Instruments on Martian Moons eXploration (MMX)

★Invited Papers

*Shingo Kameda[1], Jean-Pierre Bibring[2], David Lawrence[3], Hiroki Senshu[4], Shoichiro Yokota[5], Masanori Kobayashi[4], Patrick Michel[6], Stephan Ulamec[7], Hirotaka Sawada[8], Kiyoshi Kuramoto[9], Kazunori Ogawa[8], Koji Wada[4], Tomohiro Usui[8], Tomoki Nakamura[10], Masaki Fujimoto[8], Hidenori Genda[11], Jörn Helbert[7], Naru Hirata[12], Takeshi Imamura[13], Yasuhiro Kawakatsu[8], Hiroki Kusano[14], Koji Matsumoto[15], Hideaki Miyamoto[13], Hiromu Nakagawa[10], Hisashi Otake[8], Sara Russell[16], Sho Sasaki[5], Naoki Terada[10], Sei-ichiro WATANABE[17] (1.School of Science, Rikkyo University, 2.Université de Paris-Sud, 3.The Johns Hopkins University, 4.Chiba Institute of Technology, 5.Osaka University, 6.Observatoire de la Côte d'Azur, 7.Deutschen Zentrums für Luft- und Raumfahrt, 8.Japan Aerospace Exploration Agency, 9.Hokkaido University, 10.Tohoku University, 11.Tokyo Institute of Technology, 12.Aizu University, 13.The University of Tokyo, 14.National Institutes for Quantum and Radiological Science and Technology, 15.National Astronomical Observatory of Japan, 16.Natural History Museum, 17.Nagoya University)

[PCG24-10] Development of the Raman Spectrometer for Martian Moon Exploration (RAX) for the MMX rover

*Yuichiro Cho[1], Koki Yumoto[1], Shingo Kameda[2], Tomohiro Usui[5], Conor Ryan[3], Till Hagelschuer[3], Selene Routley[3], Maximilian Buder[3], Enrico Dietz[3], Ute Böttger[3], Heinz-Wilhelm Hübers[3], Andoni Moral[4], Tomás Belenguer[4], Pablo Rodríguez[4], Fernando Rull[6] (1.Department of Earth and Planetary Science, University of Tokyo, 2.Rikkyo University, 3.German Aerospace Center (DLR), 4. Instituto National de Técnica Aerospacial (INTA), 5.Japan Aerospace Exploration Agency (JAXA), 6.Universidad de Valladolid)

[PCG24-11] Development of a new method for in situ cosmic-ray exposure age measurements using laser ablation

*Naoki Yamamoto[1], Yuichiro Cho[2], Akinojo Ogura[1], Koki Yumoto[2], Yayoi N Miura[3] (1.Department of Earth and Planetary Physics, University of Tokyo , 2.Department of Earth and Planetary Science, University of Tokyo , 3.Earthquake Research Institute, University of Tokyo)

[PCG24-12] Examination of the Magnetic Field Experiment for the OKEANOS Mission

*Ayako Matsuoka[1], Naofumi Murata[2] (1.Research Division for Space Plasma, Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2.Environmental Test Technology Unit, Japan Aerospace Exploration Agency)

[E] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

[P-CG24] Future missions and instrumentation for space and planetary science

convener:Kazuo Yoshioka(Graduate School of frontier Science, The University of Tokyo), Satoshi Kasahara(The university of Tokyo), Kazunori Ogawa(Japan Aerospace Exploration Agency), Mitsunori Ozaki(Faculty of Electrical and Computer Engineering, Institute of Science and Engineering, Kanazawa University)

[PCG24-13] Sounding rocket missions (LAMP and SS520-3) for ionospheric and magnetospheric explorations

★Invited Papers

*Kazushi Asamura[1], Yoshizumi Miyoshi[2], Keisuke Hosokawa[3], Takefumi Mitani[1], Taku Namekawa[1], Takeshi Sakanoi[4], Naoshi Yagi[4], Mizuki Fukizawa[4], Miki Kawamura[4], Reiko Nomura[5], Masahito Nose[2], Yoshifumi Saito[1], Hirotsugu Kojima[6], Shoichiro Yokota[7], Takumi Abe[1] (1.ISAS/JAXA, 2.ISEE/Nagoya U., 3.UEC, 4.Tohoku U., 5.NAOJ, 6.RISH/Kyoto U., 7.Osaka U.)

[PCG24-14] Computer Simulation of Electric Field Sensor in Space Plasma

*Ibuki Fukasawa[1], Hirotsugu Kojima[1], Yohei Miyake[2], Hideyuki Usui[2] (1.Research institute for sustainable humanosphere, Kyoto University, 2.Graduate School of System Informatics, Kobe University)

[PCG24-15] Development of the analog integrated circuit for the new plasma wave receiver

*Takahiro Zushi[1], Hirotsugu Kojima[2] (1.National Institute of Technology, Nara College, 2.Kyoto University)

[PCG24-16] Development of Geant4 application for particle detector design

*PARK INCHUN[1], Yoshizumi Miyoshi[1], Takefumi Mitani[2], Takane Hori[1], Mariko Teramoto[4], Satoshi Kurita[1], Satoshi Kasahara[3], Nana Higashio[5], Fajardo Taipia Isai[4], Keiichi Okuyama[4] (1.Nagoya University Institute for Space-Earth Environmental Research, 2.Japan Aerospace Exploration Agency, Institute of Space and Astronautical Science, 3.The University of Tokyo, 4.Kyushu Institute of Technology, 5.Japan Aerospace Exploration Agency)

[PCG24-17] Development of a miniature Ion-trap Fourier-transform mass spectrometer for future space missions

*Oya Kawashima[1], Satoshi Kasahara[1], Yoshifumi Saito[2], Shoichiro Yokota[4], Masafumi Hirahara[3], Seiji Sugita[1] (1.The university of tokyo, 2.ISAS/JAXA, 3.Nagoya university, 4.Osaka University)

[PCG24-18] Signal and Noise Separation from Satellite Magnetic Field Data Using Independent Component Analysis: Prospect of Magnetic Measurements without Mast and Noise Source Information

*Shun Imajo[1], Masahito Nose[1], Mari Aida[2], Haruhisa Matsumoto[2], Nana Higashio[2], Terumasa Tokunaga[4], Ayako Matsuoka[3] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.Japan Aerospace eXploration Agency, 3.Kyushu Institute of Technology, 4.Institute of Space and Astronautical Science)

[E] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

[P-CG25] Planetary Magnetosphere, Ionosphere, and Atmosphere

convener:Kanako Seki(Graduate School of Science, University of Tokyo), Takeshi Imamura(Graduate School of Frontier Sciences, The University of Tokyo), Hiroyuki Maezawa(Department of Physical Science Osaka Prefecture University), Naoki Terada(Graduate School of Science, Tohoku University)

[PCG25-01] Seasonal variation of Mercury's exosphere deduced from the analysis MESSENGER data

*Yudai Suzuki[1], Kazuo Yoshioka[1], Go Murakami[2], Ichiro Yoshikawa[1] (1.University of Tokyo, 2.ISAS/JAXA)

[PCG25-03] Study of ion loss mechanisms from ancient Mars with a focus on effects of the global intrinsic magnetic field

*Ryoya Sakata[1], Kanako Seki[1], Shotaro Sakai[1], Naoki Terada[2], Hiroyuki Shinagawa[3], Takashi Tanaka[4] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 2.Department of Geophysics, Graduate School of Science, Tohoku University, 3.National Institute of Information and Communications Technology, 4.International Center for Space Weather Science and Education, Kyushu University)

[PCG25-04] Sensitivity of the difference of cumulus convection schemes to the precipitation distributions simulated in a Paleo Mars GCM

*Takeshi Kuroda[1], Katsushige Toriumi[1], Arihiro Kamada[1], Naoki Terada[1], Yasumasa Kasaba[1,2], Isao Murata[1,3], Hiromu Nakagawa[1] (1.Department of Geophysics, Tohoku University, 2.Planetary Plasma and Atmospheric Research Center, Tohoku University, 3.Graduate School of Environmental Studies, Tohoku University)

[PCG25-05] Zonal wind acceleration in the Martian mesosphere during the global dust storm 2018 observed by IR heterodyne spectroscopy

*Akiho Miyamoto[1], Hiromu Nakagawa[1], Takeshi Kuroda[1], Kosuke Takami[1], Isao Murata[1], Nao Yoshida[1], Katsushige Toriumi[1], Shohei Aoki[2], Hideo Sagawa[3], Nicholas McCord Schneider[4], Sonal Jain[4], Yasumasa Kasaba[1], Naoki Terada[1] (1.Major in Geophysics , Graduate School of Science in Tohoku University, 2.Royal Belgian Institute for Space Aeronomy (IASB-BIRA), 3.Kyoto Sangyo University, 4.Laboratory for Atmospheric and Space Physics, Boulder, CO)

[PCG25-06] Study of proton escape from Mars based on MAVEN observations

*Yuki Mori[1], Kanako Seki[1], Shotaro Sakai[1], Takuya Hara[2], David A Brain[3], James P McFadden[2], Jasper S Halekas[4], Gina A DiBraccio[5], Frank G Eparvier[3], Bruce M Jakosky[3] (1.Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo, Tokyo, Japan, 2.Space Sciences Laboratory, University of California, Berkeley, CA, USA, 3.Laboratory for Atmospheric and Space Physics, University of Colorado Boulder, Boulder, CO, USA, 4.Department of Physics and Astronomy, University of Iowa, Iowa City, IA, USA, 5.NASA Goddard Space Flight Center, Greenbelt, MD, USA)

[E] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

[P-CG25] Planetary Magnetosphere, Ionosphere, and Atmosphere

convener:Kanako Seki(Graduate School of Science, University of Tokyo), Takeshi Imamura(Graduate School of Frontier Sciences, The University of Tokyo), Hiroyuki Maezawa(Department of Physical Science Osaka Prefecture University), Naoki Terada(Graduate School of Science, Tohoku University)

[PCG25-07] Study of Molecular Ion Contribution to the Polar Plume from Mars Based on MAVEN Observations

*Sakakura Kotaro[1], Kanako Seki[1], Shotaro Sakai[1], David A Brain[2], James P McFadden[3], James S Halekas[4], Gina A Dibraccio[5], Bruce M Jakosky[2] (1.Department of Earth and Planetary Science, Graduate School of Science, The university of Tokyo, 2.Laboratory for Atmospheric and Space Physics, University of Colorado Boulder, Boulder, Colorado, USA., 3.Space Sciences Laboratory, University of California, Berkeley, California, USA., 4.Department of Physics and Astronomy, University of Iowa, Iowa City, Iowa, USA., 5.Solar System Exploration Division, NASA Goddard Space Flight Center, Greenbelt, MD, USA.)

[PCG25-08] Study of the plasma distribution along a field line between Jupiter and Io related to the auroral electron acceleration process

*Koseki Saito[1], Yuto Katoh[1], Atsushi Kumamoto[1], Tomoki Kimura[1], Yohei Kawazura[1] (1.Department of Geophysics, Graduate School of Science, Tohoku University)

[PCG25-09] Characteristics of Jovian polar atmosphere derived from multispectral and polarimetric observations

*Shuntaro Yokota[1], Mitsuteru Sato[1], Yukihiro Takahashi[1], Seiko Takagi[1], Tatsuharu Ono[1], Yuuki Sato[1], Haruki Sugiyama[1] (1.Department of Cosmosciences, Graduate School of Science, Hokkaido University)

[PCG25-10] Numerical simulations of electron elastic collisions with neutral H_2O originated from Enceladus

*Hiroyasu Tadokoro[1], Yuto Katoh[2] (1.Musashino University, 2.Tohoku University)

[PCG25-11] High-contrast imaging of planetary and satellite atmospheres by the 1.8 m off-axis PLANETS telescope

*Takeshi Sakanoi[1], Masato Kagitani[1], Masahiro Hirahara[2], Mikio Kurita[3], Toshihisa Suzuki[1], Yasumasa Kasaba[1], Takahiro Obara[1], Shoichi Okano[1], Kuhn Jeff[4], Svetlana Berdyugina[5], Emilio Marcelo[6] (1.Planetary Plasma and Atmospheric Research Center, Graduate School of Science, Tohoku University, 2.Graduate School of Environmental Studies, Nagoya University, 3.Graduate School of Science, Kyoto University, 4.Institute for Astronomy, University of Hawaii, USA, 5.Kiepenheuer Institute for Solar Physics, Germany, 6.Universidade Estadual de Ponta Grossa, Brazil)

[PCG25-12] Development of Generic Plasma Irradiation System for Modeling of Space Weathering at Solar System Bodies

*Tomoki Kimura[1], Yusuke Nakauchi[4], Jun Kimura[2], Go Murakami[4], Naoki Terada[3], Hideyuki Usui[6], Masaki N Nishino[4], Shoichiro Yokota[2], Yohei Miyake[6], Kazuo Yoshioka[5] (1.Frontier Research Institute for Interdisciplinary Sciences, Tohoku University, 2.Graduate School of Science, Osaka University, 3.Graduate school of science, Tohoku University, 4.JAXA/ISAS, 5.Department of Complexity Science and Engineering, Tokyo University, 6.Kobe University)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

[A-AS01] High performance computing for next generation weather, climate, and environmental sciences

convener:Hiromu Seko(Meteorological Research Institute), Takemasa Miyoshi(RIKEN), Chihiro Kodama(Japan Agency for Marine-Earth Science and Technology), Masayuki Takigawa(Japan Agency for Marine-Earth Science and Technology)

[AAS01-01] Big Data Assimilation: Real-time Workflow for 30-second-update Forecasting and Perspectives toward DA-AI Integration

*Takemasa Miyoshi[1], Takumi Honda[1], Shigenori Otsuka[1], Arata Amemiya[1], Yasumitsu Maejima[1], Yoshihiro Ishikawa[2], Hiromu Seko[2], Yoshito Yoshizaki[2], Naonori Ueda[1], Hirofumi Tomita[1], Yutaka Ishikawa[1], Shinsuke Satoh[3], Tomoo Ushio[4], Kana Koike[5], Yasuhiko Nakada[6] (1.RIKEN, 2.Japan Meteorological Agency, 3.National Institute of Information and Communications Technology, 4.Osaka University, 5.MTI Ltd., 6.Tokyo Electric Power Company Holdings)

[AAS01-02] Evaluating the impact of precipitation radar observations from a geostationary satellite on typhoon forecasts

★Invited Papers

*James David Taylor[1], Atsushi Okazaki[3], Moeka Yamaji[2], Takuji Kubota[2], riko Oki[2], Takemasa Miyoshi[1] (1.RIKEN Center for Computational Science, 2.Earth Observatory Research Center, 3.Pennsylvania State University)

[AAS01-03] Formation Process of a Tornado that Formed in a Quasi Linear Convective System Over Kanto Plain, Japan

*Eigo Tochimoto[1], Hiroshi Niino[1] (1.Atmosphere and Ocean Research Institute, The University of Tokyo)

[AAS01-04] **Exploring the potential of assimilating lightning flash observations with an ensemble Kalman filter**

*Takumi Honda[1], Yousuke Sato[2], Takemasa Miyoshi[1] (1.RIKEN, 2.Hokkaido University)

[AAS01-05] Impacts of vessel GNSS data on the heavy rainfall forecasts obtained by JMA's mesoscale data assimilation system (NAPEX)

*Hiromu Seko[1], Yoshinori Shoji[1], Daisuke Hotta[1], Ko Koizumi[2], Yasutaka Ikuta[2] (1.Meteorological Research Institute, 2.Japan Meteorological Agency)

[AAS01-06] Accounting for the horizontal observation error correlation of satellite radiances in ensemble Kalman filter

*Koji Terasaki[1], Takemasa Miyoshi[1] (1.RIKEN Center for Computational Science)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

[A-AS01] High performance computing for next generation weather, climate, and environmental sciences

convener:Hiromu Seko(Meteorological Research Institute), Takemasa Miyoshi(RIKEN), Chihiro Kodama(Japan Agency for Marine-Earth Science and Technology), Masayuki Takigawa(Japan Agency for Marine-Earth Science and Technology)

[AAS01-07] Projected future changes in tropical cyclone genesis and its seed frequencies by using HighResMIP multi model ensemble simulation

*Yohei Yamada[1], Chihiro Kodama[1], Masaki Satoh[2,1], Masato Sugi[3], Malcolm J Roberts[4], Ryo Mizuta[3], Akira T Noda[1], Tomoe Nasuno[1], Masuo Nakano[1], Pier-Luigi Vidale[5] (1.Japan Agency for Marine-Earth Science and Technology, 2.Atmosphere and Ocean Research Institute, The University of Tokyo, 3.Meteorological Research Institute, Japan Meteorological Agency, 4.UK MetOffice, 5.University of Reading)

[AAS01-08] 100-member ensemble forecast by NICAM to examine forecast bust case Typhoon Krosa (2019)

*Masuo Nakano[1], Ying-Wen Chen[2], Masaki Satoh[2] (1.JAMSTEC Japan Agency for Marine-Earth Science and Technology, 2.AORI / The University of Tokyo)

[AAS01-09] From K to Fugaku: activities toward extended-range prediction using NICAM/NICOCO

*Tomoki Miyakawa[1] (1.Atmosphere and Ocean Research Institute University of Tokyo)

[AAS01-10] Toward an integrated NWP-DA-AI system for precipitation prediction

*Shigenori Otsuka[1], Yasumitsu Maejima[1], Pierre Tandeo[2], Takemasa Miyoshi[1] (1.RIKEN Center for Computational Science, 2.IMT Atlantique)

[AAS01-11] **Parameterization of Subgrid Momentum Transport Using a Global Cloud Resolving Model and AI**

★Invited Papers

*Haruna Tone[1], Masaki Satoh[2], Junshi Ito[2] (1.School of Science, The University of Tokyo, 2.Atmosphere and Ocean Research Institute, The University of Tokyo)

[AAS01-12] Precipitation Nowcasting Based on Convolutional Neural Networks

★Invited Papers

*Maha Mdini[1], Shigenori Otsuka[1], Takemasa Miyoshi[1] (1.RIKEN Center for Computational Science)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

[A-AS02] Abnormal weathers and disasters in urban environments in East Asia related to climate change

convener:Masaru Inatsu(Faculty of Science, Hokkaido University), Yukari Takayabu(Atmosphere and Ocean Research Institute, the University of Tokyo)

[AAS02-01] A Statistical study of large-scale environment associated with extreme precipitation using AMeDAS and JRA55/ERA5 data

*Ryosuke Shibuya[1], Yukari Takayabu[1], Chie Yokoyama[1], Hiroki Tsuji[1], Hirotaka Kamahori[1] (1.Atmosphere and Ocean Research Institute, The University of Tokyo)

[AAS02-02] Future Projections of Precipitation Characteristics around Japan in Early Summer Combining GPM DPR and CMIP5 Data: Analysis of multi-model variations

[AAS07-27] Development of a Novel Particle Mass Spectrometer for Online Measurements of Refractory Sulfate Aerosols

*Yuya Kobayashi[1], Yu Ide[1], Nobuyuki Takegawa[1] (1.Graduate School of Science, Tokyo Metropolitan University)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

[A-AS08] Stratosphere-troposphere interaction

convener:Takatoshi Sakazaki(Graduate School of Science, Kyoto University), Takenari Kinoshita(Japan Agency for Marine-Earth Science and Technology), Pu Lin(Princeton University/NOAA Geophysical Fluid Dynamics Laboratory), Peter Hitchcock(Cornell University)

[AAS08-01] Influences on the timing of Sudden Stratospheric Warmings

★Invited Papers

*Lesley J Gray[1], Matt Brown[1], Jeff Knight[2] (1.University of Oxford, 2.Met Office)

[AAS08-02] Hindcast Experiment of the 2009 Sudden Stratospheric Warming and Following Elevated Stratopause Event by Using a High-Top Gravity Wave Resolving Model

★Invited Papers

*Shunsuke Noguchi[1], Shingo Watanabe[1], Dai Koshin[2], Kaoru Sato[2] (1.Japan Agency for Marine-Earth Science and Technology, 2.The University of Tokyo)

[AAS08-03] **Seasonal Prediction Skill of Northern Extratropical Surface Temperature Driven by the Stratosphere**

*Liwei Jia[1,2], Xiaosong Yang[1,2], Gabriel Vecchi[3], Richard Gudgel, Thomas Delworth[1], Stephan Fueglistaler[3], Pu Lin[3], Adam Scaife[4], Seth Underwood[1], Shian-Jiann Lin (1.NOAA Geophysical Fluid Dynamics Laboratory, 2.University Corporation for Atmospheric Research, 3.Princeton University, 4.Met Office Hadley Centre)

[AAS08-04] Persisted negative Antarctic oscillations after sudden stratospheric warming in the Southern Hemisphere in 2019

*Chiaki Kobayashi[1], Shuhei Maeda[1] (1.Meteorological Research Institute)

[AAS08-05] Probabilistic skill in seasonal forecasts of stratospheric extreme events

*Peter Hitchcock[1], Daniela Domeisen[2], Mikhail Dobrynin[3], Johanna Baehr[4] (1.Department of Earth and Atmospheric Sciences, Cornell University, Ithaca, NY, USA, 2.Institute for Atmospheric and Climate Science, ETH Zürich, Switzerland, 3.Deutscher Wetterdienst (DWD), Hamburg, Germany, 4.Institute of Oceanography, Center for Earth System Research and Sustainability (CEN), University of Hamburg, Germany)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

[A-AS08] Stratosphere-troposphere interaction

convener:Takatoshi Sakazaki(Graduate School of Science, Kyoto University), Takenari Kinoshita(Japan Agency for Marine-Earth Science and Technology), Pu Lin(Princeton University/NOAA Geophysical Fluid Dynamics Laboratory), Peter Hitchcock(Cornell University)

[AAS08-06] Investigating the missing gravity wave drag in the Southern Hemisphere via satellite observations

★Invited Papers

*Laura Angelina Holt[1], M Joan Alexander[1], Colby M Brabec[1] (1.NorthWest Research Associates)

[AAS08-07] Gravity waves parameterized by a transient gravity-wave model coupled with convective sources: Wave intermittency

★Invited Papers

*Young-Ha Kim[1], Gergely Bölöni[1], Sebastian Borchert[2], Hye-Yeong Chun[3], Ulrich Achatz[1] (1.Goethe-Univ. Frankfurt, Germany, 2.DWD, Germany, 3.Yonsei Univ., Korea)

[AAS08-08] Formation of the double stratopauses and elevated stratopause associated with the major stratospheric sudden warming in 2018/19

*Haruka Okui[1], Kaoru Sato[1], Dai Koshin[1], Shingo Watanabe[2] (1. Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo , 2.Japan Agency for Marine-Earth Science and Technology)

[AAS08-09] **A tropospheric pathway of the stratospheric QBO impact on the boreal winter polar vortex**

*Koji Yamazaki[1], Tetsu Nakamura[1], Jinro Ukita[2], Kazuhira Hoshi[2] (1.Hokkaido University, 2.Niigata University)

[AAS08-10] Do sudden stratospheric warmings boost convective activity in the tropics?

*Kohei Yoshida[1] (1.Meteorological Research Institute)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

[A-AS08] Stratosphere-troposphere interaction

convener:Takatoshi Sakazaki(Graduate School of Science, Kyoto University), Takenari Kinoshita(Japan Agency for Marine-Earth Science and Technology), Pu Lin(Princeton University/NOAA Geophysical Fluid Dynamics Laboratory), Peter Hitchcock(Cornell University)

[AAS08-11] The Coupling between the Troposphere and Stratosphere at Middle and High Latitudes

★Invited Papers

*Wenshou Tian[1], Jinlong Huang[1], Ruhua Zhang[1], Jiankai Zhang[1], Shiyan Zhang[1] (1. College of Atmospheric Sciences, Lanzhou University,China)

[AAS08-12] A pause in Southern Hemisphere circulation trends due to the Montreal Protocol

★Invited Papers

*Antara Banerjee[1,2], John C. Fyfe[3], Lorenzo M. Polvani[4], Darryn Waugh[5,6], Kai-Lan Chang[1,2] (1.Cooperative Institute for Research in Environmental Sciences, University of Colorado Boulder, Boulder, USA, 2.Chemical Sciences Division, National Oceanic and Atmospheric Administration/Earth System Research Laboratory, Boulder, Colorado, USA, 3.Canadian Centre for Climate Modelling and Analysis, Environment and Climate Change Canada, Victoria, British Columbia, Canada, 4.Department of Applied Physics and Applied Mathematics, Columbia University, New York, NY, USA, 5.Department of Earth and Planetary Sciences, The John Hopkins University, Baltimore, Maryland, USA., 6.School of Mathematics and Statistics, University of New South Wales, Sydney, New South Wales, Australia)

[AAS08-13] Multi-year analysis using the data assimilation system in the middle atmosphere

*Dai Koshin[1], Kaoru Sato[1], Masashi Kohma[1], Shingo Watanabe[2], Kazuyuki Miyazaki[3] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 2.Japan Agency for Marine-Earth Science and Technology, 3.National Aeronautics and Space Administration, Jet Propulsion Laboratory)

[AAS08-14] The response of extreme variability in the Arctic stratosphere to 4xCO_2 concentrations in CMIP6 models

*Blanca Ayarzaguena[1], Andrew J. Charlton-Perez[2], Amy H Butler[3], Peter Hitchcock[4], Isla R. Simpson[5], Lorenzo Polvani[6], Neal Butchart[7], Edwin Gerber[8], Lesley Gray[9], Birgit Hassler[10], Pu Lin[11], François Lott[12], Elisa Manzini[13], Ryo Mizuta[14], Clara Orbe[15], Scott Osprey[9], David Saint-Martin[16], Michael Sigmond[17], Masakazu Taguchi[18], Evgeny Volodin[19], Singo Watanabe[20] (1.Departamento de Física de la Tierra y Astrofísica, Universidad Complutense de Madrid, Spain, 2.Department of Meteorology, University of Reading, UK, 3.Cooperative Institute for Environmental Sciences (CIRES)/National Oceanic and Atmospheric Administration (NOAA) Chemical Sciences Division, USA, 4.Department of Earth and Atmospheric Sciences, Cornell University, USA, 5.Climate and Global Dynamics Laboratory, National Center for Atmospheric Research, USA, 6.Columbia University, USA, 7.Met Office Hadley Centre, UK, 8.Courant Institute of Mathematical Sciences, New York University, USA, 9.NCAS-Climate, Department of Physics, University of Oxford, UK, 10.Deutsches Zentrum für Luft-und Raumfahrt (DLR), Oberpfaffenhofen, Germany, 11.Atmospheric and Oceanic Sciences Program, NOAA, USA,, 12.Laboratoire de Météorologie Dynamique, Ecole Normale Supérieure, France, 13.Max-Planck-Institut für Meteorologie, Germany, 14.Meteorological Research Institute, Japan, 15.NASA Goddard Institute for Space Studies, USA, 16.Centre National de Recherches Météorologiques (CNRM), Université de Toulouse, Météo-France, CNRS, Toulouse, France, 17.Canadian Centre for Climate Modelling and Analysis Environment and Climate Change, Canada, 18.Department of Earth Science, Aichi University of Education, Kariya, Japan, 19.Marchuk Institute of Numerical Mathematics, Russia, 20.Japan Agency for Marine-Earth Science and Technology (JAMSTEC), Japan)

[AAS08-15] UTLS aerosol measurements over Japan within eastward shedding vortices coming from the Asian summer monsoon anticyclone

*Masatomo Fujiwara[1], Tetsu Sakai[2], Koichi Shiraishi[3], Masahiko Hayashi[3], Noriyuki Nishi[3], Shin-Ya Ogino[4], Prabir Patra[4], Taku Umezawa[5], Yoichi Inai[6], Masato Shiotani[7], Nawo Eguchi[8], Takashi Shibata[9], Sergey Khaykin[10], Laura L. Pan[11] (1.Faculty of Environmental Earth Science, Hokkaido University, 2.Meteorological Research Institute, JMA , 3.Faculty of Science, Fukuoka University, 4.JAMSTEC, 5.NIES, 6.Tohoku University, 7.RISH, Kyoto University, 8.Kyushu University, 9.Nagoya University, 10.LATMOS/IPSL, UVSQ, Sorbonne Universites, CNRS, 11.NCAR)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

[A-AS09] Cloud-Resolving Model Simulations for Climate and Weather Studies

convener:Toshihisa Matsui(NASA Goddard Space Flight Center), Masaki Satoh(Atmosphere and Ocean Research Institute, The University of Tokyo), Wei-Kuo Tao(NASA Goddard Space Flight Center)

[AAS09-02] Importance of the cloud-altitude change to the high-cloud response to sea surface temperatures

*Tomoki Ohno[1], Akira T. Noda[1], Masaki Satoh[2,1] (1.Japan Agency for Marine-Earth Science and Technology, 2. Atmosphere and Ocean Research Institute, The University of Tokyo)

[AAS09-03] Climate effects of aerosol-cloud interaction investigated by a global cloud-resolving model.

*Hotta Haruka[1], Kentaroh Suzuki[1] (1.Atmosphere and Ocean Research Institute, Tokyo University)

[AAS09-04] **An intercomparison of tropical clouds using global storm resolving simulations over the Atlantic**

*Woosub Roh[1], Masaki Satoh[1], Cathy Hohenegger[2] (1.AORI, the university of Tokyo, 2.the Max Planck Institute for Meteorology)

[AAS09-05] Improvements in super-cooled liquid water simulations of low-level mixed-phase clouds over the Southern Ocean using a single-column box model

*Tatsuya Seiki[1], Woosub Roh[2] (1.Japan Agency for Marine-Earth Science and Technology, 2.The University of Tokyo)

[AAS09-06] **How well can the Multiscale Modeling Framework (MMF) simulate MCS-associated precipitation over the Central United States?**

*Guangxing Lin[1], Jiwen Fan[1], Zhe Feng[1] (1.Pacific Northwest National Laboratory)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

[A-AS09] Cloud-Resolving Model Simulations for Climate and Weather Studies

convener:Toshihisa Matsui(NASA Goddard Space Flight Center), Masaki Satoh(Atmosphere and Ocean Research Institute, The University of Tokyo), Wei-Kuo Tao(NASA Goddard Space Flight Center)

[AAS09-07] Numerical study of the lightning frequency in tropical cyclone using a metrological model coupled with a lightning component

*Yousuke Sato[1,2], Yoshiaki Miyamoto[3,2], Hirofumi Tomita[2] (1.Faculty of Science, Department of Earth and Planetary Sciences, Hokkaido University, 2.RIKEN Center for Computational Science, 3.Faculty of Environment and Information Studies, Keio University)

[AAS09-09] Development and applications of the process-tracking scheme based on bulk microphysics to determine the properties of snow particles

*Akihiro Hashimoto[1], Hiroki Motoyoshi[2], Narihiro Orikasa[1], Ryohei Misumi[2], Masashi Niwano[1] (1.Meteorological Research Institute, 2.National Research Institute for Earth Science and Disaster Resilience)

[AAS09-10] Evaluation of microphysical schemes in a meteorological model for winter snowfall events in Hokkaido

*Makoto Kondo[1], Yousuke Sato[2], Masaru Inatsu[2], Yuuta Katsuyama[1] (1.Graduate School of Science, Hokkaido University, 2.Faculty of science, Hokkaido University)

[AAS09-11] Characterizing Convective Cells Using Cloud-Resolving Simulations

*Xiaowen Li[1], Wei-Kuo Tao[2] (1.Morgan State Univ., 2.NASA/GSFC)

[AAS09-12] **BiLateral Operational Storm-Scale Observation and Modeling: BLOSSOM**

*Toshihisa Matsui[1,4], David B. Wolff[5], Karen Mohr[1], Stephen E. Lang[1,3], Minghua Zhang[2] (1.NASA GSFC , 2.Stony Brook University, 3.SCIENCE SYSTEMS AND APPLICATIONS INC, 4.ESSIC UMD, 5.NASA WFF)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

[A-AS10] Land-Atmosphere interactions and precipitation variations over the Asian monsoon region.

convener:Hiroshi G. Takahashi(Department of Geography, Tokyo Metropolitan University), Hirokazu Endo(Meteorological Research Institute, Japan Meteorological Agency), Shiori Sugimoto(JAMSTEC Japan Agency for Marine-Earth Science and Technology), Hatsuki Fujinami(Nagoya University)

[AAS10-01] Impact of Eurasian Spring Snow Decrement on East Asian Summer Precipitation

*Ruonan Zhang[1], Renhe Zhang[1], Zhiyan Zuo[2] (1.Department of Atmospheric and Oceanic Sciences & Institute of Atmospheric Sciences, Fudan University, Shanghai, China, 2.State Key Laboratory of Severe Weather and Institute of Climate System, Chinese Academy of Meteorological Sciences, Beijing, China)

[AAS10-02] Warm-Season Convection Initiation in South China

*Lanqiang Bai[1], Guixing Chen[1], Ling Huang[2] (1.Sun Yat-sen University, 2.ITMM, CMA)

[AAS10-03] The observed properties of summer convective clouds and precipitation over the central Tibetan Plateau

*Yi Chang[1,2], Xueliang Guo[3], Jie Tang[2,4], Guangxian Lu[1,2], Peng Qi[2,5] (1.State Key Laboratory of Severe Weather (LASW), Chinese Academy of Meteorological Sciences, Beijing, China, 2.Key Laboratory for Cloud Physics, China Meteorological Administration, Beijing, China, 3.Institute of Atmospheric Physics, Chinese Academy of Sciences, Beijing, 4.Collaborative Innovation Center for Meteorological Disasters Forecast, Early Warning and Assessment, Nanjing University of Information Science and Technology, Nanjing, China, 5.University of Chinese Academy of Sciences, Beijing)

[AAS10-04] **Impact of urban induced land-use change over eastern and southern Indian cities**

*JAGABANDHU PANDA [1], Sudhansu Sekhar Rath[1] (1.National Institute of Technology Rourkela)

[AAS10-05] **A new light on the long-term trends of extreme rainfall characteristics over Central India**

*Anu Gupta[1], Hiroshi G. Takahashi[1] (1.Tokyo Metropolitan University, Tokyo)

[AAS10-06] Future changes in East Asian summer monsoon precipitation and their uncertainty in 60km-mesh MRI-AGCM ensemble simulations

*Hirokazu Endo[1], Akio Kitoh[2,1], Ryo Mizuta[1], Tomoaki Ose[1] (1.Meteorological Research Institute, Japan Meteorological Agency, 2.Japan Meteorological Business Support Center)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

[A-AS11] Aerosol impacts on air quality, climate system, and our society

convener:Teppei J Yasunari(Arctic Research Center, Hokkaido University), Kyu-Myong Kim(NASA Goddard Space Flight Center), Hongbin Yu(NASA Goddard Space Flight Center), Toshihiko Takemura(Research Institute for Applied Mechanics, Kyushu University)

[AAS11-03] **Observational study on the response of aerosol optical depth over Japan to springtime transboundary air pollution in 2011-2019**

*YING CAI[1] (1.chiba university)

[AAS11-04] Organic functional group composition of particulate matter from fresh and aged biomass burning and coal combustion emissions

*Amir Yazdani[1], Nikunj Dudani[1], Satoshi Takahama[1], Amelie Bertrand[2], André S. H. Prévôt[2], Imad El Haddad[2], Ann M. Dillner[3] (1.ENAC/IIE Swiss Federal Institute of Technology Lausanne (EPFL), Lausanne, Switzerland, 2.Laboratory of Atmospheric Chemistry, Paul Scherrer Institute, Villigen, Switzerland, 3.Air Quality Research Center, University of California Davis, Davis, California, USA)

[AAS11-05] **Fog Droplet Size Distribution** and the Interaction between **Fog Droplets** and **Fine Particles** During Dense Fog in *Tianjin, China*

*Qing Liu[1,2,4], Bingui Wu[2,3], Zhaoyu Wang [1,2] (1.Tianjin Weather Modification Office, China, 2. Tianjin Key Labarotory of Marine Meteorology, China, 3.Tianjin Meteorology Bureau, China, 4.Key Laboratory for Cloud Physics of China Meteorological Administration, Beijing, China)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

[A-AS11] Aerosol impacts on air quality, climate system, and our society

convener:Teppei J Yasunari(Arctic Research Center, Hokkaido University), Kyu-Myong Kim(NASA Goddard Space Flight Center), Hongbin Yu(NASA Goddard Space Flight Center), Toshihiko Takemura(Research Institute for Applied Mechanics, Kyushu University)

[AAS11-06] Challenges in constraining cloud and precipitation susceptibilities to aerosols: Satellite observations and global climate models

★Invited Papers

*Takuro Michibata[1], Kentaroh Suzuki[2], Toshihiko Takemura[1] (1.Research Institute for Applied Mechanics, Kyushu University, 2.Atmosphere and Ocean Research Institute, The University of Tokyo)

[AAS11-07] Effective Radiative Forcing Estimates of Anthropogenic Aerosols in MRI-ESM2

*Naga Oshima[1], Seiji Yukimoto[1], Makoto Deushi[1], Tsuyoshi Koshiro[1], Hideaki Kawai[1], Taichu Y Tanaka[1], Kohei Yoshida[1] (1.Meteorological Research Institute)

[AAS11-08] **Satellite and model perspectives of dust transport and deposition across tropical Atlantic Ocean and North Pacific Ocean in recent decades**

*Hongbin Yu[1], Qian Tan[2,3], Yingxi Shi[4,1], Huisheng Bian[1,4], Zhibo Zhang[4], Qianqian Song[4], Dongchul Kim[1,5], Mian Chin[1], Lorraine Remer[4] (1.NASA Goddard Space Flight Center, 2.Bay Area Environmental Research Center, 3.NASA Ames Research Center, 4.University of Maryland Baltimore County, 5.Universities Space Research Association)

[AAS11-09] Dependency of surface air temperature change by sulfate aerosols on CO_2 concentration

*Toshihiko Takemura[1] (1.Research Institute for Applied Mechanics, Kyushu University)

[AAS11-10] Quantifying the Impact of Missing Aerosol Sources on Long Range Transport and Extreme Events using Satellites and Models

*Jason Blake Cohen[1] (1.School of Atmospheric Sciences, Sun Yat-Sen University)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

[A-AS11] Aerosol impacts on air quality, climate system, and our society

convener:Teppei J Yasunari(Arctic Research Center, Hokkaido University), Kyu-Myong Kim(NASA Goddard Space Flight Center), Hongbin Yu(NASA Goddard Space Flight Center), Toshihiko Takemura(Research Institute for Applied Mechanics, Kyushu University)

[AAS11-11] **Impacts of increased Siberian wildfire on air quality, climate, and economy, assessed with MIROC/SPRINTARS sensitivity experiments**

*Teppei J Yasunari[1,2,3], Shigeto Wakabayashi[4], Toshihiko Takemura[5], Daiju Narita[6] (1.Arctic Research Center, Hokkaido University, 2.Global Station for Arctic Research, GI-CoRE, Hokkaido University, 3.Center for Natural Hazards Research, Hokkaido University, 4.School of Engineering, Hokkaido University, 5.Research Institute for Applied Mechanics, Kyushu University, 6.Graduate School of Arts and Sciences, The University of Tokyo)

[AAS11-12] Linking Climate Modeling to Economic Assessment of Climate Change: Analysis of MIROC-SPRINTARS AOGCM Experiments on Siberian Wildfires

★Invited Papers

*Daiju Narita[1], Teppei J Yasunari[2], Toshihiko Takemura[3] (1.University of Tokyo, 2.Hokkaido University, 3.Kyushu University)

[AAS11-14] Towards a globally harmonized air quality forecasting: GAFIS, a new WMO-GAW initiative

*Taichu Y Tanaka[1], Johannes Flemming[2], Alexander Baklanov[3], Greg Carmichael[5], James H. Crawford[6], Vincent-Henri Peuch[2], Guy Brasseur[7], Ranjeet Sokji[8], Sean Khan[9], Slobodan Nickovic[10], Xiao-ye Zhang[11,10], Christopher Gan[12], Kobus Pienaar[13], Nathalie Laure Roebbel[4], Radenko Pavlovic[14], Markus Amann[15], Robert Pinder[16], Giulia Ruggeri[4], Sophie Pauline Gumy[4] (1.Meteorological Research Institute, Japan Meteorological Agency, 2.ECMWF, 3.WMO, 4.WHO, 5.Univ. Iowa, 6.NASA, 7.MPI-MET, 8.Univ. Hertfordshire, 9.UNEP, 10.SDS-WAS, 11.CMA, 12.NEA, 13.North-West Univ, 14.ECCC, 15.IIASA, 16.EPA)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

[A-AS13] New particle formation and its impacts on atmospheric chemistry

convener:Jun Zheng(Nanjing University of Information Science and Technology), Lin Wang(Fudan University)

[AAS13-01] New particle formation in the polluted atmosphere of the North China Plain

★Invited Papers

*Hu Min[1], Dongjie Shang[1], Xin Fang[1], Song Guo[1], Zhijun Wu[1], Limin Zeng[1], Sihua Lu[1], Shiyi Chen[1], Keding Lu[1], Yuanhang Zhang[1] (1. State Key Joint Laboratory of Environmental Simulation and Pollution Control, College of Environmental Sciences and Engineering, Peking University)

[AAS13-02] **New particle formation and growth in the urban atmospheric environment**

★Invited Papers

*Jingkun Jiang[1] (1.Tsinghua University)

[AAS13-03] The role of NOx in the formation of highly oxygenated organic molecules and new particles

★Invited Papers

*Wei Nie[1], Chao Yan[2], Pontus Roldin[3], Mikael Ehn[2], Aijun Ding[1] (1.Joint International Research Laboratory of Atmospheric and Earth System Sciences, School of Atmospheric Sciences, Nanjing University, 2.Institute for Atmospheric and Earth System Research/Physics, Faculty of Science, University of Helsinki, 3.Division of Nuclear Physics, Department of Physics, Lund University)

[AAS13-05] How does NOx affect new particle formation from biogenic vapors

*Chao Yan[1] (1.University of Helsinki)

[AAS13-06] Theoretical investigation of heterogeneous oxidation of sulfuric dioxide on mineral dusts and its implication on atmospheric new particle formation

*Jun Zhao[1], Kunpeng Chen[1] (1.Sun Yat-Sen University)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

[A-AS14] Extreme Events: Observations and Modeling

convener:Sridhara Nayak(Disaster Prevention Research Institute, Kyoto University), JAGABANDHU PANDA(National Institute of Technology Rourkela)

[AAS14-01] Changes in “hotter and wetter” events across China

*Hanqing Deng[1] (1.Anhui climate center)

[AAS14-02] Modulations of European and North American weather variability and extremes by interdecadal variability of the atmospheric circulation over the North Atlantic

★Invited Papers

*Hisashi Nakamura[1], Patrick Martineau[1], Yu Kosaka[1], Bunmei Taguchi[2], Masato Mori[1] (1.Research Center for Advanced Science and Technology, University of Tokyo, 2.Faculty of Sustainable Design, University of Toyama, Toyama)

[AAS14-04] Role of midlatitude SSTs on Extreme Precipitation Events

★Invited Papers

*Satoshi Iizuka[1], ATSUYOSHI MANDA[2] (1.National Research Institute for Earth Science and Disaster Resilience, 2.Mie University Graduate School and Faculty of Biosciences)

[AAS14-05] An overall investigation of changing nature of tropical storms in the North West Pacific basin

*Ravi Shankar Pandey[1], Yuei-An Liou[1] (1.National Central University)

[AAS14-06] Variability of Monsoon Onset in India and Different Modes of Climate Variation (1951-2017)

*Atul Saini[1], Netrananda Sahu[1,2] (1.Department of Geography, University of Delhi, 2.Disaster Prevention Research Institiute, Kyoto University)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

[A-AS14] Extreme Events: Observations and Modeling

convener:Sridhara Nayak(Disaster Prevention Research Institute, Kyoto University), JAGABANDHU PANDA(National Institute of Technology Rourkela)

[AAS14-07] **Contribution of global warming and atmospheric circulation to the hottest spring in Eastern China in 2018**

*Chunhui Lu[1], Ying Sun[1], Nikolaos CHRISTIDIS[2], Peter STOTT[2] (1.Beijing Climate Center, China Meteorological Administration, 2.Met Office Hadley Centre, Met Office, UK)

[AAS14-08] **The Synoptically-Influenced Extreme Precipitation Systems over Asian-Australian Monsoon Region from TRMM PR Measurements**

*Wei-Ting Chen[1], Hong-Wen Jian[1], Peng-Ren Chen[1], Chien-Ming Wu[1], Kristen L. Rasmussen[2] (1.National Taiwan University, 2.Colorado State University)

[AAS14-09] Atmospheric Rivers in a Changing Climate: An Overview from the second phase of the Atmospheric River Tracking Method Intercomparison Project (ARTMIP)

*Ashley Elizabeth Payne[1], Christine Shields[2], Jonathan Rutz[3], L. Ruby Leung[4], Travis O'Brien[5], F. Martin Ralph[6], Michael Wehner[7] (1.Department of Climate and Space Sciences and Engineering, University of Michigan, Ann Arbor, MI, USA, 2.Climate and Global Dynamics Division, National Center for Atmospheric Research, Boulder, CO, USA, 3.Science and Technology Infusion Division, National Weather Service Western Region Headquarters, National Oceanic and Atmospheric Administration, Salt Lake City, UT, USA, 4.Earth Systems Analysis and Modeling, Pacific Northwest National Laboratory, Richland, WA, USA, 5.Earth and Atmospheric Sciences, Indiana University, Bloomington, Indiana, USA, 6.Center for Western Weather and Water Extremes, Scripps Institution of Oceanography at the University of California, San Diego, CA, USA, 7.Computational Research Division, Lawrence Berkeley National Laboratory, Berkeley, CA, USA)

[AAS14-10] An Understanding of the Physical Mechanism for the back-to-back Drought over India in last one Century

*RAJU PATHAK[1], Sandeep Sahany, Saroj Kanta Mishra (1.Centre for Atmospheric Science, Indian Institute of Technology Delhi)

[AAS14-11] Detection and Possible Interpretation of Tropospheric Dispersive Phase Associated with Heavy Rain Events

*Naufal Setiawan[1], Masato Furuya[1] (1.Space Geodesy Research Section, Department of Earth and Planetary Sciences, Hokkaido University, Japan)

[AAS14-12] **Numerical Simulations of Smoke Haze Transport over Southeast Asia by using WRF-Chem**

★Invited Papers

*Srikanth Madala[1], Tan Li[1], Santo V. Salinas [1], Jun Wang[2,3] (1.Centre for Remote Imaging Sensing and Processing, National University of Singapore, Singapore, 2.Center for Global and Regional Environmental Research, University of Iowa, Iowa City, Iowa, USA , 3.Department of Chemical and Biochemical Engineering, University of Iowa, Iowa City, Iowa, USA)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

[A-OS17] Climate variability and predictability on subseasonal to decadal timescales

convener:Takashi Mochizuki(Department of Earth and Planetary Sciences, Kyushu University), V Ramaswamy(NOAA GFDL), Yushi Morioka(Japan Agency for Marine-Earth Science and Technology)

[AOS17-01] The Role of AMOC in Atlantic Decadal Predictability

★Invited Papers

*Rong Zhang[1] (1.NOAA Geophysical Fluid Dynamics Laboratory)

[AOS17-02] Underestimated Decadal Predictability and the Existence of the Signal-to-noise Paradox in CMIP5 Models

*Wei Zhang[1], Ben Kirtman[1] (1.University of Miami)

[AOS17-03] An overview of seasonal to Decadal Predictions with MIROC6

*Takahito Kataoka[1], Hiroaki Tatebe[1], Hiroshi Koyama[1], Takashi Mochizuki[1,2], Koji Ogochi[1], Hiroaki Naoe[3], Yukiko Imada[3], Hideo Shiogama[4,5], Masahide Kimoto[5], Masahiro Watanabe[5] (1.JAMSTEC Japan Agency for Marine-Earth Science and Technology, 2.Kyusyu University, 3.Meteorological Research Institute, 4.National Institute for Environmental Studies, 5.The University of Tokyo)

[AOS17-04] Detected Climatic Change in Global Distribution of Tropical Cyclones

*Hiroyuki Murakami[1] (1.Geophysical Fluid Dynamics Laboratory/University Corporation for Atmospheric Research)

[AOS17-05] Thermodynamic coupled modes in the tropical atmosphere-ocean

*Faming Wang[1] (1.Chinese Academy of Sciences, Institute of Oceanology)

[AOS17-06] Could Gulf Stream and Kuroshio be synchronized?

★Invited Papers

*Tsubasa Kohyama[1], Yoko Yamagami[2], Hiroaki Miura[3], Shoichiro Kido[3], Hiroaki Tatebe[4], Masahiro Watanabe[2] (1.Department of Information Sciences, Ochanomizu University, 2.Atmosphere and Ocean Research Institute, The University of Tokyo, 3.Graduate School of Science, The University of Tokyo, 4.Japan Agency for Marine-Earth Science and Technology)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

[A-OS17] Climate variability and predictability on subseasonal to decadal timescales

convener:Takashi Mochizuki(Department of Earth and Planetary Sciences, Kyushu University), V Ramaswamy(NOAA GFDL), Yushi Morioka(Japan Agency for Marine-Earth Science and Technology)

[AOS17-07] Subseasonal Predictions at GFDL

★Invited Papers

*Baoqiang Xiang[1,2] (1.GFDL, 2.UCAR)

[AOS17-08] Does the tidal mixing affect the MJO in the Maritime Continent?

John D. Steffen[1], *Hyodae Seo[1] (1.Woods Hole Oceanographic Institution)

[AOS17-09] The Role of Pacific Subtropical High Belts in the ENSO Cycle

*Yafei Wang[1] (1.Chinese academy of meteorological sciences)

[AOS17-10] Seasonal-to-multiyear prediction of ENSO using machine deep learning technique

*Jing-Jia Luo[1], Fenghua Ling[1], Yoo-Geun Ham[2], Jeong-Hwan Kim[2] (1.ICAR Institute for Climate and Application Research, NUIST, 2.Chonnam National University,South Korea)

[AOS17-11] Predictability of the super IOD event in 2019 and its link with El Niño Modoki

*Takeshi Doi[1], Swadhin Behera[1], Toshio Yamagata[1,2] (1.JAMSTEC APL, 2.NUIST ICAR)

[AOS17-12] Impact of the boreal summer intraseasonal oscillation on typhoon tracks in the western North Pacific

★Invited Papers

*Masuo Nakano[1], Frederic Vitart[2], Kazuyoshi Kikuchi[3] (1.JAMSTEC Japan Agency for Marine-Earth Science and Technology, 2.ECMWF, 3.IPRC / University of Hawaii)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

[A-OS19] Marine ecosystems and biogeochemical cycles: theory, observation and modeling

convener:Takafumi Hirata(Arctic Research Center, Hokkaido University), Shin-ichi Ito(Atmosphere and Ocean Research Institute, The University of Tokyo), Enrique N Curchitser(Rutgers University New Brunswick), Eileen E Hofmann(Old Dominion University)

[AOS19-01] On three important ecological properties linking ocean changes to marine biodiversity and ecosystems impacts under a changing climate

★Invited Papers

*William Wai Lung Cheung[1], Tayler Clarke[1], Tyler D. Eddy[2], Gabriel Reygondeau[3] (1.Changing Ocean Research Unit, Institute for the Oceans and Fisheries, The University of British Columbia, 2.Fisheries and Marine Institute of Memorial University of Newfoundland, 3.Department of Ecology and Evolution Biology, Yale University)

[AOS19-02] Understanding the effects of dynamic interactions between changing ocean conditions and fishing effort on living marine resources

★Invited Papers

*Wing Yee Lam[1], Andrés Cisneros Montemayor[1], Colette C. C. Wabnitz[1], William Wai Lung Cheung[1] (1.Fisheries Economics Research Unit and Changing Ocean Research Unit, Institute for the Oceans and Fisheries, The University of British Columbia)

[AOS19-03] High resolution observations of a pelagic tunicate bloom in a warm water filament using a video plankton recorder: development, fate, and effect on biogeochemical cycles and planktonic food webs

★Invited Papers

*Kazutaka Takahashi[1] (1.The University of Tokyo)

[AOS19-04] **Large-scale study on patchy distribution of salps and doliolids in North Pacific Ocean: Patterns, Drivers and Impacts.**

*Nurul Huda Ahmad Ishak[1,2], Kentaro Motoki[1], Hiroomi Miyamoto[3], Kazutaka Takahashi[1] (1.University of Tokyo, 2.Universiti Malaysia Terengganu, 3.Tohoku National Fisheries Research Institute)

[AOS19-05] Conspecific comparison on the swimming and metabolic performance of Pacific chub mackerel (*Scomber japonicus*) distributed in different area

*Chenying Guo[1], Shin-ichi Ito[1], Megumi Enomoto[1], Tomoya Aono[1] (1.Atmosphere and Ocean Research Institute, the University of Tokyo)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

[A-OS19] Marine ecosystems and biogeochemical cycles: theory, observation and modeling

convener:Takafumi Hirata(Arctic Research Center, Hokkaido University), Shin-ichi Ito(Atmosphere and Ocean Research Institute, The University of Tokyo), Enrique N Curchitser(Rutgers University New Brunswick), Eileen E Hofmann(Old Dominion University)

[AOS19-06] **Basin-scale Relations between Marine Ecosystem Indices and Physical Environment in North Pacific**

*Emi Yati[1,6], Shoshiro Minobe[1,2], Nathan Mantua[3], Shin-ichi Ito[4], Emanuele Di Lorenzo[5] (1.Department of Natural History Sciences, Graduate School of Science, Hokkaido University., 2.Department of Earth and Planetary Sciences, Faculty of Science, Hokkaido University. E-mail: minobe@sci.hokudai.ac.jp, 3.Southwest Fisheries Science Center, National Marine Fisheries Service, National Oceanographic and Atmospheric Administration, California 95060, USA., 4.Atmosphere and Ocean Research Institute, University of Tokyo., 5.School of Earth and Atmospheric Sciences, Georgia Institute of Technology, Atlanta, Georgia, USA., 6.Remote Sensing Application Center, Indonesian National Institute of Aeronautics and Space.)

[AOS19-07] Development of the Potential Vulnerability Index for the Arctic Marine Ecosystems

*Takafumi Hirata[1], Yoshio Masuda[2], Jorge García Molinos[1], Keiko Sato[1], Irene Alabia[1], Toru Hirawake[3], EIJI WATANABE[4], Maki Noguchi Aita[5], Sei-Ichi Saitoh[1] (1.Arctic Research Center, Hokkaido University, 2.Faculty of Environmental Earth Science, Hokkaido University, 3.Graduate School of Fisheries Sciences, Hokkaido University, 4.Institute of Arctic Climate and Environment Research, Japan Agency for Marine-Earth Science and Technology, 5.Earth Surface System Research Center, Japan Agency for Marine-Earth Science and Technology)

[AOS19-08] **Environmental drivers of recent biodiversity patterns in the Eastern Bering Sea**

*Irene Alabia[1], Jorge Garcia Molinos[1], Sei-Ichi Saitoh[1], Takafumi Hirata[1], Toru Hirawake[3], Franz Mueter[2] (1.Arctic Research Center, Hokkaido University, 2.University of Alaska Fairbanks, 3.Faculty of Fisheries Sciences, Hokkaido University)

[AOS19-09] **Modeling studies on pan-Arctic ice-algal productivity: Present status and future projection**

*EIJI WATANABE[1] (1.Japan Agency for Marine-Earth Science and Technology (JAMSTEC))

[AOS19-11] **Potential differences between *in-situ* and remote oceanic primary productivity**

*Ko-Mei LIN[1], Chung-Yu Chiang[1], Yung-Yen Shih[1] (1.R.O.C NAVAL ACADEMY Dept. of Applied Science)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

[A-OS19] Marine ecosystems and biogeochemical cycles: theory, observation and modeling

convener:Takafumi Hirata(Arctic Research Center, Hokkaido University), Shin-ichi Ito(Atmosphere and Ocean Research Institute, The University of Tokyo), Enrique N Curchitser(Rutgers University New Brunswick), Eileen E Hofmann(Old Dominion University)

[AOS19-12] Impact of the deviation of phytoplankton stoichiometry from Redfield ratio on global oceanic net primary production

*Yoshio Masuda[1], Yasuhiro Yamanaka[1], Takafumi Hirata[2], Hideyuki Nakano[3] (1.Graduate School of Environmental Earth Science, Hokkaido University, 2.Arctic Research Center, Hokkaido University, 3.Meteorological Research Institute)

[AOS19-13] Vertical migration by bulk phytoplankton sustains biodiversity and nutrient input to the surface ocean

*S. Lan Smith[1], Kai W. Wirtz[2] (1.Marine Ecosystem Dynamics Research Group, Research Institute for Global Change, Japan Agency for Marine-Earth Science and Technology, 2.HZG, Geesthacht, Germany)

[AOS19-14] Breakup of marine aggregates under laminar shear flow

*Yasuhito Hayashi[1], Shigeki Wada[1], Yasuhisa Adachi[1] (1.University of Tsukuba)

[AOS19-15] **Summertime oxygen depletion and acidification in Bohai Sea, China**

*Guisheng Song[1], Liang Zhao[2], Huixiang Xie[3], Hao Wei[1] (1.Tianjin University, 2.Tianjin Univ. Sci Technol., 3.ISMER-UQAR)

[AOS19-16] **Seasonal oceanic variability and associated biogeochemical responses around a ridge area along the Kuroshio off Japan**

*Xu Zhang[1], Yusuke Uchiyama[1,2], Yota Suzue[3], Eiji Masunaga[4] (1.Kobe University, 2.Port and Airport Research Institute, 3.Construction Technique Institute Engineering Co., Ltd., 4.Ibaraki University)

[AOS19-17] Drivers and dynamics of change in Altamaha, Doboy, and Sapelo Sounds along the Georgia coast

*Kimberly K Takagi[1], Kimberley S Hunter[2], James B Deemy[1], Wei-Jun Cai[3], Samantha B Joye[2] (1.College of Coastal Georgia, 2.University of Georgia, 3.University of Delaware)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

[A-OS20] Coastal physical processes associated with mixing, eddies, and internal waves

convener:Taira Nagai(Graduate School of Science, The University of Tokyo), Eisuke Tsutsumi(Atmosphere and Ocean Research Institute, The University of Tokyo), Eiji Masunaga(Ibaraki University)

[AOS20-01] Tidally-driven submesoscale coherent eddies at Naruto Strait in the Seto Inland Sea, Japan

*Yusuke Uchiyama[1], Shota Yanase[1], Xu Zhang[1] (1.Graduate School of Engineering, Kobe University)

[AOS20-02] Seasonal variation of water masses and turbulence structure off the Sanriku Coast

*ikeda masashi[1], Eiji Masunaga[1], Toshi Nagata[2], Sachihiko Itoh[2] (1.ibaraki university , 2.Atmosphere and Ocean Research Institude, The University of Tokyo)

[AOS20-03] Material transport processes around Sagami Bay and Suruga Bay using a particle tracking model

*Takayoshi Inoue[1], Eiji Masunaga[1], Yusuke Uchiyama[2] (1.Ibaraki University, 2.Kobe University)

[AOS20-04] Three-dimensional transport of microplastics in the South China Sea using a Lagrangian particle tracking model

*Kosei Matsushita[1], Yusuke Uchiyama[1], Naru Takaura[1] (1.Kobe Univ.)

[AOS20-05] Volume transport due to internal wave generation along the continental shelf in the South China Sea

*Qiang Li[1], Xiaohua Zhang[1], Xiuyu Zheng[1], Jintao Gu[1], Xiaoting Zhu[1] (1.Tsinghua University)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

[A-OS20] Coastal physical processes associated with mixing, eddies, and internal waves

convener:Taira Nagai(Graduate School of Science, The University of Tokyo), Eisuke Tsutsumi(Atmosphere and Ocean Research Institute, The University of Tokyo), Eiji Masunaga(Ibaraki University)

[AOS20-06] Observations of vertical mixing and sediment heat flux in a shallow lake

*Eiji Masunaga[1], Shunsuke Komuro[2], Tatsumi Kitamura[2] (1.Ibaraki University, 2.Ibaraki Kasumigaura Environmental Science Center)

[AOS20-07] Effects of the wind forcing on a shallow lake associated with the lake size and stratification

*Daiki Asaoka[1], Eiji Masunaga[1], shunsuke komuro[2], Tatsumi Kitamura[2] (1.Ibaraki University, 2.Ibaraki Kasumigaura Environmental Science Center)

[AOS20-08] Estimating internal tidal current in a tidally-energetic shallow estuary, Ariake Sea, Japan

*Eisuke Tsutsumi[1], Chitake Matsufuji[2], Takeshi Matsuno[3], Tomoharu Senjyu[3], Takahiro Endoh[3] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Interdisciplinary Graduate School of Engineering Sciences, Kyushu University, 3.Research Institute for Applied Mechanics, Kyushu University)

[AOS20-09] The decreasing trend of M_2 tidal amplitude observed along northwestern Kyushu

*Hiromi Matsuura[1], Katsuto Uehara[2], Shinichiro Kida[2], Toshiyuki Hibiya[3] (1.Interdisciplinary Graduate School of Engineering Sciences, Kyushu University, 2.Research Institute for Applied Mechanics, Kyushu University, 3.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo)

[AOS20-10] **Multimodal fusion for sea level anomaly forecasting**

*Guosong Wang[1,2], Xidong Wang[1], Xinrong Wu[2], Kexiu Liu[2], Chunjian Sun[2], Hongli Fu[2] (1.College of Oceanography Hohai University, 2.National Marine Data and Information Service)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

[A-OS21] Dynamics of oceanic and atmospheric waves, vortices, and circulations

convener:Yuki Tanaka(Fukui Prefectural University), Ryo Furue(APL/JAMSTEC), Yukiharu Hisaki(University of the Ryukyus), Norihiko Sugimoto(Keio University, Department of Physics)

[AOS21-02] Structure and evolution of the tropical synoptic-scale waves in the Indian Ocean-Maritime Continent region

*Fukutomi Yoshiki[1], Hidenori AIKI[1] (1.Institute for Space-Earth Environmental Reasearch, Nagoya University)

[AOS21-03] Toward practical use of EFSO for weekly weather forecasts: Dynamics of propagation of observation impacts

*Akira Yamazaki[1], Takemasa Miyoshi[2,1], Takeshi Enomoto[3,1], Nobumasa Komori[1], Jun Inoue[4,1] (1.Application Laboratory, Japan Agency for Marine-Earth Science and Technology, 2.RIKEN Center for Computational Science, 3.Disaster Prevention Research Institute, Kyoto University, 4.National Institute of Polar Research)

[AOS21-04] Numerical and Theoretical Study on the relationship between the amplitudes of tsunamis and the associiated atmospheric Lamb waves

*Kensuke Nakajima[1] (1.Department of Earth and Planetary Sciences,Flculty of Sciences,Kyushu University)

[AOS21-05] **Persistent Small-Scale Features of Ocean Winds and Waves**

★Invited Papers

*Lie-Yauw Oey[1,2] (1.National Central University, 2.Princeton University)

[AOS21-06] Effect of swells on the development of wind waves in the real ocean

*Kosei Komatsu[1,2], Hirotaka Omatsu[1,2], Kiyoshi Tanaka[2] (1.GSFS, Univ. Tokyo, 2.AORI, Univ. Tokyo)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

[A-OS21] Dynamics of oceanic and atmospheric waves, vortices, and circulations

convener:Yuki Tanaka(Fukui Prefectural University), Ryo Furue(APL/JAMSTEC), Yukiharu Hisaki(University of the Ryukyus), Norihiko Sugimoto(Keio University, Department of Physics)

[AOS21-07] Causal Mechanism of Sea Level Rise in the South Pacific Ocean

★Invited Papers

*Ichiro Fukumori[1], Tangdong Qu[2], Ou Wang[1] (1.Jet Propulsion Laboratory, 2.University of California, Los Angeles)

[AOS21-08] Scale interactions in the tropical Pacific Ocean

★Invited Papers

*Kelvin John Richards[1] (1.University of Hawaii at Manoa)

[AOS21-09] Novel use of time-lapse seismic images and in-situ hydrographic data for detecting changes at the interface between oceanic water layers

*Vincent Tong[1], Qunshu Tang[2,3] (1.University College London, 2.CAS Key Laboratory of Ocean and Marginal Sea Geology, 3.Innovation Academy of South China Sea Ecology and Environmental Engineering)

[AOS21-10] Life-time independent approach to Lagrangian vortices detection

*Anass El Aouni[1], Arthur Vidard[1] (1.INRIA/LJK Grenoble, France)

[AOS21-11] Floating tracer clustering in divergent random flows modulated by an unsteady mesoscale ocean velocity field

*Konstantin Koshel[1,2], Pavel Berloff[3], Evgeny Ryzhov[1,3], Dmitry Stepanov[1] (1.V.I. Ilichev Pacific Oceanological Institute, FEB RAS, 2.Institute of Applied Mathematics, FEB RAS, 7, Radio Street, Vladivostok 690022, Russia, 3.Department of Mathematics, Imperial College London, London SW7 2AZ, United Kingdom)

[AOS21-12] **On the Stability of Discrete Vortex Structures in Geostrophic Models Two-Layer Rotating Fluid and Bessel Vortices**

*Leonid Kurakin[1,2], Irina - Lysenko[1], Irina - Ostrovskaya[1], Mikhail - Sokolovskiy[2,3] (1.Southern Federal University, Rostov on Don, Russia, 2.Water Problems Institute, RAS, Moscow, Russia, 3.Shirshov Institute of Oceanology, RAS, Moscow, Russia)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

[A-OS21] Dynamics of oceanic and atmospheric waves, vortices, and circulations

convener:Yuki Tanaka(Fukui Prefectural University), Ryo Furue(APL/JAMSTEC), Yukiharu Hisaki(University of the Ryukyus), Norihiko Sugimoto(Keio University, Department of Physics)

[AOS21-13] Data-driven improvement of coarse-resolution QG models

★Invited Papers

*Evgenii Ryzhov[1], Berloff Pavel[1], Kondrashov Dmitri[2], Agarwal Niraj[1] (1.Imperial College London, 2.UCLA)

[AOS21-15] Modified View of Barotropic Energy Conversion and its Application to the Kuroshio extension region

*Takuro Matsuta[1], Yukio Masumoto[1] (1.Graduate School of Science, The University of Tokyo)

[AOS21-16] Distribution and interaction of fronts and eddies in the Kuroshio Extension

*YUNTAO WANG[1], Rui Tang[1] (1.Second Institute of Oceanography Ministry of Natural Resources)

[AOS21-17] **Meridional heat transport in the Japan/East Sea from 1990 to 2010**

*Dmitry Stepanov[1] (1.Pacific Oceanological Institute, Far Eastern Branch, Russian Academy of Sciences)

[AOS21-18] Changes of Oyashio water properties due to multi-decadal and 18.6-year period variabilities

*Vigan Mensah[1], Kay I. Ohshima[1] (1.Institute of Low Temperature Science)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

[A-OS22] Physical, chemical and biological processes and variability in the Indian Ocean

convener:Yukio Masumoto(Graduate School of Science, The University of Tokyo), Hiroaki Saito(Atmosphere and Ocean Research Institute, The University of Tokyo)

[AOS22-01] **Assessing Organic Carbon on Coastal and Continental Shelf of Indonesia Waters Facing Indian Ocean**

*Aan Johan Wahyudi[1], Edwards Taufiqurrahman[1], Afdal Afdal[1], Hanif Budi Prayitno[1], Hanny Meirinawati[1] (1.Research Center for Oceanography Indonesian Institute of Sciences)

[AOS22-02] **Turbulent mixing in the Indonesian throughflow exit passages, the Lesser Sunda waters**

*Adi Purwandana[1], Yannis - Cuypers[2], Pascale - Bouruet-Aubertot[2], Mochamad Furqon - Azis Ismail[1], Dewi - Surinati[1], Ahmad - Bayhaqi[1] (1.Research Center for Oceanography - Indonesian Institute of Sciences, 2.Laboratoire d'Océanographie et de Climatologie par Expérimentation et Approche Numérique (LOCEAN) - Sorbonne Université)

[AOS22-03] Characterisation of mesoscale eddies along the eastern boundary current off the southern coast of Java

*Mochamad Furqon Azis Ismail[1], Adi Purwandana[1], Asep Sandra Budiman[1], Dewi Surinati[1], Ahmad Bayhaqi[1] (1.Research Centre for Oceanography - Indonesian Institute of Sciences)

[AOS22-04] **Estimation of phytoplankton size classes response to the tropical cyclone Ockhi over the Arabian Sea**

*Rebekah Shunmugapandi[1], Shirishkumar Gedam[2], Arun B Inamdar[2] (1.PhD Student,Centre of Studies in Resources Engineering, Indian Institute of Technology Bombay, India, 2.Professor,Centre of Studies in Resources Engineering, Indian Institute of Technology Bombay, India)

[AOS22-05] Influences of the Interdecadal Pacific Oscillation on the locally amplified Ningaloo Niño

Natsumi Tanuma[1], *Tomoki Tozuka[1] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo)

[AOS22-06] The Mode Water formation in the South Indian Ocean

*Takuro Matsuta[1], Yukio Masumoto[1] (1.Graduate School of Science, The University of Tokyo)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

[A-OS23] Atlantic climate variability, and its global impacts and predictability

convener:Ingo Richter(JAMSTEC Japan Agency for Marine-Earth Science and Technology), Hiroki Tokinaga(Research Institute for Applied Mechanics, Kyushu University), Andrea Taschetto(University of New South Wales), Noel S Keenlyside(Geophysical Institute Bergen)

[AOS23-01] **Revisiting Mechanisms of Atlantic Niño Phase Locking**

*Lin Chen[1], Tim Li[2,1], Ran Wang[1] (1.Nanjing University of Information Science and Technology, 210044, Nanjing, China, 2.University of Hawaii, Honolulu, HI, 96822, USA)

[AOS23-02] Seasonal forecasting of the Atlantic Niño

★Invited Papers

*Chloe Prodhomme[1,2], Javier García-Serrano[1,2], Eleftheria Exarchou[2], Aurore Voldoire[3], Noel Keenlyside[4] (1.Group of Meteorology, Universitat de Barcelona (UB), Barcelona, Spain, 2.Barcelona Supercomputing Center (BSC), Barcelona, Spain, 3.Centre National de Recherches Météorologiques (CNRM), Météo-France/CNRS UMR3589, Toulouse, France, 4.Bergen University, Bergen, Norway)

[AOS23-03] Atlantic Niño-Pacific connection and its implication for prediction under greenhouse warming

*wenju cai[1], Fan Jia[2], Lixin Wu[2] (1.Centre for Southern Hemisphere Oceans Research (CSHOR), CSIRO Oceans and Atmosphere, Hobart 7004, Tasmania, Australia, 2.CAS Key Laboratory of Ocean Circulation and Waves, Institute of Oceanology, Chinese Academy of Sciences and Qingdao National Laboratory for Marine Science and Technology)

[AOS23-04] **Walker Circulation strengthening due to an Atlantic Meridional Overturning Circulation collapse.**

*Luis Bryam Orihuela Pinto[1], Andrea Taschetto[1], Matthew England[1] (1.University of New South Wales)

[AOS23-05] Mechanisms of Atlantic Multidecadal Variability

*Rong Zhang[1] (1.NOAA Geophysical Fluid Dynamics Laboratory)

[AOS23-06] Bias of jet in the North Atlantic and its relation to SST in the PRIMAVERA air-sea coupled historical runs

*Fumiaki Ogawa[1], Noel S Keenlyside[1,2], Panos Athanasiadis[3], Reinhard Schiemann[4] (1.University of Bergen and Bjerknes Centre for Climate Research, Bergen, Norway, 2.NERSC, Norway, Bergen, 3.CMCC, Bologna, Italy, 4.University of Reading, Reading, UK)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

[A-OS24] Exploring new frontiers of oceanic mixing research in the next decade

convener:Toshiyuki Hibiya(Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo), Ichiro Yasuda(Atmosphere and Ocean Research Institute, The University of Tokyo), Lakshmi Kantha(Aerospace Engineering Sciences, University of Colorado, Boulder, Colorado, USA)

[AOS24-01] Global modeling of internal tides and the internal gravity wave continuum

*Brian K Arbic[1] (1.University of Michigan Ann Arbor)

[AOS24-02] Direct numerical simulation of stratified turbulence generated by local instability of internal gravity waves

*Yohei Onuki[1], Sylvain Joubaud[2,3], Thierry Dauxois[2] (1.Center for Oceanic and Atmospheric Research, Research Institute for Applied Mechanics, Kyushu University, Japan, 2.Universite de Lyon, ENS de Lyon, Universite Claude Bernard, CNRS, Laboratoire de Physique, France, 3.Institut Universitaire de France, France)

[AOS24-03] **Development of efficient and autonomous microstructure measurement system using fast-response thermistors attached to CTD, glider and deep-profiling float, to elucidate vertical distribution**

*Ichiro Yasuda[1], Keunjong Lee[1], Maki Nagasawa[1], Shuo Zhai[1], Yusuke Sasaki[1], Daigo Yanagimoto[1], Shinzo Fujio[1], Mamoru Tanaka[1], Yasutaka Goto[2], Toshiya Nakano[2], Daisuke Sasano[2], Takahiro Tanaka[4], Shinya Kouketsu[3] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Japan Meteorological Agency Japan, 3.Japan Agency of Marine-Earth Science and Technology, 4.Tohoku National Fisheries Research Institute, Fisheries Research and Education Agency)

[AOS24-04] Ocean State Estimation by Using Ocean Mixing Observations

*Shuhei Masuda[1], Satoshi Osafune[1] (1.Japan Agency for Marine-Earth Science and Technology)

[AOS24-05] **A new parameterization of tidal mixing enhanced over rough seafloor topography**

*Toshiyuki Hibiya[1] (1.Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo)

[AOS24-06] Virtual tracer analysis of the Pacific meridional overturning circulation

*Takao Kawasaki[1], Hiroyasu Hasumi[1] (1.Atmosphere and Ocean Research Insitutute, the University of Tokyo)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

[A-OS24] Exploring new frontiers of oceanic mixing research in the next decade

convener:Toshiyuki Hibiya(Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo), Ichiro Yasuda(Atmosphere and Ocean Research Institute, The University of Tokyo), Lakshmi Kantha(Aerospace Engineering Sciences, University of Colorado, Boulder, Colorado, USA)

[AOS24-07] Diagnostic evaluation of vertical mixing effects on meridional overturning circulatoin

*Yutaka Yoshikawa[1], Takao Kawasaki[1], Hiroyasu Hasumi[1] (1.Graduate School of Science, Kyoto University)

[AOS24-08] Role of deep ocean mixing on climate change assessed by an Earth system model

*Michio Watanabe[1], Akitomo Yamamoto[1], Tomohiro Hajima[1], Hiroaki Tatebe[1] (1.Japan Agency for Marine-Earth Science and Technology)

[AOS24-09] Eddy-resolved ocean characteristics of the MIROC coupled model incorporating effects of tidal mixing of the 18.6-yr modulation

*Tomonori Matsuura [1], Hiromasa Tatebe[2], Ichiro Yasuda[1] (1.The University of Tokyo , 2.Japan Agency for Marine-earth Science and Technology)

[AOS24-12] Enhanced vertical mixing along a shelf-slope front east of Japan

*Sachihiko Itoh[1], Eiji Masunaga[2], TSUTSUMI EISUKE[1], Takashi T Sakamoto[1], Ishikawa Kazuo[1], Daigo Yanagimoto[1], Hitoshi Kaneko[1], Yasuhiro Hoshiba[1], Daisuke Hasegawa[3], Toshi Nagata[1] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Center for Water Environment Studies, Ibaraki University, 3.Tohoku National Fisheries Research Institute)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

[A-OS24] Exploring new frontiers of oceanic mixing research in the next decade

convener:Toshiyuki Hibiya(Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo), Ichiro Yasuda(Atmosphere and Ocean Research Institute, The University of Tokyo), Lakshmi Kantha(Aerospace Engineering Sciences, University of Colorado, Boulder, Colorado, USA)

[AOS24-14] The observational evidence of double diffusive instability in the Arabian Sea during winter and spring

*ASHIN KURIAKOSE[1], Jofia Joseph[1], Girishkumar M. S.[1], Sureshkumar N[1], Sivaprasad S[1], Thangaprakash V P[1], Pattabhi Ram Rao E[1] (1.ESSO - Indian National Centre for Ocean Information Services)

[AOS24-16] Temporal variations of nutrient concentration east of Taiwan and its influence on downstream area

*Xinyu Guo[1], Yingying Hu[2], Yoshikazu Sasai[3], Chung-Chi Chen[4], Sen Jan[5] (1.Center for Marine Environmental Studies, Ehime University, 2.National Marine Environmental Forecasting Center, Ministry of Natural Resources of China, China, 3.Japan Agency for Marine-Earth Science and Technology, Japan, 4.Department of Life Science, National Taiwan Normal University, Taiwan, 5.Institute of Oceanography, National Taiwan University, Taiwan)

[AOS24-17] Flow-topography interaction within the Kuroshio and energy dissipation: observation and numerical simulation in the Tokara Strait south-west of Japan and the I-Lan Ridge east of Taiwan

*Eisuke Tsutsumi[1], Takeshi Matsuno[2], Takeyoshi Nagai[3], Daisuke Hasegawa[4], Hirohiko Nakamura[5], Ayako Nishina[5], Tomoharu Senjyu[2], Takahiro Endoh[2], Ming-Huei Chang[6], Yiing Jang Yang[6], Sen Jan[6], Sachihiko Itoh[1], Xinyu Guo[7] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Research Institute for Applied Mechanics, Kyushu University, 3.Department of Ocean Sciences, Tokyo University of Marine Science and Technology, 4.Tohoku National Fisheries Research Institute, Japan Fisheries Research and Education Agency, 5.Faculty of Fisheries, Kagoshima University, 6.Institute of Oceanography, National Taiwan University, 7.Center for Marine Environmental Studies, Ehime University)

[AOS24-18] The long lasting strong turbulence along the Kuroshio flowing over seamounts in the Tokara Strait

*Takeyoshi Nagai[1], Eisuke Tsutsumi[2], Daisuke Hasegawa[3], Hirohiko Nakamura[4], Ayako Nishina[4], Takeshi Matsuno[5], Tomoharu Senjyu[5] (1.Department of Ocean Sciences, Tokyo University of Marine Science and Technology, 2.The Atmosphere and Ocean Research Institute, The University of Tokyo, 3.Tohoku National Fisheries Research Institute, Japan Fisheries Research and Education Agency, Miyagi, 4.Faculty of Fisheries, Kagoshima University, 5.Research Institute for Applied Mechanics, Kyushu University)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

[A-OS24] Exploring new frontiers of oceanic mixing research in the next decade

convener:Toshiyuki Hibiya(Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo), Ichiro Yasuda(Atmosphere and Ocean Research Institute, The University of Tokyo), Lakshmi Kantha(Aerospace Engineering Sciences, University of Colorado, Boulder, Colorado, USA)

[AOS24-19] **Effects of nutrient supply with strong turbulent mixing on lower-trophic level ecosystem around the Tokara strait**

*Naoki Yoshie[1], Kazuki Ohgi[1], Anri Kabe[1], Yuma Hayashi[1], Toru Kobari[2], Eisuke Tsutsumi[3], Daisuke Hasegawa[4], Joji Ishizaka[5] (1.Center for Marine Environmental Studies, Ehime University, 2.Faculty of Fisheries, Kagoshima University, 3.Atmosphere and Ocean Research Institute, The University of Tokyo, 4.Tohoku National Fisheries Research Institute, Japan Fisheries Research and Education Agency, 5.Institute for Space-Earth Environmental Research Nagoya University)

[AOS24-20] Observation of anticyclonic eddies in the western subarctic North Pacific

*Ueno Hiromichi[1], Ryo Dobashi[2], Yuki Okada[2], Takahiro Tanaka[3], Jun Nishioka[4], Toru Hirawake[1], Atsushi Ooki[1], Sachihiko Itoh[5], Yoshikazu Sasai[6], Hideharu Sasaki[6], Ichiro Yasuda[5] (1.Faculty of Fisheries Sciences, Hokkaido University, 2.Graduate School of Fisheries Sciences, Hokkaido University, 3.Tohoku National Fisheries Research Institute, Japan Fisheries Researh and Education Agency, 4.Institute of Low Temperature Science, Hokkaido University, 5.Atmosphere and Ocean Research Institute, The University of Tokyo, 6.Japan Agency for Marine-Earth Science and Technology)

[AOS24-21] **Importance of the intermediate water nutrient pool and mixing around island chains for constructing HNLC region in the subarctic Pacific**

*Jun Nishioka[1,2], Hajime Obata[3], Toru Hirawake[2,4], Youhei Yamashita[5], Hiroshi Ogawa[3], Ichiro Yasuda[3] (1.Institute of low temperature sciences, Hokkaido University, 2.Arctic Research Center, Hokkaido University, 3.Atmosphere and Ocean Research Institute, The University of Tokyo, 4.Faculty of Fisheries Sciences, Hokkaido University, 5.Faculty of Environmental Earth Science, Hokkaido University)

[AOS24-22] Decadal variation of biological settling particle fluxes controlled by physical process in the subarctic western North Pacific.

*Naomi Harada[1], Makio Honda[1], Maki Noguchi Aita[1], Miyako Sato[1], Fujiki Tetsuichi[1], Minoru Kitamura[1], Ueno Hiromichi[2] (1.Japan Agency for Marine-Earth Science and Technology, 2.Hokkaido University)

[AOS24-23] Geographical distributions of primary production phenology and nutrient/iron supply in the subarctic North Pacific Ocean

*Toru Hirawake[1], Jun Nishioka[2], Hajime Obata[3] (1.Faculty of Fisheries Sciences, Hokkaido University, 2.Institute of low temperature sciences, Hokkaido University, 3.Marine inorganic chemistry division, Atmosphere and Ocean Research Institute, University of Tokyo)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

[A-OS25] Continental-Oceanic Mutual Interaction: Planetary scale Material Circulation

convener:Yosuke Alexandre Yamashiki(Earth & Planetary Water Resources Assessment Laboratory Graduate School of Advanced Integrated Studies in Human Survivability Kyoto University), Yukio Masumoto(Graduate School of Science, The University of Tokyo), Swadhin Behera(Climate Variation Predictability and Applicability Research Group, Application Laboratory, JAMSTEC, 3173-25 Showa-machi, Yokohama 236-0001), Takanori Sasaki(Department of Astronomy, Kyoto University)

[AOS25-01] Impact of Extreme UV fluxes on Atmospheric Escape of the Hadean Earth and Earth-like Exoplanets

★Invited Papers

*Vladimir Airapetian[1,2], Jared Bell[1], Alex Glocer[1] (1.NASA Goddard Space Flight Center, 2.American University, DC)

[AOS25-02] Lunar water exploration expands human activity in space

★Invited Papers

*Yuko Inatomi[1] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

[AOS25-03] The inner edge of habitable zone for terrestrial exoplanets

★Invited Papers

*Takanori Kodama[1] (1.University of Bordeaux)

[AOS25-04] **Plant culture system as a water recycling device in space farming**

*Kitaya Yoshiaki[1] (1.Graduate School of Life and Environmental Sciences, Osaka Prefecture University)

[AOS25-05] Probabilistic Risk Assessment of Solar Particle Events Considering the Cost of Counter Measures to Reduce the Aviation Exposure Dose

*Moe Fujita[1], Yosuke Yamashiki[1], Tatsuhiko Sato[2] (1.Graduate School of Advanced Integrated Studies in Human Survivability Kyoto University, 2.Japan Atomic Energy Agency)

[AOS25-06] Space educational program: Space camp at Biosphere 2

*Masahiro Terada[1], Yosuke Ymashiki[1], Takao Doi[1] (1.Kyoto University)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

[A-OS25] Continental-Oceanic Mutual Interaction: Planetary scale Material Circulation

convener:Yosuke Alexandre Yamashiki(Earth & Planetary Water Resources Assessment Laboratory Graduate School of Advanced Integrated Studies in Human Survivability Kyoto University), Yukio Masumoto(Graduate School of Science, The University of Tokyo), Swadhin Behera(Climate Variation Predictability and Applicability Research Group, Application Laboratory, JAMSTEC, 3173-25 Showa-machi, Yokohama 236-0001), Takanori Sasaki(Department of Astronomy, Kyoto University)

[AOS25-07] Impacts of riverine discharges on the overturning circulation and material circulation in the Sea of Okhotsk and the North Pacific Ocean

★Invited Papers

*Humio Mitsudera[1], Toru Miyama[2], Hatsumi Nishikawa[1] (1.Institute of Low Temperature Science, Hokkaido University, 2.JAMSTEC)

[AOS25-08] **The AI/ML based IOD predictions**

*Swadhin Behera[1], J Venkata Ratnam[1] (1. Application Laboratory, VAiG, JAMSTEC, 3173-25 Showa-machi, Yokohama 236-0001)

[AOS25-09] Space Architecture Reinforced by Internal Ocean on the Moon

★Invited Papers

*Takuya ONO[1], Makiko NAGURA[1] (1.Kajima Corporation)

[AOS25-10] Ultra-high resolution numerical weather simulation on the heavy rainfall event over the western Japan 2018

*Tsutao OIZUMI[1,2], Kazuo Saito[1,3,2], Duc Le[1,2], Junshi Ito[3,2] (1.The Japan Meteorological Business Support Center, 2.Meteorological Research Institute, 3.The Atmosphere and Ocean Research Institute)

[AOS25-12] Bioparticle deposition at a stratospheric altitude

*Kenji Miki[1] (1.Tokyo Institute of Technology Earth-Life Science Institute)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-HW Hydrology & Water Environment

[A-HW30] Hydrology & Water Environment

convener:Ayumi Kotani(Graduate School of Bioagricultural Sciences, Nagoya University), Takeshi Hayashi(Faculty of Education and Human Studies, Akita University), Keisuke Fukushi(Institute of Nature & Environmental Technology, Kanazawa University), Masahiro Tanoue(School of Engineering, The University of Tokyo)

[AHW30-01] **Comparing tritium concentrations and water transit times in the Chikuma and Fujikawa River basins, Japan**

*Maksym Gusyev[1], Naofumi Akata[2], Tsutomu Yamanaka[3], Kimio Hirabayashi[4], Masashi Toyota[4], Uwe Morgenstern[5], Michael Stewart[5] (1.International Centre for Water Hazard Risk Management, Public Works Research Institute, 2.Hirosaki University, Japan, 3.University of Tsukuba, Japan, 4.Shinshu University, Japan, 5.GNS Science, New Zealand)

[AHW30-02] Variation of carbon isotope ($\delta^{13}C$ and $\Delta^{14}C$) of organic matter in suspended solids at Lake Kiba-gata

*Seiya Nagao[1], Kohei Sakaguchi[2], Tetsuya Matsunaka[1], Shinya Ochiai[1], Naoya Katsumi[3] (1.Institute of Nature and Environmental Technology, Kanazawa University, 2.Graduate School of Natural Science and Technology, Kanazawa University, 3.Department of Environmental Science, Ishikawa Prefectural University)

[AHW30-03] **Integrating Method of Waste Water Treatment and Desalination: Opportunities for Innovation**

*Mst. Shamsun Nahar[1] (1.Safety- Hygiene Department, Earth Consultant Co. Ltd, Toyama, Japan)

[AHW30-04] Water Scarcity Assessment in Thailand River Basin Using Geo-Informatics Technology

*pudtraporn napang[1] (1.Kasetsart University)

[AHW30-05] **Migration and aggregation of foamed plastic debris in the urban river of Mongolia**

*Batdulam Battulga[1], Masayuki Kawahigashi[1], Bolormaa Oyuntsetseg[2] (1.Department of Geography, Tokyo Metropolitan University, Tokyo, 192-0397, Japan , 2.Department of Chemistry, National University of Mongolia, Ulaanbaatar, 210646, Mongolia)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-HW Hydrology & Water Environment

[A-HW30] Hydrology & Water Environment

convener:Ayumi Kotani(Graduate School of Bioagricultural Sciences, Nagoya University), Takeshi Hayashi(Faculty of Education and Human Studies, Akita University), Keisuke Fukushi(Institute of Nature & Environmental Technology, Kanazawa University), Masahiro Tanoue(School of Engineering, The University of Tokyo)

[AHW30-06] MERIT Hydro: a new global hydrography map based on multiple satellite observations, and its application to model-satellite integration in global river hydrodynamic simulations

★Invited Papers

*Dai Yamazaki[1] (1.Institute of Industrial Sciences, The University of Tokyo)

[AHW30-07] **Assessment of Climate Change Effects on the Rice Water Requirements for Hsin-Chu Irrigation Area in Taiwan**

YUAN-TUNG HSU[2], MEI-CHANG CHEN[2], SHU-HUE CHU[2], TA-WEI CHIEN[2], *SHIH-WEI CHIANG[1] (1.Agricultural Engineering Research Center, 2.Taiwan Hsinchu Irrigation Association)

[AHW30-08] Land use / land cover and discharge in the Altamaha River 1992-2016, Georgia, USA

*James Deemy[1], Kimberly Takagi[1], Cameron Atkinson[1], Nicholas Harris[1], Nellie Little[1] (1.College of Coastal Georgia Department of Natural Sciences)

[AHW30-09] **Role of colloids on the (im)mobility of toxic elements in mine drainage systems with acidic and circumneutral pH**

*Frances Chikanda[1], Tsubasa Otake[2], Tatsuya Matsui[1], Sereyroith Tum[1], Tsutomu Sato[2] (1.Division of Sustainable Resources Engineering, Graduate School of Engineering, Hokkaido University, 2.Division of Sustainable Resources Engineering, Faculty of Engineering, Hokkaido University)

[AHW30-10] Source Identification of Molybdenum in Natural Water Around Erdenet City, Mongolia

*Solongo Tsetsgee[1,3], Fukushi Keisuke[1], Altansukh Ochir[3], Takahashi Yoshio[2], Munemoto Takashi[4], Akitoshi Akehi[1], Ariuntungalag Yunden[3], Enkhjin Odgerel[3], Taivanbat Batbold[3], Noriko Hasebe[1] (1.Kanazawa University, 2.The University of Tokyo, 3.National University of Mongolia, 4.Industrial Research Institute of Ishikawa)

[AHW30-11] **Spatio-temporal changes of hydrochemical properties and factors controlling hydrochemistry of springs in the Seyfe Basin**

*Cansu Yurteri[1] (1.Hacettepe University)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-HW Hydrology & Water Environment

[A-HW30] Hydrology & Water Environment

convener:Ayumi Kotani(Graduate School of Bioagricultural Sciences, Nagoya University), Takeshi Hayashi(Faculty of Education and Human Studies, Akita University), Keisuke Fukushi(Institute of Nature & Environmental Technology, Kanazawa University), Masahiro Tanoue(School of Engineering, The University of Tokyo)

[AHW30-12] Hydrology and astrobiology on early Mars: Insights from hydrology in cold semiarid areas in central Aria, Mongolia

★Invited Papers

*Yasuhito Sekine[1,2], Keisuke Fukushi[2] (1.Tokyo Institute of Technology, 2.Kanazawa University)

[AHW30-14] Advantages of continuous modelling for design hydrograph estimation in small and ungauged basins

*Salvatore Grimaldi[1,4], Maria Cristina Rulli[2], Aldo Fiori[3], Elena Volpi[3] (1.Università degli Studi della Tuscia, Italy, 2.Politecnico di Milano, Italy, 3.Universita' Roma Tre, Italy, 4.International Association of Hydrological Sciences)

[AHW30-15] Comparison of speciation and solubility of arsenic, lead, and cadmium in contaminated soils from Kamegai mine tailing, Toyama, Japan

*Baasansuren Gankhurel[1], Keisuke Fukushi[1], Akitoshi Akehi[1], Yoshio Takahashi[2], Xiaolan Zhao[3], Kazuo Kawasaki[4] (1.Kanazawa University, 2.The University of Tokyo, 3.Chang'an University, 4.University of Toyama)

[AHW30-16] Amount effect on the diurnal isotopic composition of precipitation in the Kra Isthmus of Thailand

*Jeerapong Laonamsai[1], Kimpei Ichiyanagi[1], Kiattipong Kamdee[2] (1.Kumamoto University, 2.Thailand Institute of Nuclear Technology)

[AHW30-17] Seasonal fluctuation of Tritium concentration in precipitation at Akita, north east Japan

*Takeshi Hayashi[1] (1.Faculty of Education and Human Studies, Akita University)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-HW Hydrology & Water Environment

[A-HW30] Hydrology & Water Environment

convener:Ayumi Kotani(Graduate School of Bioagricultural Sciences, Nagoya University), Takeshi Hayashi(Faculty of Education and Human Studies, Akita University), Keisuke Fukushi(Institute of Nature & Environmental Technology, Kanazawa University), Masahiro Tanoue(School of Engineering, The University of Tokyo)

[AHW30-18] Remobilization mechanism of sediments phosphorus under microbial activity in a polluted river, South China

*Rui Li[1], Jianyao Chen[1], Lei Gao[1] (1.Sun yat-sen Univ.)

[AHW30-19] **Hydrogeochemical and Isotopic Evidence of Groundwater Evolution and Characterization in Upper Walawe Basin, Sri Lanka**

*Sachintha Lakshan Senarathne[1], J.M.C.K Jayawardana[1], Rohana Chandrajith[2], E.A.N.V Edirisinghe[3] (1.Sabaragamuwa University of Sri Lanka, 2.University of Peradeniya, Sri Lanka, 3.Sri Lanka Atomic Energy Board)

[AHW30-20] Application of Optimization Model for Urban Drainage Layout Design under Street Flow and Operation of Pumping Station

*Chien-Lin Huang[1], Nien-Sheng Hsu[1], Gene Jiing-Yun You[1], Sih-Wen Cheng[1], Hung-Ren Liu[1] (1.National Taiwan University, Taiwan)

[AHW30-21] **Estimation of Evapotranspiration Fluxes using METRIC Model over Sub-tropical Moist Deciduous Forest in Doon Valley, India**

*Saurabh Purohit[1,2], N R Patel[1], Bhaskar R Nikam[1], S P Aggarwal[1], Triparna Sett[1], Prakash Chauhan[1] (1.Indian Institute of Remote Sensing, Dehradun, India, 2.Forest Research Institute Deemed to be University, Dehradun, India)

[AHW30-22] Effect of precipitation on interannual variability of permafrost active layer thickness at larch forests in eastern Siberia

*Ayumi Kotani[1], Tetsuya Hiyama[2], Taro Nakai[3], Takeshi Yamazaki[4], Trofim Maximov[5] (1.Graduate School of Bioagricultural Sciences, Nagoya University, 2.Institute for Space-Earth Environmental Research, Nagoya University, 3.School of Forestry and Resource Conservation, National Taiwan University, 4.Graduate School of Science, Tohoku University, 5.Institute for Biological Problems of Cryolithozone)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-HW Hydrology & Water Environment

[A-HW31] Surface and subsurface hydrologic models: From uncertainty analysis to water management

convener:Tomochika Tokunaga(Department of Environment Systems, University of Tokyo), Rene Therrien(Laval University), Philip Brunner(Center for Hydrogeology and Geothermics, University of Neuchatel), Jiaqi Liu(The University of Tokyo)

[AHW31-01] Numerical analysis of the hyporheic flow in a gravel aquifer subjected to an extraction scheme using multiple radial collector wells

*Sue Tse Jhong[1], Jun Ying Huang[2], Chih Tse Wang[2], Tai Sheng Liou[3] (1.National Chung Cheng University Institute of applied geophysics and environmental science, 2.Stantec Consulting Services Inc., Taiwan Branch, 3.Department of Earth and Environmental Sciences, National Chung Cheng University)

[AHW31-02] Study on utilization of groundwater under emergency situations caused by natural disasters: A modeling approach in the Kanto Plain, Japan.

*Fukazawa Souki[1], Kazuhiro TADA[1], Hiroyuki TOSAKA[1], Yasuhiro TAWARA[1] (1.Geosphere Environmental Technology Corp.)

[AHW31-03] Simulating Two-Way Feedbacks between Surface-Water and Groundwater Management with the Surface Water Operations Process

*Scott E Boyce[1], Ian M. Ferguson[2] (1.U.S. Geological Survey, California Water Science Center, 2.U.S. Bureau of Reclamation)

[AHW31-04] **Predicting baseflow at the basin scale with an integrated surface and subsurface flow model**

*Rene Therrien[1], Hugo Delottier[1] (1.Laval University)

[AHW31-05] Metrics for Environmental Simulation in Decision Support

★Invited Papers

*John Doherty

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-HW Hydrology & Water Environment

[A-HW32] Material transportation and cycling in aquatic ecosystems; from headwaters to coastal areas

convener:Syuhei Ban(The University of Shiga Prefecture), Adina Paytan(University of California Santa Cruz), Takahiro Hosono(Faculty of Advanced Science and Technology, Kumamoto University), Morihiro Maeda(Okayama University)

[AHW32-01] **Geologic controls on source water drive baseflow generation and geochemistry across watershed scales**

★Invited Papers

*Adina Paytan[1], Christina Richardson[1], Margaret Zimmer[1], Joseph Fackrell[1] (1.University of California Santa Cruz)

[AHW32-02] The Processes Controlling Stream Water Chemistry at the Terrestrial-Aquatic Interface, Great Lakes Region, USA

*Fengjing Liu[1], Veronica Porter[1] (1.Michigan Technological University)

[AHW32-03] **Agriculture and brackish fishpond impact on the vulnerability of coastal groundwater in Southeast Asia**

*Anna Fadliah Rusydi[1,4], Shin-ichi Onodera[1], Mitsuyo Saito[2], Seiichiro Ioka[3], Rizka Maria[4] (1.Graduate School of Integrated Arts and Sciences, Hiroshima University, Japan, 2.Graduate School of Environmental and Life Sciences, Okayama University, Japan, 3.Institute of Regional Innovation, Hirosaki University, Japan, 4.Research Center for Geotechnology, Indonesian Institute of Sciences, Indonesia)

[AHW32-04] Permafrost distribution controls dFe concentrations in rivers, Russian Far East

*Yuto Tashiro[1], Muneoki Yoh[1], Takayuki Shiraiwa[2], Takeo Onishi[3] (1.Tokyo University of Agriculture and Technology, 2.Hokkaido University , 3.Gifu University)

[AHW32-05] **Identification of autotrophic denitrification anomaly in the fast flowing karst aquifer using $\delta^{15}N$, $\delta^{34}S$ and $\delta^{13}C$ tracers in the Ryukyu limestone aquifers, southern Okinawa, Japan**

*Oktanius Richard Hermawan[1], Takahiro Hosono[2], Jun Yasumoto[3], Masashi Nozaki[3] (1.Earth and Environmental Science, Graduate School of Science and Technology, Kumamoto University, 2.Faculty of Advanced Science and Technology, Kumamoto University, 3.Department of Regional Agriculture Engineering, University of the Ryukyu)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-HW Hydrology & Water Environment

[A-HW32] Material transportation and cycling in aquatic ecosystems; from headwaters to coastal areas

convener:Syuhei Ban(The University of Shiga Prefecture), Adina Paytan(University of California Santa Cruz), Takahiro Hosono(Faculty of Advanced Science and Technology, Kumamoto University), Morihiro Maeda(Okayama University)

[AHW32-06] Methanotrophic food webs in tropical lakes

*Noboru Okuda[1], Milette U. Mendoza[9], Jaydan I. Aguilar[2], Karol Sophia Agape R. Padilla[2], Jonathan Carlo A. Briones[2], Rey Donne S. Papa[2], Masayuki Ito[3], Megumu Fujibayashi[4], Tzu-Hsuan Tu[5], Li-Hung Lin[5], Pei-Ling Wang[5], Yuki Kobayashi[6], Eleanor Austria[7], Fuh-Kwo Shiah[8] (1.Research Institute for Humanity and Nature, 2.University of Santo Tomas, 3. University of Hyogo, 4.Kyushu University, 5.National Taiwan University, 6.Yamaguchi University, 7.Adamson University, 8.Academia Sinica, 9.Ateneo de Manila University)

[AHW32-07] Did artificial re-oligotrophication induce a reduction of fish catch in Lake Biwa?

*Syuhei Ban[1], Xin Liu[1], Masahiro Maruo[1], Naoshige Goto[1], Ken'ichi Osaka[1], Shin-ichi Onodera[2], Mitsuyo Saito[3], Takuya Ishida[4], Noboru Okuda[4] (1.The University of Shiga Prefecture, 2.Hiroshima University, 3.Okayama University, 4.Research Institute for Humanity and Nature)

[AHW32-08] Phosphorus dynamics related to phytoplankton growth with newly sensitive measurement of orthophosphate and growth experiments in north basin of Lake Biwa

*Xin Liu[1], Rong Yi[1,2], Masahiro Maruo[1], Syuhei Ban[1] (1.The University of Shiga Prefecture, 2.Gannan Normal University)

[AHW32-09] Detection of Organophosphonates and Phosphite in Suspended Matter of P-limited Lakes

*Masahiro Maruo[1], Kazuma Tsuji[2], Tomoya Iwata[3], Maki Oyagi[4], Hajime Obata[5] (1.Department of Ecosystem Studies, School of Environmental Science, The University of Shiga Prefecture, 2.Graduate School of EnvironmentalScience, The University of Shiga Prefecture, 3.Faculty of Life and Environmental Sciences, 4.Facluty of Environment and Infromation Science, 5.Atmosphere and Ocean Research Institute, The University of Tokyo)

[AHW32-10] Role of groundwater and river discharge on phosphorus supply into the lake

*Shin-ichi Onodera[1], Mitsuyo Saito[2], Kunyang Wang[1], Syuhei Ban[3], Noboru Okuda[4], Yusuke Tomozawa[1] (1.Graduate School of Integrated and Arts Sciences, Hiroshima University, 2.Okayama University, 3.Shiga Prefecture University, 4.Research Institute of Human and Nature)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-HW Hydrology & Water Environment

[A-HW32] Material transportation and cycling in aquatic ecosystems; from headwaters to coastal areas

convener:Syuhei Ban(The University of Shiga Prefecture), Adina Paytan(University of California Santa Cruz), Takahiro Hosono(Faculty of Advanced Science and Technology, Kumamoto University), Morihiro Maeda(Okayama University)

[AHW32-12] Coffee-waste biochar and nano-biochar applications to reduce nitrous oxide and carbon dioxide emissions from agricultural soils

*Morihiro Maeda[1], Thuong Thi Thu Nguyen[1], Chiyu Nakano[1], Yuta Nishina[1] (1.Okayama University)

[AHW32-13] **Suppression of phosphorous release from sediment in agricultural drainages flowing into Lake Kojima by using biochar-amended sediment microbial fuel cells**

*Gamamada Liyanage Erandi Priyangika Perera[1], Morihiro Maeda[1] (1.Graduate School of Environmental and Life Science, Okayama University)

[AHW32-14] Assessment of hydrological processes and sediment yield in Dakbla catchment, Kon Tum province, Vietnam.

*Tram Ngoc Quynh Vo[1], Hiroaki Somura[1] (1.Okayama University)

[AHW32-15] Acidic fresh submarine groundwater discharge around mud diapirs in southwestern Taiwan

*Hon-Kit Lui[1], Chen-Tung Arthur Chen[1], Wei-Ping Hou[2], Rae Chang[1] (1.Department of Oceanography, National Sun Yat-sen University, Kaohsiung 80424, Taiwan, 2.Taiwan Ocean Research Institute, National Applied Research Laboratories, Kaohsiung 80143,Taiwan.)

[AHW32-16] Spatio-temporal dynamics of submarine groundwater discharge (SGD) on an intertidal beach scale, temperate coastal area

*Mitsuyo Saito[1], Shin-ichi Onodera[2], Shingo Nozaki[2], Yusuke Tomozawa[2] (1.Okayama University, 2.Hiroshima University)

[AHW32-17] **Impact of terrestrial nutrients in groundwater on coral reefs via submarine groundwater discharge around Yoron Island of the Southwest Islands, Japan**

*Shinji Nakaya[1], Sho Nagata[1], Masashi Toyota[1], Jun Yasumoto[2], Tetsuya Shintani[3], Takashi Nakamura[4] (1.Department of Water Environment and Civil Engineering, Faculty of Engineering, Shinshu University, 2.Department of Regional Agriculture Engineering, University of the Rykuyus, Japan, 3.Department of Civil and Environmental Engineering, Tokyo Metropolitan University, 4.Biology Program, Faculty of Science, University of the Ryukyus)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-HW Hydrology & Water Environment

[A-HW32] Material transportation and cycling in aquatic ecosystems; from headwaters to coastal areas

convener:Syuhei Ban(The University of Shiga Prefecture), Adina Paytan(University of California Santa Cruz), Takahiro Hosono(Faculty of Advanced Science and Technology, Kumamoto University), Morihiro Maeda(Okayama University)

[AHW32-18] **Evaluation of the long-term impact of forest growth and change on water and sediment yield in forested watershed of Kikuchi river using SWAT model**

*Yuko Nagano[1], Soichiro Fujii[1], Masahiko Kanamori[1], Maki Kinoshita[2], Masatoshi Yamazaki[3], Yuta Shimizu[4], Shin-ichi Onodera[5] (1.Japan Forest Technology Association, 2.Field Partners, 3.PASCO Corporation, 4.Western Region Agricultural Research Center, National Agriculture and Food Research Organization, 5.Graduate School of Integrated and Arts Sciences, Hiroshima University)

[AHW32-19] **Estimation of Change in Groundwater Recharge by Urbanization in a Granitic Mountain Catchment, Using SWAT Model**

*Sharon Bih Kimbi[1], Kunyang Wang[1], Shin-ichi Onodera[1], Yusuke Tomozawa[1], Shingo Nozaki[1], Anna Fadliah Rusydi[1] (1.Graduate School of Integrate Arts and Sciences, Hiroshima University)

[AHW32-20] Understanding of Subsurface Flow Systems: Role of Environmental Tracers in Model Calibration

*A T M Sakiur Rahman[1], Takahiro Hosono[1], Yasuhiro Tawara[2], Dennis Boateng[1], Jun Shimada[1] (1.Department of Earth and Environmental Science, Kumamoto University, Japan, 2.Geosphere Environmental Technology Corporation, NCO Kanda, Awajicho, Chiyoda-ku, Tokyo 101-0063, Japan)

[AHW32-21] **Impact of Urban Functional Area Subdivision on Simulation of Flash Flood in Hydrological Model**

*Kunyang Wang[1], Shin-ichi Onodera[1], Shuxue Qu[2], Yuta Shimizu[3], Mitsuyo Saito[4] (1.Graduate School of Integrated Arts and Science, Hiroshima University, 2.College of Resources, Environment and Tourism, Capital Normal University, 3. National Agriculture and Food Research Organization, 4.Faculty of Environmental Science and Technology, Okayama University)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-HW Hydrology & Water Environment

[A-HW33] Prediction of water and sediment dynamics from small to large scales

convener:Yoshiyuki Yokoo(Fukushima University), Yuko Asano(The University of Tokyo)

[AHW33-01] Effect of spatial scales on runoff / sediment transport in mountain catchments

*Yuko Asano[1], Taro Uchida[2], Takashi Gomi[3], Shigeru Mizugaki[4], Marino Hiraoka[5], Masanori Katsuyama[6], Satoshi Niwa[7], Yoshiyuki Yokoo[8] (1.The University of Tokyo, 2.Tsukuba University, 3.Tokyo University of Agriculture and Technology, 4.Civil Engineering Research Institute for cold region, Public Works Research Institute, 5.Public Works Research Institute , 6.Kyoto Prefectural University, 7.Japan Conservation Engineers & Co., Ltd., 8.Fukushima University)

[AHW33-03] Contrasting patterns in the decrease of spatial variability with increasing catchment area between stream discharge and water chemistry

★Invited Papers

*Tomohiro Egusa[1], Tomo'omi Kumagai[1,2], Tomoki Oda[1], Takashi Gomi[3], Nobuhito Ohte[4] (1.The University of Tokyo, 2.Nagoya University , 3.Tokyo University of Agriculture and Technology, 4.Kyoto University)

[AHW33-04] Effects of small-scale vertical unsaturated flow on the exponent of a runoff-storage power-law relationship in catchment storm runoff models

*Makoto Tani[1], Yuki Matsushi[2], Takahiro Sayama[2], Roy C Sidle[3], Nagahiro Kojima[4] (1.University of Human Environments, 2.Disaster Prevention Research Institute, Kyoto University, 3.University of Central Asia, 4.Lake Biwa Environmental Research Institute)

[AHW33-05] Towards improving predictivity of runoff and sediment transport for mountainous catchments through measurement of spatial patterns of hydrological behaviors

*Taro Uchida[1], Yuko Asano[2], Shigeru Mizugaki[3], Yoshiyuki Yokoo[4], Marino Hiraoka[5], Takashi Gomi[6], Satoshi Niwa[7], Masanori Katsuyama[8] (1.University of Tsukuba, 2.University of Tokyo, 3.Civil Engineering Research Institute for cold region, Public Works Research Institute, 4.Fukushima University, 5.Public Works Research Institute, 6.Tokyo University of Agriculture and Technology , 7.Japan Conservation Engineers & Co., Ltd. , 8.Kyoto Prefectural University)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-HW Hydrology & Water Environment

[A-HW33] Prediction of water and sediment dynamics from small to large scales

convener:Yoshiyuki Yokoo(Fukushima University), Yuko Asano(The University of Tokyo)

[AHW33-06] Linking micro scale hillslope properties and a meso scale constitutive equation used in rainfall-runoff modeling

★Invited Papers

*Yutaka Ichikawa[1] (1.Graduate School of Engineering, Kyoto University)

[AHW33-07] **Sediment Transport Modeling Beyond Normality: Estimation of Sediment Concentrations Accounting for Spatial Influence of Turbulence Coherent Structures**

★Invited Papers

*Christina Tsai[1], Kuang-Ting Wu[1] (1.National Taiwan University)

[AHW33-08] **Change in Sediment Yield Dynamics in Bhagirathi Basin (Large Watershed) with Climatic Variables Having One Outlet by Using SWAT Model and SUFI-2 Algorithm.**

*Jagriti jain[1], Deepak Khare[1] (1.Indian Institute of Technology, Roorkee)

[AHW33-09] Characteristics of Discharge and Tidal Asymmetry over Two Inlets Lagoon: A Case Study on Segara Anakan Lagoon, Central Java, Indonesia

*Faruq Khadami[1,2], Kiyoshi Kawanishi[1] (1.Department of Civil and Environmental Engineering, Hiroshima University, 2.Oceanography Study Group, Faculty of Earth Science and Technology, Institut Teknologi Bandung)

[AHW33-10] Understanding catchment processes and scale effect on catchment flows

*Chris Leong[1], Yoshiyuki Yokoo[1] (1.Fukushima University)

[AHW33-11] Applying a data-based rainfall-runoff modeling approach to interpret the mechanisms of decreasing spatial variability of subcatchment-specific discharge with increasing subcatchment area

*Yoshiyuki Yokoo[1], Takeshi Sakairi[1], Chris Leong[1] (1.Fukushima University)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-HW Hydrology & Water Environment

[A-HW37] Interdisciplinary approach to support climate change adaptation measures in regional scale

convener:TEBAKARI TAICHI(Toyama Prefectural University), Yadu Pokhrel(Michigan State University), Masashi Kiguchi(University of Tokyo), Sompratana Ritphring(Kasetsart University)

[AHW37-01] ADAP-T for water-related adaptation to climate change and supporting its policy making

★Invited Papers

*Taikan Oki[1], Thanya Kiatiwat[2], Hiroaki Shirakawa[3], Weerakaset Suanpaga[2], Taichi Tebakari[4], Sompratana Ritphring[2], Masashi Kiguchi[5], Kyoko Matsumoto[5] (1.Institute for Future Initiatives, The University of Tokyo, 2.Faculty of Engineering, Kasetsart University, 3.Granduate School of Environmental Studies, Nagoya University, 4.Department of Civil and Environmental Engineering, Toyama Prefectural University, 5. Institute of Industrial Science, The University of Tokyo)

[AHW37-02] Land use and climate change impact assessments in humid tropics regions

*Eva Mia Siska Yamamoto[1], Takahiro Sayama[1], Kodai Yamamoto[2], Apip Apip[3] (1.Disaster Prevention Research Institute, Kyoto University, 2.Graduate School of Engineering, Kyoto University, 3.Indonesian Institute of Sciences)

[AHW37-03] Effects of ocean acidification on marine ecosystem services: use of natural analogues around volcanic CO_2 vents

*Shigeki Wada[1], Sylvain Agostini[1], Ben Paul Harvey[1], Koetsu Kon[1], Masanori Take[1] (1.University of Tsukuba)

[AHW37-04] Encouraging Climate Change Adapatation and Mitigation Measures Platform from Indonesia

*Komariah Komariah[1], Dwi Priyo Ariyanto[1], Sumani Sumani[1] (1.Sebelas Maret University, Indonesia)

[AHW37-05] **Impact of Sea Level Rise on Tourism Carrying Capacity in Thailand**

*Sompratana Ritphring[1], Pattrakorn Nidhinarangkoon[1], Keiko Udo[2] (1.Faculty of Engineering, Kasetsart University, 2. International Research Institute of Disaster Science,Tohoku University)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-HW Hydrology & Water Environment

[A-HW37] Interdisciplinary approach to support climate change adaptation measures in regional scale

convener:TEBAKARI TAICHI(Toyama Prefectural University), Yadu Pokhrel(Michigan State University), Masashi Kiguchi(University of Tokyo), Sompratana Ritphring(Kasetsart University)

[AHW37-06] The GEWEX Regional Hydroclimate Projects in High Mountainous Terrains: Barriers that Bridge

★Invited Papers

*Petrus J van Oevelen[1] (1.Universities Space Research Association Columbia)

[AHW37-07] Transportation in the UK's Third Climate Change Risk Assessment

*David John Jaroszweski[1] (1.University of Birmingham)

[AHW37-08] Analysis for impacts of urban flood on traffic flow in Bangkok

*Shinichiro NAKAMURA[1], Napaporn Piamsa-nga[2], Sanit Wongsa[3], Varameth Vichiensan[2] (1.Nagoya University, 2.Kasetsart University, 3.King Mongkut's University of Technology Thonburi)

[AHW37-09] Validaion of land surface model considering groundwater level change

*Daiya Shiojiri[1], Kenji Tanaka[2], Shigenobu Tanaka[2] (1.Graduate School of Engineering, Kyoto Univ., 2.Disaster Prevention Research Institute, Kyoto Univ.)

[AHW37-10] Climate Change Impacts on Groundwater Recharge in the Yom and Nan River basins, Northern Thailand

*Chaiwat Ekkawatpanit[1], Chanchai Petpongpan[1], Duangrudee Kositgittiwong[1], Naota Hanasaki[2] (1.King Mongkut s University of Technology Thonburi, 2.National Institute for Environmental Studies, Tsukuba, Japan)

[AHW37-11] **Shallow Groundwater Plays as a Key of Water Supply Management for Crop Land during Severe Drought Crisis Situation in Thailand**

*Desell Suanburi[1], Koshi Yoshida[2], Weerakaset Suanpaga[1], Naruekamon Janjirawuttikul[3] (1.Kasetsart University, 2.Ibaraki University, 3.Land Development Department)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CC Cryospheric Sciences & Cold District Environment

[A-CC38] Ice cores and paleoenvironmental modeling

convener:Ayako Abe-Ouchi(Atmosphere and Ocean Research Institute, The University of Tokyo), Ryu Uemura(Nagoya University), Kenji Kawamura(National Institute of Polar Research, Research Organization of Information and Systems), Nozomu Takeuchi(Chiba University)

[ACC38-01] Variations in nitrate stable isotopes in ice cores from two glaciers in central Asia

*Nozomu Takeuchi[1], Nobuhito Ohte[2], Koji Fujita[3] (1.Chiba University, 2.Kyoto University, 3.Nagoya University)

[ACC38-02] Reconstructions of past microbial flora from ice core samples on Gregoriev Glacier, Kyrgyz Tienshan

*Segawa Takahiro[1], Ryo Matsuzaki[2], Ayumi Akiyoshi[3], Takahiro Yonezawa[4], Hiroshi Mori[5], Nozomu Takeuchi[6] (1.University of Yamanashi, 2.National Institute for Environmental Studies, 3.National Institute of Polar Research, 4.Tokyo University of Agriculture, 5.National Institute of Genetics, 6.Chiba University)

[ACC38-03] Collaborative studies for locating the oldest ice near Dome Fuji, Antarctica

*Kenji Kawamura[1,2,3], Ayako Abe-Ouchi[4,1], Shuji Fujita[1,2], Prasad Gogineni[5], David Braaten[6], Jean-Charle Gallet[7], Kumiko Goto-Azuma[1,2], Ralf Greve[8], Elisabeth Isaksson[7], Brice van Liefferinge[7], Kenichi Matsuoka[7], Hideaki Motoyama[1,2], Fumio Nakazawa[1,2], Takashi Obase[4], Hiroshi Ohno[9], Ikumi Oyabu[1], John Paden[6], Fernando Rodriguez-Morales[6], Fuyuki SAITO[3], Ryan A. Taylor[5], Shun Tsutaki[1], Members of Third Dome Fuji Project Promotion Committee (1.National Institute of Polar Research, Research Organization of Information and Systems, 2.Graduate University for Advanced Studies, SOKENDAI, 3.Japan Agency for Marine-Earth Science and Technology (JAMSTEC), 4.University of Tokyo, 5.University of Alabama, 6.University of Kansas, 7.Norwegian Polar Institute, 8.Hokkaido University, 9.Kitami Insittute of Technology)

[ACC38-04] Mapping near-surface layers with UWB microwave radar and optimized processing of sounder data to enhance deep layers

★Invited Papers

Sivaprasad Gogineni[1], *Ryan Andrew Taylor[1], Shriniwas Kolpuke[1], Jordan Larson[1], Linfeng Li[1], Charles O'Neill[1], Ryan Thomas[1], Shashank Wattal[1], Jie-Bang Yan[1], David Braaten[2], Ayako Abe-Ouchi[3], Shuji Fujita[4], Kenji Kawamura[4], Shun Tsutaki[4], Brice van Liefferinge[5], Kenichi Matsuoka[5] (1.University of Alabama, 2.University of Kansas, 3.University of Tokyo, 4.National Institute of Polar Research, 5.Norwegian Polar Institute)

[ACC38-05] Features of the ice sheet radio-echoes from deep internal layers and ice/bed boundaries observed with radars of the Japanese Antarctic Research Expedition: a summary

★Invited Papers

*Shuji Fujita[1,2], Kenji Kawamura[1,2,3], Ayako Abe-Ouchi[1,4], Kotaro FUKUI[5], Kenichi Matsuoka[6] (1.National Institute of Polar Research, Research Organization of Information and Systems(ROIS), 2.The Graduate University for Advanced Studies (SOKENDAI), 3.Japan Agency for Marine-Earth Science and Technology (JAMSTEC), 4.Atmosphere and Ocean Research Institute, The University of Tokyo, 5.Tateyama Caldera Sabo Museum, Japan, 6.Norwegian Polar Institute)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CC Cryospheric Sciences & Cold District Environment

[A-CC38] Ice cores and paleoenvironmental modeling

convener:Ayako Abe-Ouchi(Atmosphere and Ocean Research Institute, The University of Tokyo), Ryu Uemura(Nagoya University), Kenji Kawamura(National Institute of Polar Research, Research Organization of Information and Systems), Nozomu Takeuchi(Chiba University)

[ACC38-06] Fine-Resolution Radar Measurements for Ice-Core Drilling Site identification Near Dome-Fuji

★Invited Papers

*Fernando Rodriguez Morales[1,2], David Braaten[1,2], John Paden[1,2], Prasad Gogineni, Ryan Taylor, Ayako Abe-Ouchi, Shuji Fujita, Kenji Kawamura, Shun Tsutaki, Brice Van Liefferinge, Kenichi Matsuoka (1.University of Kansas, 2.Center for Remote Sensing of Ice Sheets)

[ACC38-07] A basal topographic map in the Dome Fuji area, East Antarctica, constructed from a ground-based radar survey

★Invited Papers

*Shun Tsutaki[1], Shuji Fujita[1,2], Kenji Kawamura[1,2,3], Prasad Gogineni[4], Ayako Abe-Ouchi[5,1], David Braaten[6], Jean-Charles Gallet[7], Elisabeth Isaksson[7], Brice van Liefferinge[7], Kenichi Matsuoka[7], Charles O'Neil[4], John Paden[6], Fernando Rodriguez-Morales[6], Ryan Taylor[4], Jie-Bang Yan[4], Kumiko Goto-Azuma[1,2], Ralf Greve[8], Stephen Hudson[7], Jack Kohler[7], Shriniwas Kolpuke[4], Linfeng Li[4], Geir Moholdt[7], Hideaki Motoyama[1,2], Takashi Obase[5], Fuyuki SAITO[3], Kotaro FUKUI[9] (1.National Institute of Polar Research, 2.The Graduate University for Advanced Studies, 3.Japan Agency for Marine-Earth Science and Technology, 4.The University of Alabama, 5.The University of Tokyo, 6.The University of Kansas, 7.Norwegian Polar Institute, 8.Hokkaido University, 9.Tateyama Caldera Sabo Museum)

[ACC38-08] Searching potential sites of million year-old ice by modelling ice sheet age near New Dome Fuji region

*Ayako Abe-Ouchi[1], Takashi Obase[1], Kenji Kawamura[2], Shuji Fujita[2], Fuyuki SAITO[3], Shun Tsutaki[2], Prasad Gogineni[4], David Braaten[5], Fernando Rodriguez-Morales[5], John Paden[5], Kenichi Matsuoka[6], Hideaki Motoyama[2], Ralf Greve[7], Brice van Liefferinge[6], Ryan Taylor[4] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.NIPR, 3.JAMSTEC, 4.The University of Alabama, 5.University of Kansas, 6.Norwegian Polar Institute, 7.Institute of Low Temperature Science, Hokkaido University)

[ACC38-09] Antarctic warmth in the last interglacial driven by Northern insolation and deglaciation

*Takashi Obase[1], Ayako Abe-Ouchi[1,2], Fuyuki SAITO[3] (1.Atmosphere and Ocean Research Institute, the University of Tokyo, 2.National Institute of Polar Research, 3.Japan Agency for Marine-Earth Science and Technology)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-GE Geological & Soil Environment

[A-GE40] Subsurface Mass Transport and Environmental Assessment

convener:Hirotaka Saito(Department of Ecoregion Science, Tokyo University of Agriculture and Technology), Shoichiro Hamamoto(Department of Biological and Environmental Engineering, The University of Tokyo), Yuki Kojima(Department of Civil Engineering, Gifu University), Yasushi Mori(Graduate School of Environmental and Life Science, Okayama University)

[AGE40-01] **Impacts of Si on Se(IV) immobilization on ferrihydrite: An *in-situ* ATR-IR spectroscopic investigation**

*Paul Clarence Magdael Francisco[1], Yukio Tachi[1] (1.Japan Atomic Energy Agency)

[AGE40-02] **Reaction and alteration of mudstone with cement pore fluids**

*Keith Bateman[1], Yuki Amano[1], Yukio Tachi[1] (1.Japan Atomic Energy Agency)

[AGE40-03] Measurement and analysis of real-world pore micromodel for multiphase flow displacement

*Chun-Wei Peng[1] (1.Taiwan National Chiao Tung University)

[AGE40-04] Assessment of Soil Quality as Affected by Topography and Farming Practices in the Rice Terraces in Ifugao, the Philippines

★Invited Papers

*Tomoyo Kurozumi[1], Yasushi Mori[1], Hiroaki Somura[1], Milagros Ong How[2], Pearl Basilio Sanchez[3] (1.Graduate School of Environmental and Life Science, Okayama University,, 2.Universal Harvester Incorporated, 3.University of the Philippines Los Banos)

[AGE40-05] Effect of surface and weather conditions on subsurface water flow and heat transport

*Shintaro Kubota[1], Mito Nishioka[1], Yuki Kojima[2], Megumi Yamashita[1], Hirotaka Saito[1] (1.Graduate School of Agriculture, Tokyo University of Agriculture and Technology, 2.Department of Civil Engineering, Gifu University)

[AGE40-06] Effect of soil type on estimating infiltration front depth using time-lapse array antenna GPR data: A numerical study

*Koki Oikawa[1], Seiichiro Kuroda[2], Hirotaka Saito[1] (1.Tokyo University of Agriculture and Technology, 2.NARO Institute for Rural Engineering)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-GE Geological & Soil Environment

[A-GE41] Energy-Environment-Water Nexus and Sustainable Development

convener:Ming Zhang(Institute for Geo-Resources and Environment, Geological Survey of Japan, AIST), Yonghong Hao(Tianjin Normal University), Jet-Chau Wen(National Yunlin University of Science and Technology), Ken Kawamoto(Graduate School of Science and Engineering, Saitama University)

[AGE41-01] Impacts of the aquifer depletion on ground surface temperature in north China plain

★Invited Papers

*You-Kuan Zhang[1] (1.Southern University of Science and Technology)

[AGE41-02] **Investigate Sustainable Development for Micro-hydropower Generation of Water-food-energy Nexus of Irrigated Agriculture**

*Jen-Chieh Shih[1], Sheng-Hsin Hsieh [2], Ming-Der Hong [2], Hong-Ru Lin [3], Jyun-Lin Chen[4], Shao-Yang Huang [4], Jet-Chau Wen [4,5] (1. Graduate School of Safety Health and Environmental Engineering, National Yunlin University of Science and Technology., 2.Department of Irrigation and Engineering, Council of Agriculture, Executive Yuan., 3.Graduate School of Engineering Science and Technology, National Yunlin University of Science and Technology., 4.Research Center for Soil and Water Resources and Natural Disaster Prevention (SWAN), National Yunlin University of Science and Technology., 5.Department and Graduate School of Safety Health and Environmental Engineering, National Yunlin University of Science and Technology.)

[AGE41-03] ANALYSIS OF PORE STRUCTURAL PARAMETERS WITH MICROFOCUS X-RAY COMPUTED TOMOGRAPHY AND GAS TRANSPORT MEASURMENTS

★Invited Papers

*Arjun Baniya[1], Akihiro Matsuno[1], Takeshi Saito[1], Ken Kawamoto[1] (1.Graduate School of Science and Engineering, Saitama University, Japan)

[AGE41-04] Using ship's device-produced drinking water to achieve a ballast free management

*Kun-Tu Lu[1], Hon-Kit Lui[2], Chen-Tung Arthur Chen[2], Li-Lian Liu[2] (1.Department of Marine Environment and Engineering, National Sun Yat-sen University, Kaohsiung 80424, Taiwan., 2.Department of Oceanography, National Sun Yat-sen University, Kaohsiung 80424, Taiwan.)

[AGE41-05] Possible Pathways and Microorganisms Associated with Biodegradation of Chlorinated Ethanes

*Ming Zhang[1], Miho Yoshikawa[1] (1.Institute for Geo-Resources and Environment, Geological Survey of Japan, AIST)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-GE Geological & Soil Environment

[A-GE42] Interactions between Earth Critical Zone Hydrogeological Processes and Ecosystem

convener:Wang Wenke(Chang'an University), Yaqian Zhao(Xian University of Technology), Jet-Chau Wen(National Yunlin University of Science and Technology), Ming Zhang(Institute for Geo-Resources and Environment, Geological Survey of Japan, AIST)

[AGE42-01] Subsurface hydrology and ecological effect in arid and semi-arid regions

★Invited Papers

*Wang Wenke[1], Lei Duan[1], Zhoufeng Wang[1], Zaiyong Zhang[1] (1.Chang'an University)

[AGE42-02] **Using the Artificial Lake to Evaluate the Efficiency of Groundwater Recharge in Taiwan**

*Yi-Yu Li[1], Sheng-Hsin Hsieh[2], Ming-Der Hong[2], Jyun-Lin Chen[3], Hong-Ru Lin[4], Shao-Yang Huang[3], Jet-Chau Wen[3,5] (1.Graduate School of Safety Health and Environmental Engineering, National Yunlin University of Science and Technology, 2.Department of Irrigation and Engineering, Council of Agriculture, Executive Yuan, 3.Research Center for Soil and Water Resources and Natural Disaster Prevention (SWAN), National Yunlin University of Science and Technology, 4.Graduate School of Engineering Science and Technology, National Yunlin University of Science and Technology, 5.Department and Graduate School of Safety Health and Environmental Engineering, National Yunlin University of Science and Technology)

[AGE42-03] **Assessment of acidification hazard by acid sulfate soils in the critical zone of Muthurajawela marsh, Sri Lanka**

*Prashani Amoditha Kumari Ulapane[1], Chamindra L Vithana[1,2], Rohana Chandrajith[1], Leigh A Sullivan[3], Jochen Bundschuh[4], Atula Senaratne[1], Nick J Ward[2], Nadia Toppler[5] (1.Department of Geology, University of Peradeniya, Sri Lanka, 2.Southern Cross Geoscience, Southern Cross University, Australia, 3.University of Canberra, Australia, 4.University of Southern Queensland, Australia, 5.Environmental Analysis Laboratory, Southern Cross University, Australia)

[AGE42-04] **Analysis of one-dimensional vertical unsaturated flow in layered soils**

*Zaiyong Zhang[1], Wenke Wang[1], Chengcheng Gong[1], Tian-chyi Jim Yeh[2], Zhan Wang[1] (1.Chang'an University, 2.University of Arizona)

[AGE42-05] **Simulation of karst spring discharge using deep learning**

Lixing An[1], *Yonghong Hao[1], Tian-Chyi Jim Yeh [2], Yan Liu[1] (1.Tianjin Normal University, 2.The University of Arizona)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-GE Geological & Soil Environment

[A-GE43] Extending Hydropedology- -in memory of Professor Henry Lin

convener:Kosuke Noborio(Meiji University), Yasushi Mori(Graduate School of Environmental and Life Science, Okayama University)

[AGE43-01] Performance of moisture release curves created using *in situ* measurements for estimating infiltration and runoff

★Invited Papers

*Colin Campbell[1], Alton Campbell[2], Neil Hansen[2] (1.METER Group, Inc., 2.Dept. of Plant and Wildlife Sciences, Brigham Young University)

[AGE43-02] **Inverse Estimation of Soil Water Retention Curve from Infiltration Data**

*Hamed Ebrahimian[1,2], Mehrnaz Amini[3], Abdolmajid Liaghat[4], Haruyuki Fujimaki[5] (1.Associate professor, Department of Irrigation and Reclamation Engineering, University of Tehran, Karaj, Iran , 2.Visiting associate professor, Arid Land Research Center, Tottori University, Tottori, Japan., 3.Graduate student, Department of Irrigation and Reclamation Engineering, University of Tehran, Karaj, Iran., 4.Professor, Department of Irrigation and Reclamation Engineering, University of Tehran, Karaj, Iran., 5.Professor, Arid Land Research Center, Tottori University, Tottori, Japan.)

[AGE43-03] Soil moisture estimation using low-cost GPS multipath receiver.

*Yasushi Mori[1], Hiromitsu Funahashi[1], Tadaomi Saito[2], Kosuke Noborio[3] (1.Graduate School of Environmental and Life Science, Okayama University, 2.Fac. of Agriculture, Tottori University, 3.Fac. of Agriculture, Meiji University)

[AGE43-04] **Relationship between Soil Thermal Conductivity and Electrical Conductivity at Room Temperatures**

★Invited Papers

Lin Liu[1], Weiliu Li[1], Yili Lu[1], *Tusheng Ren[1] (1.China Agricultural University)

[AGE43-05] Gravity effect on water movement in pore space of glass beads porous media under microgravity.

*Yuichi Maruo[1], Naoto Sato[2], Kento Nogawa[1], Maho Tsukano[3], Hayato Mizutani[3], Natsumi Naganuma[1], Kosuke Noborio[3] (1.Graduate school of Agriculture, Meiji University, 2.Organization for the Strategic Coordination of Research and Intellectual Property, Meiji University, 3.Department of Agriculture, Meiji University)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

[A-CG44] Extratropical oceans and atmosphere

convener:Youichi Kamae(Faculty of Life and Environmental Sciences, University of Tsukuba), Toyama Katsuya(Meteorological Research Institute), Hyodae Seo(Woods Hole Oceanographic Institution), Yoshi N(Hokkaido University)

[ACG44-01] **Western boundary currents and their extension regions as conduits for the ejection of bomb-radiocarbon from the thermocline**

★Invited Papers

*Keith Bradley Rodgers[1,2], Ping Zhai[3], Richard D Slater[3], Brendan R Carter[4,5], Daniele Iudicone[6], Olivier Aumont[7], Jesse Farmer[8,9], Ivy Frenger[10], Yves Plancherel[11], Laure Replandy[12], Andrea Fassbdner[13], Katsuya Toyama[14] (1.IBS Center for Climate Physics, Busan, Republic of Korea, 2.Pusan National University, Busan, Republic of Korea, 3.Atmospheric and Oceanic Sciences Program, Princeton University, NJ, 4.Joint Institute for the Study of the Atmosphere and Ocean, University of Washington, Seattle, WA, 5.NOAA Pacific Marine Environmental Laboratory, Seattle, WA, 6.Department of Integrated Marine Ecology, Stazione Zoologica, Anton Dohrn, Naples, Italy, 7.Sorbonne Universités, UPMC, Univ. Paris 06-CNRS-IRD-MHNH, LOCEAN/IPSL, Paris, France, 8.Princeton University, Department of Geosciences, Princeton, NJ, 9.Climate Geochemistry, Max-Planck INstitute for Chemistry, Mainz, Germany, 10.GEOMAR Helmholz Centre for Ocean Research, Kiel, Germany, 11.Grantham Institute, Imperial College, London, UK, 12.Princeton Environmental Institute, Princeton, NJ, 13.Monterey Bay Aquarium Research Institute, Moss Landing, CA, 14.Oceanography and Geochemsitry Research Department, Meteorological Research Insistute, Japan Meteorological Agency, Tsukuba, Japan)

[ACG44-02] Modulation of western boundary current influence on the troposphere by atmospheric fronts

*Rhys Parfitt[1,2], Hyodae Seo[2], Young-Oh Kwon[2] (1.Florida State University, 2.Woods Hole Oceanographic Institution)

[ACG44-03] Processes Shaping the Time-Mean Surface Wind Convergence Patterns Aound the Kuroshio Extension and Gulf Stream in Winter

*Ryusuke Masunaga[1], Hisashi Nakamura[2], Bunmei Taguchi[4], Takafumi Miyasaka[3,2] (1.International Pacific Research Center, University of Hawaii, 2.Research Center for Advanced Science and Technology, The university of Tokyo, 3.Japan Meteorological Business Support Center, 4.University of Toyama)

[ACG44-04] *Climatic Hotspot2* project in Japan

★Invited Papers

*Masami Nonaka[1] (1.Application Laboratory, Research Institute for Value-Added Information Generation, Japan Agency for Marine-Earth Science and Technology)

[ACG44-05] Coupled ocean-atmosphere interactions over oceanic boundary currents

*Hyodae Seo[1] (1.Woods Hole Oceanographic Institution)

[ACG44-06] **Forced atmospheric circulation response and its uncertainty to decadal SST variability in the Kuroshio Extension**

*Bunmei Taguchi[1,2], Kazuaki Nishii[3,2], Hisashi Nakamura[2,4] (1.Faculty of Sustainable Design, University of Toyama, 2.Research Center for Advanced Science and Technology, The University of Tokyo, 3.Graduate School of Bioresources, Mie University , 4.APL, Japan Agency for Marine-Earth Science and Technology)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

[A-CG44] Extratropical oceans and atmosphere

convener:Youichi Kamae(Faculty of Life and Environmental Sciences, University of Tsukuba), Toyama Katsuya(Meteorological Research Institute), Hyodae Seo(Woods Hole Oceanographic Institution), Yoshi N(Hokkaido University)

[ACG44-07] Deep learning for mesoscale air-sea interactions

★Invited Papers

*Thomas Kilpatrick[1], Shang-Ping Xie[1], Will Chapman[1] (1.Scripps Institution of Oceanography)

[ACG44-08] Extratropical cyclone processes as a key to understanding climate sensitivity

*Daniel McCoy[1], Paul Field[1,2], Alejandro Bodas-Salcedo[2], Gregory Elsaesser[3], Mark Zelinka[4] (1.University of Leeds, 2.UK Met Office, 3.Columbia University and NASA Goddard Institute for Space Studies, 4.Lawrence Livermore National Laboratory)

[ACG44-09] Stability Index for Marine Low Cloud Cover over the Mid-latitudes

*Hideaki Kawai[1], Tsuyoshi Koshiro[1] (1.Meteorological Research Institute)

[ACG44-10] Air-sea fluxes and ocean variability associated with atmospheric rivers

*Toshiaki Shinoda[1], Weiqing Han[2], Luis Zamudio[3], Joe Metzger[4], Chris Fairall[5], Yanjuan Guo[6] (1.Texas A&M University Corpus Christi, 2.University of Colorado, 3.Florida State University, 4.Naval Research Laboratory, 5.NOAA, 6.University of Maryland)

[ACG44-11] On the Importance of a Midlatitude Oceanic Frontal Zone for the Baroclinic Annular Mode

*Morio Nakayama[1], Hisashi Nakamura[1], Fumiaki Ogawa[2] (1.Research Center for Advanced Science and Technology, the University of Tokyo , 2.University of Bergen)

[ACG44-12] North and South Pacific Decadal Oscillations: Tropical Pacific Forcing versus Internal Variability

*Yu Zhang[1,2], Shang-Ping Xie[3], Yu Kosaka[4], Jun-Chao Yang[1,2] (1.Physical Oceanography Laboratory, Ocean University of China, 2.Qingdao National Laboratory for Marine Science and Technology, 3.Scripps Institution of Oceanography, University of California San Diego, 4.Research Center for Advanced Science and Technology, The University of Tokyo)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

[A-CG45] Multi-scale ocean-atmosphere interaction in the tropical Indo-Pacific region

convener:Yu Kosaka(Research Center for Advanced Science and Technology, University of Tokyo), Sang-Wook Yeh(Hanyang University), Takanori Horii(Research and Development Center for Global Change (RCGC), Strategic Research and Development Area, Japan Agency for Marine-Earth Science and Technology (JAMSTEC)), Hiroki Tokinaga(Disaster Prevention Research Institute, Kyoto University)

[ACG45-01] **Impacts of Arabian Sea SST biases on Indian monsoon precipitation and eastern Mediterranean climate in a coupled GCM**

★Invited Papers

*Yoko Yamagami[1], Hiroaki Tatebe[2], Masahiro Watanabe[1] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Japan Agency for Marine-Earth Science and Technology)

[ACG45-02] Radiative impacts of low-level clouds on the subtropical high in the South Indian Ocean and their seasonal differences simulated in a coupled general circulation model

*Ayumu Miyamoto[1], Hisashi Nakamura[1], Takafumi Miyasaka[1,2], Yu Kosaka[1] (1.Research Center for Advanced Science and Technology, The University of Tokyo, 2.Japan Meteorological Business Support Center)

[ACG45-03] Salt-Stratified Barrier Layers in the Eastern Tropical North Pacific

*Shota Katsura[1], Janet Sprintall[1] (1.Scripps Institution of Oceanography, University of California, San Diego)

[ACG45-04] **ENSO Modulation of ISO intensity and Upscale Feedback of ISO on Seasonal Mean SST in the Western North Pacific**

★Invited Papers

*Renguang Wu[1], Xi Cao[2], Yuqi Wang[2] (1.Zhejiang University, 2.Institute of Atmospheric Physics, Chinese Academy of Sciences)

[ACG45-05] Incorporating the convection-SST sensitivity to understand ENSO and its diversity

*Ruihuang Xie[1] (1.Institute of Oceanology, Chinese Academy of Sciences)

[ACG45-06] **Effects of Tropical Cyclones on ENSO**

*Tao Lian[1], Hongli Ren[2] (1.State Key Laboratory of Satellite Ocean Environment Dynamics, Second Institute of Oceanography, Ministry of Natural Resources, Hangzhou, China, 2.Laboratory for Climate Studies, National Climate Center, China Meteorological Administration, Beijing, China)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

[A-CG45] Multi-scale ocean-atmosphere interaction in the tropical Indo-Pacific region

convener:Yu Kosaka(Research Center for Advanced Science and Technology, University of Tokyo), Sang-Wook Yeh(Hanyang University), Takanori Horii(Research and Development Center for Global Change (RCGC), Strategic Research and Development Area, Japan Agency for Marine-Earth Science and Technology (JAMSTEC)), Hiroki Tokinaga(Disaster Prevention Research Institute, Kyoto University)

[ACG45-07] **Marginal sea surface temperature variation as a pre-cursor of heat waves over the Korean Peninsula**

★Invited Papers

*Yoo-Geun Ham[1] (1.Department of Oceanography, Chonnam National University)

[ACG45-08] Rethinking the ENSO–monsoon relationship in light of trans-basin interactions

★Invited Papers

*Yuhei Takaya[1], Yu Kosaka[2], Masahiro Watanabe[3], Shuhei Maeda[1], Naoaki Saito[1], Ichiro Ishikawa[1] (1.Meteorological Research Institute, 2.Research Center for Advanced Science and Technology, University of Tokyo, 3.Atmosphere and Ocean Research Institute, University of Tokyo)

[ACG45-09] Indo-Pacific Climate Modes in Warming Climate: Consensus and Uncertainty Across Model Projections

*Xiao-Tong Zheng[1] (1.Ocean University of China)

[ACG45-10] Understanding the mechanisms associated with an unstable relationship between Pacific Decadal Oscillation and Indian Ocean Basin mode

*Sang-Wook Yeh[1] (1.Hanyang University)

[ACG45-11] Observed cross-basin interaction of decadal climate variability over the Indo-Pacific region

*Yuma Miyaji[1], Youichi Tanimoto[2] (1.Hokkaido University, Graduate School of Environmental Science, 2.Hokkaido University, Faculty of Environmental Earth Science)

[ACG45-12] Origin of Equatorial Pacific Decadal Variability: Thermodynamic or Dynamic Coupling?

*Yu Zhang[1,2], Shang-Ping Xie[3], Dillon J. Amaya[4,5], Qihua Peng[6], Yu Kosaka[7], Xiaopei Lin[1,2], Jun-Chao Yang[1,2], Sarah M. Larson[8], Arthur J. Miller[3] (1.Physical Oceanography Laboratory, Ocean University of China, 2.Qingdao National Laboratory for Marine Science and Technology, 3.Scripps Institution of Oceanography, University of California San Diego, 4.Cooperative Institute for Research in Environmental Sciences, University of Colorado Boulder, 5.Department of Atmospheric and Oceanic Sciences, University of Colorado Boulder, 6.State Key Laboratory of Tropical Oceanography, South China Sea Institute of Oceanology, Chinese Academy of Sciences, 7.Research Center for Advanced Science and Technology, The University of Tokyo, 8.Department of Marine, Earth, and Atmospheric Sciences, North Carolina State University)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

[A-CG47] Global Carbon Cycle Observation and Analysis

convener:Kazuhito Ichii(Chiba University), Prabir Patra(Research Institute for Global Change, JAMSTEC), Forrest M. Hoffman(Oak Ridge National Laboratory), Makoto Saito(National Institute of Environmental Studies)

[ACG47-01] Relative contributions of different methane emission categories in the continental East Asia inferred from stable carbon isotope measurements at Hateruma Station

★Invited Papers

*Taku Umezawa[1], Takuya Saito[1], Yasunori Tohjima[1], Yukio Terao[1], Akihiko Ito[1] (1.National Institute of Environmental Studies)

[ACG47-02] **Process analysis of GHGs seasonal variabilty in the UT/LS region on account of emissions, dynamics and atmospheric chemistry**

*Jagat Bisht[1], Prabir Patra[1,2], Naveen Chandra[1], Toshinobu Machida[3], Naoko Saitoh[2] (1.Research Institute for Global Change (RIGC), JAMSTEC, Yokohama, 236-0001, Japan, 2.Center for Environmental Remote Sensing, Chiba University, Chiba, 263-8522, Japan, 3.CGER, National Institute for Environmental Studies, Tsukuba, Japan)

[ACG47-03] An observation-based synthetic reconstruction of surface ocean inorganic carbon variables

*Yosuke Iida[1,2], Yusuke Takatani[1], Atsushi Kojima[1], Takashi Nakamura[1,2], Masao Ishii[2,1] (1.Japan Meterological Agency, 2.Meteorological Research Institute)

[ACG47-04] Decoupling of projected oceanic uptake of carbon and heat in the 21st century in a high carbon emission pathway

*Eric Mortenson[1], Andrew Lenton[1,2,3], Tom Trull[1,2], Elizabeth Shadwick[1,2,3], Xuebin Zhang[1,3], Matt Chamberlain[1] (1.Commonwealth Scientific and Industrial Research Organization, Australia, 2.Australian Antarctic Program Partnership, 3.The Centre for Southern Hemisphere Oceans Research)

[ACG47-05] **Utility of total column CO_2 observations by satellites and atmospheric CO_2 inversion for evaluating carbon cycle processes in the Earth System Models**

*Prabir Patra[1,2], Tomohiro Hajima[1], Ryu Saito[3], Naveen Chandra[1], Yukio Yoshida[4], Michio Kawamiya[1], Masayuki Kondo[2], Kazuhito Ichii[2], Akihiko Ito[4], Dave Crisp[5] (1.Research Institute for Global Change, JAMSTEC, 2.Center for Environmental Remote Sensing, Chiba University, Chiba 263-8522, Japan, 3.Disaster Risk Reduction and Environ. SBU, Kokusai Kogyo Co., Ltd., Tokyo, 183-0057, Japan, 4.Center for Global Environmental Research, NIES, Tsukuba, 305-8506, Japan, 5.NASA Jet Propulsion Laboratory, California Institute of Technology, Pasadena, CA 91109, USA)

[ACG47-06] Diagnosing Climate–Carbon Cycle Feedbacks Constrained by ILAMB

*Forrest M. Hoffman[1,2], Nathan Collier[1], Mingquan Mu[3], Cheng-En Yang[2], Gretchen Keppel-Aleks[4], David M. Lawrence[5], Charles D. Koven[6], William J. Riley[6], James T. Randerson[3] (1.Oak Ridge National Laboratory, 2.University of Tennessee Knoxville, 3.University of California Irvine, 4.University of Michigan, 5.National Center for Atmospheric Research, 6.Lawrence Berkeley National Laboratory)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

[A-CG47] Global Carbon Cycle Observation and Analysis

convener:Kazuhito Ichii(Chiba University), Prabir Patra(Research Institute for Global Change, JAMSTEC), Forrest M. Hoffman(Oak Ridge National Laboratory), Makoto Saito(National Institute of Environmental Studies)

[ACG47-07] On reliable pattern of historical land-use and land-cover change transition in Southeast Asia

★Invited Papers

*Masayuki Kondo[1] (1. Center for Environmental Remote Sensing, Chiba University)

[ACG47-08] Detecting the Borneo ecosystem changes caused by 2015 El Nino events using Satellite SIF data

*Kazutaka Murakami[1], Makoto Saito[1], Hibiki M Noda[1], Haruki Oshio[1], Yukio Yoshida[1], Kazuhito Ichii[2,1] (1.National Institute for Environmental Studies, 2.Chiba University)

[ACG47-09] **Response of tropical terrestrial gross primary production to the super El Niño event in 2015**

*Jiawen Zhu[1], Minghua Zhang[2], Yao Zhang[3], Xiaodong Zeng[1], Xiangming Xiao[4] (1.Institute of Atmospheric Physics, CAS, 2.Stony Brook Univ., 3.Columbia Univ., 4.Univ. of Oklahoma)

[ACG47-10] **Fixed Nonlinear Multiregression Based Spectral Modelling Approach for Predictive Quantification of Biomass and Carbon stocks of Tree Outside Forest areas (TOFs) over Arid zone of Jodhpur, Rajasthan, India**

*SWATI UNIYAL[1], Sitiraju Srinivasa Rao[2], Eadara Amminedu[1] (1.Andhra University,Visakhapatnam,Andhra Pradesh,India, 2.National Remote Sensing Center,Hyderabad,India)

[ACG47-11] Updating data-driven estimation of terrestrial carbon fluxes across Asia

*Kazuhito Ichii[1], Riku Kawase[1], Zhiyan Liu[1] (1.Chiba University)

[ACG47-12] **Regional estimates of CO_2 budget using inverse modelling for the past two decades (1996-2018)**

*Naveen Chandra[1], Prabir Patra[1] (1.Japan Agency for Marine Earth Science and Technology)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

[A-CG48] Projection and detection of global environmental change

convener:Michio Kawamiya(Japan Agency for Marine-Earth Science and Technology), Kaoru Tachiiri(Japan Agency for Marine-Earth Science and Technology), Hiroaki Tatebe(Japan Agency for Marine-Earth Science and Technology), V Ramaswamy(NOAA GFDL)

[ACG48-01] Exploring physical and biological environmental responses to differing rates of carbon emissions

★Invited Papers

*John P Krasting[1], John P Dunne[1], Jasmin G John[1], Michael Winton[1] (1.NOAA - Geophysical Fluid Dynamics Laboratory)

[ACG48-02] Highlighted results from the latest MIROC-based ESM and activities of TOUGOU-B

*Michio Kawamiya[1], Kaoru Tachiiri[1], Tomohiro Hajima[1], Tokuta Yokohata[2], Junichi Tsutsui[4], Takashi Arakawa[3], Takahiro Inoue[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.National Institute for Environmental Studies, 3.Research Organization for Information Science and Technology, 4.Central Research Institute of Electric Power Industry)

[ACG48-03] Evaluation of carbon cycles in a suite of CMIP6-C^{4}MIP experiments by Meteorological Research Institute Earth System Model version 2.0 (MRI-ESM2.0)

*Hiroyuki Tsujino[1], Atsushi Obata[1], Seiji Yukimoto[1], Masahiro Hosaka[1], Taichu Y Tanaka[1], Toyama Katsuya[1], Tsuyoshi Koshiro[1], Shogo Urakawa[1], Hideyuki Nakano[1] (1.Japan Meteorological Agency / Meteorological Research Institute)

[ACG48-04] Evaluation of terrestrial carbon cycle processes in MIROC-ES2L

*Tomohiro Hajima[1], Akihiko Ito[2], Prabir Patra[1], Kaoru Tachiiri[1], Kazuhito Ichii[3], Manabu Abe[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.National Institute for Environmental Studies, 3.Center for Environmental Remote Sensing, Chiba University)

[ACG48-05] Using UAVs and deep learning techniques to detect invasive species in forests and wetlands

*Sarah Kentsch[1,2], Maximo Larry Lopez Caceres[1], Yago Diez Donoso[1], Jens Gross[3] (1.Yamagata University, 2.United Graduate school of Agriculture Sciences (UGAS), 3.Leibniz University of Hannover)

[ACG48-06] Modeling ocean-ice shelf interaction over the Southern Ocean under RCP8.5 scenario

*Kazuya Kusahara[1], Hiroaki Tatebe[1], Tomohiro Hajima[1], Fuyuki SAITO[1] (1.Japan Agency for Marine-Earth Science and Technology)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

[A-CG48] Projection and detection of global environmental change

convener:Michio Kawamiya(Japan Agency for Marine-Earth Science and Technology), Kaoru Tachiiri(Japan Agency for Marine-Earth Science and Technology), Hiroaki Tatebe(Japan Agency for Marine-Earth Science and Technology), V Ramaswamy(NOAA GFDL)

[ACG48-07] Toward marine ecosystem prediction with a global ESM

★Invited Papers

*Jong-yeon Park[1], Charles A. Stock[2], John P. Dunne[2], Xiaosong Yang[2], Anthony Rosati[2] (1.Jeonbuk National University (JBNU), 2.Geophysical Fluid Dynamics Laboratory (GFDL))

[ACG48-08] Estimating global air–sea and air–land CO2 flux fluctuations over the past forty years with an Earth system model incorporating a data assimilation system

*Michio Watanabe[1], Hiroaki Tatebe[1], Hiroshi Koyama, Tomohiro Hajima[1], Masahiro Watanabe[2], Michio Kawamiya[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.The University of Tokyo)

[ACG48-09] Overview of the processes interacting between Earth and socio-economic systems

*Kaoru Tachiiri[1], Ken'ichi Matsumoto[2], Xuanming Su[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.Nagasaki University)

[ACG48-10] **Quantify allowable warmings for 2 °C and 1.5 °C climate targets**

*Xuanming Su[1], Katsumasa Tanaka[2,3], Kaoru Tachiiri[1], Michio Watanabe[1], Michio Kawamiya[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.Laboratoire des Sciences du Climat et de l'Environnement (LSCE), Commissariat à l'énergie atomique et aux énergies alternatives (CEA), Gif-sur-Yvette, France, 3.National Institute for Environmental Studies (NIES))

[ACG48-11] Impacts of climate and socio-economic changes on water, food, bio-energy and land use investigated with an integrated land surface model (MIROC-INTEG)

*Tokuta Yokohata[1], Tsuguki Kinoshita[2], Gen Sakurai[3], Akihiko Ito[1], Yusuke Satoh[1], Yadu Pokhrel[4], Masashi Okada[1], Etsushi Kato[5], KIYOSHI TAKAHASHI[1], Naota Hanasaki[1], Shinichiro Fujimori[6], Seita Emori[1] (1.National Institute for Environmental Studies, 2.Ibaraki University, 3.National Agriculture and Food Research Organization, 4.Michigan State University, 5.The Institute of Applied Energy, 6.Kyoto University)

[ACG48-12] Multi-type global drought projection using multi-model hydrological simulations

*Yusuke Satoh[1], Tokuta Yokohata[1], Yadu Pokhrel[2], Naota Hanasaki[1], Julien ERIC STANISLAS Boulange[1], Peter Burek[3], Kumiko TAKATA[1], Hideo Shiogama[1] (1.National Institute for Environmental Studies, 2.Department of Civil and Environmental Engineering, Michigan State University, 3.International Institute for Applied Systems Analysis)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

[A-CG49] Greenhouse Gas Monitoring from Space: Current Capabilities, Challenges, and Future Needs

convener:kurosu thomas p(Jet Propulsion Laboratory, California Institute of Technology), Annmarie Eldering(Jet Propulsion Laboratory), Akihiko Kuze(Japan Aerospace Exploration Agency), Tsuneo Matsunaga(Center for Global Environmental Research and Satellite Observation Center, National Institute for Environmental Studies)

[ACG49-01] Current status of GOSAT and GOSAT-2 operation

*HIROKO IMAI[1], Hiroshi Suto[1], Kei Shiomi[1], Nobuhiro Kikuchi[1], Fumie Kataoka[2], Hiroyuki Miyamoto[1], Akihiko Kuze[1] (1.Japan Aerospace Exploration Agency, 2.Remote Sensing Technology Center of Japan)

[ACG49-02] Greenhouse gas concentrations retrieved from a combined use of SWIR and TIR observations by the GOSAT series satellites

*Nobuhiro Kikuchi[1], Akihiko Kuze[1], Fumie Kataoka[2], Kei Shiomi[1], Makiko Hashimoto[1], Hiroshi Suto[1] (1.Japan Aerospace Exploration Agency, 2.Remote Sensing Technology Center of Japan)

[ACG49-03] GOSAT collaboration activities with OCO-2 for calibration and validation

*Kei Shiomi[1], Akihiko Kuze[1], Hiroshi Suto[1], Nobuhiro Kikuchi[1], Mariko HASHIMOTO[1], Fumie KATAOKA[2] (1.Japan Aerospace Exploration Agency, 2.RESTEC)

[ACG49-04] The OCO-3 Mission: Performance of the Snapshot Area Map and Target Mode Observations and Coincident Measurements with the OMPS and TROPOMI Air Quality Sensors

*thomas p kurosu[1], Annmarie Eldering[1], Ralph basilio[1], matthew Bennett[1], Christopher O'Dell[2], Peter Somkuti[2], Thomas Taylor[2], Matthäus Kiel[1], Robert Nelson[1], Gary Spiers[1], Brendan Fisher[1], Ryan Pavlick[1], Gregory Osterman[1], Joshua Laughner[3], Graziela Keller-Rodrigues[1], Shanshan Yu[1], David Crisp[1], Paul Wennberg[3] (1.NASA Jet Propulsion Laboratory/California Institute of Technology, Pasadena, CA 91109, 2.Colorado State University, Fort Collins, CO 80523, 3.California Institute of Technology, Pasadena, CA 91125)

[ACG49-05] Early Comparison of OCO-3 XCO2 Measurements with TCCON

*Matthäus Kiel[1], Joshua Laughner[2], Annmarie Eldering[1], Brendan M. Fisher[1], thomas p kurosu[1], Ryan P. Pavlick[1], Gregory B. Osterman[1], Robert R. Nelson[1], Christopher W. O'Dell[3], Peter Somkuti[3], Thomas E. Taylor[3], Coleen M. Roehl[2], TCCON Team (1.NASA Jet Propulsion Laboratory, 2.Division of Geological and Planetary Sciences, California Institute of Technology, Pasadena, CA (USA), 3.Colorado State University, Fort Collins, CO (USA))

[ACG49-06] Temporally and spatially coincident observation of NO_2, CO_2 and CH_4 by manned and unmanned airplanes toward to detection of anthropogenic carbon signature

*Hiroshi Suto[1], Akihiko Kuze[1] (1.JAXA)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

[A-CG50] Earth & Environmental Sciences and Artificial Intelligence

convener:Tomohiko Tomita(Faculty of Advanced Science and Technology, Kumamoto University), Shigeki Hosoda(Japan Marine-Earth Science and Technology), Ken-ichi Fukui(Osaka University), Satoshi Ono(Kagoshima University)

[ACG50-01] What is "Explainable AI"?

★Invited Papers

*Satoshi Hara[1] (1.Osaka University)

[ACG50-02] Predicting global potential natural vegetation with an image recognition AI

*Hisashi Sato[1], Takeshi Ise[2] (1.Department of Environmental Geochemical Cycle Research, Japan Agency for Marine-Earth Science and Technology (JAMSTEC), 2.Field Science Education and Research Center, Kyoto University)

[ACG50-03] **Digital Soil Mapping of Soil Fertility in Thung Kula Rong-Hai Region, Thailand using Machine Learning Algorithm**

*Sasirin Srisomkiew[1], Masayuki Kawahigashi[1], Pitayakon Limtong[2] (1.Tokyo Metropolitan University, 2.Land Development Department)

[ACG50-04] **Robustness of optical remote sensing of cloud by deep convolutional neural network using multi-channel imaging spectroradiometer**

*Hironobu Iwabuchi[1], Hana Kato[1], Aki Masuda[1] (1.Graduate School of Science, Tohoku University)

[ACG50-05] Multi-location meteorological observation system and micro-satellites for extreme weather forecast

★Invited Papers

*Yukihiro Takahashi[1,2], Mitsuteru Sato[1,2], Hisayuki Kubota[1,2], Kozo Yamashita[3], Tetsuro Ishida[1,2], Ellison Caparas Castro[4], Loren Joy De Vera Estrebillo[1], Purwadi Purwadi[1], Gay Perez[4], Joel Marciano[4], Jun Matsumoto[5], Jun-Ichi Hamada[5] (1.Department of Cosmosciences, Graduate School of Science, Hokkaido University, 2.Faculty of Science, Hokkaido University, 3.Faculty of Engineering, Ashikaga University, 4.University of the Philippines, Diliman, 5.Tokyo Metropolitan University)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

[A-CG51] Satellite Earth Environment Observation

convener:Riko Oki(Japan Aerospace Exploration Agency), Yoshiaki HONDA(Center for Environmental Remote Sensing, Chiba University), Yukari Takayabu(Atmosphere and Ocean Research Institute, the University of Tokyo), Tsuneo Matsunaga(Center for Global Environmental Research and Satellite Observation Center, National Institute for Environmental Studies)

[ACG51-01] GOSAT and GOSAT-2 Higher Level Products: Current Status and Future Plan

★Invited Papers

*Tsuneo Matsunaga[1], Isamu Morino[1], Yukio Yoshida[1], Makoto Saito[1], Hibiki M Noda[1], Hirofumi Ohyama[1], Yosuke Niwa[1], Akihide Kamei[1], Fumie Kawazoe[1], Tazu Saeki[1], Ryoichi Imasu[2], Naoko Saitoh[3], Takashi Nakajima[4], Teruyuki Nakajima[5], Makiko Hashimoto[5] (1.National Institute for Environmental Studies, 2.The University of Tokyo, 3.Chiba University, 4.Tokai University, 5.Japan Aerospace Exploration Agency)

[ACG51-02] Progress on validation of GOSAT and GOSAT-2 FTS SWIR L2 Products

*Isamu Morino[1], Yukitomo Tsutsumi[1], Osamu Uchino[1], Hirofumi Ohyama[1], Thi Ngoc Trieu Tran[1], Frey Max Matthias[1], Yukio Yoshida[1], Tsuneo Matsunaga[1], Akihide Kamei[1], saito makoto[1], Hibiki M Noda[1], TCCON partners[2] (1.NIES National Institute of Environmental Studies, 2.https://tccon-wiki.caltech.edu)

[ACG51-03] **Spatiotemporal variabilities of ammonia in China as seen from IASI and AMoN**

*Xuehui Guo[1], Rui Wang[1], Da Pan[1], Kang Sun[2], Lieven Clarisse[3], Martin Van Damme[3], Simon Whitburn[3], Pierre-François Coheur[3], Yuepeng Pan[4], Mark Zondlo[1] (1.Princeton University, 2.University at Buffalo, 3.Université libre de Bruxelles , 4.Chinese Academy of Sciences)

[ACG51-04] Scientific Overview of the GCOM-W/AMSR2 Mission and Outlook for GOSAT-GW/AMSR3

★Invited Papers

*Naoto Ebuchi[1,2], Misako Kachi[2], Hideyuki Fujii[2], Takashi Maeda[2], Nodoka Ono[2], Kazuya Inaoka[2], Marehito Kasahara[2], Yasushi Kojima[2] (1.Institute of Low Temperature Science, Hokkaido University, 2.JAXA)

[ACG51-05] Current Status of AMSR2 on board GCOM-W and Development of AMSR3 on GOSAT-GW

*Misako Kachi[1], Naoto Ebuchi[2,1], Takashi Maeda[1], Nodoka Ono[1], Hideyuki Fujii[1], Kazuya Inaoka[3], Marehito Kasahara[3], Yasushi Kojima[3] (1.Earth Observation Research Center, Japan Aerospace Exploration Agency, 2.Institute of Low Temperature Science, Hokkaido University, 3.GOSAT-GW Project Team, Japan Aerospace Exploration Agency)

[ACG51-06] **The Inversion and Quality Validation of FY3 MWRI Sea Surface Temperature**

*miao zhang[1] (1.National satellite meteorological center)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

[A-CG51] Satellite Earth Environment Observation

convener:Riko Oki(Japan Aerospace Exploration Agency), Yoshiaki HONDA(Center for Environmental Remote Sensing, Chiba University), Yukari Takayabu(Atmosphere and Ocean Research Institute, the University of Tokyo), Tsuneo Matsunaga(Center for Global Environmental Research and Satellite Observation Center, National Institute for Environmental Studies)

[ACG51-07] 2018-2019 global environment observation by GCOM-C “SHIKISAI”

★Invited Papers

*Hiroshi Murakami[1], Masahiro Hori[1], Kazuhisa Tanada[1], Toshiyuki Kobayashi[1], Megumi Okata[1], Kazunori Ogata[1], Rigen Shimada[1], Yukio Kurihara[1] (1.Earth Observation Research Center, Japan Aerospace Exploration Agency)

[ACG51-08] Two distinct modes of variability in the Euphotic depth in the Arctic ocean as revealed by satellite obsevation

*Takafumi Hirata[1] (1.Arctic Research Center, Hokkaido University)

[ACG51-09] Retrieval of Atmospheric Aerosol Properties for geostationary and polar-orbital Satellite Imaging Sensors: GCOM-C/SGLI and Himawari8/AHI results

*Mayumi Yoshida[1], Maki Kikuchi[1], Takashi M. Nagao[2], Hiroshi Murakami[1], Keiya Yumimoto[3], Taichu Y Tanaka[4] (1.Japan Aerospace Exploration Agency, 2.Tokyo University, 3.Kyushu University, 4.Meteorological Research Institute of Japan Meteorological Agency)

[ACG51-10] Satellite analysis by a multi-wavelength multi-pixel method and simultaneous method using GCOM-C/SGLI data

*Miho Sekiguchi[1], Makiko Hashimoto[2], Hideaki Takenaka[2], Chong Shi[2], Teruyuki Nakajima[2] (1.Tokyo University of Marine Science and Technology, 2.Japan Aerospace Exploration Agency)

[ACG51-11] **Quality assessment of SGLI/GCOM-C observed cloud properties using surface observation data**

*Pradeep Khatri[1], Tadahiro Hayasaka[1], Hitoshi Irie[2], Tamio Takamura[2] (1.Center for Atmospheric and Oceanic Studies,Tohoku University, 2.Center for Environmental Remote Sensing, Chiba University)

[ACG51-12] **Variabilities of Western Himalayan Forest Fire with Relation to Primary Productivity**

*SOMNATH BAR[1], Bikash Ranjan Parida[1], Deep Prakash Sarkar[1] (1.Dept. of Geoinformatics, School of Natural Resource Management, Central University of Jharkhand)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

[A-CG51] Satellite Earth Environment Observation

convener:Riko Oki(Japan Aerospace Exploration Agency), Yoshiaki HONDA(Center for Environmental Remote Sensing, Chiba University), Yukari Takayabu(Atmosphere and Ocean Research Institute, the University of Tokyo), Tsuneo Matsunaga(Center for Global Environmental Research and Satellite Observation Center, National Institute for Environmental Studies)

[ACG51-13] An Overview of NASA's Aerosols and Clouds-Convection-Precipitation (A-CCP) Pre-formulation Study

★Invited Papers

*Arlindo da SIlva[1] (1.NASA Goddard Space Flight Center)

[ACG51-14] **Cloud liquid water database derived from a global cloud-system resolving model for precipitation retrievals of GPM/DPR observations**

*Takuji Kubota[1], Masaki Satoh[2], Shinta Seto[3], Toshio Iguchi[4], Takeshi Masaki[5], Tomoe Nasuno[6], Riko Oki[1] (1.Earth Observation Research Center,Japan Aerospace Exploration Agency, 2.Atmosphere and Ocean Research Institute, University of Tokyo, 3.Graduate School of Engineering, Nagasaki University, 4.Earth System Science Interdisciplinary Center, University of Maryland, 5.Remote Sensing Technology Center of Japan, 6.Research Institute for Global Change, Japan Agency for Marine-Earth Science and Technology)

[ACG51-15] Validation of DPR products by using MP-PAWR data - thunder storm case on August 27, 2018 –

*Nobuhiro Takahashi[1], Takeharu Kouketsu[1] (1.Institute for Space-Earth Environmental Research, Nagoya University)

[ACG51-16] Near-global three-dimensional hail signals detected by using GPM-DPR observations

*Tatsuya Seiki[1] (1.Japan Agency for Marine-Earth Science and Technology)

[ACG51-17] Precipitation and latent heating distribution in extratropical cyclones observed by the Global Precipitation Measurement Dual-frequency Precipitation Radar

*Hiroki Tsuji[1], Yukari Takayabu[1], Eigo Tochimoto[1] (1.Atmosphere and Ocean Research Institute, The University of Tokyo)

[ACG51-18] Ensemble-Based Data Assimilation of GPM/DPR Reflectivity into the Nonhydrostatic Icosahedral Atmospheric Model NICAM

*Shunji Kotsuki[1], Koji Terasaki[2], Masaki Satoh[3], Takemasa Miyoshi[2] (1.Center for Environmental Remote Sensing, Chiba University, 2.RIKEN Center for Computational Science, 3.Atmosphere and Ocean Research Institute, The University of Tokyo)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

[A-CG51] Satellite Earth Environment Observation

convener:Riko Oki(Japan Aerospace Exploration Agency), Yoshiaki HONDA(Center for Environmental Remote Sensing, Chiba University), Yukari Takayabu(Atmosphere and Ocean Research Institute, the University of Tokyo), Tsuneo Matsunaga(Center for Global Environmental Research and Satellite Observation Center, National Institute for Environmental Studies)

[ACG51-19] Improvement and Evaluation of 1-moment Cloud Microphysics using GPM Satellite Data

*Yasutaka Ikuta[1] (1.Japan Meteorological Agency)

[ACG51-20] Satellite-based Data Assimilation Systems by Using Microwave Radiometers

★Invited Papers

*Toshio Koike[1] (1.International Centre for Water Hazard and Risk Management)

[ACG51-21] How much is the accuracy of land emissivity representation necessary for adequate cloud water content estimation over land using satellite-based passive microwave remote sensing?

*Rie Seto[1], Kentaro Aida[2], Toshio Koike[2], Shinjiro Kanae[1] (1.Tokyo Institute of Technology, 2.The International Centre for Water Hazard and Risk Management under the auspices of UNESCO)

[ACG51-22] Detectability of Heavy Rainfall and Drought in East Asia and Western Pacific Region using GSMaP

*Tashima Tomoko[1], Takuji Kubota[1], Riko Oki[1] (1.Japan Aerospace Exploration Agency)

[ACG51-23] Identifying Gaps Between Satellite Measurement Capability and Decision-making in Water Resource Management – A Case Study from Australia

*Maki Kikuchi[1,2], Anthony S. Kiem[2], Andrew D. Magee[2], Matthew Armstrong[2] (1.Japan Aerospace Exploration Agency (JAXA), 2.The University of Newcastle)

[ACG51-24] Rice planted area mapping using ALOS-2 ScanSAR data with Machine Learning Algorithm

*Kei Oyoshi[1], Shinichi Sobue[1] (1.JAXA Japan Aerospace Exploration Agency)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

[A-CG52] Large Ensemble Modeling Approaches as Tools for Climate and Impacts Research

convener:Rodgers Keith Bradley(IBS Center for Climate Physics), Shoshiro Minobe(Graduate School of Science, Hokkaido University), Hideo Shiogama(Center for Global Environmental Research, National Institute for Environmental Studies), Ryo Mizuta(Meteorological Research Institute)

[ACG52-01] **Evaluating ocean physical biogeochemical interactions in ESM large ensembles**

★Invited Papers

*Takamitsu Ito[1], Filippos Tagklis[1], Yohei Takano[2] (1.Georgia Institute of Technolog, 2.Los Alamos National Laboratory)

[ACG52-02] Event attribution using large ensemble model simulations by MIROC5-AGCM, MRI-AGCM, and NHRCM

★Invited Papers

*Yukiko Imada[1], Hiroaki Kawase[1], Hideo Shiogama[3], Masato Mori[4], Chiharu Takahashi[2], Miki Arai[5], Masahiro Watanabe[2], Izuru Takayabu[1] (1.Meteorological Research Institute, Japan Meteorological Agency, 2.Atmosphere and Ocean Research Institute, the University of Tokyo, 3.National Institute for Environmental Studies, 4.Research Center for Advanced Science and Technology, the University of Tokyo, 5.Japan Agency for Marine-Earth Science and Technology)

[ACG52-03] Changes in global terrestrial ecosystem respiration with future warming: a probabilistic approach

*Irina Melnikova[1], Takahiro Sasai[1] (1.Tohoku University)

[ACG52-04] Global warming changes tropical cyclone translation speed

*Munehiko Yamaguchi[1], Johnny C. L. Chan[2], Il-Ju Moon[3], Kohei Yoshida[1], Ryo Mizuta[1] (1.Meteorological Research Institute, Japan Meteorological Agency, 2.City University of Hong Kong, 3.Jeju National University)

[ACG52-05] Nonlinear forced change implies nonergodicity and vice-versa: The case of ENSO teleconnections

*Tamas Bodai[1,2], Axel Timmermann[1,2], Gabor Drotos[3], Timea Haszpra[4] (1.Pusan National University, 2.Center for Climate Physics, Institute for Basic Science, South Korea, 3.Instituto de Física Interdisciplinar y Sistemas Complejos, CSIC-UIB, Palma de Mallorca, Spain, 4.Institute for Theoretical Physics, Eötvös Loránd University, Budapest, Hungary)

[ACG52-06] Parallel Analog Ensemble: The Power of Weather Analogs

*Weiming Hu[1], Guido Cervone[1], Martina Calovi[1], Laura Clemente-Harding[2] (1.Pennsylvania State University Main Campus, 2.Engineer Research and Development Center)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

[A-CG53] Terrestrial monitoring using new-generation geostationary satellites

convener:Yuhei Yamamoto(Center for Environmental Remote Sensing, Chiba University), Yunyue Yu(NOAA National Environmental Satellite, Data, and Information Service), Tomoaki Miura(Univ Hawaii), Kazuhito Ichii(Chiba University)

[ACG53-01] GeoNEX: Earth observations from operational geostationary satellite systems

★Invited Papers

*Ramakrishna R Nemani[1] (1.NASA Ames Research Center)

[ACG53-02] Preliminary research on validation for the atmospheric correction of HIMAWARI-8 AHI data using SKYNET data

*Hirokazu YAMAMOTO[1], Satoshi Tsuchida[1] (1.Geological Survey of Japan, AIST)

[ACG53-03] An analysis of land surface temperature during summer clear-sky days focusing on the diurnal change characteristics using Himawari-8 data

*Yuhei Yamamoto[1], Kazuhito Ichii[1] (1.Center for Environmental Remote Sensing, Chiba University)

[ACG53-04] An Enterprise Land Surface Temperature (LST) Algorithm for the GOES-R and Himawari Satellites

*Yunyue Yu[1], Jaime Daniels[1], Satya Kalluri[1], Peng Yu[1] (1.NOAA National Environmental Satellite, Data, and Information Service)

[ACG53-05] Analysis of differences between NDVI-based indices of Himawari 8 AHI and Aqua MODIS using Rayleigh-corrected reflectances

*Kenta Obata[1], Hiroki Yoshioka[1] (1.Aichi Prefectural University)

[ACG53-06] Functional grassland phenology discrimination and analyses with Himawari-8 geostationary data

★Invited Papers

*Alfredo R Huete[1], Ngoc Nguyen Tran[1], Qiaoyun Xie[1], Tomoaki Miura[2] (1.University of Technology Sydney, 2.University of Hawaii)

[E] Oral | H (Human Geosciences)：H-GM Geomorphology

[H-GM02] Geomorphology

convener:Tsuyoshi Hattanji(Faculty of Life and Environmental Sciences, University of Tsukuba), Masayuki Seto(Fukushima Future Center for Regional Revitalization, Fukushima University)

[HGM02-01] Detecting geomorphic and sedimentary effects of modern climate change: how much do we know?

*Amy E East[1], Joel B Sankey[2] (1.U.S. Geological Survey, Santa Cruz, California, U.S.A., 2.U.S. Geological Survey, Flagstaff, Arizona, U.S.A.)

[HGM02-02] Effects of different controlling factors on the experimental landform development

*Shunji Ouchi

[HGM02-03] Measurement of landslide surface deformation along Kali Gandaki River, Nepal using time-series Sentinel-1 InSAR images

*Hiroshi, P. Sato[1], Masahiro Chigira[2], Ching-Ying Tsou[3] (1.College of Humanities and Sciences, Nihon University, 2.Disaster Prevention Research Institute, Kyoto University, 3.Faculty of Agriculture and Life Science, Hirosaki University)

[HGM02-04] UAV SfM monitoring of coastal morphology on Kujukuri beach

*Mergen Kungaa[1], Toshihiko Sugai[1], Natsuki Sasaki[1], Tatsuki Miyamoto[1], Tatsuya Terada[1] (1.Tokyo University, Graduate School of Frontier Sciences, Department of Natural Environmental Studies)

[HGM02-05] Evaluating soil physical properties and their spatial variability in a headwater catchment

*Ingrid Lima[1], Takashi GOMI[1], Taro UCHIDA[2], Takao YAMAKOSHI[3], Yohei ARATA[1], Kenta Koyanagi[1] (1.Tokyo University of Agriculture and Technology , 2.University of Tsukuba , 3.National Institute for Land and Infrastructure)

[HGM02-06] Four major geomorphological debates in Japan

*Takashi Oguchi[1] (1.Center for Spatial Information Science, The University of Tokyo)

[E] Oral | H (Human Geosciences)：H-QR Quaternary research

[H-QR04] Innovative Applications of Trapped-Charge Dating to Quaternary Geochronology

convener:Toru Tamura(Institute of Geology and Geoinformation Geological Survey of Japan, AIST), Shin Toyoda(Department of Applied Physics, Faculty of Science, Okayama University of Science), Yuji Ishii(National Institute of Advanced Industrial Science and Technology), Sumiko Tsukamoto(Leibniz Institute for Applied Geophysics)

[HQR04-01] **East Asian summer monsoon dynamics over the last interglacial-glacial cycle inferred from fluctuations of Lake Daihai in northern China**

★Invited Papers

*Hao Long[1], Yandong Hou[1], Lei Gao[1], Qian Liu[2] (1.NIGLAS, 2.Nanjing Normal Univ.)

[HQR04-02] Fine-grained quartz OSL dating for reconstructing the Holocene evolution of the Mekong River floodplain

*Yuji Ishii[1,2], Toru Tamura[2], Ben Bunnarin[3] (1.Research Fellow of the Japan Society for the Promotion of Science, 2.Geological Survey of Japan, AIST, 3.Department of Geology, GDMR, MIME, Cambodia)

[HQR04-03] Feldspar pIRIR dating for defining glacial-interglacial depositional sequences in the Kanto Plain, eastern Japan

*Toru Tamura[1,4], Hiroko Okazaki[2], Hiroomi Nakazato[3], Tomonori Naya[1], Rei Nakashima[1] (1.Institute of Geology and Geoinformation Geological Survey of Japan, AIST, 2.Natural Hisory Museum and Institute, Chiba, 3.The National Agriculture and Food Research Organization, 4.Graduate School of Frontier Sciences, The University of Tokyo)

[HQR04-04] **Testing the reliability of the fading correction near saturation for the Infrared stimulated luminescence dating**

★Invited Papers

*Yan Li[1,2], Sumiko Tsukamoto[2], Hao Long[3], Jingran Zhang[4], Linhai Yang[5], Manfred Frechen[2] (1.China Univ. of Geosci., 2.LIAG, 3.NIGLAS, 4.Nanjing Normal Univ., 5.Shaanxi Normal Univ.)

[HQR04-05] The production mechanism of the E_1' center by low-velocity friction based on the particle characteristics

*Kiriha Tanaka[1], Jun Muto[1], Yasuo Yabe[2], Toshitaka Oka[3], Hiroyuki Nagahama[1] (1.Earth Science, Graduate School of Science, Tohoku University, 2.Research Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University, 3.Japan Atomic Energy Agency)

[HQR04-06] ESR dating of quartz: issues on sediment dating and on thermochronometry

*Shin Toyoda[1] (1.Department of Applied Physics, Faculty of Science, Okayama University of Science)

[E] Oral | H (Human Geosciences)：H-DS Disaster geosciences

[H-DS08] Tsunami and tsunami forecast

convener:Hiroaki Tsushima(Meteorological Research Institute, Japan Meteorological Agency), Tatsuya Kubota(National Research Institute for Earth Science and Disaster Resilience)

[HDS08-01] N-net: Nankai Trough Seafloor Observation Network for Earthquakes and Tsunamis

*Shin Aoi[1], Tetsuya Takeda[1], Takashi Kunugi[1], Kenji Uehira[1], Masanao Shinohara[1], Toshikazu Tanada[1], Shigeru Nagata[1], Takayuki Miyoshi[1], Narumi Takahashi[1] (1.National Research Institute for Earth Science and Disaster Resilience)

[HDS08-02] Probabilistic Tsunami Hazard Assessment for next Nankai Earthquake sequence

*Kenji Hirata[1], Hiroyuki Fujiwara[1], Hiromitsu Nakamura[1], Tsuneo Ohsumi[1], Nobuyuki Morikawa[1], Shinichi Kawai[1], Takahiro Maeda[1], DOHI YUJI1[1], Hisanori Matsuyama[2], Nobuhiko Toyama[2], Tadashi Kito[2], Kenshi Ohshima[2], Xuelei Zhang[2], Yasuhiro Murata[3], Ryu Saito[3], Tomoyuki Shibuki[3], Shin'ichi Akiyama[4], Mariko Korenaga[4], Yuta Abe[4], Teppei Ono[4] (1.National Research Institue for Earth Science and Diaster resilience, 2.OYO corporation, 3.KKC, 4.CTC)

[HDS08-03] **J-THIS** - a Public System for Sharing Information on Nationwide Probabilistic Tsunami Hazard Assessment in Japan -

*DOHI YUJI[1], Hiromitsu Nakamura[1], Hiroyuki Fujiwara[1], Tsuneo Ohsumi[1], Kenji Hirata[1], Shinichi Kawai[1], Nobuyuki Morikawa[1], Takahiro Maeda[1] (1.National Research Institute for Earth Science and Disaster Resilience)

[HDS08-04] Tsunami height variations due to stochastic self-similar slip distributions on a non-planar fault for megathrust earthquakes

*Masaru Nakano[1], Shane Murphy[2], Ryoichiro Agata[1], Yasuhiko Igarashi[3], Masato Okada[3], Takane Hori[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.Ifremer, France, 3.Graduate School of Frontier Sciences, The University of Tokyo)

[HDS08-05] Tsunami synthetics using mechanic-based earthquake rupture scenarios

*Tatsuhiko Saito[1], Akemi Noda[1] (1.National Research Institute for Earth Science and Disaster Resilience)

[HDS08-06] Probabilistic tsunami hazard assessment for the Japan Sea region

*Iyan E. Mulia[1], Takeo Ishibe[2], Kenji Satake[1], Aditya Riadi Gusman[3] (1.Earthquake Research Institute, The University of Tokyo, 2.Association for the Development of Earthquake Prediction, 3.GNS Science)

[E] Oral | H (Human Geosciences)：H-DS Disaster geosciences

[H-DS08] Tsunami and tsunami forecast

convener:Hiroaki Tsushima(Meteorological Research Institute, Japan Meteorological Agency), Tatsuya Kubota(National Research Institute for Earth Science and Disaster Resilience)

[HDS08-07] Numerical simulation of debris avalanche and tsunami caused by the 2018 sector collapse of Anak Krakatau

*Hideaki Yanagisawa[1], Tatok Yatimantoro[2] (1.Department of regional Management, Faculty of Liberal Arts, Tohoku Gakuin University, 2.Indonesian Agency for Meteorology, Climatology and Geophysics)

[HDS08-08] **Tsunami hazards in East Indonesia: the case of 14 November 2019 Mw7.1 earthquake and tsunami in Molucca Sea, Indonesia**

*Mohammad Heidarzadeh[1], Takeo Ishibe[2], Tomoya Harada[3], Bayu Triyogo Widyantoro[4] (1.Brunel Univ. London, UK, 2.Association for the Development of Earthquake Prediction, Japan, 3.Univ. of Tokyo, Japan, 4.Indonesian Geospatial Information Agency, Indonesia)

[HDS08-09] *Augmenting GNSS and Teleseismic networks for improved tsunami early warning*

*Y Tony Song[1] (1.Jet Propulsion Laboratory)

[HDS08-10] Determination of Appropriate Source Models for Tsunami Forecasting: Application to Large Earthquakes in Central Sumatra, Indonesia

*Yuichiro Tanioka[1], Rinda Nita Ratnasari[1] (1.Hokkaido University, Institute of Seismology and Volcanology)

[HDS08-11] Tsunami analysis using the S-net pressure gauge records during the Mw 7.0 Off-Fukushima earthquake on 22 Novenver 2016 to reduce the effects of tsunami-irrelevant pressure components

*Tatsuya Kubota[1], Naotaka Yamamoto Chikasada[1], Hiroaki Tsushima[2], Wataru Suzuki[1], Takeshi Nakamura[1] (1.National Research Institute for Earth Science and Disaster Resilience, 2.Meteorological Research Institute)

[HDS08-12] Operational use of tsunami source inversion in near-field tsunami warning by JMA

*Hiroaki Tsushima[1], Takeyasu Yamamoto[2] (1.Japan Meteorological Agency, 2.Meteorological Research Institute, Japan Meteorological Agency)

[E] Oral | H (Human Geosciences)：H-DS Disaster geosciences

[H-DS08] Tsunami and tsunami forecast

convener:Hiroaki Tsushima(Meteorological Research Institute, Japan Meteorological Agency), Tatsuya Kubota(National Research Institute for Earth Science and Disaster Resilience)

[HDS08-13] Point-to-point Tsunami Ray Tracing Method

*Tungcheng Ho[1,2], Shingo Watada[2], Kenji Satake[2] (1.Disaster Prevention Research Institute, Kyoto University, 2.Earthquake Research Institute, the University of Tokyo)

[HDS08-15] Derivation of Time Difference Equation using Continuous Expression in Nonlinear Long Wave Equation and Evaluation of its Discretization Error

*Masaaki MINAMI[1], Takeyasu Yamamoto[1] (1.Meteorological Research Institute)

[HDS08-16] Estimating tsunami currents from shipborne Automatic Identification System data

*Daisuke Inazu[1], Tsuyoshi Ikeya[1], Toshio Iseki[1], Takuji Waseda[2] (1.Tokyo University of Marine Science and Technology, 2.The University of Tokyo)

[HDS08-18] Hydraulic experiments to investigate how vegetation coverage affects sediment transport during a tsunami

*Ako YAMAMOTO[1], Yuki Kanemaru[2], Ryunosuke Matsunaga[3], Takayuki Minamino[3], Tsuyoshi Tada[2], yo Fukutani[3], Yoshinori Shigihara[2] (1.Forest of Research and Management Organization Forestry and Forest Products Research Institute, 2.National Defense Academy, 3.Kanto Gakuin University)

[E] Oral | H (Human Geosciences)：H-DS Disaster geosciences

[H-DS09] Landslides and related phenomena

convener:Masahiro Chigira(Disaster Prevention Research Institute, Kyoto University), Fumitoshi Imaizumi(Faculty of Agriculture, Shizuoka University), Gonghui Wang(Disaster Prevention Research Institute, Kyoto University)

[HDS09-01] Examining the mobility of earthquake-induced landslides materials using small flume apparatus

*Rozaqqa Noviandi[1], Hefryan Sukma Kharismalatri[2], Takashi Gomi[3], Yoshiharu Ishikawa[3], Rasis Putra Ritonga[4] (1.Department of International Environmental and Agricultural Science, Tokyo University of Agriculture and Technology, Japan, 2.Institute of Global Innovation Research, Tokyo University of Agriculture and Technology, Japan, 3.Graduate School of Agriculture, Tokyo University of Agriculture and Technology, Japan, 4.United Graduate School of Agricultural Science, Tokyo University of Agriculture and Technology, Japan)

[HDS09-02] Seismic signal analysis of the 2011 landslide in Misakubo, Shizuoka prefecture and the potential for the real-time landslide detection

*Masumi Yamada[1], Ryo Okuwaki[2], Hikaru Osawa[2] (1.Disaster Prevention Research Institute, Kyoto University, 2.Mountain Science Center, Univ. of Tsukuba)

[HDS09-03] Steady-state shear resistance and viscosity of brittle dense grain flows appear to be independent of grain material and normal stress

★Invited Papers

*wei hu[1], Mauri McSaveney[2] (1.Chegndu University of Technology, 2.GNS Science, New Zealand)

[HDS09-04] A discussion on the characteristics of seismic signals of different landslide movement types by coupling PFC and FLAC codes

*Rui-Jia Zhuang[1], Zheng-yi Feng[1] (1.National Chung Hsing University Department of Soil and Water Conservation)

[HDS09-05] Tertiary Creep Behavior of Soils and Corresponding Power Law Singularity

*Chengrui Chang[1], Gonghui Wang[2] (1.Graduate School of Science, Kyoto University, 2.Disaster Prevention Research Institute, Kyoto University)

[E] Oral | H (Human Geosciences)：H-DS Disaster geosciences

[H-DS09] Landslides and related phenomena

convener:Masahiro Chigira(Disaster Prevention Research Institute, Kyoto University), Fumitoshi Imaizumi(Faculty of Agriculture, Shizuoka University), Gonghui Wang(Disaster Prevention Research Institute, Kyoto University)

[HDS09-06] Long-term rates of gravitational slope deformations on a low-angle fault that forms a dip slope in the Shimanto Belt, in the Kanto Mountains

Masakazu Mashiko[1], *Masahiro Chigira[1], Hirokazu Furuki[2], Takehiko Suzuki[3] (1.Disaster Prevention Research Institute, Kyoto University, 2.Nippon Koei Co. Ltd., 3.Tokyo Metropolitan University)

[HDS09-07] Hydrological and Seismic Observations at a Gravitationally Deformed Slope

*Noriyuki Arai[1], Masahiro Chigira[1], Issei Doi[1] (1.Disaster Prevention Research Institute,Kyoto University)

[HDS09-08] Post Deformation Characteristics of a Large-scale Slope in the Reservoir Area

*Yao Jiang[1], Shenghua Cui[2] (1.Institute of Mountain Hazards and Environment, Chinese Academy of Sciences, 2.State Key Laboratory of Geohazard Prevention and Geoenvironment Protection, Chengdu University of Technology, China)

[HDS09-09] Geological structural control on rock mass movement in response to fluvial incision along the plateau margin of Tibet

*Siyuan Zhao[1], Masahiro Chigira[2], Xiyong Wu[3] (1.College of Water Resources and Hydropower, Sichuan University, Chengdu 610065, Sichuan, China, 2.Disaster Prevention Research Institute, Kyoto University, Gokasho, Uji, Kyoto 611–0011, Japan, 3.Faculty of Geosciences and Environmental Engineering, Southwest Jiaotong University, Chengdu, 611756, China)

[HDS09-10] A field example of flexural toppling at Song-Mao Village in central Taiwan

*Ching-Ying Tsou[1], Osamu Yokoyama[2], Fumitoshi Imaizumi[3], Hsi-Hung Lin[4], Yu-Chung Hsieh[4], Mien-Ming Chen[4], Masahiro Chigira[5], Chun-Yi Wu[6], Su-Chin Chen[6] (1.Faculty of Agriculture and Life Science, Hirosaki University, 2.Japan Conservation Engineers Co., Ltd., 3.Faculty of Agriculture, Shizuoka University, 4.Central Geological Survey, Taiwan, 5.Disaster Prevention Research Institute, Kyoto University, 6.College of Agriculture and Natural Resources, National Chung Hsing University)

[HDS09-11] The role of faults for the formation of uphill-facing scarps

*Osamu Yokoyama[1], Masahiro Chigira[2], Ching-Ying Tsou[3] (1.Japan Conservation Engineers & Co., Ltd., 2.Disaster Prevention Research Institute, Kyoto University, 3.Faculty of Agriculture and Life Science, Hirosaki University)

[E] Oral | H (Human Geosciences)：H-DS Disaster geosciences

[H-DS09] Landslides and related phenomena

convener:Masahiro Chigira(Disaster Prevention Research Institute, Kyoto University), Fumitoshi Imaizumi(Faculty of Agriculture, Shizuoka University), Gonghui Wang(Disaster Prevention Research Institute, Kyoto University)

[HDS09-12] The 2016-17 landslide hazard in Siorapaluk and landsliding environment in NW Greenland

*Shintaro Yamasaki[1], Tastuya Watanabe[2], Shin Sugiyama[3] (1.Disaster Prevention Research Institute, Kyoto University, 2.Kitami Institute of Technology, 3.Institute of Low Temperature Science, Hokkaido University)

[HDS09-13] Landslides of altered rhyolite induced by the Heavy Rain Event of July 2018 in the south of Hiroshima Prefecture, Japan

*Yasuto Hirata[1] (1.Central Research Institute of Electric Power Industry)

[HDS09-14] **Characterization of rainfall events that triggered landslides in different regions in Japan**

*Slim Mtibaa[1], Haruka Tsunetaka[1] (1.Forestry and Forest Products Research Institute)

[HDS09-15] Landslides and driftwoods in headwater catchments: Supply, transport, and storage

*Takashi Gomi[1] (1.Tokyo University of Agriculture and Technology)

[HDS09-16] Temporal Changes in Landslide Frequency After Forest Harvesting in Ikawa, Central Japan

*Al Nuriza Rahmadania[1], Fumitoshi Imaizumi[2] (1.Graduate School of Integrated Science and Technology, Shizuoka University, 2.Faculty of Agriculture, Shizuoka University)

[HDS09-17] **Investigating the effect of forest stand age on slope stability in terms of root reinforcement in the Ikawa Artificial Forest, central Japan**

*Vany Fadhilah[1], Fumitoshi Imaizumi[2] (1.Graduate School of Integrated Science and Technology, Shizuoka University, 2.Faculty of Agriculture, Shizuoka University)

[E] Oral | H (Human Geosciences)：H-DS Disaster geosciences

[H-DS10] Natural hazard impacts on human society, economics and technological systems

convener:ELENA PETROVA(Lomonosov Moscow State University, Faculty of Geography), Hajime Matsushima(Research Faculty of Agriculture, Hokkaido University)

[HDS10-02] Lessons Learned from Wind Turbine Failures Caused by Natural Hazards

*Jui-Sheng Chou[1] (1.National Taiwan University of Science and Technology)

[HDS10-03] Impacts of the risk of chemical release from unregistered plant triggered by a future local earthquake in Osaka

*Takehisa Ishida[1], Lisa Ito[1], Akihiro Tokai[1] (1.Graduate School of Engineering, Osaka University)

[HDS10-04] Effects of abandoned paddy field use for the conservation of threatened hydrophyte after the 2011 Tohoku-oki tsunami.

★Invited Papers

*Korehisa Kaneko[1], Hiroshi Jinguji[2] (1.Hokuso Creature Association, 2.Miyagi University)

[HDS10-05] **The influence of the construction of the seawall on the on the coastal plant community in Sendai coast**

*XIANGMEI ZHONG[1], Hajime Matsushima[2], Akira Suzuki[3], Yoshihiko Hirabuki[4], Kouji Kimura[5] (1.Graduate school of Agriculture, Hokkaido University, 2.Research Faculty of Agriculture, Hokkaido University, 3.Kita-no-satohama Hana-no-kakehashi Network, 4.Faculty of Liberal Arts, Tohoku Gakuin University, 5.Snow Brand Seed Co., Ltd.)

[HDS10-06] Japanese coastal dune crisis and future prospects

*Hajime Matsushima[1] (1.Research Faculty of Agriculture, Hokkaido University)

[E] Oral | H (Human Geosciences)：H-DS Disaster geosciences

[H-DS11] Subaqueous Landslides and Their Anthropogenic Impact for Coastal Regions

convener:Yujin Kitamura(Department of Earth and Environmental Sciences, Graduate School of Science and Engineering, Kagoshima University), Kiichiro Kawamura(Yamaguchi University)

[HDS11-01] The progressive development of microfabrics from initial deposition to slump deformation on the Nankai prism

*Kiichiro Kawamura[1] (1.Yamaguchi University)

[HDS11-02] Structure of submarine mass-transport complexes(MTCs) southern Mt.Kaimon

*Hiroto Yamaguchi[1], Mamoru Sano[2], Satoshi Shimizu[2], Hikaru Iwamaru[2], Nobukazu Seama[1,2], Tetsuo Matsuno[1,2], Yoshiyuki Tatsumi[1,2] (1.Department of Planetology, Graduate School of Science, Kobe university, 2.Kobe Ocean-bottom Exploration Center)

[HDS11-03] On generation mechanism of the tsunami due to the 1923 Great Kanto Earthquake and bathymetric change in Sagami bay

*Kazuki Murata[1], Toshikazu Ebisuzaki[2], Shigenori Maruyama[2] (1.Port and Airport Research Institute, Japan, 2.RIKEN)

[HDS11-04] What "tsunami earthquake" is?

★Invited Papers

*Toshikazu Ebisuzaki[1] (1.RIKEN)

[HDS11-05] Tsunami modeling by marine landslides and reduction of disasters

★Invited Papers

*Yuichiro Tanioka[1], Hideaki Yanagisawa[2], Kei Ioki[3], Tatsuya Nakagaki[1] (1.Hokkaido University, Institute of Seismology and Volcanology, 2.Tohoku-Gakuin University, 3.National Institute of Advanced Industrial Science and Technology)

[HDS11-06] Submarine mass transport marked by mercury-bearing sediments and tephra in active fault zone, Yatsushiro sea, Japan

*Yujin Kitamura[1], Takashi Tomiyasu[1], Daigo Ito[2], Ryoga Kimura[2], Yuki Tamachi[2], Kuniyo Kawabata[3], Yuta Ikebata[4], Ryoya Goto[5], Koki Hori[4], Hakuho-maru KH-18-3 Scientists (1.Department of Earth and Environmental Sciences, Graduate School of Science and Engineering, Kagoshima University, 2.Department of Earth and Environmental Sciences, Faculty of Science, Kagoshima University, 3.Institute for Comprehensive Education, Kagoshima University, 4.Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University, 5.Graduate School of Frontier Sciences, The University of Tokyo)

[E] Oral | H (Human Geosciences)：H-TT Technology & Techniques

[H-TT14] Geographic Information Systems and Cartography

convener:Takashi Oguchi(Center for Spatial Information Science, The University of Tokyo), Yoshiki Wakabayashi(Graduate School of Urban Environmental Sciences, Tokyo Metropolitan University), Yuei-An Liou(National Central University), Ronald C. Estoque(National Institute for Environmental Studies, Japan)

[HTT14-01] **Analysis of the Land Surface Temperature Pattern in Kathmandu, Nepal, Using Remote Sensing and GIS.**

*Siri Karunaratne Batugoda Gedara[1], Morimoto - Takehiro[2], Yuji - Murayama[3] (1.Division of Spatial Information Science,Graduate School of Life and Environmental Sciences, University of Tsukuba, 2.Division of Spatial Information Science,Faculty of Life and Environmental Sciences, University of Tsukuba, 3.Division of Spatial Information Science,Faculty of Life and Environmental Sciences, University of Tsukuba)

[HTT14-02] Detecting Heat Spot within the City using Drones

★Invited Papers

*Kotaro Iizuka[1], Yuki Akiyama[1] (1.Center for Spatial Information Science, University of Tokyo)

[HTT14-03] **Landsat 8 data for soil salinity mapping in Tra Vinh Province, Mekong Delta, Vietnam**

★Invited Papers

*Kim-Anh Nguyen[1], Yuei-An Liou[1], Ha-Phuong Tran[2] (1.National Central University, 2.Ho Chi Minh City Institute of Resources Geography, VAST)

[HTT14-04] **Geospatial Approaches to Modell the Landslide Risk: A case study for Kegalle District-Sri Lanka**

★Invited Papers

*Elibichchiralalage Nimala Chinthake Perera[1], HMDS Wijenayaka[1], DSP Kuruppuarachchi[1] (1.Faculty of Management and Finance, SANASA CAMPUS, SRI LANKA)

[HTT14-05] Permafrost environment in Kongsfjord, Svalbard, from the viewpoint of topography and vegetation change

*Jaeyong Lee[1], Takashi Oguchi[2] (1.Department of Environmental Studies, Graduate School of Frontier Sciences, The University of Tokyo, 2.Center for Spatial Information Science, The University of Tokyo)

[HTT14-06] **Responses of suspended sediment yield to topography and land use in the Yellow River Basin, China**

*Ruiqi Zhang[1], Takashi Oguchi[2], Zhiguo Meng[3], Lele Hou[3] (1.The University of Tokyo, Graduate school of Frontier Sciences, 2.The University of Tokyo, Center for Spatial Information Science, 3.The University of Jilin, College of Geoexploration Science and Technology)

[E] Oral | H (Human Geosciences)：H-TT Technology & Techniques

[H-TT14] Geographic Information Systems and Cartography

convener:Takashi Oguchi(Center for Spatial Information Science, The University of Tokyo), Yoshiki Wakabayashi(Graduate School of Urban Environmental Sciences, Tokyo Metropolitan University), Yuei-An Liou(National Central University), Ronald C. Estoque(National Institute for Environmental Studies, Japan)

[HTT14-07] **A study on the selection process of tsunami evacuation sites using qualitative GIS approaches: the case of Ishinomaki city, Miyagi prefecture**

*Yuki Iwai[1,2] (1.Graduate School, University of Tsukuba, 2.JSPS Research Fellow)

[HTT14-08] **A Comparative Analysis of the Impacts of Various Natural Disasters on Human Mobility based on Geotagged Photos**

★Invited Papers

*Ahmed Derdouri[1], Toshihiro Osaragi[1], Takuya Oki[1] (1.School of Environment and Society, Tokyo Institute of Technology)

[HTT14-09] **Impact of Curriculum Design for Disaster Risk Reduction Education Using Web GIS Technology on Student Learning Effects in Secondary Schools**

*Jiali Song[1], Takashi Oguchi[1] (1.The University of Tokyo)

[HTT14-10] **Urban Expansion and Its Impact on the Urban Flood Disaster: A Case Study of Colombo Metropolitan Area, Sri Lanka**

*Ranagalage Mahinda Manjula[1], Yuji Murayama[1], Takehiro Morimoto[1] (1.Faculty of Life and Environmental Sciences, University of Tsukuba)

[HTT14-11] Changes in the landscape pattern of the Muthurajawela Marsh and Negombo Lagoon Sri Lanka: Socio-ecological implications

*SUMUDU DARSHANA ATHUKORALA ARACHCHIGE[1], Yuji Murayama[2], Bunkei Matsushita[2], Ronald C. Estoque[3] (1.Graduate School of Life and Environmental Sciences, University of Tsukuba, Japan, 2.Faculty of Life and Environmental Sciences, University of Tsukuba, Japan, 3.National Institute for Environmental Studies, Japan)

[HTT14-12] Relationships between the locations of ancient sites and topographic factors in Japan and China to explore interactions between human and nature

*Yuan Wang[1], Takashi Oguchi[1] (1.The University of Tokyo)

[E] Oral | H (Human Geosciences)：H-TT Technology & Techniques

[H-TT14] Geographic Information Systems and Cartography

convener:Takashi Oguchi(Center for Spatial Information Science, The University of Tokyo), Yoshiki Wakabayashi(Graduate School of Urban Environmental Sciences, Tokyo Metropolitan University), Yuei-An Liou(National Central University), Ronald C. Estoque(National Institute for Environmental Studies, Japan)

[HTT14-13] Potential influence of the use of sample survey data on spatial statistical analysis

★Invited Papers

*Ikuho Yamada[1] (1.Center for Spatial Information Science, University of Tokyo)

[HTT14-15] **Modeling and Mapping the Suitability of Parcel Pick-up Points using GIS-based Multivariate Binary Logistic Regression Model: A Case Study of Guangzhou City, China**

*ZILAI ZHENG[1], Takehiro Morimoto[2] (1.Graduate School of Life and Environmental Sciences, University of Tsukuba, 2.Faculty of Life and Environmental Sciences, University of Tsukuba)

[HTT14-16] **Simulating Land Use Change with Rapid Urbanization under the Natural and Anthropogenic Driving Forces**

*BINGYU WANG[1], Takashi Oguchi[1,2] (1.Department of Natural Environment Studies, The University of Tokyo, 2.Center for Spatial Information Science, The University of Tokyo, Japan)

[HTT14-17] Visualization of the supply-demand gap in childcare services in Tokyo

*Yoshiki Wakabayashi[1], Hitoshi Miyazawa[2] (1.Graduate School of Urban Environmental Sciences, Tokyo Metropolitan University, 2.Faculty of Letters and Education, Ochanomizu University)

[HTT14-18] **Comparative analysis of spatial patterns of tourists' behavior in Japanese cities using Online Geotagged Photographs**

*Bochra Bettaieb[1], Yoshiki Wakabayashi[1] (1.Tokyo Metropolitan University)

[E] Oral | H (Human Geosciences)：H-TT Technology & Techniques

[H-TT15] Environmental Remote Sensing

convener:Wei Yang(Chiba University), Akihiko Kondoh(Center for Environmental Remote Sensing, Chiba University), Carolynne Hultquist(Columbia University), Elena Sava(US Army Corps of Engineers Geospatial Research Laboratory), Guido Cervone(Pennsylvania State University Main Campus)

[HTT15-01] **Satellite-based Regional Scale Evapotranspiration Estimation Mapping**

*Manoj Hari[1], Bhishma Tyagi[1], Mohammad Sanaulla K. Huddar[2], Harish A.[3] (1.National Institute of Technology Rourkela, Odisha, India., 2.Indian Council of Agricultural Research, New Delhi, India., 3.Karaikal, Puducherry, India.)

[HTT15-02] Remote sensing of floating macroalgae in the coastal areas based on machine learning

*Zhaoxin Li[1], Zhongfeng Qiu[2], Wei Yang[1] (1.Chiba Univ., 2.NUIST)

[HTT15-03] Update of GCOM-C/SGLI Leaf Area Index & fraction of Absorbed Photosynthetically Active Radiation products

*Toshiyuki Kobayashi[1], Hideki Kobayashi[2], Wei Yang[3], Yoshiaki HONDA[3], Yuhsaku Ono, Shin Nagai[2], Tomoko Akitsu[4], Kenlo Nasahara[4], Masahiro Hori[1], Hiroshi Murakami[1] (1.Japan Aerospace Exploration Agency, 2.Japan Agency for Marine-Earth Science and Technology, 3.Chiba University, 4.University of Tsukuba)

[HTT15-04] **Comparison of five smoothing methods for noise removal in MODIS LAI time series data**

*Bageshree K[1], Tsuyoshi Kinouchi[1] (1.Tokyo Institute of Technology)

[HTT15-05] Mapping and comparing the geomorphological environments of designated conservation area and urban city in Majuro using drone data

*Benedict Yamamura[1,2], Hayate Kimura[1], Wataru Sano[1], Soko Hirabayashi[1], Yukihiko Imai[1], Kyotak Ishiguro[2], Hironobu Kan[1] (1.Kyushu University, Integrated Sciences for Global Society - Research Center for Coastal Seafloor , 2.Marshall Islands Marine Resources Authority)

[HTT15-06] Spatial Investigations of Surface Urban Heat Islands in 10 Chinese Metropolises: A Perspective from Land Cover/Use Composition

*Fei LIU[1] (1.University of Tsukuba)

[E] Oral | H (Human Geosciences)：H-TT Technology & Techniques

[H-TT15] Environmental Remote Sensing

convener:Wei Yang(Chiba University), Akihiko Kondoh(Center for Environmental Remote Sensing, Chiba University), Carolynne Hultquist(Columbia University), Elena Sava(US Army Corps of Engineers Geospatial Research Laboratory), Guido Cervone(Pennsylvania State University Main Campus)

[HTT15-07] Landscape changes in the Cordillera Real, Andes detected from satellite images

*YILIN HUANG[1] (1.Tokyo Institute of Technology)

[HTT15-08] **Assessment of local climate zones in Tokyo (Japan) and Lyon (France) using satellite and mobile measurements**

*Florent Renard[1,2], Lucille Alonso[1,2] (1.University of Lyon, France, 2.UMR CNRS Environment City Society)

[HTT15-09] **Deep learning for atmospheric duct estimation from radar sea clutter**

*Xiaofeng Zhao[1], Huadong Du[1], Zhixian Luo[1] (1.College of Meteorology and Oceanography, National University of Defense Technology)

[HTT15-10] Verification of forest cover changes in China using multiple satellites

*Takuto Taguchi[1], Kazuhito Ichii[1], Jingfeng Xiao[2] (1.Chiba University, 2.University of New Hampshire)

[HTT15-11] High-resolution aerosol remote sensing retrieval using Chinese High-Resolution Earth Observation Satellite I (GF-1) wide-field images (WFI) and MODIS surface products

*Fangwen Bao[1] (1.Center for Oceanic and Atmospheric Science at SUSTech (COAST), Department of Ocean Sciences and Engineering, Southern University of Science and Technology)

[HTT15-12] Toward operational satellite monitoring of chlorophyll-a concentrations in turbid inland waters

*Wei Yang[1], Bunkei Matsushita[2], Akihiko Kondoh[1] (1.Chiba University, 2.University of Tsukuba)

[E] Oral | H (Human Geosciences)：H-CG Complex & General

[H-CG21] International Comparison of Landscape Appreciation

convener:yoji aoki(Open University of Japan)

[HCG21-01] “The Original Landscape” of Niigata City in the Early Meiji Era (1876): from the Viewpoint of a Russian Geographer, *A. I. Voeikov*.

★Invited Papers

*Masahiro Nakatani[1] (1.none)

[HCG21-02] Recognition Structure about Japanese Garden Identity analyzed from the Incongruity Feelings of Overseas Japanese Gardens

★Invited Papers

*Liu Ming[1], Kazuhiko Nakamura[1] (1.Graduate School of Agricultural and Life Sciences, The University of Tokyo)

[HCG21-03] Perception Differences between Managers and Visitors on Landscape Changes in Urban Woodlands' Understory: A case in suburban Tokyo

*Bao Guo[1], Toru Terada[1] (1.Graduate School of Frontier Sciences, The University of Tokyo)

[HCG21-04] Consideration on the technique of landscape formation in Japanese garden

★Invited Papers

*Masayshi Kikuchi[1] (1.Tokyo Metropolitan Park Association)

[HCG21-05] **A Study on the Gugok Distribution as Current Status in Chungcheong-do and Jeolla-do Korea**

★Invited Papers

*HyunBin Park[1,2], KeeRae Kang[3], dongpil kim[1,2] (1.The Korean Institute of Landscape Architecture, 2. Dept. of Landscape Architecture, Pusan National University, 3.Institute of Comprehensive Bio industrial, Pusan National University)

[HCG21-06] Spatial conditions related to the sublimity of the shrine forest of Meiji Jingu :Landscape evaluation of the 100-years plan forest at 100 years after afforestation

*Yusuke Mizuuchi[1], Kazuhiko W. Nakamura[1], Katsunori Furuya[2] (1.Graduate School of Agricultural and Life Sciences, The University of Tokyo, 2.Graduate School of Horticulture, Chiba University)

[E] Oral | H (Human Geosciences)：H-CG Complex & General

[H-CG23] Earth surface processes related to deposition, erosion and sediment transport

convener:Koji Seike(Geological Survey of Japan, AIST), Masayuki Ikeda(University of Tokyo), Hideko Takayanagi(Institute of Geology and Paleontology, Graduate School of Science, Tohoku University), Hajime Naruse(Department of Geology and Mineralogy, Graduate School of Science, Kyoto University)

[HCG23-01] Formation of Large Blocked-Valley Lakes by Holocene Sea Level Rise: Poyang and Dongting Lakes, China

★Invited Papers

*Gary Parker[1], Chenge An[2], Li Zhang[2], Hongwei Fang[2], Xudong Fu[2] (1.University of Illinois at Urbana Champaign, 2.Tsinghua University)

[HCG23-02] Evolution of a Mixed Bedrock-Alluvial Canyon Incising into an Uplifting Plateau and Debouching into a Subsiding Valley: Linked Knickpoint Migration and Valley Fill

Li Zhang[1], *Gary Parker[2] (1.Tsinghua University, 2.University of Illinois Urbana-Champaign)

[HCG23-04] Detrital Zircon and Provenance Analysis of Sedimentary Rock in the Nemuro and Urahoro Groups, Eastern Hokkaido, Northern Japan.

*Harisma Harisma[1], Hajime Naruse[1] (1.Department of Geology and Mineralogy, Graduate School of Science, Kyoto University)

[E] Oral | H (Human Geosciences)：H-CG Complex & General

[H-CG23] Earth surface processes related to deposition, erosion and sediment transport

convener:Koji Seike(Geological Survey of Japan, AIST), Masayuki Ikeda(University of Tokyo), Hideko Takayanagi(Institute of Geology and Paleontology, Graduate School of Science, Tohoku University), Hajime Naruse(Department of Geology and Mineralogy, Graduate School of Science, Kyoto University)

[HCG23-05] **Spatio-temporal changes in sedimentation rate and its impact on overpressure evolution in offshore Suriname**

*Nifuku Ko[1], Yuki Kobayashi[1], Yasuhiko Araki[1], Takafumi Ashida[1], Takashi Taniwaki[1] (1.INPEX Corporation)

[HCG23-06] Spatial–temporal evolution of blowout on the southeastern fringe of Otindag sandy land in recent decade

*Rina Hu[1], eerdun Hasi[1], jie Yin[1] (1.Beijing Normal university)

[HCG23-07] Can Superoxide Nanobubbles Inhibit the Release of Phosphorus from Reservoir with Stagnant Water?

*Qingqing Sun[1], Siliang Li[1], Jingfu Wang[2], Pingping Yu[3] (1.Institute of Surface-Earth System Science, Tianjin University, 2.State Key Laboratory of Environmental Geochemistry, Institute of Geochemistry, Chinese Academy of Sciences, 3.Zunyi City Drainage Limited Liability Company)

[HCG23-08] Short to long term morphological changes and migration of sand waves in a semi-enclosed sea: a case study in Okinose area of Osaka Bay

Kojima Hibiki[1], *Atsushi Tani[1], Tetsuo Matsuno[2,3], Mamoru Sano[2], Nobukazu Seama[3,2], Noritaka Endo[4], Ken'ichi Ohkushi[1], Xu Zhang[5], Yusuke Uchiyama[5] (1.Graduate School of Human Development and Environment, Kobe University, 2.Kobe Ocean Bottom Exploration Center (KOBEC), Kobe University, 3.Graduate School of Science, Kobe University, 4.School of Geoscience and Civil Engineering College of Science and Engineering, Kanazawa University, 5.Graduate School of Engineering, Kobe University)

[HCG23-09] Heavy mineral assemblage of river sands along the Kaligandaki River, central Nepal and its application for Bengal Fan sediments

*Kohki Yoshida[1], Nakajima Toru[3], Lalit Kumar Rai[2], Asako Masuda[4] (1.Department of Geology, Faculty of Science, Shinshu University, 2.Graduate School of Medicine, Science and Technology, Shinshu University, 3.Graduate School of Science, Kyoto University, 4.Graduate School of Science and Technology, Shinshu University)

[HCG23-10] Spatial variability of grain size parameters and depositional process in the coastal marshland of Orissa, India

*Koushik Saha[1,2], Subhajit Sinha[1] (1.Department of Geology, University of Calcutta, 35 Ballygunge Circular Road, Kolkata-700019, India, 2.Department of Geology, University of North Bengal,Raja Rammohunpur, West Bengal 734014, India)

[E] Oral | H (Human Geosciences)：H-CG Complex & General

[H-CG24] Enhancing Integrated Research for Sustainable Future - a human geoscience perspective

convener:Yukio Himiyama(Emeritus Professor, Hokkaido University of Education), Takeshi Sakurai(Graduate School of Agricultural and Life Sciences, The University of Tokyo), Akihiko Kondoh(Center for Environmental Remote Sensing, Chiba University)

[HCG24-01] Enhancing Integrated Research for Sustainable Future - a human geoscience perspective

*Yukio Himiyama[1] (1.Emeritus Professor, Hokkaido University of Education)

[HCG24-02] Comprehensive research for land system science towards sustainable land management in Asia

*Okuro Toshiya[1] (1.Graduate School of Agricultural and Life Sciences, The University of Tokyo)

[HCG24-03] KLaSiCa Workshop to connect rural landscape in Asia through theater

*Ken-ichi Abe[1] (1.Research Institute for Humanity and Nature)

[HCG24-04] Do the Rich Suffer Less Damage from a Natural Hazard? A Case of the 2015 Nepal Earthquake

*Sato Takeshi[1], Santosh Rayamajhi[2], Tachibana Towa[3], Takeshi Sakurai[1] (1.Graduate School of Agricultural and Life Sciences, The University of Tokyo , 2.Institute of Forestry, Tribhuvan University, 3.Graduate School of Social Sciences, Chiba University)

[HCG24-05] **Assessment of regional eco-environmental vulnerabilities - - -A case study in Mongolia**

*Qinxue Wang[1] (1.National Institute for Environmental Studies)

[E] Oral | H (Human Geosciences)：H-CG Complex & General

[H-CG25] Turbidity current: generation, morphodynamics and deposits

convener:Hajime Naruse(Department of Geology and Mineralogy, Graduate School of Science, Kyoto University), Robert Michael Dorrell(University of Hull), Miwa Yokokawa(Osaka Institute of Technology)

[HCG25-01] Autogenic foreset-bottomset transition trajectory: Experiment and theory

*Wonsuck Kim[1,2], Haein Shin[1] (1.Yonsei Univ., 2.Univ. of Texas)

[HCG25-02] Submarine topographic control on the distribution of supercritical-flow deposits: insights from the Middle Eocene deep-marine system, Ainsa-Jaca basins, Spanish Pyrenees

*Pauline H Cornard[1], Kevin Pickering[1] (1.University College London)

[HCG25-03] Flume experiments for Froude supercritical flow submarine fan: morphology and grain size distribution

*Kenya Ono[1], Hajime Naruse[2], Kazuki Kikuchi[2], Qifeng Yao[2], Zhirong Cai[2], Shunsuke Watanuki[1], Koji Ohata[2], Sojiro Fukuda[2,3], Kazushi Nakata[2], Miwa Yokokawa[4] (1.INPEX Corporation, 2.Kyoto University, 3.University of Hull, 4.Osaka Institute of Technology)

[HCG25-04] The scales and profiles of submarine cyclic steps

*Zhuyuan Wu[1], Norihiro Izumi[1] (1.Hokkaido University)

[HCG25-05] **The interplay of turbidity and contour currents: its representative products, flow dynamics, and significance**

★Invited Papers

*Chenglin Gong[1,2], Yingmin Wang[1,2], Ronald J. Steel[3], Michele Rebesco[4], Stefano Salon[4] (1.State Key Laboratory of Petroleum Resources and Prospecting (China University of Petroleum, Beijing), Beijing 102249, China, 2.College of Geosciences, China University of Petroleum (Beijing), Changping, Beijing, 102249, China, 3.Department of Geological Sciences, Jackson School of Geosciences, The University of Texas, Austin, Texas78712, USA, 4.Istituto Nazionale di Oceanografia e di Geofisica Sperimentale (OGS), Borgo Grotta Gigante 42/C, 34010 Sgonico, Trieste, Italy)

[E] Oral | H (Human Geosciences)：H-CG Complex & General

[H-CG25] Turbidity current: generation, morphodynamics and deposits

convener:Hajime Naruse(Department of Geology and Mineralogy, Graduate School of Science, Kyoto University), Robert Michael Dorrell(University of Hull), Miwa Yokokawa(Osaka Institute of Technology)

[HCG25-06] Critical Transitions in Particulate Density Currents

★Invited Papers

*Benjamin Charles Kneller

[HCG25-07] **Laminar-turbulent transition in saturated granular free-surface flow**

*Sakai Yuichi[1], Norifumi Hotta[1] (1.Graduate School of Agricultural and Life Sciences, The University of Tokyo)

[HCG25-08] Statistical Analyses of Vertical Flow Profile show Turbidity Currents and Open-Channel Flow are Fundamentally Different

*Sojiro Fukuda[1], Elena Bastianon[2], Bill McCaffrey[3], Hajime Naruse[4], Robert Michael Dorrell[1] (1.Center for Environmental Fluid Dynamics, University of Hull, UK, 2.Energy and Environment Institute, University of Hull, UK, 3.Institute of Applied Geoscience, School of Earth and Environment, University of Leeds, 4.Department of Geology and Mineralogy, Graduate School of Science, Kyoto University, Japan)

[HCG25-09] Quantifying suspended sediment dynamics in a large-scale turbidity currents: Direct measurements from full scale flows

★Invited Papers

*Daniel R Parsons[1] (1.University of Hull, UK)

[E] Oral | S (Solid Earth Sciences)：S-GD Geodesy

[S-GD01] Geodetic Infrastructure for Monitoring the Dynamic Earth: The Global Geodetic Observing System

convener:Basara Miyahara(GSI of Japan), Richard S Gross(NASA Jet Propulsion Laboratory)

[SGD01-01] The Global Geodetic Observing System

*Basara Miyahara[1] (1.GSI of Japan)

[SGD01-03] GGOS External Relations Update: Using United Nations Frameworks to Promote International Cooperation and Geodetic Capacity Building in support of Disaster Risk Reduction and Resiliency

★Invited Papers

*Allison Craddock[1], John Labrecque[2], John Rundle[3], Basara Miyahara[4] (1.NASA Jet Propulsion Laboratory, California Institute of Technology, USA, 2.University of Texas, Center for Space Research, USA, 3.University of California, Departments of Physics and Earth & Planetary Science, USA, 4.Geospatial Information Authority of Japan, Japan)

[SGD01-04] **GGOS Bureau of Networks and Observations: Network Infrastructure and Related Activities**

*Michael R Pearlman[1], Carey E Noll[2], Dirk Behrend[3], Allison Craddock[4], Erricos Pavlis[5], Jérôme Saunier[6], Elizabeth Bradshaw[7], Riccardo Barzaghi[8], Daniela Thaller[9], Benjamin Maennel[10], Ryan Hippenstiel Hippenstiel[11], Roland Pail[12], Nicholas Brown[13] (1.Center for Astrophysics, Cambridge MA, United States, 2.NASA Goddard Space Flight Center, Code 61A, Greenbelt MD, United States, 3.NVI, Inc./NASA Goddard Space Flight Center, Greenbelt MD, United States, 4.Jet Propulsion Laboratory/California Institute of Technology, Pasadena, CA, United States, 5.University of Maryland, Baltimore MD, United States, 6.Institut Géographique National, St. Mande, France , 7.National Oceanography Centre, Liverpool, United Kingdom, 8.Politecnico di Milano, Milan, Italy, 9.Bundesamt fuer Kartographie und Geodaesie, Frankfurt, Germany, 10.GeoForschungsZentrum, Potsdam, Germany, 11.National Geodetic Survey, Silver Spring, MD, United States, 12.Technische Universitaet Muenchen, Munich, Germany, 13.Geoscience Australia, Canberra, Australia)

[SGD01-05] Activities of WG on DOIs in GGOS and Data DOI WG in GGOS Japan

★Invited Papers

*Yusuke Yokota[1], Basara Miyahara[3], Toshimichi Otsubo[4], Yasuhiro Murayama[5], Hiroshi Munekane[3], Tadashi Ishikawa[2] (1.Institute of Industrial Science, The University of Tokyo, 2.Hydrographic and Oceanographic Department, Japan Coast Guard, 3.Geospatial Information Authority of Japan, 4.Hitotsubashi University, 5.National Institute of Information and Communications Technology)

[SGD01-06] GGOS Japan's roles and activities as a GGOS Affiliate

*Toshimichi Otsubo[1], Basara Miyahara[2], Yusuke Yokota[3], Shinobu Kurihara[2] (1.Hitotsubashi University, 2.Geospatial Information Authority of Japan, 3.Institute of Industrial Science, the University of Tokyo)

[E] Oral | S (Solid Earth Sciences)：S-GD Geodesy

[S-GD01] Geodetic Infrastructure for Monitoring the Dynamic Earth: The Global Geodetic Observing System

convener:Basara Miyahara(GSI of Japan), Richard S Gross(NASA Jet Propulsion Laboratory)

[SGD01-08] The Next Generation Lunar Retroreflector and Lunar Laser Ranging

*Douglas G Currie[1], Dennis Wellnitz[1], Chensheng Wu[1], Giovanni Delle Monache[2], Simone Dell'Agnello[2], Bradford Behr[1] (1.University of Maryland, College Park, 2.INFN-LNF, Frascati, Italy)

[SGD01-09] Determination of geopotential value over Japan for contribution to the International Height Reference Frame

*Koji Matsuo[1] (1.GSI of Japan)

[SGD01-11] Integrated Space Geodetic Study of the 2019 Typhoon Hagibis: Signatures in Troposphere, Lithosphere, and Ionosphere

★Invited Papers

*Kosuke Heki[1], Wei Zhan[2], Syachrul Arief[1] (1.Department of Earth and Planetary Sciences, Faculty of Science, Hokkaido University, 2.The First Monitoring and Application Center, China Earthquake Administration, Tianjin, China)

[SGD01-12] Accuracy evaluation of a crustal deformation model with velocity in terms of maintaining the Japanese geodetic datum

*Yu Takagi[1], Kensuke Kokado[1], Yasuhiro Koso[1], Hiromi Yamao[1], Takashi Tsutsumi[1], Masao Iwata[1] (1.GSI of Japan)

[E] Oral | S (Solid Earth Sciences)：S-SS Seismology

[S-SS03] Seismological advances in the ocean

convener:Takashi Tonegawa(Research and Development center for Earthquake and Tsunami, Japan Agency for Marine-Earth Science and Technology), Takeshi Akuhara(Earthquake Research Institute, University of Tokyo), Pascal Audet(University of Ottawa), Taka'aki Taira(Berkeley Seismological Laboratory, University of California, Berkeley)

[SSS03-01] Millimeter-scale tsunami of an M6 earthquake observed by the nearest-field pressure gauge array: a fault modeling and stress drop estimation

★Invited Papers

*Tatsuya Kubota[1], Tatsuhiko Saito[1], Wataru Suzuki[1] (1.National Research Institute for Earth Science and Disaster Resilience)

[SSS03-02] Seismic velocity structure along the Japan trench inferred from ambient noise and teleseismic surface waves observed by S-net

*Ryota Takagi[1], Akira Ishigami[1], Genti Toyokuni[1], Ryosuke Azuma[1], Mare Yamamoto[1] (1.Research Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University)

[SSS03-03] Seismic ambient noise interferometry applied to dense OBS array of off Ibaraki region

*Lina Yamaya[1], Kimihiro Mochizuki[1], Takeshi Akuhara[1], Kiwamu Nishida[1], Tsuyoshi Ichimura[1], Kohei Fujita[1], Takuma Yamaguchi[1], Takane Hori[2] (1.Earthquake Research Institute, University of Tokyo, 2.Japan Agency for Marine-Earth Science and Technology)

[SSS03-04] Lithospheric structure beneath the extinct Mid-Ocean-Ridge in South China Sea: Constraints from passive-source OBS data

*Ting Yang[1], Ba Manh Le[1], Chenguang Liu[3], Mei Xue[2] (1.Southern University of Science and Technology, 2.Tongji University, 3.First institute of oceanography, MNR, China)

[SSS03-05] Development of seismic inversion tool for flat and isotropic layered structures in the ocean (SEIS-FILO)

*Takeshi Akuhara[1] (1.Earthquake Research Institute, The University of Tokyo)

[SSS03-06] Inverting OBS compliance signals for oceanic crust and sediment velocity structure using mixture density neural networks

*Stephen Glenn Mosher[1], Zach Eilon[2], Pascal Audet[1] (1.University of Ottawa, 2.University of California Santa Barbara)

[E] Oral | S (Solid Earth Sciences)：S-SS Seismology

[S-SS03] Seismological advances in the ocean

convener:Takashi Tonegawa(Research and Development center for Earthquake and Tsunami, Japan Agency for Marine-Earth Science and Technology), Takeshi Akuhara(Earthquake Research Institute, University of Tokyo), Pascal Audet(University of Ottawa), Taka'aki Taira(Berkeley Seismological Laboratory, University of California, Berkeley)

[SSS03-07] Seafloor seismology with Distributed Acoustic Sensing in Monterey Bay

★Invited Papers

*Nate Lindsey[1,2], Jonathan Ajo-franklin[4,2], T. Craig Dawe[3], Lise Retailleau[1], Biondo Biondi[1], Lucia Gualtieri[1] (1.Stanford University, 2.Lawrence Berkeley National Laboratory, 3.Monterey Bay Aquarium Research Institute, 4.Rice University)

[SSS03-08] Marine seismic observation by Distributed Acoustic Sensing using seafloor cable off Sanriku for long-term monitoring

*Masanao Shinohara[1], Tomoaki Yamada[1], Takeshi Akuhara[1], Kimihiro Mochizuki[1], Takeo Kasajima[2], Takahiro Arioka[2], Masayuki Hamakawa[3], Shunsuke Kubota[4] (1.Earthquake Research Institute, University of Tokyo, 2.Fujitsu Laboratories Ltd., 3.Fujitsu Limited, 4.YK Giken Co., Ltd.)

[SSS03-09] Strain release by “rapid” aseismic slip at the Izu-Bonin trench

*Yoshio Fukao[1], Hiroko Sugioka[5], Aki Ito[1], Takashi Tonegawa[1], Mikiya Yamashita[4], Hajime Shiobara[2], Tatsuya Kubota[3], Tatsuhiko Saito[3] (1.Japan Agency for Marine-Earth Science & Technology, 2.University of Tokyo, 3.National Research Institute of Earth Science and Disaster Resillence , 4.National Institute of Advanced Industrial Science and Technology, 5.Kobe University)

[SSS03-10] Glacier tremors revealed by Ocean Bottom Seismometer in Greenland

*Evgeny A. Podolskiy[1], Yoshio Murai[2], Naoya Kanna[1], Shin Sugiyama[3] (1.Arctic Research Center, Hokkaido University, 2.Institute of Seismology and Volcanology, Hokkaido University, 3.Institute of Low Temperature Science, Hokkaido University)

[SSS03-11] Distribution of long period seismic "hum" sources following large storms in the north Pacific and their relation to infragravity waves

Satish Maurya[1,2], *Taka'aki Taira[1], Barbara Romanowicz[1,3] (1.Berkeley Seismological Laboratory, University of California, Berkeley, 2.Department of Earth Sciences, Indian Institute of Technology Bombay, 3.Collège de France, Paris)

[SSS03-12] Ambient noise field and temporal changes on ambient noise auto/cross-correlogram at the sea bottom inferred from ocean-bottom seismic and pressure arrays

*Yoshihiro Ito[1], Miyuu Uemura[1], Spahr C. Webb[2], Kimihiro Mochizuki[3], Stuart Henrys[4] (1.Disaster Prevention Research Institute, Kyoto University, 2.Lamont Doherty Earth Observatory, Columbia University, 3.Earthquake Research Institute, The University of Tokyo, 4.GNS Science)

[E] Oral | S (Solid Earth Sciences)：S-SS Seismology

[S-SS04] Strong Ground Motion and Earthquake Disaster

convener:Kazuhiro Somei(Geo-Research Institute), Yasuhiro Matsumoto(Kozo Keikaku Engineering)

[SSS04-01] Separation of High-frequency Source and Path Effects from South Africa Mine Data

*James Mori[1], Hiroshi Ogasawara[2] (1.Earthquake Hazards Division, Disaster Prevention Research Institute, Kyoto University, 2.Faculty of Science and Engineering, Ritsumeikan University)

[SSS04-02] Site effects at strong motion stations in Shizuoka prefecture, Japan, and its application for validating the underground velocity model

*Tomotaka Iwata[1], Hayato Shimazu[2], Kimiyuki Asano[1], Kazuhiro Somei[3], Shigeki Senna[4] (1.Disaster Prevention Research Institute, Kyoto University, 2.Graduate School of Science, Kyoto University, 3.Geo-Research Institute, 4.National Research Institute for Earth Science and Disaster Resilience)

[SSS04-03] Small-aperture Microtremor Array Surveys in the Southern Part of the Kyoto Basin and Northern Part of the Nara Basin, Japan

*Kimiyuki Asano[1], Tomotaka Iwata[1], Haruko Sekiguchi[1] (1.Disaster Prevention Research Institute, Kyoto University)

[SSS04-04] Microtremor observation in the tsunami inundation predicted area in Hokuriku Region: Preliminary resutls from observed data in Suzu city, Ishikawa prefecture

*Michihiro Ohori[1] (1.Research Institute of Nuclear Engineering, University of Fukui)

[SSS04-05] Subsurface velocity structure of Saga Plain and Shiroishi Plain, Kyushu, Japan, estimated by microtremor array survey

*Masayuki Yoshimi[1], Michiko Shigefuji[2], Tatsuo Kanno[2], Ryosuke Noma[2], Hiro Nimiya[1] (1.Geological Survey of Japan, AIST, 2.Faculty of Human-Environment Studies, Kyushu University)

[E] Oral | S (Solid Earth Sciences)：S-SS Seismology

[S-SS04] Strong Ground Motion and Earthquake Disaster

convener:Kazuhiro Somei(Geo-Research Institute), Yasuhiro Matsumoto(Kozo Keikaku Engineering)

[SSS04-06] Estimation of shallow 3D S-wave velocity structure by applying surface-wave tomography using MeSO-net

*Hiro Nimiya[1,2], Tatsunori Ikeda[2], Takeshi Tsuji[2] (1.National Institute of Advanced Industrial Science and Technology, 2.Kyushu University)

[SSS04-07] Comparison of subsurface models derived from different physical quantities in the inversion based on microtremors and earthquake motions

*Kentaro Motoki[1], Kenichi Kato[1] (1.Kobori Research Complex)

[SSS04-08] Impact of Seismic Velocity Change on Ground Motion Modeling

*Hiroe Miyake[1], Taka'aki Taira[2], Li-Wei Chen[2] (1.Earthquake Research Institute, University of Tokyo, 2.Berkeley Seismological Laboratory, University of California, Berkeley)

[SSS04-09] Validation of S-wave velocity structure of sedimentary layers of the Kanto basin using strong motion records applied to seismic interferometry

*Kosuke Chimoto[1], Hiroaki Yamanaka[1] (1.Tokyo Institute of Technology)

[SSS04-10] Comparison of PGA and PGV at the S-net and land stations for the 2016 Mw7 off Fukushima earthquake

*Yadab Prasad Dhakal[1], Wataru Suzuki[1], Takashi Kunugi[1], Takeshi Kimura[1], Shin Aoi[1] (1.National Research Institute for Earth Science and Disaster Resilience (NIED))

[E] Oral | S (Solid Earth Sciences)：S-SS Seismology

[S-SS04] Strong Ground Motion and Earthquake Disaster

convener:Kazuhiro Somei(Geo-Research Institute), Yasuhiro Matsumoto(Kozo Keikaku Engineering)

[SSS04-11] Source scaling and stress drop for the 2018 Hokkaido Eastern Iburi earthquake sequence estimated by the S-wave coda spectral ratio method

*Kazuhiro Somei[1], Kimiyuki Asano[2], Tomotaka Iwata[2], Ken Miyakoshi[1], Takashi Akazawa[1] (1.Geo-Research Institute, 2.Disaster Prevention Research Institute, Kyoto University)

[SSS04-12] Estimation of the strong motion generation area (SMGA) during the 2018 Hokkaido eastern Iburi earthquake

*Susumu Kurahashi[1], Kojiro Irikura[1] (1.Aichi Institute of Technology)

[SSS04-13] Strong ground motions from deep earthquakes in Hokkaido and attenuation structure of island arc

*Yasumaro Kakehi[1] (1.Graduate School of Science, Kobe University)

[SSS04-14] Simulation of near-fault ground motion for the 2016 Kumamoto earthquake (Mj7.3) considering the surface rupture geometry

*Asako Iwaki[1], Nobuyuki Morikawa[1], Hiroyuki Fujiwara[1], Takashi Kumamoto[2], Yurie Okuma[2], Hinata Kimura[3] (1.National Research Institute for Earth Science and Disaster Prevention, 2.Faculty of Science, Okayama University, 3.Graduate School of Environmental Studies, Nagoya University)

[SSS04-15] Modeling procedure of fault rupturing with detailed information of surface traces for predicting strong motions and permanent displacements

*Kazuo Dan[1], Saruul Dorjpalam[1], Atsuko Oana[2], Kensuke Arai[2], Hiroyuki Fujiwara[3], Nobuyuki Morikawa[3] (1.Ohsaki Research Institute, Inc., 2.Shimizu Corporation, 3.National Research Institute for Earth Science and Disaster Resilience)

[SSS04-16] Waveform inversion with empirical Green's functions for the source rupture process of the mainshock of the 2019 Ridgecrest earthquake sequence

*SHUANGLAN WU[1], Atsushi Nozu[1], Yosuke Nagasaka[1] (1.PORT AND AIRPORT RESEARCH INSTITUTE)

[E] Oral | S (Solid Earth Sciences)：S-SS Seismology

[S-SS04] Strong Ground Motion and Earthquake Disaster

convener:Kazuhiro Somei(Geo-Research Institute), Yasuhiro Matsumoto(Kozo Keikaku Engineering)

[SSS04-17] A point source model considering the directivity effect

*Yosuke Nagasaka[1], Atsushi Nozu[1] (1.Port and Airport Research Institute)

[SSS04-18] Supplementing Vs30 and Z1.0 with H/V Fourier Spectral Ratios and Spatial Correlation for Predicting Site Effect

*Shu-Hsien Chao[1], Che-Min Lin[1], Chun-Hsiang Kuo[1], Jyun-Yan Huang[1] (1.National Center for Research on Earthquake Engineering)

[E] Oral | S (Solid Earth Sciences)：S-SS Seismology

[S-SS05] Innovative data analysis methods for characterization of seismicity

convener:Francesco Grigoli(ETH Zurich Swiss Federal Institute of Technology Zurich), Bogdan Enescu(Department of Geophysics, Kyoto University), Aitaro Kato(Earthquake Research Institute, the University of Tokyo), Yosuke Aoki(Earthquake Research Institute, University of Tokyo)

[SSS05-01] Deep Learning for Earthquake Monitoring

★Invited Papers

*Weiqiang Zhu[1], S. Mostafa Mousavi[1], Kai Sheng Tai[2], Yongsoo Park[1], Yen Joe Tan[1], William Ellsworth[1], Gregory C. Beroza[1] (1.Department of Geophysics, Stanford University, 2.Computer Science Department, Stanford University)

[SSS05-02] Deep Learning (& classification models) performance in aftershock prediction

★Invited Papers

*Marco Broccardo[1,2], Arnaud Mignan[2,3] (1.Institute of Risk and Uncertainty, University of Liverpool , 2.Swiss Seismological Service, ETH Zürich, Switzerland, 3.Institute of Risk Analysis, Prediction and Management, Academy for Advanced Interdisciplinary Studies, Southern University of Science and Technology, Shenzhen, China)

[SSS05-03] Statistical learning and denoising for multivariate seismic data streams

*Andrey Lokhov[1] (1.Los Alamos National Laboratory)

[SSS05-04] Testing foreshock hypothesis against the ETAS model: why is it so difficult?

*Jiancang Zhuang[1] (1.Institute of Statistical Mathematics)

[SSS05-05] Analyses of the temporal change in size distribution of the earthquakes without using “moving window”

*Kohei Nagata[1] (1.Meteorological Research Institute)

[E] Oral | S (Solid Earth Sciences)：S-SS Seismology

[S-SS07] Earthquake prediction and forecast+pre-earthquake geoscientific changes(TBD)

convener:Masayuki Obayashi(Japan Agency for Marine-Earth Science and Technology), Toshitaka Baba(Graduate School of Science and Technology, Tokushima University), Chi-Yu King(Retired)

[SSS07-01] Hydrological earthquake precursors caused by slow-slip events

★Invited Papers

*Chi-Yu King[1], Chi-Yu King[1] (1.Retired)

[SSS07-02] Crustal deformations precursory to the Tohoku M9 earthquake and tsunami

*Fumihide Takeda[1,2] (1.Takeda Eng Consultant Co., 2.Earthquake Prediction Inst.)

[SSS07-03] **Nowcasting Earthquakes in Sulawesi Island, Indonesia**

*Sumanta Pasari[1], Andrean VH Simanjuntak[2] (1.Birla Institute of Technology and Science Pilani, 2.Indonesian Agency for Meteorology, Climatology and Geophysics)

[SSS07-04] Dilation of a sheared granular model experiment of earthquake to serve as a possible precursor

*Victor Simon Levy dit Vehel[1], Florine Dubourg, Loic Vanel[1], Knut Jørgen Måløy[2], Osvanny Ramos[1] (1.Institut Lumiere Matiere Lyon 1, 2.University of Oslo)

[SSS07-05] **A Mechanochemical Model of Stress-induced Charges for Generating the Electromagnetic Precursors of Earthquakes**

*Jeen-Hwa Wang[1] (1.Academia Sinica)

[SSS07-06] Likelihood model of crustal earthquakes in southwest Japan using GNSS strain rate data

*Takuya NISHIMURA[1] (1.Disaster Prevention Research Institute, Kyoto University)

[E] Oral | S (Solid Earth Sciences)：S-SS Seismology

[S-SS08] Statistical seismology and underlying physical processes

convener:Yasuhiro Yoshida(Meteorological College, Japan Meteorological Agency)

[SSS08-01] Stress state of the Earth's crust in the Korean Peninsula with reference to Japanese islands: Implication of weak faults

*Yasuto Kuwahara[1], Jin-Hyuck Choi[1], Youngbeom Cheon[1], Kazutoshi Imanishi[2] (1.Korea Institute of Geoscience and Mineral Resources, 2.Geological Survey of Japan, AIST)

[SSS08-02] **Effect of seasonal snow load on earthquake occurrence in the Pamir Mountains**

*Muhammad Usman[1,2], Kosuke Heki[2], Sigurjon Jonsson[1] (1.Department of Physical Sci. and Engineering, King Abdullah Univ. of Sci. and Tech., Thowal, Saudi Arabia, 2.Department of Natural History Sci., Hokkaido Univ. Sapporo, Japan)

[SSS08-03] The diversity of similar earthquakes in subduction zone

*Ayako Tsuchiyama[1], Junichi Nakajima[1] (1.Earth and Planetary Sciences, Tokyo Institute of Technology)

[SSS08-04] **Spatio-temporal clustering of successive earthquakes in Japan: analyses of F-net catalogue**

*Thystere Matondo Bantidi[1], Takeshi Nishimura[1] (1.Tohoku Univesity)

[SSS08-05] Foreshock Cascade to Failure in the M 6.4 July 4, 2019 Ridgecrest, California Earthquake

*William L Ellsworth[1], Andrew J Barbour[2], David R Shelly[2] (1.Stanford University, 2.U. S. Geological Survey)

[SSS08-06] Changes in stress state associated with the 2019 Ridgecrest, California, earthquakes

*Kazuyoshi Nanjo[1] (1.University of Shizuoka)

[E] Oral | S (Solid Earth Sciences)：S-SS Seismology

[S-SS09] INDUCED AND TRIGGERED SEISMICITY: CASE STUDIES, MONITORING AND MODELING TECHNIQUES

convener:Luca Urpi, Yusuke Mukuhira(Institute of Fluid Science, Tohoku University), Bogdan Enescu(Department of Geophysics, Kyoto University), Francesco Grigoli(ETH Zurich Swiss Federal Institute of Technology Zurich)

[SSS09-01] Value at Induced Risk: Managing injection-induced seismic risks based on low-probability, high-impact events

★Invited Papers

*William L Ellsworth[1], Cornelius Langenbruch[2], Jeong-Ung Woo[3], David J Wald[4] (1.Stanford University, 2.Risk Management Solutions, 3.Seoul National University, 4.U. S. Geological Survey)

[SSS09-02] Large-scale response of injection-induced seismicity modulated by geomechanics

*Matthew Weingarten[1] (1.San Diego State University)

[SSS09-03] Fast-linearized methods for hypocentre location, magnitude estimation and site amplification effects of seismic events induced in conventional and unconventional gas fields

*Germán Rodríguez-Pradilla[1,2] (1.Department of Geoscience, University of Calgary, 2.School of Earth Sciences, University of Bristol)

[SSS09-04] Seismicity induced by the Hutubi Underground Gas Storage Facility

*Hongfeng Yang[1], Pengcheng Zhou[1], Guoyan Jiang[1], Baoshan Wang[2], Jiancang Zhuang[3] (1.The Chinese University of Hong Kong, 2.University of Science and Technology of China, 3.Institute of Statistical Mathematics)

[SSS09-05] Detection and location of seismic events in continuous data of sparse monitoring network of an abandoned flooded mine

*Dalija Namjesnik[1,2], Jannes Kinscher[1], Yann Gunzburger[2], Pascal Dominique[3], Pascal Bernard[4], Isabelle Contrucci[1], Natalia Poiata[4,5], Emmanuelle Klein[1] (1.Ineris, Institut national de l'environnement industriel et des risques, France , 2.University of Lorraine, France, 3.BRGM, Bureau de recherches géologiques et minières, France, 4.IPGP, Institut de Physique du Globe de Paris, France, 5.National Institute for Earth Physics, Romania)

[E] Oral | S (Solid Earth Sciences)：S-SS Seismology

[S-SS09] INDUCED AND TRIGGERED SEISMICITY: CASE STUDIES, MONITORING AND MODELING TECHNIQUES

convener:Luca Urpi, Yusuke Mukuhira(Institute of Fluid Science, Tohoku University), Bogdan Enescu(Department of Geophysics, Kyoto University), Francesco Grigoli(ETH Zurich Swiss Federal Institute of Technology Zurich)

[SSS09-06] Monitoring anthropogenic seismicity in Italy

★Invited Papers

*Thomas Braun[1], Stefania Danesi[1], Daniela Famiani[1], Andrea Morelli[1] (1.Istituto Nazionale di Geofisica e Vulcanologia (INGV))

[SSS09-07] Examination of the finite fault model for the M_W 5.5 2017 Pohang earthquake with multi-segmented fault system

*Jeong-Ung Woo[1], Junkee Rhie[1], Eunbyeol Cho[1] (1.Seoul National University)

[SSS09-08] Revisiting triggering intensity of earthquakes in southern California using resent seismic catalogs from 2008 to 2017

*Masatoshi Miyazawa[1], Emily E Brodsky[2], Huiyun Guo[2] (1.Disaster Prevention Research Institute, Kyoto University, 2.Department of Earth & Planetary Sciences, University of California Santa Cruz)

[SSS09-09] Effective medium approach for analysis of natural fracture activation trends during hydraulic fracturing

*Nikita Dubinya[1,2], Maria Trimonova[3], Victor Nachev[1,3] (1.Moscow Institute of Physics and Technology, 2.Schmidt Institute of Physics of the Earth of the Russian Academy of Sciences, 3.Sadovsky Institute of Geospheres Dynamics of the Russian Academy of Sciences)

[E] Oral | S (Solid Earth Sciences)：S-EM Earth's Electromagnetism

[S-EM18] Paleomagnetism and rock magnetism applied to solving geological and geophysical problems

convener:Martin Chadima(Institute of Geology of the Czech Academy of Sciences), Balazs Bradak(University of Burgos, Spain), Daniel Pastor-Galan(Center for North East Asian Studies, Tohoku University), Myriam Annie Claire Kars(Center for Advanced Marine Core Research)

[SEM18-01] Implications of new Paleocene paleomagnetic data from SW Japan for the mode of early opening of the Japan Sea

★Invited Papers

*Hiroyuki Hoshi[1] (1.Department of Earth Sciences, Aichi University of Education)

[SEM18-02] **Paleomagnetic and paleointensity results from a Pliocene lava flow sequence including a transitional field record**

*Manuel Calvo-Rathert[1,2], Elisa Maria Sanchez Moreno[1], Maria Felicidad Bogalo[1], Avto Gogichaishvili[3], George Vashakidze[4], Emilio Herrero-Bervera[2], Juan Julio Morales[3] (1.Departamento de Fisica, EPS, Universidad de Burgos, 09006 Burgos, Spain, 2.Hawaii Institute of Geophysics and Planetology, University of Hawaii at Manoa, Honolulu, Hawaii, United States, 3.Servicio Arqueomagnetico Nacional – Instituto de Geofisica, Universidad Nacional Autonoma de Mexico, Morelia, Mexico , 4.Alexandre Janelidze Institute of Geology – Ivane Javakhishvili Tbilisi State University, 0171 Tbilisi, Georgia)

[SEM18-03] Paleomagnetic study of Holocene lava flow age at Nakadake volcano in Aso caldera, Kyushu Japan: Contribution to establish the Eruption history

*Chisato Anai[1], Nobutatsu Mochizuki[2], Yasuo Miyabuchi[3], Mitsuru Utsugi[1], Hidetoshi Shibuya[2], Takahiro Ohkura[1] (1.Aso Volcanological Laboratory, Institute for Geothermal Sciences, Graduate School of Science, Kyoto University, 2.Earth and Environmental Science, Division of Natural Science, Faculty of Advanced Science and Technology, Kumamoto University, 3.Center for Water Cycle, Marine Environment and Disaster Management, Kumamoto University)

[SEM18-04] **Magnetic mineral change during thermal demagnetization monitored by principle component analysis of FORC: Sediments from Boso Peninsula recording geomagnetic reversals**

*Hirokuni Oda[1], Hiroomi Nakazato[2], Futoshi Nanayama[1] (1.Institute of Geology and Geoinformation, Geological Survey of Japan, AIST, 2.National Agriculture and Food Research Organization)

[SEM18-05] **Eocene global cooling event registered in the red clay sequence near Tibet**

*Vadim A Kravchinsky[1,2], Rui Zhang[2], Lioudmila P Koukhar[1] (1.Geophysics, Department of Physics, University of Alberta, Edmonton, Alberta T6G 2E1, Canada, 2.Institute of Cenozoic Geology and Environment, State Key Laboratory of Continental Dynamics, Department of Geology, Northwest University, Xi'an 710069, China)

[SEM18-06] Analyze the early 19th century's geomagnetic declination in Japanese archipelago from Tadataka Inoh's 67 volumes magnetic survey azimuth ledger Santou-Houi-Ki national treasure of Japan (The 14th report)

*Motohiro Tsujimoto[1], Akitoshi Omotani[2] (1.none, 2.San-in.System Consultant Co.Ltd)

[E] Oral | S (Solid Earth Sciences)：S-EM Earth's Electromagnetism

[S-EM19] Earth and planetary magnetism: Observations, modeling, and implications on dynamics and evolution

convener:Hirokuni Oda(Institute of Geology and Geoinformation, Geological Survey of Japan, AIST), Futoshi Takahashi(Faculty of Sciences, Kyushu University), Courtney Jean Sprain(University of Florida), Yoichi Usui(Japan Agency for Marine-Earth Science and Technology)

[SEM19-01] Interpretation techniques for crustal magnetic fields in the presence of solar fields, instrument or mission challenges

★Invited Papers

*Michael E Purucker[1], Dhananjay Ravat[2], Benoit Langlais[5], Alexander Michels[3], Jack Connerney[4], Suzanne McEnroe[3] (1.NASA/GSFC, Greenbelt, MD, USA, 2.Univ.Kentucky, Lexington, KY, USA, 3.NTNU, Trondheim, Norway, 4.ADNET/NASA, Greenbelt, MD USA, 5.CNRS, U.Nantes, Nantes, France)

[SEM19-02] Constraints on the Source of the Martian Magnetic Anomalies Inferred From Relaxation Time of Remanent Magnetization

★Invited Papers

*Masahiko Sato[1], Yuhji Yamamoto[2], Takashi Nishioka[2], Kazuto KODAMA[3], Nobutatsu Mochizuki[4], Masashi Ushioda[5], Ryoichi Nakada[6], Hideo Tsunakawa[7] (1.The University of Tokyo, 2.Kochi University, 3.Doshisha University, 4.Kumamoto University, 5.National Institute of Advanced Industrial Science and Technology, 6.Japan Agency for Marine-Earth Science and Technology, 7.Japan Aerospace Exploration Agency)

[SEM19-04] Anelastic torsional oscillations in Jupiter's metallic hydrogen region

*Kumiko Hori[1,2], Robert J Teed[3], Chris A Jones[2] (1.Graduate School of System Informatics, Kobe University, 2.Department of Applied Mathematics, University of Leeds, 3.School of Mathematics and Statistics, University of Glasgow)

[SEM19-05] Quantitative evaluation of the convection structure in the core with reference to a compositionally-driven lunar dynamo

*Fumi Hyodo[1], Futoshi Takahashi[2], Satoshi Kaneshima[2], Hisayoshi Shimizu[3], Hideo Tsunakawa[4] (1.Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University, 2.Department of Earth and Planetary Sciences, Faculty of Science, Kyushu University, 3.Earthquake Research Institute, University of Tokyo, 4.Japan Aerospace Exploration Agency)

[SEM19-06] Effects of thermal boundary conditions on geodynamo with various Rayleigh numbers and inner core radii

*Yuki Nishida[1], Yuto Katoh[1], Hiroaki Matsui[2], Masaki Matsushima[3], Atsushi Kumamoto[1] (1.Department of Geophysics, Graduate School of Science, Tohoku University, 2.Dept. of Earth and Planetary Sciences, University of California, Davis, 3.Department of Earth and Planetary Sciences, School of Science, Tokyo Institute of Technology)

[E] Oral | S (Solid Earth Sciences)：S-EM Earth's Electromagnetism

[S-EM19] Earth and planetary magnetism: Observations, modeling, and implications on dynamics and evolution

convener:Hirokuni Oda(Institute of Geology and Geoinformation, Geological Survey of Japan, AIST), Futoshi Takahashi(Faculty of Sciences, Kyushu University), Courtney Jean Sprain(University of Florida), Yoichi Usui(Japan Agency for Marine-Earth Science and Technology)

[SEM19-07] **Origin, Diversity and Evolution of Magnetotctic Bacteria: Implication for Earth's Magnetic Field**

★Invited Papers

*Yongxin Pan[1], Wei Lin[1] (1.Biogeomagnetism Group, Key Laboratory of Earth and Planetary Physics, Institute of Geology and Geophysics, Chinese Academy of Sciences)

[SEM19-08] Hints of 3.4 billion-year-old magnetofossils: Possible early coevolution of life and the geodynamo

*John Anthony Tarduno[1,2], Axel Hofmann[3], Rory D Cottrell[1] (1.University of Rochester, Department of Earth and Environmental Sciences, Rochester, New York, United States, 2.University of Rochester, Department of Physics and Astronomy, Rochester, New York, United States, 3.University of Johannesburg, Department of Geology, Johannesburg, South Africa)

[SEM19-09] Shallow water MHD waves trapped near the poles in a stably stratified outermost Earth's core

*Ryosuke Nakashima[1], Shigeo Yoshida[2] (1.Faculty of Sciences, Kyushu University, 2.Department of Earth and Planetary Sciences, Faculty of Science, Kyushu University)

[SEM19-10] Contribution to IGRF-13 from Japan: A secular variation model using a numerical dynamo model and 4DEnVar data assimilation

*Takuto Minami[1], Shin ya Nakano[2], Futoshi Takahashi[3], Masaki Matsushima[4], Ryosuke Nakashima[3], Hisayoshi Shimizu[5], Hinami Taniguchi[3], Hiroaki TOH[6] (1. Kobe University, 2.The Institute of Statistical Mathematics, 3.Kyushu University, 4.Tokyo Institute of Technology, 5.The University of Tokyo, 6.Kyoto University)

[SEM19-11] **Estimating rates of change in the geomagnetic field**

★Invited Papers

*Catherine Constable[1], Christopher J Davies[2] (1.Scripps Institution of Oceanography, University of California San Diego, USA, 2.School of Earth and Environment, University of Leeds, UK)

[E] Oral | S (Solid Earth Sciences)：S-EM Earth's Electromagnetism

[S-EM20] Electric and Electromagnetic survey technologies and the scientific achievements: Recent advances

convener:Kiyoshi Baba(Earthquake Research Institute, The University of Tokyo), Tada-nori Goto(Graduate School of Life Science, University of Hyogo), Toshihiro Uchida(National Institute of Advanced Industrial Science and Technology), Toru Mogi(Faculty of Science, Tokyo Institute of Technology)

[SEM20-01] Case studies on ERT monitoring in Taiwan

★Invited Papers

*Chien-Chih Chen[1,2] (1.Department of Earth Sciences, National Central University, Taoyuan, Taiwan, 2.Earthquake-Disaster and Risk Evaluation and Management Center, National Central University, Taoyuan, Taiwan)

[SEM20-02] Carbonate Imaging with Magnetotellurics in a Shallow-Water Environment, South Yellow Sea, China

*Shuangmin Duan[1], Yuguo Li[1], Jianxin Pei[1], Tiehu Zhao[2], Zhiqiang Wu[2], Bo Han[3], Xinsheng Yu[1], Lanjun Liu[1], Jialin Chen[1] (1.Ocean Univ. of China, 2.Qingdao Inst. of Marine Geology, 3.China Univ. of Geosciences (Wuhan))

[SEM20-03] Three-dimensional Electrical Resistivity Structure of Tokachidake Volcano Revealed by GREATEM Survey Data

*Sabry Abdallah[1], Toru Mogi[1], Yusuke Yamaya[2], Takashi Hashimoto[2], Makoto Murakami[2], Akira Jomori[3], Youichi Yuuki[4], Hideshi Kaieda[5], Hisatoshi Ito[5] (1.Earthquake and Volcano Research Center Graduate School of Environmental Studies, Nagoya University, 2.Institute of Seismology and Volcanology, Hokkaido Univ., 3.Neoscience co., 4.Oyo,Co., 5.CRIEPI)

[SEM20-04] Anatomy of Active Volcanic Edifice at the Kusatsu-Shirane Volcano, Japan, by Magnetotellurics: Hydrothermal Implications for Volcanic Unrests

Kuo Hsuan Tseng[1], *Yasuo Ogawa[1], Nurhasan Nurhasan[1], Sabri Bülent Tank[1], Yoshimori Honkura[1], Naoto Ujihara[1], Akihiko Terada[1], Yoshiya Usui[1], Wataru Kanda[1] (1.Volcanic Fluid Research Center, School of Science, Tokyo Institute of Technology)

[SEM20-05] Global electrical conductivity model of Miyake-jima: insights into its hydrothermal and magmatic system

*Marceau Gresse[1], Takao Koyama[1], Makoto Ueshima[1], Yuichi Morita[1], Yoichi Sasai[2], Jacques Zlotnicki[3], Tsuneo Ishido[4], Hideaki Hase[5], Wataru Kanda[6], Koki Aizawa[7], Derek Weller[1], Tawat Rung-Arunwan[8], Yasuo Matsunaga[6], Hideki Ueda[9], Maki Hata[1], Yusuke Yamaya[10] (1.Earthquake Research Institute, The University of Tokyo, Tokyo, Japan, 2.Earthquake Prediction Research Centre, Tokai University, Shizuoka, Japan, 3.CNRS, OPGC-UMR6524, Aubière, France, 4.Geological Survey of Japan, AIST, Tsukuba Ibaraki, Japan, 5.Geothermal Energy Research & Development Co., Ltd., Tokyo, Japan, 6.Tokyo Institute of Technology School of Science, Tokyo, Japan, 7.Institute of Seismology and Volcanology, Faculty of Science, Kyushu University, Fukuoka, Japan, 8.Curl-E Geophysics Co., Ltd., Thailand, 9.National Research Institute for Earth Science and Disaster Resilience, Tsukuba, Japan, 10.Renewable Energy Research Center, National Institute of Advanced Industrial Science and Technology (AIST), Fukushima, Japan)

[E] Oral | S (Solid Earth Sciences)：S-EM Earth's Electromagnetism

[S-EM20] Electric and Electromagnetic survey technologies and the scientific achievements: Recent advances

convener:Kiyoshi Baba(Earthquake Research Institute, The University of Tokyo), Tada-nori Goto(Graduate School of Life Science, University of Hyogo), Toshihiro Uchida(National Institute of Advanced Industrial Science and Technology), Toru Mogi(Faculty of Science, Tokyo Institute of Technology)

[SEM20-06] Advances in Marine Electromagnetic Instruments and Data Processing Techniques

★Invited Papers

*Yuguo Li[1,2] (1.Ocean Univ. of China, 2.Key Lab of Submarine Geosciences and Prospecting Techniques of Ministry of Education)

[SEM20-07] Ocean bottom electromagnetometers of Earthquake Research institute

*Kiyoshi Baba[1] (1.Earthquake Research Institute, The University of Tokyo)

[SEM20-09] Effecitive combination of MT and GDS survey for three-dimensional imaging of geothermal resovoir

*Tada-nori Goto[1], Yuji Yamada[2] (1.Graduate School of Life Science, University of Hyogo, 2.Graduate School of Engineering, Kyoto University)

[SEM20-10] Estimation of electrical conducitivity in the mantle transition zone by using the Sq source model GAIA

*Takao Koyama[1], Shigeru Fujita[2], Ikuko Fujii[2], Kiyoshi Baba[1] (1.Earthquake Research Institute, The University of Tokyo, 2.Meteorological College)

[E] Oral | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

[S-IT23] Property and role of liquids inside terrestrial planets

convener:Tatsuya Sakamaki(Department of Earth Science, Tohoku University), Yoichi Nakajima(Kumamoto University, Priority Organization for Innovation and Excellence)

[SIT23-01] A multifaceted experimental approach to studying silicate liquids under high pressure

★Invited Papers

Young Jay Ryu[1], *Yanbin Wang[1], Tony Yu[1], Vitali Prakapenka[1], Zhicheng Jing[6], Man Xu[5], Clemens Prescher[2], Eran Greenberg[1], Sergey Tkachev[1], Heather Watson[3], Yoshio Kono[4], Peter Eng[1], Joanne Stubbs[1] (1.Center for Advanced Radiation Sources, University of Chicago, Chicago, IL, USA, 2.DESY, FS-PS, Hamburg, Germany, 3.Union College, NY, USA, 4.Geodynamics Research Center, Ehime University, Matsuyama, Japan, 5.Case Western Reserve University, OH, USA, 6.Southern University of Science and technology, Guangdong, China)

[SIT23-05] X-ray diffraction measurements on aluminosilicate glasses at ultrahigh-pressure conditions

*Itaru Ohira[1,2], Yoshio Kono[1,2], Yu Shu[3], Yuki Shibazaki[4,5], Curtis Kenney-Benson[3], Rostislav Hrubiak[3], Atsunobu Masuno[6], Guoyin Shen[3] (1.Geodynamics Research Center, Ehime University, 2.Geophysical Laboratory, Carnegie Institution of Washington, 3.High Pressure Collaborative Access Team (HPCAT), X-ray Science Division, Argonne National Laboratory, 4.Frontier Research Institute for Interdisciplinary Sciences (FRIS), Tohoku University, 5.International Center for Young Scientists (ICYS), National Institute for Materials Science (NIMS), 6.Graduate School of Science and Technology, Hirosaki University)

[SIT23-06] Equation of State for Liquid Iron under Extreme Conditions

★Invited Papers

*Yasuhiro Kuwayama[1], Guillaume Morard[2], Yoichi Nakajima[3,4], Kei Hirose[1,5], Alfred Q. R. Baron[4], Saori I Kawaguchi[6], Taku Tsuchiya[7], Daisuke Ishikawa[6,4], Naohisa Hirao[6], Yasuo Ohishi[6] (1.The University of Tokyo, 2.Laboratoire ISTERRE, Université Grenoble Alpes, 3.Kumamoto University, 4.RIKEN MDR, 5.Tokyo Institute of Technology, 6.JASRI, 7.Ehime University)

[E] Oral | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

[S-IT24] MAGMA AND FLUID TRANSPORT IN THE EARTH'S INTERIOR

convener:Bjorn Mysen(Geophysical Laboratory, Carnegie Inst. Washington), Eiji Ohtani(Department of Earth and Planetary Materials Science, Graduate School of Science, Tohoku University), Dapeng Zhao(Department of Geophysics, Tohoku University), Michihiko Nakamura(Division of Earth and Planetary Materials Science, Department of Earth Science, Graduate School of Science, Tohoku University)

[SIT24-01] Searching for the deep roots of arc volcanoes: seismic imaging in the Washington Cascades (Invited)

★Invited Papers

*Geoffrey A Abers[1], Michael E Mann[1], Kayla J Crosbie[1], Roque Soto Castaneda[1], Carl Ulberg[2], Kenneth C Creager[2] (1.Cornell University, 2.University of Washington)

[SIT24-02] **Combining InSAR and GNSS to model magma transport during the May 2016 eruption of Piton de la Fournaise Volcano (La Réunion Island**

*Valerie Cayol[1], Delphine Smittarello[2], Virginie Pinel[2], Aline Peltier[3], Jean-Luc Froger[1] (1.CNRS, UCA, LMV, OPGC, IRD, Clermont-Ferrand, France, 2.ISTerre, IRD, CNRS, USMB, Le Bourget du Lac, France, 3.OVPF, IPGP, UP, CNRS, La Réunion, France.)

[SIT24-03] Salinity map of subduction-zones fluids recorded in fluid inclusions

★Invited Papers

*Tatsuhiko Kawamoto[1] (1.Department of Geoscience, Faculty of Science, Shizuoka University)

[SIT24-04] Developing a laboratory technique to probe volatile transport in the deep mantle

★Invited Papers

*Catherine McCammon[1], Serena Dominijanni[1], Leonid Dubrovinsky[1], Nobuyoshi Miyajima[1], Egor Gennadievich Koemets[1], Dan Frost[1] (1.Bayerisches Geoinstitut, University of Bayreuth)

[SIT24-05] Temperature dependence on nitrogen solubility in bridgmanite under lower mantle conditions: its role in formation of deep nitrogen reservoir through solidification of magma ocean.

*Ko Fukuyama[1], Hiroyuki Kagi[1], Toru Inoue[2,3], Sho Kakizawa[1], Toru Shinmei[3], Yuji Sano[4,5], Cécile Deligny[6], Evelyn Füri[6] (1.Geochemical Research Center, Graduate School of Science, The University of Tokyo, 2.Department of Earth and Planetary Systems Science, Graduate School of Science, 3.Geodynamics Research Center, Ehime University, 4.Division of Ocean and Earth Systems, Atmosphere and Ocean Research Institute, University of Tokyo, 5.Institute of Surface-Earth System Science, Tianjin University, 6.Centre de Recherches Pétrographiques et Géochimiques)

[SIT24-06] Effect of Spin transition of iron in physical properties of hydrous phase δ-(Al,Fe)OOH under the lower mantle conditions

*Eiji Ohtani[1], Wen-pin Hsieh[2], Takayuki Ishii[3], Itaru Ohira[4] (1.Department of Earth and Planetary Materials Science, Graduate School of Science, Tohoku University, 2.Institute of Earth Science, Academia Sinica, 3.Bayeriches Geoinstitute, University of Bayreuth, 4.Geodynamics Research Center, Ehime University)

[E] Oral | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

[S-IT25] Structure and Dynamics of Earth and Planetary Mantles

convener:Takashi Yoshino(Institute for Planetary Materials, Okayama University), Takashi Nakagawa(Department of Earth Sciences, The University of Hong Kong), Dapeng Zhao(Department of Geophysics, Tohoku University)

[SIT25-01] Application of the mixed length theory to assess the generation of melt in internally heated systems

*Kenny Vilella[1], Shunichi Kamata[1] (1.Hokkaido University)

[SIT25-02] **New insights into structural elements of the upper mantle below the contiguous United States from S-to-P converted seismic waves**

Rainer Kind[2], *Walter D Mooney[1], Xiaohui Yuan[2] (1.USGS Western Regional Offices Menlo Park, 2.Helmholtz Center Potsdam GFZ)

[SIT25-03] **The effect of water on seismic attenuation of upper mantle olivine and its implications for origin of the sharp lithosphere-asthenosphere boundary**

*Chao Liu[1], Takashi Yoshino[1] (1.Institute for Planetary Materials, Okayama University)

[SIT25-06] **Source stacking followed by cross-correlation: the first application to real long period data for full-waveform inversion at the global scale**

*Li-Wei Chen[1], Barbara Romanowicz[1,2,3] (1.University of California, Berkeley, 2.Institut de Physique du Globe de Paris, 3.Collège de France, Paris)

[E] Oral | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

[S-IT25] Structure and Dynamics of Earth and Planetary Mantles

convener:Takashi Yoshino(Institute for Planetary Materials, Okayama University), Takashi Nakagawa(Department of Earth Sciences, The University of Hong Kong), Dapeng Zhao(Department of Geophysics, Tohoku University)

[SIT25-07] Numerical experiments on stagnation and avalanche of subducting slabs: Important roles of trench migration and its temporal change

*Mana Tsuchida[1], Masanori Kameyama[1] (1.Geodynamics Research Center, Ehime University)

[SIT25-08] Topography on the mantle discontinuities beneath the Ontong Java Plateau

*Daisuke Suetsugu[1], Hajime Shiobara[2], Hiroko Sugioka[3], Aki Ito[1], Takehi Isse[2], Yasushi Ishihara[1], Satoru Tanaka[1], Masayuki Obayashi[1], Takashi Tonegawa[1], Junko Yoshimitsu[1], Takumi Kobayashi[3] (1.institute for Marine Geodynamics, Japan Agency for Marine-Earth Science and Technology, 2.Earthquake Research Institute, the University of Tokyo, 3.Department of Planetrology, Graduate School of Science Kobe University)

[SIT25-10] **Iron content induced pressure- and temperature-dependency change of thermal conductivity of ferropericlase: implications for mantle dynamics**

*Youyue Zhang[1], Takashi Yoshino[1], Masahiro Osako[2] (1.Institute for Planetary Materials, Okayama University, 2.National Museum of Nature and Science)

[SIT25-11] Shear localization and shear instability induced by the olivine-spinel transformation of fayalite at 8 GPa

*Yuichiro Mori[1], Tomoaki Kubo[1], Takuya Iwasato[2], Yuji Higo[3], Yoshinori Tange[3] (1.Kyushu University, 2.Shin-Nippon Nondestructive Inspection Co., Ltd, 3.JASRI)

[SIT25-12] Volatile cycle across the Earth-like planet – Impact to plate tectonics and climate

*Takashi Nakagawa[1] (1.Department of Earth Sciences, The University of Hong Kong)

[E] Oral | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

[S-IT26] Interaction and Coevolution of the Core and Mantle in the Earth and Planets

convener:Kenji Ohta(Department of Earth and Planetary Sciences, Tokyo Institute of Technology), Tsuyoshi Iizuka(University of Tokyo), Kenji Kawai(Department of Earth and Planetary Science, School of Science, University of Tokyo), Taku Tsuchiya(Geodynamics Research Center, Ehime University)

[SIT26-01] Thermal and Chemical Interactions between the Core and Mantle

*Taku Tsuchiya[1], Haruhiko Dekura[1], Zhihua Xiong[1], Atsuroh Ohba[1] (1.Geodynamics Research Center, Ehime University)

[SIT26-02] Martian Core Heat Flux: Electrical Resistivity and Thermal Conductivity of Liquid Fe at Martian Core P-T Conditions

*Innocent Ezenwa[1], Takashi Yoshino[1] (1.Institute for Planetary Materials, Okayama University)

[SIT26-03] **Advances in a high pressure-temperature experiment for understanding thermal transport property of the Earth's core**

*Kenji Ohta[1], Sho Suehiro[1], Hayato Inoue[1], Akira Hasegawa[1] (1.Department of Earth and Planetary Sciences, Tokyo Institute of Technology)

[SIT26-04] Iron diffusion in ε-iron

*Daisuke Yamazaki[1], Naoya Sakamoto[2], Hisayoshi Yurimoto[2] (1.Institute for Planetary Materials, Okayama University, 2.Hokkaido University)

[SIT26-05] Determination of noble gas partition coefficients between metal and silicate melts under high-pressure and high-temperature conditions

*Hirochika Sumino[1], Tomotaka Tanaka[1], Hideharu Kuwahara[2], Satoshi Kishi[1], Kenji Mibe[4], Ryuichi Nomura[3], Hiroyuki Kagi[5] (1.Department of Basic Science, Graduate School of Arts and Sciences, University of Tokyo, 2.Geodynamics Research Center, Ehime University, 3.Graduate School of Human and Environmental Studies, Kyoto University, 4.Earthquake Research Institute, University of Tokyo, 5.Geochemical Research Center, Graduate School of Science, University of Tokyo)

[E] Oral | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

[S-IT26] Interaction and Coevolution of the Core and Mantle in the Earth and Planets

convener:Kenji Ohta(Department of Earth and Planetary Sciences, Tokyo Institute of Technology), Tsuyoshi Iizuka(University of Tokyo), Kenji Kawai(Department of Earth and Planetary Science, School of Science, University of Tokyo), Taku Tsuchiya(Geodynamics Research Center, Ehime University)

[SIT26-06] Tungsten isotopic compositions of Ethiopian and Aden Bay basalts and the Samoan ocean island: implications for core-mantle interaction in their source

*Katsuhiko Suzuki[1], Asako Takamasa[2,1], Yusuke Fukami[3,1], Tsuyoshi Iizuka[4], Yuji Orihashi[5], Ryuichi Shinjo[6], Takeshi Hanyu[7] (1.Submarine Resources Research Center, JAMSTEC, 2.JAPAN NUS CO., Ltd, 3.Department of Chemistry, Gakushuin University, 4.Department of Earth and Planetary Science, The University of Tokyo, 5.Department of Earth and Environmental Sciences, Hirosaki University, 6.Department of Physics and Earth Sciences, University of the Ryukyus , 7.Volcanoes and Earth's Interior Research Center, JAMSTEC)

[SIT26-07] Ultrasonic velocity measurement of deep Earth hydrous phase (Al-bearing phase D) under high pressure and high temperature

*Toru Inoue[1,2], Chaowen Xu[2], Steeve Gre'aux[2], Masamichi Noda[1], Wei Sun[2], Hideharu Kuwahara[2], Yuji Higo[3] (1.Department of Earth and Planetary Systems Science, Graduate School of Science, Hiroshima University, 2.Geodynamics Research Center, Ehime University, 3.Japan Synchrotron Radiation Research Institute)

[SIT26-08] Mantle flows in the lowermost mantle beneath the Northern Pacific inferred by 3-D waveform inversion for radially anisotropic structure

*Yuki Suzuki[1], Kenji Kawai[1], Robert J. Geller[1] (1.Department of Earth and Planetary Sciences, Graduate School of Science,The University of Tokyo)

[SIT26-09] Spin transition in (Mg,Fe)O tilt grain boundaries across the Earth's lower mantle

*Sebastian Ritterbex[1], Taku Tsuchiya[1] (1.Geodynamics Research Center, Ehime University)

[SIT26-10] **First principles study of the lattice thermal conductivity of ferropericlase**

★Invited Papers

*Kaihua He[1] (1.China University of Geosciences)

[E] Oral | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

[S-IT26] Interaction and Coevolution of the Core and Mantle in the Earth and Planets

convener:Kenji Ohta(Department of Earth and Planetary Sciences, Tokyo Institute of Technology), Tsuyoshi Iizuka(University of Tokyo), Kenji Kawai(Department of Earth and Planetary Science, School of Science, University of Tokyo), Taku Tsuchiya(Geodynamics Research Center, Ehime University)

[SIT26-11] Assessment and implication on the thermal and chemical state of the Earth's core in the 1-D radial convective structure tracking over 4 billion years

*Takashi Nakagawa[1] (1.Department of Earth Sciences, The University of Hong Kong)

[SIT26-12] Elastic wave velocity of Al-bearing anhydrous bridgmanites under high pressure and high temperature

*Masamichi Noda[1], Toru Inoue[1], Steeve GREAUX[2], Chaowen Xu[3], Hideharu Kuwahara[2], Wei Sun[2], Yuji Higo[4] (1.Graduate School of Science, Hiroshima University, 2.Geodynamics Research Center, Ehime University, 3.Institute of earthquake forecasting, CEA, 4.JASRI)

[SIT26-13] **Detector study for geo-neutrino directional measurement**

*Naoya Maemura[1], Hiroko Watanabe[1] (1.Tohoku University)

[SIT26-14] Ratest results of geo-neutrino measurement with KamLAND

*Hiroko Watanabe[1] (1.Research Center for Neutrino Science, Tohoku University)

[SIT26-15] Is there primordial reservoir in lower mantle?

*Takashi Yoshino[1] (1.Institute for Planetary Materials, Okayama University)

[E] Oral | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

[S-IT27] Oceanic lithosphere and asthenosphere

convener:Nozomu Takeuchi(Earthquake Research Institute, University of Tokyo), Ban-Yuan Kuo(Institute of Earth Sciences, Academia Sinica), Rob L Evans(Woods Hole Oceanographic Institution), Younghee Kim(Seoul National University)

[SIT27-01] *Pacific Array* update 2020

*Hitoshi Kawakatsu[1], - the international Pacific Array team (1.Earthquake Research Institute, The University of Tokyo)

[SIT27-02] Olivine fabric development during Newtonian (diffusion creep) corner flow.

*NAHYEON KIM[1], Takehiko Hiraga[1] (1.Earthquake Research Institute, University of Tokyo)

[SIT27-03] The seismic structure of the oldest Pacific: Preliminary results from the broadband Rayleigh-wave dispersion analysis of the Pacific Array, Oldest-1

*Yuki Kawano[1], Takehi Isse[1], Akiko Takeo[1], Hitoshi Kawakatsu[1], Hajime Shiobara[1], Nozomu Takeuchi[1], Hiroko Sugioka[2], YoungHee Kim[3], Hisashi Utada[1], Sang-Mook Lee[3] (1.Earthquake Research Institute, The University of Tokyo, 2.Kobe University, 3.Seoul National University)

[SIT27-05] A peridotite xenolith from garnet-stability field beneath Aitutaki (Cook islands): an implication for small-scale convection

*Norikatsu Akizawa[1], Kazuhito Ozawa[2], Simon Richard Wallis[2], Akihiro Tamura[3], Akira Ishikawa[4], Tetsu Kogiso[5] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Department of Earth and Planetary Science, The University of Tokyo, 3.Faculty of Geosciences and Civil Engineering, Kanazawa University, 4.Department of Earth and Planetary Sciences, Tokyo Institute and Technology, 5.Graduate School of Human and Environmental Studies, Kyoto University)

[SIT27-06] Three dimensional shear wave structure in the upper mantle beneath the oldest Pacific plate

*Takehi Isse[1], Hitoshi Kawakatsu[1], Hajime Shiobara[1], Nozomu Takeuchi[1], Hiroko Sugioka[2], Younghee Kim[3], Hisashi Utada[1], Sang-Mook Lee[3], Kazunori Yoshizawa[4] (1.Earthquake Research Institute, the University of Tokyo, 2.Department of Planetology, Kobe University, 3.Seoul National University, 4.Faculty of Science, Hokkaido University)

[E] Oral | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

[S-IT27] Oceanic lithosphere and asthenosphere

convener:Nozomu Takeuchi(Earthquake Research Institute, University of Tokyo), Ban-Yuan Kuo(Institute of Earth Sciences, Academia Sinica), Rob L Evans(Woods Hole Oceanographic Institution), Younghee Kim(Seoul National University)

[SIT27-07] A comprehensive portrait of the central Pacific lithosphere-asthenosphere system from NoMelt seafloor geophysical observations

James Gaherty[2], Joshua Russell[3], Hannah Mark[4], Zhitu Ma[5], Colleen Dalton[5], Daniel Lizarralde[1], Greg Hirth[5], John Collins[1], *Rob L Evans[1] (1.Dept of Geology and Geophysics, Woods Hole Oceanographic Institution, 2.School of Earth and Sustainability, Northern Arizona University, 3.Columbia Univ., Lamont Doherty Earth Observatory, 4.Dept. of Earth and Planetary Sciences, Washington University, St. Louis, 5.Dept. of Earth, Environmental, and Planetary Sciences, Brown Univ)

[SIT27-08] Seismic discontinuity at lithosphere-asthenosphere boundary predicted from laboratory-based anelasticity model

Hatsuki Yamauchi[1], *Yasuko Takei[1] (1.Earthquake Research Institute, University of Tokyo)

[SIT27-09] Shear attenuation and anelastic mechanisms in the central Pacific upper mantle

★Invited Papers

*Zhitu Ma[1], Colleen A Dalton[2], Joshua B Russell[3], James B Gaherty[3], Greg Hirth[2], Donald W Forsyth[2] (1.State Key Laboratory of Marine Geology, Tongji University, Shanghai, China, 2.Department of Earth, Environmental and Planetary Sciences, Brown University, Providence, RI, USA, 3.Lamont-Doherty Earth Observatory, Columbia University, Palisades, NY, USA)

[SIT27-10] Viscosity-depth profiles of the oceanic upper mantle deforming by grain-boundary diffusion creep

*Kosuke Yabe[1], Takehiko Hiraga[1] (1.School of Science, The University of Tokyo)

[SIT27-11] **Upper mantle velocity structure beneath the northern Ryukyu subduction zone revealed from multiscale finite-frequency traveltime tomography**

★Invited Papers

*Shu-Huei Hung[1], Ban-Yuan Kuo[2], Pei-Ying Patty Lin[3], Yuancheng Gung[1], Eh Tan[2], Kate Huihsuan Chen[3], Ching-Ren Lin[2], Chau-Chang Wang[5,4], Shuichi Kodaira[6], Yasushi Ishihara[6], Mamoru Nakamura[7] (1.National Taiwan University, Taipei, Taiwan, 2.Academia Sinica, Taipei, Taiwan, 3.National Taiwan Normal University, Taipei, Taiwan, 4.Taiwan Ocean Research Institute, National Applied Research Laboratories, Kaohsiung, Taiwan , 5.National Sun Yat-sen University, Kaohsiung, Taiwan, 6.Japan Agency for Marine-Earth Science and Technology, Yokohama, Japan, 7.University of the Ryukyus, Okinawa, Japan)

[SIT27-12] Future geophysical observation on oceanic lithosphere and asthenosphere study: Hawaii-Emperor Bend (HEB) Project

*Kiyoshi Baba[1], Bernhard Steinberger[2,3], Marion Jegen[4], Max Moorkamp[5], Takehi Isse[1], Akiko Takeo[1], Antje Schlömer[5], HEB Research group (1.Earthquake Research Institute, The University of Tokyo, 2.GFZ, Helmholtz Centre, Potsdam, 3.CEED, University of Oslo, 4.GEOMAR, Helmholtz Centre of Ocean Research Kiel, 5.Munich University)

[E] Oral | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

[S-IT29] New perspectives on East Asia geodynamics

convener:Jonny Wu(University of Houston), Asuka Yamaguchi(Atomosphere and Ocean Research Institute, The University of Tokyo), Kyoko Okino(Atmosphere and Ocean Research Institute, The University of Tokyo), Timothy B Byrne(University of Connecticut)

[SIT29-01] New insights into East Asian mantle structure and dynamics

★Invited Papers

*Dapeng Zhao[1] (1.Department of Geophysics, Tohoku University)

[SIT29-02] **NE Asian arc magmatic tempos and their relationship to Western Pacific-Izanagi plate tectonics since Cretaceous times**

*Jonny Wu[1], Tsung-Jui Wu[1] (1.University of Houston)

[SIT29-03] Mesozoic island arc rocks in Hokkaido: potential keys to reconstruct ancient oceanic plates offshore East Asia.

★Invited Papers

*Hayato Ueda[1], Ryusei KOTA[1], Mitsuhiko Ishino[1], Minato Munakata[1], Komei Nara[1], Yuta Akutsu[1], Yusuke Sugiyama[1], Nozomu Suzuki[1] (1.Department of Geology, Niigata University)

[SIT29-04] Mid-Cretaceous Tectonics of the Ryukyu arc reconstructed by geology of Kerama Islands, Okinawa

*Ippei Yamamoto[1], Kenichiro Tani[2], Yui Kouketsu[3], Asuka Yamaguchi[1] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.National Museum of Nature and Science, 3.Nagoya University)

[SIT29-05] The last unknown pieces of the Proto-Philippine Sea Plate: Huatung Basin and Gagua Ridge

★Invited Papers

*Kenichiro Tani[1], Osamu Ishizuka[2], Kyoko Okino[3], Hayato Ueda[4] (1.Department of Geology and Paleontology, National Museum of Nature and Science, 2.Geological Survey of Japan/AIST, 3.Atmosphere and Ocean Research Institute, The University of Tokyo, 4.Faculty of Science, Niigata University)

[SIT29-06] **Maturation of incipient island arcs: New insights from the southern Mariana arc**

★Invited Papers

*Julia Ribeiro[1], Osamu Ishizuka[2], Cin-Ty Lee[3], Guillaume Girard[4] (1.Guangzhou Institute of Geochemistry, the Chinese Academy of Sciences, Guangzhou, China, 2.Geological Survey of Japan, AIST, Ibaraki, Japan, 3.Rice University, Earth Science Department, Houston, Tx, USA, 4.Northern Illinois University, DeKalb, Illinois, USA.)

[E] Oral | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

[S-IT29] New perspectives on East Asia geodynamics

convener:Jonny Wu(University of Houston), Asuka Yamaguchi(Atomosphere and Ocean Research Institute, The University of Tokyo), Kyoko Okino(Atmosphere and Ocean Research Institute, The University of Tokyo), Timothy B Byrne(University of Connecticut)

[SIT29-07] Post-back-arc spreading magmatism: an example of the Seifu Seamount in the Sea of Japan
★Invited Papers

*Tomoaki Morishita[1,2,3], Naoto Hirano[4], Hirochika Sumino[5], Hiroshi Sato[6], Tomoyuki Shibata[7], Masako Yoshikawa[7], Shoji Arai[1], Akihiro Tamura[1] (1.Kanazawa University, 2.JAMSTEC, 3.Columbia University, 4.Tohoku University, 5.University of Tokyo, 6.Senshu University, 7.Hiroshima University)

[SIT29-08] Tectonics in the Median Tectonic Line and surrounding areas, southwest Japan during the Late Cretaceous to Paleogene periods

*Toru Takeshita[1], Yasuuchi Kubota[2] (1.Department of Natural History Sciences, Graduate School of Science, Hokkaido University, 2.Oyo Co., Ltd.)

[SIT29-09] **Doming induced by rapid exhumed serpentinite bodies in the subduction mélange and the associated structures: a case study of the Yuli Belt in eastern Taiwan**

*Jian-Cheng Lee[1,6], Gong-Ruei Ho[1,6], Kai-Hsiang Yang[1,6], Yuan-Hsi Lee[2,6], En-Chao Yeh[3,6], Wei Lo[4,6], Ching-Ho Tsai[5,6] (1.Academia Sinica, 2.National Chung Cheng University, 3.National Taiwan Normal University, 4.National Taipei University of Technology, 5.National Dung Hwa University, 6.The Yuli Exhumation Study team (YES Team))

[SIT29-10] A high strain shear zone in the metamorphic core of Central Range, Taiwan: A possible Plio-Pleistocene transform fault

*Gong-Ruei Ho[1], Jian-Cheng Lee[1], Timothy B Byrne[2] (1.Institute of Earth Sciences, Academia Sinica, 2.Department of Geography, University of Connecticut)

[SIT29-11] Exhumation and deformation partitioning in an arc-continent collision during highly oblique plate convergence ~6 to ~2 Ma, Taiwan

*Timothy B Byrne[1], Gong-Ruei Ho[2], Yuan-Hsi Lee[3], Chase J. Shyu[2] (1.University of Connecticut, 2.Institute of Earth Sciences, 3.National Chung Cheng University)

[SIT29-12] Two steps of onset of the modern geodynamic framework; ~6Ma and ~2.5Ma in east Asia and western Pacific margin

*Gaku Kimura[1], Takeshi Tsuji[2], Asuka Yamaguchi[3] (1.Tokyo University of Marine Science and Technology, 2.Dept. Earth Resources Engineering, Kyushu University, 3.Atmosphere and Ocean Research Institute, The University of Tokyo)

[E] Oral | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

[S-IT30] Tectonic collision systems in continents and oceans

convener:Ling Bai(ITP Institute of Tibetan Plateau Research, Chinese Academy of Sciences), James Mori(Earthquake Hazards Division, Disaster Prevention Research Institute, Kyoto University), Xiaodong Song(University of Illinois at Urbana-Champaign), Yuzo Ishikawa(The National Institute of Advanced Industrial Science and Technology)

[SIT30-01] **Seismic recordings of ice collapses along Yarlung Tsangpo Grand Canyon**

*Ling Bai[1], Yong Jiang[1], James Mori[2] (1.ITP Institute of Tibetan Plateau Research, Chinese Academy of Sciences, 2.Disaster Prevention Research Institute, Kyoto University)

[SIT30-02] Mountain height at convergent plate boundaries is controlled by the megathrust shear force

★Invited Papers

*Armin Dielforder[1], Ralf Hetzel[2], Onno Oncken[1] (1.Helmholtz Centre Potsdam, GFZ German Research Centre for Geosciences, Germany, 2.Institute of Geology and Paleontology, University of Muenster, Germany)

[SIT30-03] **Episodic Lithospheric Deformation in Eastern Tibet Inferred from Seismic Anisotropy**

★Invited Papers

*Xuewei Bao[1], Xiaodong Song[2,3], David Eaton[4], Yixian Xu[1], Hanlin Chen[1] (1.Key Laboratory of Geoscience Big Data and Deep Resource of Zhejiang Province, School of Earth Sciences, Zhejiang University, Hangzhou 310027, China, 2.Institute of Theoretical and Applied Geophysics, School of Earth and Space Sciences, Peking University, China, 3.Department of Geology, University of Illinois at Urbana-Champaign, USA, 4.Department of Geoscience, University of Calgary, Canada)

[SIT30-04] **Deformation of Tibetan plateau from recent seismic images: “thin skinned” or lithospheric tectonics?**

*Xiaodong Song[1,2], Jiangtao Li[3] (1.Peking University, China , 2.University of Illinois at Urbana-Champaign, USA, 3.Wuhan University, China)

[SIT30-05] **Subduction thermal regime, slab metamorphism and interplate earthquakes beneath Mariana based on 3-D numerical simulation**

*Yingfeng Ji[1] (1.Institute of Tibetan Plateau Research, Chinese Academy of Sciences)

[SIT30-06] Structural variation along the Main Himalayan Thrust in the source region of 2015 Gorkha earthquake, Nepal

*Chintan Timsina[1], James Mori[2], Masumi Yamada[2] (1.Department of Geophysics, Graduate School of Science, Kyoto University, 2.Disaster Prevention Research Institute, Kyoto University)

[E] Oral | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

[S-IT31] Planetary cores: Structure, formation, and evolution

convener:Hidenori Terasaki(Faculty of Science, Okayama University), Eiji Ohtani(Department of Earth and Planetary Materials Science, Graduate School of Science, Tohoku University), Gerd Steinle-Neumann(Bayerisches Geoinstitut, Universitaet Bayreuth), William F McDonough(Department of Earth Science and Research Center for Neutrino Science, Tohoku University, Sendai, Miyagi 980-8578, Japan)

[SIT31-01] Compositional model for the terrestrial planets

*William F McDonough[1,2], Takashi Yoshizaki[3] (1.Department of Earth Science and Research Center for Neutrino Science, Tohoku University, Sendai, Miyagi 980-8578, Japan, 2.Department of Geology, University of Maryland, College Park, MD 20742, USA, 3.Department of Earth Science, Graduate School of Science, Tohoku University, Sendai, Miyagi 980-8578, Japan)

[SIT31-02] Anomalous is normal in planetary dynamos: A case of Mercury

★Invited Papers

*Futoshi Takahashi[1], Hisayoshi Shimizu[2], Hideo Tsunakawa[3] (1.Faculty of Sciences, Kyushu University, 2.Earthquake Research Institute, University of Tokyo, 3.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

[SIT31-03] Liquid Iron Alloys with Light Elements at Outer Core Conditions by First Principles

★Invited Papers

*Koichiro Umemoto[1], Kei Hirose[1,2] (1.Earth-Life Science Institute, Tokyo Institute of Technology, 2.Department of Earth and Planetary Science, The University of Tokyo)

[SIT31-04] **High-pressure melting experiments on Fe-Si-C; Implications for Si in the core**

*Masahiro Hasegawa[1], Kei Hirose[2], Kenta Oka[1] (1.Department of Earth and Planetary Science, The University of Tokyo, 2.Earth-Life Science Institute, Tokyo Institute of Technology)

[SIT31-05] Sound velocity of B2-FeNiSi alloy at high pressure determined with inelastic X-ray scattering: Implications for the composition of the Earth's inner core

Serena Dominijanni[1], *Eiji Ohtani[2], Daijo Ikuta[2], Tatsuya Sakamaki[2], Hiroshi Fukui[3], Catherine McCammon[1], Leonid Dubrovinsky[1], Hiroshi Uchiyama[4], Alfred Q.R. Baron[5] (1.Bayeriches Geoinstitit, University of Bayreuth, 2.Department of Earth and Planetary Materials Science, Graduate School of Science, Tohoku University, 3.University of Hyogo, 4.Japan Synchrotron Radiation Research Institute, 5.RIKEN)

[E] Oral | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

[S-IT31] Planetary cores: Structure, formation, and evolution

convener:Hidenori Terasaki(Faculty of Science, Okayama University), Eiji Ohtani(Department of Earth and Planetary Materials Science, Graduate School of Science, Tohoku University), Gerd Steinle-Neumann(Bayerisches Geoinstitut, Universitaet Bayreuth), William F McDonough(Department of Earth Science and Research Center for Neutrino Science, Tohoku University, Sendai, Miyagi 980-8578, Japan)

[SIT31-06] Rising or falling snow: Constraints on core composition from the F-layer

*Irene Bonati[1], Marine Lasbleis[2], John W Hernlund[1], Kei Hirose[1] (1.Earth-Life Science Institute,Tokyo Institute of Technology, 2.LPG Nantes)

[SIT31-07] **Fe alloy snow and fractional solidification at the lowermost outer core**

*Youjun Zhang[1], Peter Nelson[2], Nick Dygert[3], Jung-Fu Lin[2] (1.Sichuan University, China, 2.The University of Texas at Austin, USA, 3.University of Tennessee, USA)

[SIT31-08] Light elements in iron-hydrous silicate system: Searching for core formation process using in-situ high-pressure and high-temperature neutron and X-ray observations

★Invited Papers

*Riko Iizuka-Oku[1], Hirotada Gotou[2], Chikara Shito[1], Hiroyuki Kagi[1], Akio Suzuki[3] (1.Geochemical Research Center, Graduate School of Science, The University of Tokyo, 2.The Institute for Solid State Physics, The University of Tokyo, 3.Department of Earth Science, Graduate School of Science, Tohoku University)

[SIT31-09] Mass Transport and Structural Properties of Liquid Iron Alloys at high pressure from *ab-initio* simulations

*Gerd Steinle-Neumann[1], Esther S. Posner[1] (1.Bayerisches Geoinstitut, Universitaet Bayreuth)

[SIT31-10] Experimental examination of self-diffusion coefficient of iron under high pressure and its implication to the viscosity of the Earth’s inner core: a preliminary result

*Yohan Park[1], Kenji Ohta[1], Shoichi Itoh[2], Kei Hirose[3] (1.Tokyo institute of technology, 2.Kyoto University, 3.University of Tokyo)

[E] Oral | S (Solid Earth Sciences)：S-GL Geology

[S-GL33] Geologic structure and tectonic history of East Asia and Japanese Islands

convener:Jun Hosoi(Geological Survey of Japan, Institute of Geology and Geoinformation, AIST), Makoto Otsubo(Geological Survey of Japan, Research Institute of Earthquake and Volcano Geology)

[SGL33-01] **Sedimentary History of the Ryukyu Group on Okinawa Island, southwestern Japan**

*SHUYIN CHENG[1], Yasufumi Iryu[2], J Bruce H Shyu[1] (1.National Taiwan Univ., 2.Tohoku Univ.)

[SGL33-03] Temporal changes of Cenozoic volcanic rock petrochemistry in Oki-Dogo, SW Japan

*Masataka Aizawa[1], Ryuichi Shinjo[2], Satoshi Okamura[3,4] (1.Graduate School of Engineering and Sience, University of the Ryukyus, 2.Faculty of Science, University of the Ryukyus, 3.Hokkaido Education University, 4.Hokkaido Soil-Research Co-op.)

[SGL33-04] Highly scattered paleomagnetic directions of middle Miocene volcanic rocks in the Inase area in Northeast Japan: vertical-axis rotations?

*Hiroyuki Hoshi[1], Miki Ohashi[2] (1.Department of Earth Sciences, Aichi University of Education, 2.Graduate, Aichi University of Education)

[SGL33-05] Stratigraphy and sedimentary facies of the Late Jurassic Nakanosawa Formation, Somanakamura Group: Facies changes from wave-dominated siliciclastic facies to lagoonal carbonate facies and their significance

*Hisao Ando[1], Shota Taguchi[2], Yoshihiro Morino[3] (1.Department of Earth Sciences, College of Science, Ibaraki University, 2.Graduate School of Science and Engineering, Ibaraki University, 3.Osaka Headquarters, Pacific Consultant Co. Ltd.)

[SGL33-06] Origin of alkali basalts in Late Jurassic to Early Cretaceous accretionary complex in Amami–Oshima Island, Ryukyu Arc

*Ginta Motohashi[1], Kohtaro Ujiie[1], Takashi Sano[2] (1.University of Tsukuba, 2.Department of Geology and Paleontology, National Museum of Nature and Science)

[E] Oral | S (Solid Earth Sciences)：S-GL Geology

[S-GL33] Geologic structure and tectonic history of East Asia and Japanese Islands

convener:Jun Hosoi(Geological Survey of Japan, Institute of Geology and Geoinformation, AIST), Makoto Otsubo(Geological Survey of Japan, Research Institute of Earthquake and Volcano Geology)

[SGL33-07] Cretaceous Amur sedimentary complex in the Kiselevka area, Far East Russia: Cretaceous history of accretion and rearrangement

*Shigeru Otoh[1], Yuko Miyake[2], Mitsuhiro Nagata[2], Alexei Didenko[3], Alexander Kudymov[3], Mikhail Arkhipov[3], Koshi Yamamoto[4] (1.Academic Assembly, Faculty of Sustainable Design, University of Toyama, 2.Graduate School of Science and Engineering, University of Toyama, 3.Kosygin Institute of Tectonics and Geophysics, FEB, Russian Academy of Science, 4.Graduate School of Environmental Studies, Nagoya University)

[SGL33-08] Geological and thermal structures along the Butsuzo Tectonic Line in the eastern Kyushu

*Hiroki Goto[1], Keita Nakano[1], Tomohiro Tsuji[1] (1.Division of Earth Science The Graduate School of Science and Technology for Innovation Yamaguchi University)

[SGL33-09] Early Paleozoic zircon U-Pb age for high P/T-type metagabbro from western Tokyo

*Hikaru Sawada[1], Yukio Isozaki[2], Shuhei Sakata[2] (1.Japan Marine Science and Technology Center, 2.The University of Tokyo)

[SGL33-11] **3-D magnetic imaging of Taiwan region**

*Qiang Zu[1], Chun-Rong Chen[2], Chieh-Hung Chen[1] (1.China University of Geosciences, 2.National Central University)

[E] Oral | S (Solid Earth Sciences)：S-RD Resources, Mineral Deposit & Resource Exploration

[S-RD35] Mineral Resources for Society: Ore deposit formation and exploration

convener:Yasushi Watanabe(Faculty of International Resource Sciences, Akita University), Kotaro Yonezu(Deaprtment of Earth Resources Engineering, Faculty of Engineering, Kyushu University)

[SRD35-01] **Hydrothermal Mineralization and Alteration of the Sediment-Hosted Fe-Cu-Co Target H Prospect, Mumbwa Iron-Oxide Copper-Gold District, Zambia**

*Mukuka Simusokwe[1], Yasushi Watanabe[1], Takuya Echigo[1] (1.Graduate School of International Resource Sciences, Akita University)

[SRD35-02] **Multi-stage mineralization of the sediment-hosted stratabound Zone 5 copper-silver deposit, Kalahari Copperbelt, NW Botswana**

*Mpho Keeditse[1], Yasushi Watanabe[1], Antonio Arribas[2] (1.Akita Univ., 2.Univ. of Texas at El Paso)

*Masami Kanzaki[1] (1.Institute for Planetary Matereials, Okayama University)

[SMP36-03] Molecular Dynamics Simulations of Sodium Water Glass

*Fumiya Noritake[1] (1.Graduate Faculty of interdisciplinary Research, University of Yamanashi)

[SMP36-04] Structural change processes of iron sulfide nanoparticle under hydrothermal conditions

Yoshinari Sano[1], *Atsushi Kyono[1], Yasuhiro Yoneda[2], Sota Takagi[1], Gen-ichiro Yamamoto[1] (1.Division of Earth Evolution Sciences, Faculty of Life and Environmental Sciences, University of Tsukuba, 2.Japan Atomic Energy Agency)

[SMP36-05] **Crystal structure of nesquehonite, $MgCO_3 \cdot 3(H,D)_2O$ by neutron diffraction, Raman spectroscopy, and thermal analysis**

*Gen-ichiro Yamamoto[1], Atsushi Kyono[1], Jun Abe[2], Asami Sano-Furukawa[3], Takanori Hattori[3] (1.University of Tsukuba, 2.CROSS, 3.JAEA)

[SMP36-06] High-*PT* neutron diffraction experiments on guyanaite: Pressure-temperature dependence of hydrogen bonding in hydrous minerals

*Chikara Shito[1], Hiroyuki Kagi[1], Asami Sano-Furukawa[2], Sho Kakizawa[1], Kazuki Komatsu[1], Katsutoshi Aoki[1], Riko Iizuka-Oku[1], Shinichi Machida[3], Noboru Furukawa[4], Akio Suzuki[5] (1.Geochemical Research Center, Graduate School of Science, The University of Tokyo, 2.Japan Atomic Energy Agency, 3.Comprehensive Research Organization for Science and Society, 4.Graduate School of Science, Chiba University, 5.Graduate School of Science, Tohoku University)

[E] Oral | S (Solid Earth Sciences)：S-MP Mineralogy & Petrology

[S-MP36] Physics and Chemistry of Minerals

convener:Seiji Kamada(Frontier Research Institute for Interdisciplinary Sciences, Tohoku University), Masahiro KAYAMA(Department of General Systems Studies, Graduate School of Arts and Sciences, The University of Tokyo)

[SMP36-07] Single crystal elasticity of minerals under high-pressure conditions determined by inelastic x-ray scattering

★Invited Papers

*Hiroshi Fukui[1], Akira Yoneda[2], Seiji Kamada[3], Alfred Baron[4] (1.University of Hyogo, 2.Osaka University, 3.Tohoku University, 4.RIKEN)

[SMP36-08] Redetermination of enthalpy and reassessment of thermodynamic data set for SiO_2 stishovite

*Hiroshi Kojitani[1], Masaki Akaogi[1] (1.Department of Chemistry, Faculty of Science, Gakushuin University)

[SMP36-09] Generalized Theory of Brillouin Scattering Toward Multi-Grain Analyses

*Miaki Ishii[1], Raymond Jeanloz[2] (1.Department of Earth & Planetary Sciences, Harvard University, 2.Department of Earth & Planetary Science, University of California, Berkeley)

[SMP36-10] GHz ultrasonic velocity measurements of iron beyond the bcc-hcp transition

*Akira Yoneda[1], Ryo Tsuruoka[2], Seiji Kamada[3], Hidenori Terasaki[2] (1.Institute for Planetary Materials, Okayama University, 2.Graduate school of Science, Osaka Univ., 3.Frontier Research Institute for Interdisciplinary Sciences, Tohoku Univ.)

[SMP36-11] Density measurements of Fe up to 25 GPa based on X-ray absorption

*Seiji Kamada[1,2], Fumiya Maeda[2], Hidenori Terasaki[3,4], Ryo Tsuruoka[3], Yusaku Takubo[3], Saori I Kawaguchi[5], Naohisa Hirao[5], Akihiko Machida[6] (1.Frontier Research Institute for Interdisciplinary Sciences, Tohoku University, 2.Dept. Earth Science, Tohoku University, 3.Osaka University, 4.Okayama University, 5.JASRI, 6.QST)

[E] Oral | S (Solid Earth Sciences)：S-MP Mineralogy & Petrology

[S-MP37] Supercontinents and crustal evolution

convener:Madhusoodhan Satish-Kumar(Department of Geology, Faculty of Science, Niigata University), Krishnan Sajeev(Centre for Earth Sciences, Indian Institute of Science), Tomokazu Hokada(National Institute of Polar Research), Yasuhito Osanai(Division of Evolution of Earth Environments, Faculty of Social and Cultural Studies, Kyushu University)

[SMP37-01] **Magma activities in Sør Rondane, eastern Dronning Maud Land, East Antarctica: Implications for amalgamation of the Gondwana supercontinent**

★Invited Papers

*Masaaki Owada[1], Atsushi Kamei[2], Yasuhito Osanai[3], Nobuhiko Nakano[3], Ippei Kitano[3] (1.Yamaguchi University, 2.Shimane University, 3.Kyushu University)

[SMP37-02] Thermal gap between UH *T* granulite and surrounding pelitic gneiss from Rundvågshetta in the Lützow-Holm Complex, East Antarctica

*Kota Suzuki[1], Tetsuo Kawakami[1] (1.Department of Geology and Mineralogy, Graduate School of Science, Kyoto University)

[SMP37-03] **Spinel+quartz assemblage in granulites from the Southeastern Madurai Block- Southern Granulite Terrain, India: Implications for ultrahigh-temperature Metamorphism**

*Rajkumar Perumal[1], Krishnan Sajeev[1], KUMAR R. S.[2], Vinod Samuel[3], Kim S. W.[3], Justin K Antony[2] (1.Indian Institute of Science, Bangalore India, 2.Department of earth sciences, Annamalai University, Annamalai nagar, India, 3.Yonsei University, Department of Earth Sciences, South Korea)

[SMP37-04] **Neoproterozoic fayalite-bearing charnockite from south-eastern India—its genesis and metamorphism**

*Krishnan Sajeev[1], P Rajkumar[1], - Durgalakshmi[2], Ian S Williams[2] (1.Centre for Earth Sciences, Indian Institute of Science, Bengaluru 560 012, India, 2.Research School of Earth Sciences, Australian National University, Acton, ACT, 2601, Australia)

[SMP37-05] **C-O-Sr-Nd-Pb isotope geochemistry of metacarbonate rocks in continental collision zones as proxies for estimating the sedimentation age and understanding the tectonic setting of deposition**

*Madhusoodhan Satish-Kumar[1], A. Imura[1], M. Shirakawa[1], Gen Shimoda[2], Kosuke T. Goto[2], M A Sanjeewa P K Malaviarachchi[3] (1.Department of Geology, Faculty of Science, Niigata University, 2.Geological Survey of Japan, AIST, 3.Department of Geology, Peradeniya University, Peradeniya 20400, Sri Lanka.)

[E] Oral | S (Solid Earth Sciences)：S-MP Mineralogy & Petrology

[S-MP37] Supercontinents and crustal evolution

convener:Madhusoodhan Satish-Kumar(Department of Geology, Faculty of Science, Niigata University), Krishnan Sajeev(Centre for Earth Sciences, Indian Institute of Science), Tomokazu Hokada(National Institute of Polar Research), Yasuhito Osanai(Division of Evolution of Earth Environments, Faculty of Social and Cultural Studies, Kyushu University)

[SMP37-06] **Bulk rock Nd-Sr and multiple-sulfur isotope compositions of carbonatites from the Phalaborwa complex, South Africa**

★Invited Papers

*Anupam Banerjee[1], Madhusoodhan Satish-Kumar[1] (1.Niigata University)

[SMP37-07] Circum-Indian ca. 800 Ma tectonothermal activities: A review of imprints of Rodinia growth and dispersal at Indian Archean cratonic margin

*Kaushik Das[1] (1.Hiroshima University)

[SMP37-08] **Tectonics and crustal evolution of Shevaroy Block, Southern India: Insights from petrology, geochemistry and U-Pb zircon geochronology**

*Sam Uthup[1], Tsunogae Toshiaki[1,2], Rajesh VJ[3], Tsutsumi Yukiyasu[4] (1.Graduate School of Life and Environmental Sciences, University of Tsukuba, Japan, 2.Department of Geology, University of Johannesburg, Auckland Park 2006, South Africa, 3.Department of Earth and Space Sciences, Indian Institute of Space Science and Technology, Trivandrum, India, 4.Department of Geology and Paleontology, National Museum of Nature and Science, Ibaraki 305-0005, Japan.)

[SMP37-09] Multiple sulfur isotope characteristics of felsic-mafic-ultramafic granulites from the Nilgiri Block, southern India

*VINOD O SAMUEL[1], Madhusoodhan Satish-Kumar[2] (1.Department of Earth System Sciences, Yonsei University, Seoul 03722, Republic of Korea, 2.Faculty of Science, Niigata University, Niigata, Japan)

[E] Oral | S (Solid Earth Sciences)：S-MP Mineralogy & Petrology

[S-MP38] Deformed rocks, Metamorphic rocks and Tectonics

convener:Yoshihiro Nakamura(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Yumiko Harigane(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST))

[SMP38-01] Pure shear deformation experiments of polycrystalline olivine : Relationship between grain shape and crystallographic preferred orientation during diffusion creep

*AKIHIRO ANDO[1], Takehiko Hiraga[1], Kosuke Yabe[1] (1.Earthquake Research Institute, University of Tokyo)

[SMP38-02] Olivine-plagioclase assemblage in orogenic peridotites: Proxy for the extent of lithosphere thinning and asthenosphere shallowing

*Kazuhito Ozawa[1], Carlos J. Garrido[2], Karoly Hidas[3], Jean-Louis Bodinier[4], Tomo Aoki[1], Françoise Boudier[5] (1.Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo, 2.Instituto Andaluz de Ciencias de la Tierra (IACT), CSIC – UGR, Armilla, Granada, Spain, 3.Instituto Geológico y Minero de España (IGME), Tres Cantos, Madrid, Spain, 4.Geosciences Montpellier, Montpellier, France, 5.University of Montpellier, Faculté des Sciences de Montpellier, Place E. Bataillon, 34095 Montpellier, France)

[SMP38-03] Early subduction processes recorded by the metamorphic sole of the Palawan Ophiolite, Philippines

*Gabriel Theophilus Vinalay Valera[1], Tetsuo Kawakami[1], Betchaida Duetes Payot[2] (1.Department of Geology and Mineralogy, Graduate School of Science, Kyoto University, 2.National Institute of Geological Sciences, University of the Philippines)

[SMP38-04] **Transition of melt-fluid infiltration along detachment fault sampled from deformed gabbroic rocks and amphibolites of initial and final stages on the Godzilla Megamullion, Parece Vela Basin, Philippine Sea**

*Yumiko Harigane[1], Jonathan Snow[2], Yasuhiko Ohara[3,4,5] (1.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST), 2.Louisiana State University, 3.Hydrographic and Oceanographic Department of Japan, 4.JAMSTEC, 5.Nagoya University)

[E] Oral | S (Solid Earth Sciences)：S-MP Mineralogy & Petrology

[S-MP38] Deformed rocks, Metamorphic rocks and Tectonics

convener:Yoshihiro Nakamura(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Yumiko Harigane(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST))

[SMP38-06] **Fault zone structure and deformation in pelagic sedimentary rocks in the Jurassic chert-clastic complex, Central Japan**

*Wang Ding[1], Kohtaro Ujiie[1] (1.University of Tsukuba)

[SMP38-07] Energy based normalized brittleness index and its relationship with mineralogical composition of shale rock

*Nikita Dubinya[1,2], Kirill Ezhov[3], Aleksander Kolomytsev[3], Daria Petrova[3] (1.Moscow Institute of Physics and Technology, 2.Schmidt Institute of Physics of the Earth of the Russian Academy of Sciences, 3.Center of integrated engineering for e&p of unconventional resources, Gazprom neft)

[SMP38-08] Banded marbles and pseudotachylyte-like veins from the Higo Metamorphic Rocks:Indication of deep earthquake?

*Tadao Nishiyama[1], Ryuraro Nishida[1] (1.Department of Earth and Environmental Sciences, School of Science, Graduate School of Science and Technology, Kumamoto University)

[SMP38-09] Estimating volume change in metamorphic rocks using deformed vein sets example of the Del Puerto canyon region, in the Franciscan belt, W USA

*Shogo Soejima[1], Simon Richard Wallis[1] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo)

[SMP38-10] Petrologic evidence for ultrahigh-temperature metamorphism in lower crustal granulite xenoliths from Siberian kimberlite pipes

*Shunsuke Fukuhara[1], Tatsuki Tsujimori[1], Shogo Aoki[2], Kazumasa Aoki[2], Vladimir Malkovets[3], Ludmila Pokhilenko[3] (1.Tohoku University, 2.Okayama University of Science, 3.S.V. Sobolev Institute of Geology and Mineralogy)

[SMP38-11] Petrology and metamorphism of pelitic rocks from the internal zone of the Pan-African Lufilian belt, Copperbelt, Zambia

*Kabangu Grace Sakuwaha[1], Toru Takeshita[1] (1.Hokkaido Univ.)

[E] Oral | S (Solid Earth Sciences)：S-MP Mineralogy & Petrology

[S-MP38] Deformed rocks, Metamorphic rocks and Tectonics

convener:Yoshihiro Nakamura(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Yumiko Harigane(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST))

[SMP38-13] Single-shot laser ablation ICP-MS U-Pb dating of invisible outer-rim of zircon

*Hideki Iwano[1], Takafumi Hirata[2], Yuji Orihashi[3], Tohru Danhara[1], Harutaka Sakai[4] (1.Kyoto Fission-Track Co., Ltd., 2.Geochemical Research Center, University of Tokyo, 3.Hirosaki University, 4.Kyoto University)

[SMP38-14] **Detection of zircon growth pulses and thermal evolution of Ryoke complex**

*Kazuhiro Miyazaki[1], Takeshi Ikeda[2], Hideki Iwano[3], Takafumi Hirata[4], Tohru Danhara[3] (1.Orogenic Processes Research Group, Institute of Geology and Geoinformation, Geological Survey of Japan/National Institute of Advanced Industrial Science and Technology, 2.Kyushu Univ., 3.Kyoto FT, 4.Tokyo Univ.)

[SMP38-15] Dating ductile deformation in a high-temperature/low-pressure type metamorphic terrane (Ryoke belt, Japan)

*Tetsuo Kawakami[1], Tomoe Ichino[1], Shuhei Sakata[2] (1.Graduate School of Science, Kyoto University, 2.Earthquake Research Institute, The University of Tokyo)

[SMP38-16] **Does the Median Tectonic Line in the Chubu district, Japan preserve a subduction interface? Implication for a paired metamorphism in subduction zone**

*Yoshihiro Nakamura[1], Kazuhiro Miyazaki[1], Yutaka Takahashi[1] (1.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology)

[E] Oral | S (Solid Earth Sciences)：S-MP Mineralogy & Petrology

[S-MP38] Deformed rocks, Metamorphic rocks and Tectonics

convener:Yoshihiro Nakamura(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Yumiko Harigane(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST))

[SMP38-18] Hydrologic properties evolution during magmatic fluid activity in the middle-crustal conditions estimated from metamorphic fluid-rock reaction zones, Sør Rondane Mountains, East Antarctica.

*Diana Mindaleva[1], Masaoki Uno[1], Atsushi Okamoto[1], Noriyoshi Tsuchiya[1] (1.Graduate school of environmental studies, Tohoku University)

[SMP38-19] Mass transport during carbonate–silicate rock interaction in a collisional orogen: C-O-Sr isotope study of drill core samples from the Hida Belt, Japan.

*Hironobu Harada[1], Tatsuki Tsujimori[1], Keitaro Kunugiza[2], Katsuyuki Yamashita[3], Hideko Takayanagi[1], Yasufumi Iryu[1] (1.Tohoku Univesity, 2.Toyama University, 3.Okayama University)

[SMP38-20] **The formation of micro- to nano-pores in feldspars induced by fluid infiltration within the crust**

*Astin Nurdiana[1], Atsushi Okamoto[1], Masaoki Uno[1], Kenta Yoshida[2], Takayoshi Nagaya[3], Noriyoshi Tsuchiya[1] (1.Tohoku University, 2.Japan Agency for Marine-earth Science and Technology (JAMSTEC), 3.The University of Tokyo)

[SMP38-21] An integrated study of prograde-zoned garnets in low-temperature eclogites: Reappraisal of omphacite antiphase domain geospeedometry and new insights in fluid-induced metamorphic crystal growths

*Ryo Fukushima[1], Tatsuki Tsujimori[1], Nobuyoshi Miyajima[2], Kazumasa Aoki[3] (1.Tohoku University, 2.Bayerisches Geoinstitut, University of Bayreuth, 3.Okayama University of Science)

[SMP38-22] Migration of Albite and Chlorite Rhythmic Bands with Temperature and Pressure Change in the Metamorphic Rocks.

*mitsuhiro toriumi[1] (1.Japan agency of marine science and technology)

[E] Oral | S (Solid Earth Sciences)：S-MP Mineralogy & Petrology

[S-MP39] Oceanic and Continental Subduction Processes

convener:REHMAN Hafiz Ur(Department of Earth and Environmental Sciences, Graduate School of Science and Engineering, Kagoshima University), Tatsuki Tsujimori(Tohoku University), Kazuaki Okamoto(Faculty of Education, Saitama University)

[SMP39-01] **Models for Seismic slip and Fluid Flow along the Subduction Interface**

*Donald M Fisher[1], John N Hooker[1] (1.Pennsylvania State University)

[SMP39-02] Geological records related to ridge subduction in the back-arc basin: a case study from East China Sea Shelf Basin

*Shunli Gao[1], Jun Zhao[1], Senqing Hu[1], Xiaowei Fu[2] (1.China National Offshore Oil Corporation (CNOOC), China Limited-Shanghai, 2.State Key Laboratory of Marine Geology, Tongji University)

[SMP39-03] Slab breakoff tectonics: constraints from temporal changes of melting conditions recorded in geochemical stratigraphy of the Cumulate Member and ultramafic dikes of the Hayachine-Miyamori ophiolite, northeast Japan

*Takafumi Kimura[1], Kazuhito Ozawa[1] (1.Department of Earth and Planetary Science, The University of Tokyo)

[SMP39-04] **Boninites and related tholeiites from the southernmost of West Mariana Arc: geochemical evidence for subduction initiation**

*Ji Zhang[1,2], Guoliang Zhang[1] (1.Institute of Oceanology, Chinese Academy of Sciences, 2.University of Chinese Academy of Sciences)

[SMP39-06] A new scheme of diffusion-limited REE-uptake model for prograde-zoned garnets in low-temperature eclogites: Principle and application

*Ryo Fukushima[1], Tatsuki Tsujimori[1] (1.Tohoku University)

[E] Oral | S (Solid Earth Sciences)：S-MP Mineralogy & Petrology

[S-MP39] Oceanic and Continental Subduction Processes

convener:REHMAN Hafiz Ur(Department of Earth and Environmental Sciences, Graduate School of Science and Engineering, Kagoshima University), Tatsuki Tsujimori(Tohoku University), Kazuaki Okamoto(Faculty of Education, Saitama University)

[SMP39-07] Push out and Phase Transition of Mantle under the Izu Slab, recorded on CMT solutions of JMA

*Nobuaki Niitsuma[1] (1.Institute of Geosciences,Shizuoka University)

[SMP39-08] **Variations in Frictional Properties Depending on Temperature in Tectonic Mélanges of Ancient Accretionary Prisms**

*Tsai-Wei Chen[1], Donald M Fisher[1], Andrew J Smye[1], Chris J Marone[1], Yoshitaka Hashimoto[2] (1.Pennsylvania State University , 2.Kochi University)

[E] Oral | S (Solid Earth Sciences)：S-MP Mineralogy & Petrology

[S-MP40] Thermal structure of subduction zones: modeling and the rock record

convener:Simon Richard Wallis(The University of Tokyo), Takayoshi Nagaya(Graduate School of Science, The University of Tokyo), Shoichi Yoshioka(Research Center for Urban Safety and Security, Kobe University)

[SMP40-01] Bayesian inference of model parameters controlling the thermal structure of subduction zones

*Manabu Morishige[1], Tatsu Kuwatani[1] (1.Japan Agency for Marine-Earth Science and Technology)

[SMP40-02] A holistic view of the thermal structure of subduction zones

★Invited Papers

*Peter E Van Keken[1], Geoff Abers[2], Cian Wilson[1] (1.Carnegie Institution for Science, Washington DC, USA, 2.Cornell University, Ithaca, NY, USA)

[SMP40-03] Subduction zone processes with fluid and melt: numerical model and observations

★Invited Papers

*Hikaru Iwamori[1] (1.Earthquake Research Institute, The University of Tokyo)

[SMP40-04] Low and high stress subduction zones recognized from metamorphic P-T paths

*Simon Richard Wallis[1], Kazuhiko Ishii[2] (1.The University of Tokyo, 2.Osaka Prefecture University)

[SMP40-05] Constraining the temperature conditions of paleo-subduction plate interfaces: Combining petrology and geodynamics

★Invited Papers

*Sarah Penniston-Dorland[1], Kayleigh Harvey[1], Xin Zhou[2], Ikuko Wada[2], Besim Dragovic[3], Peter E Van Keken[4] (1.University of Maryland College Park, 2.University of Minnesota, 3.University of South Carolina, 4.Carnegie Institution for Science)

[SMP40-06] Thermal structure near the continental Moho of subduction zone: Natural example of the Asemigawa region of the Sanbagawa metamorphic belt, SW Japan

*Yui Kouketsu[1], Kazushi Sadamoto[1], Hayato Umeda[2], Hirokazu Kawahara[3], Takayoshi Nagaya[4], Tomoki Taguchi[5], Hiroshi Mori[6], Simon Richard Wallis[4], Masaki Enami[7] (1.Department of Earth & Planetary Sciences, Graduate School of Environmental Studies, Nagoya University, 2.DOWA Metals & Mining Co., Ltd., 3.Japan Oil, Gas and Metals National Corporation (JOGMEC), 4.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 5.Department of Geology and Mineralogy, Graduate School of Science, Kyoto University, 6.Faculty of Science, Shinshu University, 7.Nagoya University)

[E] Oral | S (Solid Earth Sciences)：S-VC Volcanology

[S-VC41] Timescales of magmatism: from genesis to eruption

convener:Chamberlain Katy Jane(University of Derby), Iona McIntosh(Japan Agency for Marine-Earth Science and Technology), Kenichiro Tani(Department of Geology and Paleontology, National Museum of Nature and Science), Akihiko Tomiya(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology)

[SVC41-01] Degassing processes of silicic magma estimated from multivolatile analysis of obsidian pyroclast

★Invited Papers

*Shumpei Yoshimura[1] (1.Department of Earth and Planetary Sciences, Hokkaido University)

[SVC41-02] Decoding the pre-eruptive process by crystal clots: A case study of Unzen 1991-95 eruption

*Kurumi Iwahashi[1], ATSUSHI YASUDA[1], Hidemi Ishibashi[2] (1.Earthquake Research Institute,The University of Tokyo, 2.Shizuoka University)

[SVC41-03] ***Crystal archives of the Havre 2012 submarine rhyolite eruption: Understanding the origin of crystal-poor rhyolites***

*Joseph Knafelc[1], Scott E. Bryan[1], Henrietta Cathey[1], David Gust[2] (1.School of Earth, Environmental and Biological Sciences, Queensland University of Technology, Brisbane, Australia, 2.Institute of Future Environments, Central Analytical Research Facility, Queensland University of Technology, Brisbane, Australia)

[SVC41-04] **Extent of late Holocene volcanic activity in Southern Patagonia**

*Maximillian Van Wyk de Vries[1], Emi Ito[1], Mark Shapley[1], Guido Brignone[2], Shanti Penprase[1], Alexander Schmies[1] (1.University of Minnesota, Twin Cities, 2.University of Cordoba)

[SVC41-05] **Time constraints on magma ascent from volatile element diffusion in apatite**

★Invited Papers

*Weiran Li[1], Fidel Costa[1,2], Sumit Chakraborty[3], Kazuhide Nagashima[4] (1.Earth Observatory of Singapore, Nanyang Technological Univ, 2.Asian School of Environment, Nanyang Technological Univ, 3.Ruhr Universität Bochum, Germany, 4.Univ. of Hawai‘i at Mānoa)

[SVC41-06] Plagioclase and biotite in holocrystalline composite dike record pre-solidification chemical diffusion in melt

*Ayu Yamazaki[1], Tetsuo Kawakami[1], Fumiko Higashino[2] (1.Department of Geology and Mineralogy, Graduate school of Science, Kyoto University , 2.Faculty of Science, Okayama University of Science)

[E] Oral | S (Solid Earth Sciences)：S-VC Volcanology

[S-VC42] Dynamics of volcanic eruptions and their physical and chemical processes

convener:Atsuko Namiki(Graduate School of Integrated Arts and Sciences, Hiroshima University), Christian Huber(Brown University), Michael Manga(University of California Berkeley), Yujiro Suzuki(Earthquake Research Institute, The University of Tokyo)

[SVC42-01] Magma flow style based on deformed bubble structure of pumice

*Masatoshi Ohashi[1], Mie Ichihara[2] (1.Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University, 2.Earthquake Research Institute, the University of Tokyo)

[SVC42-03] **The dynamics of buoyancy driven fragmentation in a deep subaqueous volcanic eruption, observations of the 2009 eruption of West Mata**

*Arran Peter Murch[1], Ryan A. Portner[2], Kenneth H. Rubin[3], David A. Clague[4] (1.Department of Geology and Paleontology, National Museum of Nature and Science, Tsukuba, Japan , 2.Geology Department, San Jose State University, USA, 3.SOEST, University of Hawaii at Manoa, USA, 4.Monterey Bay Aquarium Research, Moss Landing, USA)

[SVC42-04] Eruption mechanics of the 2012 eruption of Mount Tongariro, NZ: Revealed by temporal Magnetotellurics

*Graham Hill[1,2], Hugh Bibby[3], Jared Peacock[4], Erin Wallin[5], Yasuo Ogawa[6], Luca Caricchi[7], Harry Keys[8], Stewart Bennie[3], Yann Avram[9] (1.Institute of Geophysics, Czech Academy of Science, Prague, Czech Republic, 2.Gateway Antarctica, University of Canterbury, Christchurch, New Zealand, 3.GNS Science, Lower Hutt, New Zealand, 4.United States Geological Survey, Menlo Park CA, USA, 5.United States Army Corps of Engineers, Huntsville AL, USA, 6.Volcanic Fluid Research Centre, Tokyo Institute of Technology, Tokyo, Japan, 7.Department of Earth Sciences, University of Geneva, Geneva, Switzerland, 8.Department of Conservation, Turangi, New Zealand, 9.Phoenix Geophysics, Toronto, Canada)

[SVC42-05] Fluid ascent dynamics of the Onikobe geyser, NE Japan: Insight from the thermal infrared imagery

*Noriko Teshima[1], Takeshi Nishimura[1], Hiroshi Aoyama[2], Ayuta Tsuge[2] (1.Department of Geophysics, Graduate School of Science, Tohoku University, 2.Institute of Seismology and Volcanology, Faculty of Science, Hokkaido University)

[E] Oral | S (Solid Earth Sciences)：S-VC Volcanology

[S-VC42] Dynamics of volcanic eruptions and their physical and chemical processes

convener:Atsuko Namiki(Graduate School of Integrated Arts and Sciences, Hiroshima University), Christian Huber(Brown University), Michael Manga(University of California Berkeley), Yujiro Suzuki(Earthquake Research Institute, The University of Tokyo)

[SVC42-07] An analysis of the relationship between mass eruption rate and runout distance of pyroclastic density currents

★Invited Papers

*Olivier Roche[1], Nourddine Azzaoui[2], Arnaud Guillin[2] (1.Laboratoire Magmas et Volcans, Université Clermont Auvergne-CNRS-IRD, OPGC, Clermont-Ferrand, France, 2.Laboratoire de Mathématiques Blaise Pascal, Université Clermont Auvergne-CNRS, Clermont-Ferrand, France)

[SVC42-08] 3D numerical simulations of volcanic jets inside a crater during explosive volcanic eruptions

*Fiodar Perakozhau[1], Takehiro Koyaguchi[1] (1.Earthquake Research Institute, the University of Tokyo)

[SVC42-09] Simulating tephra fall deposit from a bending eruption plume: development of a new code and its validation using inversion

*Kazutaka Mannen[1] (1.Hot Springs Research Institute of Kanagawa Prefecture)

[SVC42-10] Dynamics of ballistic projectiles based on Trashcano experiment

*Saruta Shusaku[1], Kae Tsunematsu[1], Isao Motoyama[1] (1.Yamagata University)

[SVC42-12] **ERUPTION DYNAMICS AND CONDUIT PROCESS OF THE 52-ka MANINJAU CALDERA FORMING ERUPTION, WEST SUMATRA, INDONESIA**

*Indranova Suhendro[1], Atsushi Toramaru[1], Agung Harijoko[2,3], Haryo Edi Wibowo[2,3] (1.Department of Earth and Planetary Sciences, Graduate School of Sciences, Kyushu University, 2.Department of Geological Engineering, Faculty of Engineering, Universitas Gadjah Mada, Jl. Grafika no. 2, Yogyakarta, 3.Center for Disaster Studies Universitas Gadjah Mada, Jl. Mahoni C-16 Bulaksumur, Yogyakarta)

[E] Oral | S (Solid Earth Sciences)：S-VC Volcanology

[S-VC43] Magma crystallization, fragmentation, and their roles on volcanic eruption

convener:Takahiro Miwa(National research institute for earth science and disaster prevention), Satoshi Okumura(Division of Earth and Planetary Materials Science, Department of Earth Science, Graduate School of Science, Tohoku University), Pranabendu Moitra(University of Arizona)

[SVC43-01] **Highly explosive basaltic eruptions: magma fragmentation induced by rapid crystallisation**

★Invited Papers

*Mike Burton[1], Fabio Arzilli[1], Giuseppe La Spina[1], Margherita Polacci[1], Nolwenn Le Gall[2], Margaret Hartley[1], Danilo Di Genova[3], Biao Cai[4], Nghia Vo[5], Sara Nonni[1], Robert Atwood[5], Edward Llewellin[6], Richard Brooker[7], Heidy Mader[7], Peter Lee[2] (1.Department of Earth and Environmental Sciences, University of Manchester, Manchester M13 9PL, UK, 2.Department of Mechanical Engineering, University College London, London, UK, 3.Institute of Non-Metallic Materials, Clausthal University of Technology, Zehntner Str. 2a, 38678 Clausthal-Zellerfeld, Germany, 4.School of Metallurgy and Materials, University of Birmingham, Birmingham B15 2TT, UK, 5.Diamond Light Source, Harwell Science and Innovation Campus, Didcot OX11 0DE, UK, 6.Department of Earth Sciences, Durham University, Durham DH1 3LE, UK, 7.School of Earth Sciences, University of Bristol, Bristol BS8 1RJ, UK)

[SVC43-02] Petrological Constraints on the Magma Fragmentation Pressure on the Hoei Eruption (AD 1707) of Fuji Volcano - Implications for the dynamics of Basaltic Plinian Eruptions

*Kyungmin Kim[1], Michihiko Nakamura[1], Tomofumi Kozono[2], Mitsuhiro Yoshimoto[3] (1.Department of Earth Science, Graduate School of Science, Tohoku University, Sendai, Japan, 2.Department of Geophysics, Graduate School of Science, Tohoku University, Sendai, Japan, 3.Mount Fuji Research Institute, Yamanashi Prefecture Government, Japan)

[SVC43-03] Role of crystallization and conduit structure on small transitions of Strombolian eruption at Suwanosejima volcano, SW Japan

*Taketo Shimano[1], Atsushi Yasuda[2], Masato Iguchi[3] (1.Graduate School of Environment and Disaster Research, Tokoha University, 2.Earthquake Research Institute, University of Tokyo, 3.Disaster Prevention Research Institute, Kyoto University)

[SVC43-04] Importance of Q as a measure of the fragmentation potential

★Invited Papers

*Atsuko Namiki[1], Yukie Tanaka[1], Satoshi Okumura[2], Osamu Sasaki[2], Kyohei Sano[3], Shingo Takeuchi[4] (1.Hiroshima University, 2.Tohoku University, 3.University of Hyogo, 4.Central Research Institute of Electric Power Industry)

[SVC43-05] **Heterogeneities in Crystal from YTT (74 ka) and the Implications for Toba Magma Chamber Systems**

*Gabriela Nogo Retnaningtyas Bunga Naen[1], Atsushi Toramaru[1], Tomoharu Miyamoto[1], Haryo Edi Wibowo[2] (1.Department Earth and Planetary Sciences, Kyushu University, Fukuoka, Japan, 2.Geological Engineering Departement, Universitas Gadjah Mada, Yogyakarta, Indonesia)

[SVC43-06] Crystal-size distribution and micro-textural variation of Holocene volcanic products from the last 2000 years eruption of Kelud Volcano, Indonesia: an approach to understand the conduit dynamics.

*Jananda Nuralam Indriyanto[1], Tsukasa Ohba[1], Takashi Hoshide[1], Mirzam Abdurrachman[2] (1.Faculty of International Resource Sciences, Akita University, 2.Department of Geological Engineering, Bandung Institute of Technology)

[E] Oral | S (Solid Earth Sciences)：S-GC Geochemistry

[S-GC48] Volatiles in the Earth - from Surface to Deep Mantle

convener:Takeshi Hanyu(Japan Agency for Marine-Earth Science and Technology, Research Institute for Marine Geodynamics), Gray E Bebout(Lehigh University), Hirochika Sumino(Department of Basic Science, Graduate School of Arts and Sciences, The University of Tokyo), Yuji Sano(Division of Ocean and Earth Systems, Atmosphere and Ocean Research Institute, University of Tokyo)

[SGC48-01] Spatial distribution of halogen compositions near the paleo slab-mantle wedge boundary, example from the Sanbagawa metamorphic belt

*JIE REN[1], Hirochika Sumino[1], Yui Kouketsu[2], Simon Richard Wallis[3] (1.Graduate School of Arts and Sciences, The University of Tokyo , 2.Graduate School of Enviromental Studies, Nagoya University, 3.Graduate School of Science, The University of Tokyo)

[SGC48-02] Multiple halogen components in subcontinental lithospheric mantle revealed by single-grain analysis of mantle-derived xenoliths

*Hirochika Sumino[1], Sota Niki[2], Ray Burgess[3], Masahiro Kobayashi[4], Hiroyuki Kagi[2] (1.Department of Basic Science, Graduate School of Arts and Sciences, The University of Tokyo, 2.Geochemical Research Center, Graduate School of Science, University of Tokyo, 3.School of Earth and Environmental Sciences, University of Manchester, 4.Tokyo Metropolitan Industrial Technology Research Institute)

[SGC48-03] **C-N-He-Ar Cycling at the Hikurangi Subduction Margin, New Zealand**

Gabe S Epstein[1], *Gray E Bebout[1,2], Bruce W Christenson[3], Hirochika Sumino[4], Ikuko Wada[5], Cynthia A Werner[6], David R Hilton[7] (1.Dept. Earth and Environmental Sciences, Lehigh University, USA, 2.Okayama University, Institute for Planetary Materials, 3.National Isotope Center, GNS Science, New Zealand, 4.Dept. of Basic Science, University of Tokyo, 5.Dept. of Earth Sciences, University of Minnesota, USA, 6.USGS-Contractor, USA, 7.Scripps Institution of Oceanography, USA)

[SGC48-04] Helium and carbon characteristics in forearc fluids of Central America

★Invited Papers

*Peter H Barry[1], J. M. de Moor[2], M. Nakagawa[3], D. Giovannelli[4], M. Schrenk[5], A. M. Selzer[1], K. G. Lloyd[6] (1.Woods Hole Oceanographic Institution, 2.Observatorio Volcanológico y Sismológico de Costa Rica (OVSICORI), Universidad Nacional, Costa Rica, 3.Earth-Life Science Institute, Tokyo Institute for Technology, Tokyo, Japan, 4.Department of Biology, University of Naples “Federico II”, Naples, Italy, 5.Department of Earth and Environmental Sciences, Michigan State University, MI, USA, 6.Department of Microbiology, University of Tennessee, TN, USA)

[SGC48-05] Evidence for volatile-rich mantle transition zone beneath NE China: implication from the geochemistry of melt inclusions from Wudalianchi basalts

*Tetsuya Sakuyama[1], Yuma Hayashi[1], Kenji Shimizu[2], Takayuki Ushikubo[2], Takeshi Hanyu[3], Jun-Ichi Kimura[3], Wei Tian[4] (1.Faculty of Science, Osaka City University, 2.Kochi Institute for Core Sample Research, JAMSTEC, 3.JAMSTEC, Yokosuka, 4.Peking University)

[SGC48-06] **Crustal and mantle degassing in continental China**

★Invited Papers

*Maoliang Zhang[1], Zhengfu Guo[2], Sheng Xu[1], Yuji Sano[3,1], Peter H. Barry[4] (1.Tianjin University, 2.Institute of Geology and Geophysics, Chinese Academy of Sciences, 3.The University of Tokyo, 4.Woods Hole Oceanographic Institution)

[E] Oral | S (Solid Earth Sciences)：S-GC Geochemistry

[S-GC48] Volatiles in the Earth - from Surface to Deep Mantle

convener:Takeshi Hanyu(Japan Agency for Marine-Earth Science and Technology, Research Institute for Marine Geodynamics), Gray E Bebout(Lehigh University), Hirochika Sumino(Department of Basic Science, Graduate School of Arts and Sciences, The University of Tokyo), Yuji Sano(Division of Ocean and Earth Systems, Atmosphere and Ocean Research Institute, University of Tokyo)

[SGC48-08] **Investigating past eruptive activity of a silicic submarine volcano using FTIR volatile analyses**

*Iona McIntosh[1], Kenichiro Tani[2], Alexander Robert Lee Nichols[3], Qing Chang[1], Jun-Ichi Kimura[1] (1.Japan Agency for Marine-Earth Science and Technology, Yokosuka, Japan, 2.National Museum of Nature and Science, Tsukuba, Japan, 3.University of Canterbury, Christchurch, New Zealand)

[SGC48-09] **Reactive evolution of carbonated silicate melt in the mantle lithosphere**

*Guoliang Zhang[1,3], Shuai Wang[1,2], Ji Zhang[1,2], Ming-Jun Zhan[1,2], Zhi-Hua Zhao[1,2] (1.Institute of Oceanology, Chinese Academy of Sciences, 2.University of Chinese Academy of Sciences, 3.Center for Ocean Mega-Science, Chinese Academy of Sciences)

[SGC48-10] **.** ***The conditions of sub-lithospheric diamond formation constrained from ferric iron-rich exsolution in ferropericlase inclusions in diamond*** **.**

*Caterina Melai[1], Daniel Frost [1], Tiziana Boffa Ballaran[1], Catherine McCammon[1], Katharina Marquardt [2] (1.Bayerisches Geoinstitut, Universitaet Bayreuth, 2.Imperial College, London)

[SGC48-11] **The effects of carbon concentration and silicate melt structure on the metal-silicate partitioning of carbon in a shallow magma ocean**

*Hideharu Kuwahara[1], Akimasa Suzumura[2], Shoichi Itoh[2], Ryoichi Nakada[3], Tetsuo Irifune[1,4] (1.Geodynamics Research Center, Ehime University, 2.Graduate School of Science, Kyoto University, 3.Kochi Institute for Core Sample Research, Japan Agency for Marine-Earth Science and Technology (JAMSTEC), 4.Earth-Life Science Institute, Tokyo Institute of Technology)

[SGC48-12] Subduction barrier for argon

★Invited Papers

*Shigeaki Ono[1] (1.Japan Agency for Marine-Earth Science and Technology)

[E] Oral | S (Solid Earth Sciences)：S-TT Technology & Techniques

[S-TT50] Synthetic Aperture Radar and its application

convener:Yohei Kinoshita(University of Tsukuba), Yu Morishita(Geospatial Information Authority of Japan), Shoko Kobayashi(Tamagawa University), Takahiro Abe(Earth Observation Research Center, Japan Aerospace Exploration Agency)

[STT50-01] Trial of deforestation detection accuracies improvement for JJ-FAST algorithm by using deep learning.

*Manabu Watanabe[1], Christian Naohide koyama[1], Masato Hayashi[2], Isumi Nagatani[2], Takeo Tadono[2], Masanobu Shimada[1] (1.School of Science and Engineering, Tokyo denki university, 2.JAXA/EORC)

[STT50-02] **Changes in surface conditions and permafrost environment of a summit area of the Daisetsu Mountains, Hokkaido, Japan**

*Go Iwahana[1], Toshio Sone[2], Masao Uchida[3], Tokuta Yokohata[3] (1.International Arctic Research Center, University of Alaska Fairbanks, 2.Institute of Low Temperature Science, Hokkaido University, 3.National Institute for Environmental Studies)

[STT50-03] **Determination of the dipping direction of a blind reverse fault from InSAR: Case study on the 2017 Sefid Sang earthquake, Northeastern Iran**

*Nematollah Ghayournajarkar[1], Yo Fukushima[2] (1.Graduate School of Science, Tohoku University, 2.International Research Institute of Disaster Science, Tohoku University)

[STT50-04] **DefVolc: Interface and web service for fast computation of volcano displacement**

*Valerie Cayol[1], Farshid Dabaghi[2], Yo Fukushima[3], Marine Tridon[1], Delphine Smittarello[4], Olivier Bodart[2], Jean-Luc Froger[1] (1.CNRS, UCA, LMV, OPGC, IRD, Clermont-Ferrand, France, 2.UdL, ICJ, Saint-Etienne, France, 3.IRIDeS, TU, Tohoku, Japan, 4.UGA, USMB, CNRS, IRD,IFSTTAR, ISTerre, Grenoble, France)

[E] Oral | S (Solid Earth Sciences)：S-TT Technology & Techniques

[S-TT50] Synthetic Aperture Radar and its application

convener:Yohei Kinoshita(University of Tsukuba), Yu Morishita(Geospatial Information Authority of Japan), Shoko Kobayashi(Tamagawa University), Takahiro Abe(Earth Observation Research Center, Japan Aerospace Exploration Agency)

[STT50-05] Ups and downs in the Osaka metropolitan area, Japan, detected by LiCSBAS InSAR time-series analysis

*Yo Fukushima[1] (1.International Research Institute of Disaster Science, Tohoku University)

[STT50-06] Time-series surface displacements in Taiwan using Sentinel-1 wide-swath SAR data

*Shoki Hiranaka[1], Kazuya Ishitsuka[1], Weiren Lin[1] (1.Kyoto University)

[STT50-07] Deep learning InSAR: atmospheric noise removal and small deformation signal extraction from InSAR time series using a convolutional autoencoder

*Bertrand Rouet-Leduc[1], Manon Dalaison[2], Claudia Hulbert[2], Paul Johnson[1], Romain Jolivet[2] (1.Los Alamos National Laboratory, USA, 2.Ecole Normale Superieure, France)

[STT50-08] Mitigation of ionospheric noise in azimuth pixel offset based on the split-spectrum method

*Tatsuya Yamashita[1], Tomokazu Kobayashi[1], Yu Morishita[1] (1.GSI of Japan)

[STT50-09] Detection of huge deformation by SAR interferometry with split-spectrum method

*Taku Ozawa[1], Yuji Himematsu[1] (1.National Research Institute for Earth Science and Disaster Resilience)

[E] Oral | S (Solid Earth Sciences)：S-TT Technology & Techniques

[S-TT51] seismic monitoring and processing system

convener:Takahiro Maeda(National Research Institute for Earth Science and Disaster Resilience)

[STT51-01] Automatic identification of airgun signals observed by ocean bottom seismic network

*Koji Tamaribuchi[1] (1.Meteorological Research Institute)

[STT51-02] Processing the Deep-towed Autonomous Continous System (ACS) Data in Joetsu Basin, Niigata Prefecture, Japan

*Fernando Lawrens Hutapea[1,2,3], Takeshi Tsuji[1,2,4], Eiichi Asakawa[5], Masafumi Kato[6] (1.Department Earth Resources Engineering, Kyushu University, Japan, 2.International Institute for Carbon-Neutral Energy Research (WPI-I2CNER), Kyushu University, Japan, 3.Exploration and Engineering Seismology Research Group, Institute Technology of Bandung (ITB), Indonesia, 4.Disaster Prevention Research Institute, Kyoto University, Japan, 5.JGI, Inc. Japan, 6.Japan Oil Gas and Metals National Corporation (JOGMEC), Japan)

[STT51-03] Performance evaluation of seismic observation system using phase-shifted optical interferometry

*Yoshiharu Hirayama[1], Minemori Sato[1], Atsushi Takahara[1], Toshiharu Ikeda[1], Keiji Takeuchi[1], Taiichi Taniguchi[1], Yoshihiro Sawada[2] (1.Hakusan Corporation, 2.Association for the Development of Earthquake Prediction)

[STT51-04] Extracting Noise-Correlation Functions from Analogue Seismograms

Thomas Lee[1], *Miaki Ishii[1], Paul Okubo (1.Department of Earth & Planetary Sciences, Harvard University)

[STT51-05] Crustal Thickness Behind the Tonga Arc Measured by Stacking of pP Precursors

*Lauren McLeod[1], Larry D Brown[1] (1.Cornell Univ.)

[STT51-06] Investigation on the traceable calibration of sensors for monitoring the seismic activities based on the international metrology system

*Wan-Ho Cho[1], Yong-Bong Lee[1], Sung-Soo Jung[1], Byeng-Su Jeon[1] (1.Korea Research Institute of Standards and Science)

[E] Oral | S (Solid Earth Sciences)：S-TT Technology & Techniques

[S-TT52] Seismic Big Data Analysis Based on the State-of-the-Art of Bayesian Statistics

convener:Hiromichi Nagao(Earthquake Research Institute, The University of Tokyo), Aitaro Kato(Earthquake Research Institute, the University of Tokyo), Keisuke Yano(The University of Tokyo, Graduate School of Information Science and Technology), Takahiro Shiina(Earthquake Research Institute, The University of Tokyo)

[STT52-01] Multiple classes of non-tectonic emergent and impulsive seismic noise identified in continuous waveforms

★Invited Papers

*Christopher W Johnson[1,2], Yehuda Ben-Zion[3] (1.Scripps Institution of Oceanography, 2.Los Alamos National Lab, 3.University of Southern California)

[STT52-02] Uncertainty Quantification for Inhomogeneous Frictional Features in a Slow-Slipping Fault Based on a Large-Scale Four-Dimensional Variational Data Assimilation

*Shin-ichi Ito[1], Masayuki Kano[2], Hiromichi Nagao[1] (1.The University of Tokyo, 2.Tohoku University)

[STT52-03] A hidden Markov model for overlapping of seismic waves

*Sumito Kurata[1], Keisuke Yano[1], Fumiyasu Komaki[1] (1.Graduate School of Information Science and Technology, The University of Tokyo)

[STT52-04] Prediction of Aftershocks With Gaussian Process Regression: Application to the 2004 Chuetsu Earthquake

*Kosuke Morikawa[1], Hiromichi Nagao[2], Shin-ichi Ito[2], Yoshikazu Terada[1,3], Shin'ichi Sakai[2], Naoshi Hirata[2] (1.Osaka University, 2.The University of Tokyo, 3.RIKEN AIP)

[STT52-05] On statistical declustering of global earthquake catalogue

★Invited Papers

*Debashis Mondal[1], Suhas Sastry[1] (1.Oregon State University)

[E] Oral | S (Solid Earth Sciences)：S-TT Technology & Techniques

[S-TT53] Airborne surveys and monitoring of the Earth

convener:Shigekazu Kusumoto(Graduate School of Science and Engineering for Research, University of Toyama), Takao Koyama(Earthquake Research Institute, The University of Tokyo), Yuji Mitsuhata(AdvancedIndustrial Science and Technology), Shigeo Okuma(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST))

[STT53-01] Compute environment agnostic scientific research platform for exploration geophysics

★Invited Papers

*Pavel Golodoniuc[1], Davis Aaron[1], Samuel Bradley[1], Shane Mule[1], John Hille[1] (1.CSIRO)

[STT53-02] Investigation of geological structure using airborne electromagnetic survey method in which transmitter and receiver are towed by drone.

★Invited Papers

*Youichi Yuuki[1], akira shinsei[1], satoshi tomimori[1], Zenshiro Saito[1], akira jomori[2], atsuyoshi jomori[2] (1.Oyo corporation, 2.Neo Science)

[STT53-03] Special Techniques for Airborne Survey Technologies Using Unmanned Helicopters in Noboribetsu Volcano

*Tomoya Hayakawa[1], Keitaro Yoshikawa[2], Takeshi hashimoto[3] (1.NIPPON KOEI CO., LTD., 2.Hokkaido Regional Development Bureau, 3.Hokkaido University Institute of Seismology and Volcanology)

[STT53-04] Repeated aeromagnetic survey of Noboribetsu volcano

Akinori Satoh[1], *Takeshi Hashimoto[1], Tomoya Hayakawa[2], Keitaro Yoshikawa[3], Takao Koyama[4] (1.Institute of Seismology and Volcanology, Graduate School of Science, Hokkaido University, 2.Nippon Koei Co.,Ltd, 3.Hokkaido Regional Development Bureau, 4.Earthquake Research Institute, The University of Tokyo)

[STT53-05] Evaluation of a UAV-enabled Magnetometer for Geophysical Survey in Volcanic Areas

*Shigeo Okuma[1], Masahiko Makino[2], Ayumu Miyakawa[1], Tadashi Nakatsuka[1], Shogo Komori[3], Yoshiki Sugino[1], makoto yanagida[4], Atsushi Oshida[5] (1.Insititute of Geology and Geoinformation, National Institute of Advanced Industrial Science and Technology (AIST), 2.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST), 3.Research Institute for Geo-Resources and Environment, National Institute of Advanced Industrial Science and Technology (AIST), 4.Hanshin Consultants Co., Ltd., 5.Kawasaki Geological Engineering Co., Ltd.)

[STT53-06] The initial report of aeromagnetic studies for Nishinoshima

*Noriko Tada[1], Hiroshi Ichihara[2], Takao Koyama[3], Kiyoshi Baba[3], Akimichi Takagi[4], Fukashi Maeno[3], Minoru Takeo[3] (1.Japan Agency for Marine-Earth Science and Technology, 2.Nagoya University, 3.Earthquake Research Institute, The University of Tokyo, 4.Japan Meteorological Agency)

[E] Oral | S (Solid Earth Sciences)：S-TT Technology & Techniques

[S-TT54] Creating future of solid Earth science with high performance computing (HPC)

convener:Takane Hori(R&D Center for Earthquake and Tsunami, Japan Agency for Marine-Earth Science and Technology), Yuji Yagi(Graduate School of Life and Environmental Sciences, University of Tsukuba, Tsukuba), Katsuhiko Shiomi(National Research Institute for Earth Science and Disaster Resilience)

[STT54-01] Exploiting exascale computing to unravel multi-physics and multi-scale earthquake dynamics and seismic wave propagation

★Invited Papers

*Alice-Agnes Gabriel[1], Bo Li[1], Duo Li[1], Thomas Ulrich[1], Carsten Uphoff[1] (1.Department of Earth and Environment Sciences, Ludwig-Maximilians-Universitat Munchen)

[STT54-02] Development and application of large scale numerical simulations for earthquake generation, ground motion and non-linear soil amplification

*Takane Hori[1], Tsuyoshi Ichimura[2], Kohei Fujita[2], Ryoichiro Agata[1] (1.Research Institute for Marine Geodynamics, Japan Agency for Marine-Earth Science and Technology, 2.Earthquake Research Institute, The University of Tokyo)

[STT54-03] **Computing 3-D Viscoelastic Earthquake Cycle Models for Cascadia Using Large-Scale, High-Fidelity Finite Element Methods**

*Kaj M Johnson[1], Takane Hori[2], Tsuyoshi Ichimura[3], Kohei Fujita[3] (1.Indiana University Bloomington, 2.Research Institute for Marine Geodynamics, JAMSTEC , 3.Earthquake Research Institute & Department of Civil Engineering, The University of Tokyo)

[STT54-04] Fast and scalable finite-element solvers for three-dimensional urban earthquake simulation

*Kohei Fujita[1], Tsuyoshi Ichimura[1], Takuma Yamaguchi[1], Muneo Hori[2], Lalith Wijerathne[1] (1.Earthquake Research Institute, The University of Tokyo, 2.Japan Agency for Marine-Earth Science and Technology)

[STT54-05] Finite element solver for large-scale three-dimensional soil liquefaction analysis

★Invited Papers

*Ryota Kusakabe[1], Tsuyoshi Ichimura[1], Kohei Fujita[1], Muneo Hori[2], Lalith Wijerathne[1] (1.Earthquake Research Institute, The University of Tokyo, 2.Japan Agency for Marine-Earth Science and Technology)

[STT54-06] Large-scale finite element simulation of earthquake ground motion and its numerical verification aiming for enhanced earthquake damage estimation

*Ryoichiro Agata[1], Kohei Fujita[2,3], Tsuyoshi Ichimura[2,3,4], Takane Hori[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.Earthquake Research Institute, The University of Tokyo, 3.RIKEN Center for Computational Science, 4.RIKEN Center for Advanced Intelligence Project)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG55] Petrology, Mineralogy & Resource Geology

convener:Yu Nishihara(Geodynamics Research Center Ehime University), Koichi Momma(National Museum of Nature and Science), Tatsuo Nozaki(Submarine Resources Research Center, Research Institute for Marine Resources Utilization, Japan Agency for Marine-Earth Science and Technology), Nobutaka Tsuchiya(Department of Geology, Faculty of Education, Iwate University)

[SCG55-01] The relationship between the morphology of entablature and the magma cooling process in the Genbudo lava, Iwate Prefecture

*Takashi Hoshide[1], Nao Ishibashi[1] (1.Faculty of International Resource Sciences, Akita University)

[SCG55-02] Preliminary paleomagnetic results from the manganese wad deposit at the Sanbe hot springs, Shimane.

*Kazuo Kawasaki[1], Sunao Kobayashi[2] (1.School of Sustainable Design, University of Toyama, 2.Department of Earth Sciences, University of Toyama)

[SCG55-03] Geochemistry of Middle Permian Tavantolgoi sandstone: Implications for paleoclimate and provenance

*Bat-Orshikh Erdenetsogt[1], Enkhbayar Bolormaa[1], Dashpuntsag Nansalmaa[1], Baigalmaa Norov[1], Bat Bold[1], Luvsanchultem Jargal[1] (1.National University of Mongolia)

[SCG55-04] Proposal for novel quantitative classification method of below the hundred-micron particle in soils using a microscope Raman spectroscopy combined with an automated image analysis.

*Daisuke Sasakura[1], Aiko Hayauchi[1] (1.Malvern Japan ,Div of Spectris Co.Ltd,.)

[SCG55-05] High-pressure phase relations of K-bearing NAL phase with implications to aluminosilicate inclusions in superdeep diamonds in kimberlites

*Masaki Akaogi[1], Fumiya Kimura[1], Hiroshi Kojitani[1] (1.Department of Chemistry, Faculty of Science, Gakushuin University)

[SCG55-06] Rheology of bcc-iron at high-pressure and -temperature

*Yu Nishihara[1], Yuji Higo[2], Yoshinori Tange[2] (1.Geodynamics Research Center, Ehime University, 2.Japan Synchrotron Radiation Research Institute)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG56] ICDP Oman Drilling Project: Oman to Oceanic Lithosphere to Island Arc Formation and Beyond

convener:Eiichi TAKAZAWA(Department of Geology, Faculty of Science, Niigata University), Katsuyoshi Michibayashi(Department of Earth and Planetary Sciences, Nagoya University), Sayantani Chatterjee(Niigata University, Department of Geology, Faculty of Science)

[SCG56-01] Feedback between melt percolation and deformation at Oman crust-mantle transition zone: ICDP_ Exp. 807 Holes CM1A and CM2B

★Invited Papers

*Fatma Kourim[1], Katsuyoshi Michibayashi[2], Kou-Lung Wang[1,3], Jürgen Koepke[4], Mathieu Rospabé[5], Mary-Alix Kaczmarek[6], Eiichi Takazawa[7], Damon A-H Teagle[8], Marguerite Godard[9], Mathieu Benoit[6], Peter Kelemen[10], Yuki Kakihata[2], Oman Drilling Project Phase 2 Science Party (1.Institute of Earth Sciences, Academia Sinica, 2.Nagoya University, 3.National Taiwan University, 4.Hannover University, 5.Research Institute for Marine Geodynamics, JAMSTEC, 6.Toulouse university, 7.Nigata University, 8.Southampton University, 9.University of Montpellier, 10.Columbia University)

[SCG56-02] Important role of the ultramafic layers in the lower oceanic crust and Moho

*Natsue Abe[1,2], Keishi Okazaki[3], Kohei Hatakeyama[4], Yuya Akamatsu[4], Ikuo Katayama[4], Benoit Ildefonse[5], Katsuyoshi Michibayashi[6], Eiichi TAKAZAWA[7], Damon A H Teagle[8], Peter B Kelemen[9], Science Party The Oman Drilling Project (1.Mantle Drilling Promotion Office, MarE3, Japan Agency for Marine-Earth Science and Technology , 2.Graduate School of Natural Science & Technology, Kanazawa University, 3.KCC, X-star, Japan Agency for Marine-Earth Science and Technology , 4.Hiroshima University, 5.University of Montpellier, 6.Nagoya University, 7.Niigata University, 8.University of Southampton, 9.LDEO, Columbia University)

[SCG56-03] An idea of borehole measurements at Mantle drilling: insights from the OmanDP

★Invited Papers

*Yasuhiro Yamada[1,2,3], KYAW MOE[1], Kazuya Shiraishi[1] (1.Japan Agency for Marine-Earth Science and Technology (JAMSTEC), 2.Kochi University, Japan, 3.Royal Holloway University of London, UK)

[SCG56-04] Strontium isotopic compositions of mantle peridotites in the Oman ophiolite

*Jiwon Eom[1], Shigeyuki Wakaki[2], Norikatsu Akizawa[1], Tsuyoshi Ishikawa[2], Kyoko Yamaoka[3], Eiichi TAKAZAWA[4], Hodaka Kawahata[1] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Kochi Institute for Core Sample Research, JAMSTEC, 3.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology, 4.Department of Geology, Faculty of Science, Niigata University)

[SCG56-05] Reconstruction of peridotite textures preserved within serpentinites from BA site of Oman Drilling Project Phase II

*Kakihata Yuki[1], Katsuyoshi Michibayashi[1], Laura Crispini[2], Oman Drilling Project Phase2 Science Party (1.Nagoya University Graduate School of Environmental Studies, 2.University of Genova)

[SCG56-06] Rock Magnetic Properties of Oman Drilling Project Cores BA1B, BA3A, BA4A and Its Implications on Iron Oxide Alteration

*Gilbert Hong[1], Jessica Lynn Till[2], Annika Greve[3], Sang-Mook Lee[1], Oman Drilling Project Phase 2 Science Party - (1.Seoul National University, 2.University of Iceland, 3.Utrecht University)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG56] ICDP Oman Drilling Project: Oman to Oceanic Lithosphere to Island Arc Formation and Beyond

convener:Eiichi TAKAZAWA(Department of Geology, Faculty of Science, Niigata University), Katsuyoshi Michibayashi(Department of Earth and Planetary Sciences, Nagoya University), Sayantani Chatterjee(Niigata University, Department of Geology, Faculty of Science)

[SCG56-07] Melt-rock interaction processes inferred from spinel-bearing layered gabbros in the Hess deep rift, East Pacific Rise

*Keita Kondo[1], Takashi Hoshide[1] (1.Faculty of International Resource Science, Akita University)

[SCG56-08] **Petrography and geochemistry of lower crustal gabbros at Oman ophiolite: Insight from Oman Drilling Project Phase 1 & 2**

*Sayantani Chatterjee[1], Eiichi Takazawa[1,2], Katsuyoshi Michibayashi[3], Oman Drilling Project Science Party (1.Department of Geology, Faculty of Science, Niigata University, 2.Volcanoes and Earth's Interior Research Center, Research Institute for Marine Geodynamics, JAMSTEC , 3.Department of Earth and Environmental Sciences, Nagoya University, Japan)

[SCG56-09] Velocity gradient in the oceanic crust layer 3 based on seismic velocity of cores drilled from the Oman ophiolite

*Kohei Hatakeyama[1], Ikuo Katayama[1], Natsue Abe[2], Keishi Okazaki[3], Katsuyoshi Michibayashi[4], The Oman Drilling Project Science Party (1.Department of earth and planetary systems science, Hiroshima University , 2.Japan Agency for Marine-Earth Science and Technology, 3.Kochi Institute for Core Sample Research, Japan Agency for Marine-Earth Science and Technology, 4.Nagoya University)

[SCG56-10] Synthesis of Oceanic Crustal Structure from Two-Dimensional Seismic Profiles

★Invited Papers

*Gail Lynn Christeson[1], John Goff[1], Robert Reece[2] (1.University of Texas at Austin, 2.Texas A&M University)

[SCG56-11] **Petrographical and chemical evolution of a troctolites rich section of oceanic crust located directly above a spreading centre, example from Wadi Mahram, Oman ophiolite**

★Invited Papers

*Marie Python[1], Mathieu Rospabe[2], Claire Charles[3], Georges Ceuleneer[4], Shoji Arai[5] (1.Hokkaido University Department of Natural History Science Division of Earth and Planetary Systems Sciences, 2.Japan Agency for Marine-Earth Science and Technology, 3.IFREMER, Université de Bretagne Loire, Brest, France, 4.Université Paul Sabatier, GET, OMP, Toulouse, 5.Department of Earth Sciences, Faculty of Science, Kanazawa University)

[SCG56-12] **The PGE and Os isotope variations of the mantle derived rocks from the ICDP Cores of the Oman Drilling Project at the Samail Ophiolite, Oman**

*Ryoko Senda[1,2], Katsuhiko Suzuki[2], Tomoaki Morishita[3], Eiichi TAKAZAWA[4], The Oman Drilling Project Science Party (1.Faculty of Social and Cultural Studies, Kyushu University, 2.Submarine Resources Research Center, Japan Agency for Marine-Earth Science and Technology, 3.School of Geoscience and Civil Engineering, College of Science and Technology, Kanazawa University, 4.Department of Geology, Faculty of Science, Niigata University)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG56] ICDP Oman Drilling Project: Oman to Oceanic Lithosphere to Island Arc Formation and Beyond

convener:Eiichi TAKAZAWA(Department of Geology, Faculty of Science, Niigata University), Katsuyoshi Michibayashi(Department of Earth and Planetary Sciences, Nagoya University), Sayantani Chatterjee(Niigata University, Department of Geology, Faculty of Science)

[SCG56-13] Knockout seawater –basalt experiments and its implications to hydrothermal alteration in midocean ridges

★Invited Papers

*Atsushi Okamoto[1], Yusuke Netsu[1], Masaoki Uno[1], Noriyoshi Tsuchiya[1] (1.Graduate School of Environmental Studies)

[SCG56-14] Petrology of Oman listvenite (carbonated ultramafic rocks) and related serpentinite from the Hole BT1B of the Oman Drilling Project

*Toma Takahashi[1], Tomoaki Morishita[1], Akihiro Tamura[1], Yumiko Harigane[3], Tatsuhiko Kawamoto[2] (1.Kanazawa university, 2.Shizuoka university, 3.Geological survey of Japan ,National Institute of Advanced Industrial Science and Technology (AIST))

[SCG56-15] Major mineral mode of listvenite from ICDP Oman Drilling Project Hole BT1B inferred from X-ray CT core images

★Invited Papers

*Keishi Okazaki[1], Katsuyoshi Michibayashi[2], Kohei Hatakeyama[3], Natsue Abe[4], Kevin T.M. Johnson[5], Peter B Kelemen[6], Oman Drilling Project Phase I Science Party (1.Kochi Institute for Core Sample Research, Japan Agency for Marine-Earth Science and Technology, 2.Department of Earth and Planetary Sciences, Nagoya University, 3.Department of Earth and Planetary Systems Sciences, Hiroshima University, 4.Mantle Drilling Promotion Office (MDP), Japan Agency for Marine-Earth Science and Technology, 5.Department of Earth Sciences, University of Hawai‘i at Mānoa, 6.Lamont Doherty Earth Observatory, Columbia University)

[SCG56-16] Crustal structure, ophiolites and flexure beneath the Oman-UAE mountains

*Mohammed Ali[1], Anthony Watts[2], Michael Searle[2], Brook Keats[2], Simone Pilia[3], Tyler Ambrose[2] (1.Khalifa University of Science and Technology, 2.University of Oxford, 3.University of Cambridge)

[SCG56-17] *Clues to Cretaceous subduction initiation in South-East Asia - A geochronological and geochemical perspective from the Andaman Ophiolite*

*Debaditya Bandyopadhyay[1,2], Douwe J.J. van Hinsbergen[3], Alexis Plunder[3,4], Biswajit Ghosh[1], Fernando Corfu[5], Carl Guilmette[6], Eldert L. Advokaat[3,7], Pinaki C. Bandopadhyay[1] (1.Department of Geology, University of Calcutta, 35 Ballygunge Circular Road, Kolkata-700019, India, 2.Department of Geology, University of North Bengal, Darjeeling-734013, India, 3.Department of Earth Sciences, Utrecht University, Princetonlaan 8A, 3584 CB Utrecht, The Netherlands, 4.BRGM, 3 avenue Claude Guillemin, BP 36009, 45060 Orléans Cedex 2, France, 5.Department of Geosciences and CEED, University of Oslo, Oslo, Norway, 6.E4m, Département de Géologie et de Génie Géologique, Université Laval, Québec, Québec, Canada, 7.Department of Physical Geography, Utrecht University, Princetonlaan 8A, 3584 CD Utrecht, The Netherlands)

[SCG56-18] Comparison of olivine crystal-fabrics between Oman ophiolite peridotites and Supra-subduction zone peridoitites

*Katsuyoshi Michibayashi[1] (1.Department of Earth and Planetary Sciences, Graduate School of Environmental Studies, Nagoya University)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG57] New perspectives of subduction zone earthquake dynamics through experiments across-scales

convener:Masataka Kinoshita(Earthquake Research Institute, University of Tokyo), Yoshio Kono(Geodynamics Research Center, Ehime University), Eiichiro Araki(Japan Agency for Marine-Earth Science and Technology), Hiroko Kitajima(Texas A&M University College Station)

[SCG57-01] Combined X-ray microtomography and elastic wave velocity measurements of porous material at in situ high pressures

*Yoshio Kono[1], Brendan Anzures[2], Heather Watson[3], Tony Yu[4], Yanbin Wang[4] (1.Geodynamics Research Center, Ehime University, 2.Brown University, 3.Union College, 4.University of Chicago)

[SCG57-02] A consideration on friction experiments with synchrotron radiation towards unveiling earthquake generation processes

*Takehiro Hirose[1], Yoshio Kono[2] (1.Kochi Institute for Core Sample Research, Japan Agency for Marine-Earth Science and Technology, 2.Geodynamics Research Center, Ehime, University)

[SCG57-03] Riserless contingency operations during IODP NanTroSEIZE Expedition 358

*Asuka Yamaguchi[1], Matt Ikari[2], Gaku Kimura[3], Lena Maeda[4], Toczko Sean[4], Scientists IODP Expedition 358 (1.Atomosphere and Ocean Research Institute, The University of Tokyo, 2.Marum, University of Bremen, 3.Tokyo University of Marine Science and Technology, 4.JAMSTEC)

[SCG57-04] Overpressured underthrust sediment in the Nankai Trough forearc revealed by high-frequency receiver function inversion

*Takeshi Akuhara[1], Takeshi Tsuji[2], Takashi Tonegawa[3] (1.Earthquake Research Institute, The University of Tokyo, 2.Kyushu University, 3.Research and Development center for Earthquake and Tsunami, JAMSTEC)

[SCG57-05] **Regional imaging of the Nankai subduction zone from decades' worth of active and passive seismic data.**

★Invited Papers

*Adrien F Arnulf[1], Dan Bassett[2], Alistair Harding[3], Shuichi Kodaira[4], Ayako Nakanishi[4] (1.Institute for Geophysics, University of Texas at Austin, 2.GNS Science, 3.IGPP, Scripps Institution of Oceanography, University of California San Diego, 4.Japan Agency for Marine-Earth Science and Technology)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG57] New perspectives of subduction zone earthquake dynamics through experiments across-scales

convener:Masataka Kinoshita(Earthquake Research Institute, University of Tokyo), Yoshio Kono(Geodynamics Research Center, Ehime University), Eiichiro Araki(Japan Agency for Marine-Earth Science and Technology), Hiroko Kitajima(Texas A&M University College Station)

[SCG57-06] Thermal conductivity under high-pressure conditions of core samples from IODP NanTroSEIZE input site C0012

*Weiren Lin[1], Osamu Tadai[2], Takehiro Hirose[3], Wataru Tanikawa[3], Xiaoqiu Yang[4] (1.Graduate School of Engineering, Kyoto University, 2.Marin Works Japan LTD, 3.Kochi Institute for Core Sample research, Japan Agency for Marine-Earth Science and Technology, 4.South China Sea Institute of Oceanology, Chinese Academy of Sciences)

[SCG57-07] Pilot seafloor borehole tilt observation in the Nankai Trough seismogenic zone: development for future array network observation for slow slip events.

*Eiichiro Araki[1], Takashi Yokobiki[1], Toshinori Kimura[1], Shuhei Nishida[1], Shuichi Kodaira[1] (1.Japan Agency for Marine-Earth Science and Technology)

[SCG57-08] Comparison of active seismic signals collected from DAS along seafloor cable and conventional OBS

*Toshinori Kimura[1], Eiichiro Araki[1], Hiroyuki Matsumoto[1], Takashi Yokobiki[1], Gou Fujie[1], Shuichi Kodaira[1], Takashi Tonegawa[1], Kazuya Shiraishi[1], Koichiro Obana[1], Ryuta Arai[1], Yuka Kaiho[1], Yasuyuki Nakamura[1], Martin Horst Karrenbach[2], Robert Ellwood[2], Victor Yartsev[2] (1.Japan Agency for Marine-Earth Science and Technology, 2.Optasense)

[SCG57-09] Seafloor geodetic observation network using seafloor pressure gauges for monitoring of real-time plate coupling strength in the Nankai trough seismogenic zone

*Yuya Machida[1], Shuhei Nishida[1], Toshinori Kimura[1], Hiroyuki Matsumoto[1], Eiichiro Araki[1] (1.Japan Agency for Marine-Earth Science and Technology)

[SCG57-10] Hydroacoustic signals detected by distributed acoustic sensing (DAS) using submarine cable

*Hiroyuki Matsumoto[1], Eiichiro Araki[1], Toshinori Kimura[1], Takashi Yokobiki[1], Gou Fujie[1], Shuichi Kodaira[1], Takashi Tonegawa[1], Kazuya Shiraishi[1], Koichiro Obana[1], Ryuta Arai[1], Yuka Kaiho[1], Yasuyuki Nakamura[1], Narumi Takahashi[1,2], Martin Karrenbach[3], Robert Ellwood[3], Victor Yartsev[3] (1.Japan Agency for Marine-Earth Science and Technology, 2.National Research Institute for Earth Science and Disaster Resilience, 3.OptaSense Ltd.)

[SCG57-11] Crustal deformation observations and monitoring using a seafloor optical fiber strainmeter on the DONET seafloor cabled network

*Matthew James Cook[1], Eiichiro Araki[1], Mark Zumberge[2], Takashi Yokobiki[1], Toshinori Kimura[1], Shuhei Nishida[1], Shuichi Kodaira[1] (1.JAMSTEC Japan Agency for Marine-Earth Science and Technology, 2.University of California San Diego)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG58] Science of slow earthquakes: Toward unified understandings of whole earthquake process

convener:Satoshi Ide(Department of Earth an Planetary Science, University of Tokyo), Hitoshi Hirose(Research Center for Urban Safety and Security, Kobe University), Kohtaro Ujiie(Graduate School of Life and Environmental Sciences, University of Tsukuba), Takahiro Hatano(Department of Earth and Space Science, Osaka University)

[SCG58-01] Characteristic activities of deep low frequency tremor in Cascadia and southwest Japan based on energy information

*Kazushige Obara[1], Kenneth C. Creager[2] (1.Earthquake Research Institute, The University of Tokyo, 2.University of Washington)

[SCG58-02] Seismic energy estimation for shallow tremors in the Nankai trough and Japan trench

*Suguru Yabe[1], Masaru Nakano[2], Takashi Tonegawa[2], Satoru Baba[3], Shunsuke Takemura[3] (1.National Institute of Advanced Industrial Science and Technology, 2.Japan Agency for Marine-Earth Science and Technology, 3.Earthquake Research Institute, UTokyo)

[SCG58-03] Triggering of deep low-frequency earthquakes along the Parkfield-Cholame section of the San Andreas Fault by local and regional earthquakes

★Invited Papers

*Zhigang Peng[1], David R Shelly[2], Taka'aki Taira[3] (1.Georgia Institute of Technology Main Campus, 2.United States Geological Survey, 3.University of California Berkeley)

[SCG58-04] Characteristics of tectonic tremors in the northern Mexican subduction zone remotely triggered by the 2017 Mw8.2 Tehuantepec earthquake

*Masatoshi Miyazawa[1], Miguel A Santoyo[2] (1.Disaster Prevention Research Institute, Kyoto University, 2.Instituto de Geofísica, Universidad Nacional Autónoma de México)

[SCG58-05] **Tectonic tremors in southern Chile, observed in three space-time windows**

*Satoshi Ide[1], Miguel Sáez[2], Sergio Ruiz[2], Hiroko Sugioka[3], Matthew Miller[4] (1.Department of Earth an Planetary Science, University of Tokyo, 2.Department of Geophysics, University of Chile, Chile, 3.Department of Planetology, Kobe University, 4.Department of Geophysics, University of Concepción, Chile)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG58] Science of slow earthquakes: Toward unified understandings of whole earthquake process

convener:Satoshi Ide(Department of Earth an Planetary Science, University of Tokyo), Hitoshi Hirose(Research Center for Urban Safety and Security, Kobe University), Kohtaro Ujiie(Graduate School of Life and Environmental Sciences, University of Tsukuba), Takahiro Hatano(Department of Earth and Space Science, Osaka University)

[SCG58-06] Calibration of portable relative gravimeters toward the detection of gravity signals accompanied by slow slip events

*Yoshiyuki Tanaka[1], Chikara Shibata[1], Yoshiaki Tamura[2], Akio Kobayashi[3] (1.Earth and Planetary Science, UTokyo, 2.Mizusawa VLBI Observatory, NAOJ, 3.Meteorologocal Research Institute, JMA)

[SCG58-07] Long-lasting afterslip associated with the 2016 moderate earthquakes along the Chaman fault, Pakistan

Fumiko Matsumoto[1], *Masato Furuya[1] (1.Department of Earth and Planetary Sciences Hokkaido University)

[SCG58-08] Detection of short-term slow slip events and estimation of their duration by using three components of GNSS data in the Nankai subduction zone, southwest Japan

*Yutaro Okada[1], Takuya NISHIMURA[2], Takao Tabei[3], Takeshi Matsushima[4], Hitoshi Hirose[5] (1.Graduate School of Science, Kyoto University, 2.Disaster Prevention Research Institute, Kyoto University, 3.Department of Global Environment and Disaster Prevention, Faculty of Science and Technology, Kochi University , 4.Institute of Seismology and Volcanology, Faculty of Science, Kyushu University, 5.Research Center for Urban Safety and Security, Kobe University)

[SCG58-09] Slow slip events in the Kanto region, central Japan detected from 25-years-long GNSS data

*Takuya NISHIMURA[1] (1.Disaster Prevention Research Institute, Kyoto University)

[SCG58-10] Afterslip in the ETS zone at Nankai trough, SW Japan, and implications for rheology

★Invited Papers

*Kaj M Johnson[1] (1.Indiana University Bloomington)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG58] Science of slow earthquakes: Toward unified understandings of whole earthquake process

convener:Satoshi Ide(Department of Earth an Planetary Science, University of Tokyo), Hitoshi Hirose(Research Center for Urban Safety and Security, Kobe University), Kohtaro Ujiie(Graduate School of Life and Environmental Sciences, University of Tsukuba), Takahiro Hatano(Department of Earth and Space Science, Osaka University)

[SCG58-11] Slow slip events and temporal changes of coupling condition on the shallow side of the Nankai Trough

★Invited Papers

*Yusuke Yokota[1], Tadashi Ishikawa[2], Shun-ichi Watanabe[2], Yuto Nakamura[2] (1.Institute of Industrial Science, The University of Tokyo, 2.Hydrographic and Oceanographic Department, Japan Coast Guard)

[SCG58-12] Slow slips with durations between VLF and short-term SSE

*Akio Katsumata[1], Kazuki Miyaoka[2], Takahiro Tsuyuki[1], Satoshi Itaba[4], Masayuki Tanaka[1], Takeo Ito[5], Akiteru Takamori[3], Akito Araya[3] (1.Meteorological Research Institute, Japan Meteorological Agency, 2.Seismology and Volcanology Department, Japan Meteorological Agency, 3.Earthquake Research Institute, The University of Tokyo, 4.The National Institute of Advanced Industrial Science and Technology, 5.Nagoya University)

[SCG58-13] Seismic heterogeneity changes before and during slow earthquakes

*Takashi Tonegawa[1], Shunsuke Takemura[2], Suguru Yabe[3], Kiyoshi Yomogida[4] (1.Research and Development center for Earthquake and Tsunami, Japan Agency for Marine-Earth Science and Technology, 2.Earthquake Research Institute, The University of Tokyo, 3.National Institute of Advanced Industrial Science and Technology, 4.Hokkaido University)

[SCG58-14] Multi-band Receiver Function Analysis Including Local Deep-focus Events in Northeastern Kii

*Yasunori Sawaki[1], Yoshihiro Ito[2], Kazuaki Ohta[3], Takuo Shibutani[2], Tomotaka Iwata[2] (1.Graduate School of Science, Kyoto University , 2.Disaster Prevention Research Institute, Kyoto University, 3.National Research Institute for Earth Science and Disaster Resilience)

[SCG58-15] The relationship between slow earthquake activity and frictional property on the plate boundaries around Japan islands

*Satoru Baba[1], Shunsuke Takemura[1], Kazushige Obara[1], Akemi Noda[2] (1.Earthquake Research Institute, The University of Tokyo, 2.National Research Institute for Earth Science and Disaster Resilience)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG58] Science of slow earthquakes: Toward unified understandings of whole earthquake process

convener:Satoshi Ide(Department of Earth an Planetary Science, University of Tokyo), Hitoshi Hirose(Research Center for Urban Safety and Security, Kobe University), Kohtaro Ujiie(Graduate School of Life and Environmental Sciences, University of Tsukuba), Takahiro Hatano(Department of Earth and Space Science, Osaka University)

[SCG58-17] Seismic evidence for fault-bound anisotropy and its implications on fault structure in the northern Hikurangi subduction zone

*Ryuta Arai[1], Shuichi Kodaira[1], Stuart Henrys[2], Nathan Bangs[3], Koichiro Obana[1], Gou Fujie[1], Seiichi Miura[1], Dan Barker[2], Dan Bassett[2], Rebecca Bell[4], Kimihiro Mochizuki[5], Richard Kellett[2], Valerie Stucker[2], Fry Bill[2], NZ3D Team (1.Japan Agency Marine-Earth Science and Technology, 2.GNS Science, 3.University of Texas, Institute for Geophysics, 4.Imperial College London, 5.Earthquake Research Institute, University of Tokyo)

[SCG58-18] Marine observations of slow earthquakes using ocean bottom seismometers in the northern part of the Hikurangi subduction zone, NZ

*Kimihiro Mochizuki[1], Yusuke Yamashita[2], Martha K Savage[3], Emily Warren-Smith[4], Katie Jacobs[3], Laura M Wallace[4] (1.Earthquake Prediction Research Center, Earthquake Research Institute, University of Tokyo, 2.Disaster Prevention Institute, Kyoto University, 3.Veictoria University of Wellington, 4.GNS Science)

[SCG58-19] **Seismic evidence for megathrust fault-valve behavior during episodic tremor and slip**

★Invited Papers

Jeremy M Gosselin[1], *Pascal Audet[1], Clement Esteve[1], Morgan McLellan[1], Stephen G Mosher[1], Andrew J Schaeffer[2] (1.University of Ottawa, 2.Geological Survey of Canada)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG58] Science of slow earthquakes: Toward unified understandings of whole earthquake process

convener:Satoshi Ide(Department of Earth an Planetary Science, University of Tokyo), Hitoshi Hirose(Research Center for Urban Safety and Security, Kobe University), Kohtaro Ujiie(Graduate School of Life and Environmental Sciences, University of Tsukuba), Takahiro Hatano(Department of Earth and Space Science, Osaka University)

[SCG58-20] Deformation of antigorite serpentinite in the base of the shallow wedge mantle and relationship to slow earthquakes

*Kazuyuki Yoshida[1], Takayoshi Nagaya[1], Simon Richard Wallis[1] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo)

[SCG58-21] Serpentinized shear zones with low frictional strength by grain-boundary sliding of antigorite at the depth of deep SSEs

*Takayoshi Nagaya[1], Simon Richard Wallis[1] (1.Graduate School of Science, The University of Tokyo)

[SCG58-23] Role of metasomatic reactions on plate-boundary shear localization near mantle wedge corner

*Naoki Nishiyama[1], Kohtaro Ujiie[1], Kazuya Noro[1], Yasushi Mori[2], Haruna MASUYAMA[1] (1.University of Tsukuba, 2.Kitakyusyu Museum of Natural History & Human History)

[SCG58-24] Stress heterogeneity on shallow decollement controls property of sediments and Very Low Frequency Earthquakes in Nankai Trough

*Yoshitaka Hashimoto[1], Haruki Kuchimoto[1], Shigeyuki Sato[1], Gaku Kimura[2], Masataka Kinoshita[3], Ayumu Miyakawa[4], Gregory F Moore[5], Masaru Nakano[6], Kazuya Shiraishi[6], Yasuhiro Yamada[6] (1.Kochi University, 2.TUMSAT, 3.ERI, University of Tokyo, 4.AIST, 5.Hawaii University, 6.JAMSTEC)

[SCG58-25] Rheology of the fluid oversaturated simulated quartz shear zone at the brittle-ductile transition

*Keishi Okazaki[1], Eric Burdette[2], Greg Hirth[2] (1.Kochi Insutitute for Core Sample Research, Japan Agency for Marine-Earth Science and Technology, 2.Department of Earth, Environmental and Planetary Sciences, Brown University)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG58] Science of slow earthquakes: Toward unified understandings of whole earthquake process

convener:Satoshi Ide(Department of Earth an Planetary Science, University of Tokyo), Hitoshi Hirose(Research Center for Urban Safety and Security, Kobe University), Kohtaro Ujiie(Graduate School of Life and Environmental Sciences, University of Tsukuba), Takahiro Hatano(Department of Earth and Space Science, Osaka University)

[SCG58-26] Slow slip prior to runaway slip in laboratory

*Miki Takahashi[1] (1.Institute of Earthquake and Volcano Geology, Geological Survey of Japan, AIST)

[SCG58-28] Slow slip and transition to fast rupture in friction of gels

*Tetsuo Yamaguchi[1] (1.Graduate school of Engineering, Kyushu University)

[SCG58-29] Experiments simulating the subduction of seamounts beneath a viscoelastic crust

*Atsuko Namiki[1] (1. School of Integrated Arts and Sciences, Hiroshima University)

[SCG58-30] Episodic fluid pressure cycling controls the interplay between Slow Slip Events and Large Megathrust Earthquakes

★Invited Papers

*Luca Dal Zilio[1], Claudio Petrini[2], Taras Gerya[2] (1.Seismological Laboratory, California Institute of Technology, Pasadena, CA, 2.Department of Earth Sciences, ETH Zürich, Zürich, Switzerland)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG58] Science of slow earthquakes: Toward unified understandings of whole earthquake process

convener:Satoshi Ide(Department of Earth an Planetary Science, University of Tokyo), Hitoshi Hirose(Research Center for Urban Safety and Security, Kobe University), Kohtaro Ujiie(Graduate School of Life and Environmental Sciences, University of Tsukuba), Takahiro Hatano(Department of Earth and Space Science, Osaka University)

[SCG58-31] Slip-front-propagation velocity with non-vanishing friction stress at infinitely large slip velocity

*Takehito Suzuki[1], Hiroshi Matsukawa [1] (1.Department of Physics and Mathematics, Aoyama Gakuin University)

[SCG58-32] Modeling tremor with cellular automaton

*Kota Fukuda[1], Takahiro Hatano[2], Kimihiro Mochizuki[1] (1.Earthquake Research Institute The University of Tokyo, 2.Department of Earth and Space Science The Osaka University)

[SCG58-33] **Continuum model for interacting many faults: emergence of main fault and Gutenberg-Richter's law**

*Akio ISHII[1], Takahiro Hatano[1], Tomoaki Niiyama[2] (1.Osaka University, 2.Kanazawa Univesity)

[SCG58-34] New atomistic mechanism for velocity-weakening friction

*Takahiro Hatano[1], Akio Ishii[2], Tomoaki Niiyama[3], Tomotsugu Shimokawa[3], Shigenobu Ogata[2] (1.Department of Earth and Space Science, Osaka University, 2.Department of Mechanical Science and Bioengineering, Osaka University, 3.Department of Mechanical Engineering, Kanazawa University)

[SCG58-35] Reduction of mathematical model for slip behavior of one dimensional elastic layer with rate and state friction

*Yutaka Sumino[1], Takuya Saito[2], Tetsuo Yamaguchi[3], Takahiro Hatano[4], Satoshi Ide[5] (1.Tokyo University of Science, 2.Aoyama Gakuin University, 3.Graduate School of Engneering, Kyushu University, 4.Department of Earth and Space Science, Osaka University, 5.Department of Earth and Planetary Science, Tokyo University of Science)

[SCG58-36] Effects of periodic stress perturbations on earthquake nucleation

*Takuya Saito[1], Takahiro Hatano[2] (1.Aoyama Gakuin University, 2.Osaka University)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG59] Evolution and movement of the crustal surface and application of geo- and thermochronology

convener:Noriko Hasebe(Institute of Nature and Environmental Technology, Kanazawa University), Shigeru Sueoka(Japan Atomic Energy Agency), Frederic Herman(University of Lausanne), Takahiro Tagami(Graduate School of Science, Kyoto University)

[SCG59-01] Overview of geo- and thermo-chronology applicable to unravel the earth's surface evolution

*Takahiro Tagami[1], Shigeru Sueoka[2], Noriko Hasebe[3], Frederic Herman[4] (1.Graduate School of Science, Kyoto University, 2.Japan Atomic Energy Agency, 3.Institute of Nature and Environmental Technology, Kanazawa University, 4.University of Lausanne)

[SCG59-02] **Direct dating of faults by luminescence and ESR: Case studies from Japan and Switzerland**

★Invited Papers

*Sumiko Tsukamoto[1], Benny Guralnik[2], Kiyokazu Oohashi[3], Makoto Otsubo[4], David Colin Tanner[1], Christian Brandes[5], Christoph von Hagke[6] (1.Leibniz Institute for Applied Geophysics , 2.Technical University of Denmark, 3.Yamaguchi University, 4.Geological Survey of Japan, AIST, 5.Leiniz University of Hannover, 6.RWTH Aachen University)

[SCG59-03] Thermal characteristics of slab fluid in Hongu area, southwest Japan: Insights form thermochronology and fluid inclusion analyses

*Shigeru Sueoka[1], Mizuho Kanno[1], Makoto Kawamura[1], Masakazu Niwa[1], Hideki Iwano[2], Tohru Danhara[2] (1.Japan Atomic Energy Agency, 2.Kyoto Fission-Track Co., Ltd.)

[SCG59-04] Tectono–thermal history of the Lesser Himalaya in eastern Nepal: Insights from multi-thermochronological study and thermo-kinematic modeling

*Nakajima Toru[1], Hideki Iwano[2], Tohru Danhara[2], Harutaka Sakai[1] (1.Division of Earth and Planetary Sciences, Graduate School of Science, Kyoto University, 2.Kyoto Fission-Track Co. Ltd)

[SCG59-05] Resolving rates of landscape evolution with $^{4}He/^{3}He$ thermochronometry: examples from Grand Canyon and Yosemite Valley

★Invited Papers

*Matthew Fox[1] (1.Dept. of Earth Sciences, University College London, London UK)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG60] Toward Discoveries in Solid Earth Sciences by Machine Learning

convener:Takahiko Uchide(Research Institute of Earthquake and Volcano Geology, Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST)), Yuki Kodera(Meteorological Research Institute, Japan Meteorological Agency), Hisahiko Kubo(National Research Institute for Earth Science and Disaster Resilience)

[SCG60-01] Automatic Digitization of Seismograms in Smoked Paper using Convolutional Neural Network

*Mitsuko Furumura[1], Yoko Ogawa[2], Kazuo Sakamoto[2], Ritsuko S. Matsu'ura[1] (1.Research Division, Earthquake Research Center, Association for the Development of Earthquake Prediction, 2.KOZO KEIKAKU ENGINEERING Inc.)

[SCG60-03] Improving the Retrieval of Offshore-Onshore Correlation Functions with Machine Learning

*Loic Viens[1], Tomotaka Iwata[1] (1.DPRI, Kyoto University)

[SCG60-04] Neural Network-Based Ground Motion Model Learning Site Property from Data

*Tomohisa Okazaki[1], Tomoharu Iwata[1,2], Asako Iwaki[3], Hiroyuki Fujiwara[3], Naonori Ueda[1] (1.Center for Advanced Intelligence Project, RIKEN, 2.NTT Communication Science Laboratories, 3.National Research Institute for Earth Science and Disaster Resilience)

[SCG60-05] Towards robust, reliable earthquake detection with deep neural networks

*Karianne J. Bergen[1] (1.School of Engineering and Applied Sciences, Harvard University)

[SCG60-06] Focal mechanism determination of inland microearthquakes in Japan based on P-wave first-motion polarities picked by neural network model

*Takahiko Uchide[1] (1.Geological Survey of Japan, AIST)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG61] The Japan Trench: Learning from the 2011 M=9 Tohoku-Oki earthquake, a decade later

convener:Takeshi Iinuma(National Research and Development Agency Japan Agency for Marine-Earth Science and Technology), Asuka Yamaguchi(Atomosphere and Ocean Research Institute, The University of Tokyo), Aitaro Kato(Earthquake Research Institute, the University of Tokyo), Tianhaozhe Sun(Pacific Geoscience Centre, Geological Survey of Canada)

[SCG61-01] A review of decade-long marine geophysical studies in the Japan Trench since the 2011 Tohoku-oki earthquake

*Shuichi Kodaira[1], Toshiya Fujiwara[1], Yasuyuki Nakamura[1], Gou Fujie[1], Koichiro Obana[1], Ryota Hino[2] (1.Research Institute for Marine Geodynamics, Japan Agency for Marine-Earth Science and Technology, 2.Graduate school of Science, Tohoku University)

[SCG61-02] **Geologic constraints on the geometry composition and structural evolution of the shallow subduction interface and frontal prism in the Japan Trench**

★Invited Papers

*Christine Regalla[1], Emily Schottenfels[1], Paul Bierman[2] (1.Northern Arizona University, Flagstaff Arizona, USA, 2.University of Vermont, Burlington Vermont, USA)

[SCG61-03] Frictional properties of incoming sediments and rocks at shallow conditions of the Japan Trench subduction zone

*Kyuichi Kanagawa[1], Sayumi Sagano[2], Tomoya Nakanishi[2], Junya Fujimori[2], Michiyo Sawai[1] (1.School of Science, Chiba University, 2.Graduate School of Science and Engineering, Chiba University)

[SCG61-04] Seismic imaging of the Tohoku megathrust zone using S-net and Hi-net data

*Dapeng Zhao[1], Yuanyuan Hua[1], Genti Toyokuni[1] (1.Department of Geophysics, Tohoku University)

[SCG61-05] Modeling the hydromechanical effects of seamount subduction on megathrust stress and slip in southern Japan Trench

*Tianhaozhe Sun[1], Demian M Saffer[2], Susan Ellis[3] (1.Pacific Geoscience Centre, Geological Survey of Canada, 2.Univ. of Texas Institute for Geophysics, USA, 3.GNS Science, New Zealand)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG61] The Japan Trench: Learning from the 2011 M=9 Tohoku-Oki earthquake, a decade later

convener:Takeshi Iinuma(National Research and Development Agency Japan Agency for Marine-Earth Science and Technology), Asuka Yamaguchi(Atomosphere and Ocean Research Institute, The University of Tokyo), Aitaro Kato(Earthquake Research Institute, the University of Tokyo), Tianhaozhe Sun(Pacific Geoscience Centre, Geological Survey of Canada)

[SCG61-06] Seismicity in the trench-outer rise region along the Japan Trench based on repeated OBS observations: Implications for large outer-rise earthquakes

*Koichiro Obana[1], Gou Fujie[1], Yasuyuki Nakamura[1], Tsutomu Takahashi[1], Yojiro Yamamoto[1], Takashi Tonegawa[1], Yuka Kaiho[1], Seiichi Miura[1], Shuichi Kodaira[1] (1.Research Institute for Marine Geodynamics, Japan Agency for Marine-Earth Science and Technology)

[SCG61-07] **Head and tail of massive earthquakes: Mechanism arresting growth of interplate earthquakes**

*Ryota Hino[1], Naoki Uchida[1], Masanao Shinohara[2], Yoshihiro Ito[3], Takeshi Iinuma[4], Yasuyuki Nakamura[4], Toshiya Kanamatsu[4], Ken Ikehara[5], Ryoko Nakata[1,4] (1.Graduate School of Science, Tohoku University, 2.Earthquake Research Institute, University of Tokyo, 3.Disaster Prevention Research Institute, Kyoto Univesity, 4.Japan Agency for Marine-Earth Science and Technology, 5.National Institute of Advanced Industrial Science and Technology)

[SCG61-08] Development of GNSS-A in this decade and observation results along the Japan Trench

★Invited Papers

*Yusuke Yokota[1], Tadashi Ishikawa[2], Shun-ichi Watanabe[2], Yuto Nakamura[2] (1.Institute of Industrial Science, The University of Tokyo, 2.Hydrographic and Oceanographic Department, Japan Coast Guard)

[SCG61-09] On the cause of enhanced landward motion of the overriding plate after the Tohoku-Oki earthquake

Mario D'Acquisto[1], Matthew Herman[1], *Rob Govers[1] (1.Utrecht University, Netherlands)

[SCG61-10] Elucidation of locking state at the shallower plate boundary after the Tohoku Earthquake based on seafloor acoustic ranging

*Ryusuke Yamamoto[1,2], Ryota Hino[1], Motoyuki Kido[3], Chie Honsho[1], Shuichi Kodaira[4], Yasuyuki Nakamura[4] (1.Graduate School of Science, Tohoku University, 2.Tokio Marine & Nichido Risk Consulting Co., Ltd., 3.International Research Institute of Disaster Science, Tohoku University, 4.Japan Agency for Marine-Earth Science and Technology)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG62] Investigation of inputs to subduction zones: Influence of tectonic processes on the incoming plate

convener:Makoto Yamano(Earthquake Research Institute, the University of Tokyo), Tomoaki Morishita(School of Geoscience and Civil Engineering, College of Science and Technology, Kanazawa University), Gou Fujie(Japan Agency for Marine-Earth Science and Technology)

[SCG62-01] CHIKYU IODP Full proposal for Bend-Fault Hydrology in the Old Incoming Plate (H-ODIN): Scientific objectives and drilling strategy

*Tomoaki Morishita[1,2,3], Gou Fujie[2], Shigeaki Ono[2], Makoto Yamano[4], Kohtaro Ujiie[5], Asuka Yamaguchi[4], Akira Ijiri[2], Tomohiro Toki[6], Takanori Kagoshima[4], Masahiro Ishikawa[2], Ikuo Katayama[7], Junichiro Kuroda[4], Yohey Suzuki[4] (1.Kanazawa University, 2.JAMSTEC, 3.Columbia University, 4.The University of Tokyo, 5.University of Tsukuba, 6.University of the Ryukyu, 7.Hiroshima University)

[SCG62-02] **Role of hydrated oceanic lithosphere on global water cycle in the Earth**

★Invited Papers

*Ikuo Katayama[1], Kohei Hatakeyama[1] (1.Department of Earth and Planetary Systems Science, Hiroshima University)

[SCG62-03] Heat flow observation around a young petit spot volcano on the old Pacific Plate subducting into the Japan Trench

*Yoshifumi Kawada[1], Makoto Yamano[2], Kouta Sasaki[2] (1.International Research Institute of Disaster Science, Tohoku University, 2.Earthquake Research Institute, The University of Tokyo)

[SCG62-04] $^{3}He/^{4}He$ ratios in pore fluids and bottom seawater around the Japan Trench

★Invited Papers

*Takanori Kagoshima[1], Naoto Takahata[1], Makoto Yamano[2], Asuka Yamaguchi[1], Jin-Oh Park[1], Yuji Sano[1] (1.Atmosphere and Ocean Research Institute, the University of Tokyo, 2.Earthquake Research Institute, the University of Tokyo)

[SCG62-05] **Shallow crustal structure in the outer rise of the Japan Trench by high-resolution seismic reflection survey**

*YUE SUN[1], Ehsan Jamali Hondori[1], GUO CHEN[1], Tomoko Hanyu[2], Jin-Oh Park[1] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Kobe Ocean-Bottom Exploration Center, Kobe University)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG62] Investigation of inputs to subduction zones: Influence of tectonic processes on the incoming plate

convener:Makoto Yamano(Earthquake Research Institute, the University of Tokyo), Tomoaki Morishita(School of Geoscience and Civil Engineering, College of Science and Technology, Kanazawa University), Gou Fujie(Japan Agency for Marine-Earth Science and Technology)

[SCG62-06] Event layers within graben-fill deposits in the outer ruse of the Japan Trench

*Asuka Yamaguchi[1], Hiroaki Kurano[1], Rina Fukuchi[2], Kazuno Arai[3], Ken Ikehara[4], Toshiya Kanamatsu[5], Takanori Kagoshima[1], Tomoko Hanyu[6], Juichiro Ashi[1], Jin-Oh Park[1] (1.Atomosphere and Ocean Research Institute, The University of Tokyo, 2.DIA CONSULTANTS CO., Ltd., 3.Center for Advanced Marine Core Research, Kochi University, 4.National Institute of Advanced Industrial Science and Technology, 5.Japan Agency for Marine-Earth Science and Technology , 6.KOBEC, Kobe University)

[SCG62-07] Spatial variations in incoming oceanic plate and its implications for subduction zone processes along the Japan Trench

*Gou Fujie[1], Koichiro Obana[1], Yojiro Yamamoto[1], Tomoaki Yamada[2], Takehi Isse[2], Shuichi Kodaira[1], Seiichi Miura[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.Earthquake Research Institute, Univ. of Tokyo)

[SCG62-08] Active-source seismic study with a dense linear OBS array off Nemuro, the southern Kuril subduction zone

*Ryosuke Azuma[1], Shuichi Kodaira[2], Ryota Hino[1], Gou Fujie[2], Koichiro Obana[2], Fumiaki Tomita[2], Yusaku Ohta[1] (1.Recearch Center for Prediction of Earthquake and Volcanic Eruption, Graduate School of Science, Tohoku University, 2.Japan Agency for Marine-Earth and Technology)

[SCG62-09] Fluid circulation and heat transport in fractured oceanic crust in the Japan and Kuril trench outer rise regions

*Kouta Sasaki[1], Makoto Yamano[1], Yoshifumi Kawada[2] (1.Earthquake Research Institute, the University of Tokyo, 2.International Research Institute of Disaster Science, Tohoku University)

[SCG62-11] Discussion on inputs to subduction zones

*Makoto Yamano[1] (1.Earthquake Research Institute, the University of Tokyo)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG63] Dynamics in mobile belts

convener:Yukitoshi Fukahata(Disaster Prevention Research Institute, Kyoto University), Ray Y Chuang(Department of Geography, National Taiwan University), Toru Takeshita(Department of Natural History Sciences, Graduate School of Science, Hokkaido University), Hikaru Iwamori(Earthquake Research Institute, The University of Tokyo)

[SCG63-01] Onshore temporal aftershock observation for the 2019 Yamagata-Oki earthquake (2)

*Tomomi Okada[1], Ayaka Tagami[1], Tatsuya Mizuta[1], Shin'ichi Sakai[2], Keisuke Yoshida[1], Naoki Uchida[1], Takashi NAKAYAMA[1], Satoshi Hirahara[1], Toru Matsuzawa[1] (1.Research Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University, 2.ERI, University of Tokyo)

[SCG63-02] Stationarity of aftershock activities of the 2016 Central Tottori Prefecture Earthquake revealed by dense seismic observation

*Yoshihisa Iio[1], Satoshi Matsumoto[2], Joint aftershock observation group of the Central Tottori Prefecture earthquake[1] (1.Disater Prevention Research Institute, Kyoto University, 2.Institute of Seismology and Volcanology, Faculty of Sciences, Kyushu University)

[SCG63-03] Hyperdense seismic network reveals multiscale complexity in the young fault system that hosted the 2000 Tottori earthquake, Japan

*Aitaro Kato[1], Shin'ichi Sakai[1], Satoshi Matsumoto[2], Yoshihisa Iio[3] (1.Earthquake Research Institute, the University of Tokyo, 2.Kyushu University, 3.Disaster Prevention Research Institute, Kyoto University)

[SCG63-04] Characteristic of fault geometry of the 2016 Mw7.8 Kaikoura Earthquake, New Zealand inferred from high precision aftershock distribution

*Yuta Kawamura[1], Satoshi Matsumoto[1], Tomomi Okada[2], Miu Matsuno[2], Yoshihisa Iio[3], Tadashi Sato[2], Stephen Bannister[4], John Ristau[4], Martha Savage[5], Clifford Thurber[6], Richard Sibson[7] (1.Kyushu University, 2.Tohoku University, 3.Kyoto University, 4.GNS Science, 5.Victoria University of Wellington, 6.University of Wisconsin - Madison, 7.University of Otago)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG63] Dynamics in mobile belts

convener:Yukitoshi Fukahata(Disaster Prevention Research Institute, Kyoto University), Ray Y Chuang(Department of Geography, National Taiwan University), Toru Takeshita(Department of Natural History Sciences, Graduate School of Science, Hokkaido University), Hikaru Iwamori(Earthquake Research Institute, The University of Tokyo)

[SCG63-07] Development of Strike-Slip Fault Related to the Mud Diapirism in SW Taiwan

★Invited Papers

*Kuo-En Ching[1], Yu-Tsung Lo[2], Song-Chuen Chen[3], Ruey-Juin Rau[1] (1.National Cheng Kung University, 2.National Central University, 3.Central Geological Survey)

[SCG63-08] **Fluid pressure gradients and permeability evolution in the crust: insights from metamorphic fluid-rock reaction zones and hydrothermal experiments**

★Invited Papers

*Masaoki Uno[1], Atsushi Okamoto[1], Diana Mindaleva[1], Hisamu Kasahara[1], Naoki Sugisawa[1], Jun Kameda[2], Noriyoshi Tsuchiya[1] (1.Graduate School of Environmental Studies, Tohoku University, 2.Department of Natural History Sciences, Graduate School of Science, Hokkaido University)

[SCG63-09] **Grain growth experiment of albitic feldspar**

*Norio Shigematsu[1], Masanori Kido[1], You Zhou[2], Hideki Hyuga[2], Yuuichi Yoshizawa[2] (1.Research Institute of Earthquake and Volcano Geology, Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology, 2.Structural Materials Research Institute, National Institute of Advanced Industrial Science and Technology)

[SCG63-10] **3D fault zone architecture across the brittle-plastic transition along the Median Tectonic Line, eastern Kii Peninsula, SW Japan**

*Takuma Katori[1,2], Norio Shigematsu[1], Jun Kameda[3], Ayumu Miyakawa[1], Tatsuya Sumita[1] (1.Geological Survey of Japan, AIST, 2.Graduate School of Science & Technology, Niigata university, 3.Department of Natural History and Sciences, Hokkaido university)

[SCG63-11] Development of the Median Tectonic Line fault zone, Mie Prefecture, southwest Japan: Processes of strain localization

*Toru Takeshita[1], Dong Van Bui[1], Jun-ichi Ando[2] (1.Department of Natural History Sciences, Graduate School of Science, Hokkaido University, 2.Department of Earth and Planetary Systems Science, Graduate School of Science, Hiroshima University)

[SCG63-12] **Fault strength of the ancient Median Tectonic Line at the brittle-ductile transitional depths**

*Ichiko Shimizu[1], Ayumi S. Okamoto, André R. Niemeijer[2], Masao Nakatani[3], Shun Arai[4], Spiers J. Christopher [2], Toru Takeshita[5], Tadamasa Ueda[1] (1.Kyoto University, 2.Utrecht University, 3.Earthquake Research Institute, the University of Tokyo, 4.Tohoku University, 5.Hokkaido University)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG63] Dynamics in mobile belts

convener:Yukitoshi Fukahata(Disaster Prevention Research Institute, Kyoto University), Ray Y Chuang(Department of Geography, National Taiwan University), Toru Takeshita(Department of Natural History Sciences, Graduate School of Science, Hokkaido University), Hikaru Iwamori(Earthquake Research Institute, The University of Tokyo)

[SCG63-13] Resistivity structure around the Atotsugawa fault system revealed by inversion schemes combining Wideband- and Network-MT methods

★Invited Papers

*Yoshiya Usui[1,2], Makoto Uyeshima[1], Tsutomu Ogawa[1], Ryokei Yoshimura[3], Naoto Oshiman[3], Satoru Yamaguchi[4], Hiroaki Toh[5], Hideki Murakami[6], Koki Aizawa[7], Toshiya Tanbo[8], Yasuo Ogawa[9], Tadashi Nishitani[10], Shin'ya Sakanaka[10], Masaaki Mishina[11], Hideyuki Satoh[12], Tada-nori Goto[13], Takafumi Kasaya[14], Toru Mogi[15], Yusuke Yamaya[16], Ichiro Shiozaki[17], Yoshimori Honkura[18] (1.Earthquake Research Institute, the University of Tokyo, 2.ITOCHU Techno-Solutions Corporation, 3.Disaster Prevention Research Institute, Kyoto University, 4.Graduate School of Science, Osaka City University, 5.Graduate School of Science, Kyoto University, 6.Natural Sciences Cluster-Science and Technology Unit, Research and Education Faculty, Kochi University, 7.Institute of Seismology and Volcanology, Faculty of Science, Kyushu University, 8.Tateyama Caldera Sabo Museum, 9.Volcanic Fluid Research Center, School of Science, Tokyo Institute of Technology, 10.Graduate School of International Resource Sciences, Akita University, 11.Graduate School of Science, Tohoku University, 12.Nuclear Regulation Department, Nuclear Regulation Authority, 13.Graduate School of Life Science, University of Hyogo, 14.Japan Agency for Marine–Earth Science and Technology, 15.Faculty of Science, Hokkaido university, 16.National Institute of Advanced Industrial Science and Technology, 17.Graduate School of Engineering, Tottori University, 18.Graduate School of Science and Engineering, Tokyo Institute of Technology)

[SCG63-14] High pressure electrical conductivity in a brine-saturated rock and microstructure of pores

*Tohru Watanabe[1], Kenta Yoshida[2], Katsuyoshi Michibayashi[3] (1.University of Toyama, 2.Japan Agency for Marine-Earth Science and Technology, 3.Nagoya University)

[SCG63-15] Fluid distribution beneath volcanically and seismically active island, Kyushu, based on 3-D electrical resistivity model

★Invited Papers

*Maki Hata[1] (1.Earthquake Research Institute, the University of Tokyo)

[SCG63-16] The Quaternary tectonics of central Kyushu and the 2016 Kumamoto earthquake: from a multifaceted viewpoint of geology, seismology, and geodesy

★Invited Papers

*Kiyokazu Oohashi[1], Makoto Otsubo[2], Satoshi Matsumoto[3], Kenta Kobayashi[4], Katsushi Sato[5], Takuya NISHIMURA[6] (1.Graduate School of Sciences and Technology for Innovation, Yamaguchi University, 2.Geological Survey of Japan, AIST, 3.Faculty of Science, Kyushu University, 4.Department of Geology, Faculty of Science, Niigata University, 5.Graduate School of Science, Kyoto University, 6.Disaster Prevention Research Institute, Kyoto University)

[SCG63-17] A semi-kinematic reference frame of Taiwan considering earthquake-cycle deformation at a plate boundary deformation zone

*Kwo-Hwa Chen[1], Kuo-En Ching[2], Ray Y Chuang[3], Shih-Han Hsiao[2], Ming Yang[2], He-Chin Chen[4] (1.Department of Real Estate and Built Environment, National Taipei University, New Taipei City, Taiwan, 2.Department of Geomatics, National Cheng Kung University, Tainan City, Taiwan, 3.Department of Geography, National Taiwan University, Taipei City, Taiwan, 4.Control Survey Section, National Land Surveying and Mapping Center, Taichung City, Taiwan)

[SCG63-18] Consideration of Formation factor of Trench-parallel fore-arc ridge

*Shohei Iwama[3,1], Ryoya Ikuta[2], Yuto Iwase[4] (1.Graduate school of Integrated Science and Technology, 2.Faculty of Science, Shizuoka University, 3.Kokusai Kogyo Co., Ltd., 4.Kawasaki Geological Engineering Co. Ltd.)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG63] Dynamics in mobile belts

convener:Yukitoshi Fukahata(Disaster Prevention Research Institute, Kyoto University), Ray Y Chuang(Department of Geography, National Taiwan University), Toru Takeshita(Department of Natural History Sciences, Graduate School of Science, Hokkaido University), Hikaru Iwamori(Earthquake Research Institute, The University of Tokyo)

[SCG63-19] Separation of Plastic, Viscous, and Elastic Strains From Observed GNSS Data in the Niigata-Kobe Tectonic Zone

*Yukitoshi Fukahata[1], Angela Meneses-Gutierrez[2,3], Takeshi Sagiya[3,4] (1.Disaster Prevention Research Institute, Kyoto University, 2.Institute for Advanced research, Nagoya University, 3.Disaster Mitigation Research Center, Nagoya University, 4.Graduate School of Environmental Studies, Nagoya University)

[SCG63-20] Elasto-plastic behavior of the concentrated deformation zone based on baseline strain rates

*Takeshi Sagiya[1], Angela Meneses-Gutierrez[1,2] (1.Disaster Mitigation Research Center, Nagoya University, 2.Institute for Advanced Research, Nagoya University)

[SCG63-21] Geodetic evidence of time-dependent viscoelastic interseismic deformation driven by megathrust locking in the southwest Japan subduction zone

*Shaoyang Li[1], Jun'ichi Fukuda[1], Onno Oncken[2] (1.The University of Tokyo, Earthquake Research Insititute, 2.German Geoscience Research Center)

[SCG63-22] Horizontal deformation in NE Japan from triangulation, trilateration, and GPS from 1890 to 2010

*Angela Meneses-Gutierrez[1,2], Paul Segall[3], Takeshi Sagiya[2,4] (1.Institute for Advanced Research, Nagoya University, 2.Disaster Mitigation Research Center, Nagoya University, 3.Stanford University, 4.Graduate School of Environmental Studies, Nagoya University)

[SCG63-23] **Interseismic slip of the Shanchiao fault in northern Taiwan from GPS and leveling measurements**

*Yining Ke[1], Wu-Lung Chang[1] (1.Department of Earth Sciences, National Central University)

[SCG63-24] Decomposition of elastic potential energy and the meaning of the energetics-based failure stress criterion

*Mitsuhiro Matsu'ura[1], Toshiko Terakawa[2] (1.Institute of Statistical Mathematics, 2.Nagoya University)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG64] Crust-mantle connections

convener:Yoshihiko Tamura(Research Institute for Marine Geodynamics, Japan Agency for Maine-Earth Science and Technology), Osamu Ishizuka(Geological Survey of Japan, AIST)

[SCG64-01] Synmagmatic faulting partly controls fluid-melt-peridotite reaction and lithospheric melts generation at the crust-mantle transition

*Mathieu Rospabe[1], Mathieu Benoit[2], Georges Ceuleneer[2], Mary-Alix Kaczmarek[2] (1.Research Institute for Marine Geodynamics (IMG), Japan Agency for Marine-Earth Science and Technology, 2.Géosciences Environnement Toulouse (GET), Observatoire Midi-Pyrénées, Université de Toulouse, CNRS, IRD)

[SCG64-02] Multi-stage metasomatism and metamorphism of the Mesoarchean Ulamertoq ultramafic rocks in southern West Greenland

*Ikuya Nishio[1], Tomoaki Morishita[1], Akihiro Tamura[1], Juan Miguel Ramirez Guotana[1], Kenichiro Tani[2], Yumiko Harigane[3], Kristoffer Szilas[4], D. Graham Pearson[5] (1.Kanazawa University, 2.Department of Geology and Paleontology, National Museum of Nature and Science, 3.Institute of Geology and Geoinformation Geological Survey of Japan/AIST, 4.University of Copenhagen, 5.University of Alberta)

[SCG64-03] Arc magma genesis: evidence from Kibblewhite Volcanic Complex in the Kermadec arc, New Zealand

★Invited Papers

*Yasuhiro Hirai[1,2], Yoshihiko Tamura[2], Kaj Hoernle[3], Reinhard Werner[3], Folkmar Hauff[3], Christian Timm[4], Bogdan Vaglarov[2], Qing Chang[2], Takashi Miyazaki[2], Jun-Ichi Kimura[2], Takeshi Hanyu[2] (1.Graduate School of Natural Science and Technology, Kanazawa University, Japan, 2.Research Institute for Marine Geodynamics (IMG), Japan Agency for Marine-Earth Science and Technology (JAMSTEC), Yokosuka, Kanagawa, Japan, 3.GEOMAR Helmholtz Centre for Ocean Research, Kiel, Germany, 4.GNS Science, Lower Hutt, New Zealand)

[SCG64-04] The Atlantis Bank Batholith, SW Indian Ridge, the Link Between Lower Crustal Accretion at High and Low Melt Supply

*Henry J Dick[1] (1.Woods Hole Oceanographic Institution)

[SCG64-05] Oceanic lower crust and uppermost mantle of the Shikoku Basin: insights from expeditions to Mado Megamullion

*Yasuhiko Ohara[1,2,3], Kyoko Okino[4], Norikatsu Akizawa[4], Masakazu Fujii[5], Yumiko Harigane[6], Ken-ichi Hirauchi[7], Osamu Ishizuka[6], Shiki Machida[8], Katsuyoshi Michibayashi[3], Alessio Sanfilippo[9], Sani Camilla[9], Snow E. Jonathan[10], Kenichiro Tani[11], Hiroyuki Yamashita[12] (1.Hydrographic and Oceanographic Department of Japan, 2.Japan Agency for Marine-Earth Science and Technology , 3.Nagoya University, 4.Atmosphere and Ocean Research Institute, University of Tokyo, 5.National Institute of Polar Research , 6.Geological Survey of Japan, AIST, 7.Shizuoka University, 8.Chiba Institute of Technology, 9.University of Pavia, 10.Louisiana State University, 11.National Science Museum, 12.Kanagawa Prefectural Museum of Natural History)

[SCG64-06] Petrological characteristics of serpentinized peridotites dredged from oceanic core complexes in the Shikoku Basin

Izumi Segawa[1], *Ken-ichi Hirauchi[1], Yasuhiko Ohara[2,3], Yui Kouketsu[3], Katsuyoshi Michibayashi[3] (1.Department of Geosciences, Faculty of Science, Shizuoka University, 2.Hydrographic and Oceanographic Department of Japan, 3.Department of Earth & Planetary Sciences, Graduate School of Environmental Studies, Nagoya University)

[E] Oral | S (Solid Earth Sciences)：S-CG Complex & General

[S-CG64] Crust-mantle connections

convener:Yoshihiko Tamura(Research Institute for Marine Geodynamics, Japan Agency for Maine-Earth Science and Technology), Osamu Ishizuka(Geological Survey of Japan, AIST)

[SCG64-07] Was the Jurassic–Cretaceous boundary a critical event for marine life in the pelagic Panthalassa?

★Invited Papers

*Atsushi Matsuoka[1] (1.Department of Geology, Faculty of Science, Niigata University)

[SCG64-08] The Renaissance of the oldest oceanic plate: Perspective of REY-rich mud as a paleoceanographic archive in a pelagic realm of the Pacific Ocean

★Invited Papers

*Erika Tanaka[1], Kazutaka Yasukawa[2,1,3], Kentaro Nakamura[1], Junichiro Ohta[2,3], Tatsuo Nozaki[4,2,5,3], Yoichi Usui[4], Koichiro Fujinaga[3,2], Koichi Iijima[4], Yasuhiro Kato[2,1,3] (1.Department of Systems Innovation, School of Engineering, The University of Tokyo, 2.Frontier Research Center for Energy and Resources, School of Engineering, The University of Tokyo, 3.Ocean Resources Research Center for Next Generation, Chiba Institute of Technology, 4.Submarine Resources Research Center, Japan Agency for Marine-Earth Science and Technology, 5.Department of Planetology, Faculty of Science, Kobe University)

[SCG64-09] REY-rich mud in the western North Pacific Ocean: An overview and implication for Earth system dynamics

★Invited Papers

*Yasuhiro Kato[1,2], Kazutaka Yasukawa[1,2], Junichiro Ohta[1,2], Erika Tanaka[1], Kazuhide Mimura[1], Koichiro Fujinaga[2,1], Kentaro Nakamura[1] (1.Graduate School of Engineering, University of Tokyo, 2.ORCeNG, Chiba Institute of Technology)

[SCG64-10] The Renaissance of the Oldest Oceanic Plate: Jurassic Oceanic Crust without Moho

*Yoshihiko Tamura[1], Mathieu Rospabe[1], Kentaro Kaneda[2], Alexander Nichols[3], Gou Fujie[1], Eiichi TAKAZAWA[4], Katsuyoshi Michibayashi[5], Shuichi Kodaira[1] (1.Research Institute for Marine Geodynamics, Japan Agency for Maine-Earth Science and Technology, 2.Japan Coast Guard, 3.University of Canterbury, New Zealand, 4.Niigata University, 5.Nagoya University)

[SCG64-11] Magma genesis model of the subduction zones based on hydrous melting experiments of a mantle peridotite

*Eiichi Takahashi[1], Jintuan Wang[1] (1.Guangzhou Institute of Geochemistry, Chinese Academy of Science)

[SCG64-12] The tectonic-magmatic characteristics in the Kamchatka: Implications for the dynamics around the northern edge of Pacific Plate

*Tatsuji Nishizawa[1], Hitomi Nakamura[2,3,4,5], Hikaru Iwamori[3,4,6] (1.Volcanic Fluid Research Center, School of Science, Tokyo Institute of Technology, 2.Institute of Earthquake and Volcano Geology, Geological Survey of Japan, AIST, 3.Department of Solid Earth Geochemistry, Japan Agency for Marine-Earth Science and Technology, 4.Depeartment of Earth and Planetary Sciences, School of Science, Tokyo Institute of Technology, 5.ORCeNG, Chiba Institute of Technology, 6.Earthquake Research Institute, The University of Tokyo)

[E] Oral | B (Biogeosciences)：B-BC Biogeochemistry

[B-BC03] Earth and Planetary Science Frontiers for Life and Global Environment

convener:Yoshinori Takano(Japan Agency for Marine-Earth Science and Technology (JAMSTEC)), Yohey Suzuki(Graduate School of Science, The University of Tokyo), Shingo Kato(RIKEN), Keisuke Fukushi(Institute of Nature & Environmental Technology, Kanazawa University)

[BBC03-01] The prebiotic chemistry of Enceladus' hydrothermal systems

*Wataru Takahagi[1,2] (1.Department of Chemistry, Graduate School of Science, The University of Tokyo, 2.Institute for Extra-cutting-edge Science and Technology Avant-garde Research (X-star), Japan Agency for Marine-Earth Science and Technology (JAMSTEC))

[BBC03-02] **Pressure-induced esterification reaction between phosphoric acid and methanol: a possibility of prebiotic formation of alkyl phosphate and phospholipid at high pressure**

*Yuchen Sun[1], Chikako Fujimoto[1], Hiroyuki Kagi[1] (1.Graduate School of Science, The University of Tokyo)

[BBC03-03] **Iron mediated synthesis of thioesters with thioacetic acid and simultaneous formation of FeS clusters in aqueous solution**

*Sebastian Adrian Sanden[1], Shawn Erin McGlynn[1], Masahiko Hara[1], Riquin Yi[1] (1.Tokyo Institute of Technology)

[BBC03-04] Japanese challenges to explore Martian biosphere

*Yohey Suzuki[1], Tomohiro Usui[2], Akihiko Yamagishi[2] (1.Graduate School of Science, The University of Tokyo, 2.Japan Aerospace Exploration Agency (JAXA))

[BBC03-05] Habitable aqueous environment on Early Mars inferred from reconstructed water chemistry at Gale

★Invited Papers

*Keisuke Fukushi[1], Yasuhito Sekine[2,1], Hiroshi Sakuma[3], Koki Morida[4], Robin Wordsworth[5] (1.Institute of Nature & Environmental Technology, Kanazawa University, 2.Earth-Life Science Institute, Tokyo Institute of Technology, 3.National Institute for Materials Science, 4.Division of Natural System, Kanazawa University, 5.Department of Earth and Planetary Sciences, Harvard University)

[BBC03-06] Toward the exploration of habitable Mars: MMX and beyond

*Tomohiro Usui[1] (1.Japan Aerospace Exploration Agency)

[E] Oral | B (Biogeosciences)：B-BC Biogeochemistry

[B-BC03] Earth and Planetary Science Frontiers for Life and Global Environment

convener:Yoshinori Takano(Japan Agency for Marine-Earth Science and Technology (JAMSTEC)), Yohey Suzuki(Graduate School of Science, The University of Tokyo), Shingo Kato(RIKEN), Keisuke Fukushi(Institute of Nature & Environmental Technology, Kanazawa University)

[BBC03-07] Isolation and physiological characterization of an archaeon at the prokaryote-eukaryote interface

★Invited Papers

*Hiroyuki Imachi[1], Masaru K Nobu[2] (1.Japan Agency for Marine-Earth Science and Technology, 2.National Institute of Advanced Industrial Science and Technology)

[BBC03-08] Genomic analyses of the closest isolated archaeal relative of eukaryotes reveals novel insights into eukaryogenesis

★Invited Papers

*Masaru Konishi Nobu[1], Hiroyuki Imachi[2], Nozomi Nakahara[2,1,3], Yuki Morono[2], Miyuki Ogawara[2], Yoshihiro Takaki[2], Katsuyuki Uematsu[4], Tetsuro Ikuta[2], Motoo Ito[2], Yohei Matsui[2], Masayuki Miyazaki[2], Kazuyoshi Murata[5], Yumi Saito[2], Sanae Sakai[2], Chihong Song[5], Eiji Tasumi[2], Yuko Yamanaka[2], Takashi Yamaguchi[3], Yoichi Kamagata[1], Hideyuki Tamaki[1], Ken Takai[2] (1.National Institute of Advanced Industrial Science and Technology, 2.Japan Agency for Marine-Earth Science and Technology, 3.Nagaoka University of Technology, Nagaoka, 4.Marine Work Japan Ltd, 5.National Institute for Physiological Sciences)

[BBC03-09] The origin of scaly-foot gastropod's scale and iron sulfide nanoparticles inside

★Invited Papers

*Okada Satoshi[1] (1.Japan Agency for Marine-Earth Science and Technology)

[BBC03-10] Interaction of organic matter and submarine hydrothermal fluids on the early Earth: its importance for origin of proto-enzyme and early microbial activities

*Takeshi Kakegawa[1] (1.Graduate School of Science, Tohoku University)

[BBC03-11] Revised kinetic parameters of the Aps reductase enzyme: effect on microbial sulfur isotope fractionation.

*Shawn E McGlynn[1], Tommy Po-Hsiang Wang[1], Mayuko Nakagawa[1], Yuichiro Ueno[1] (1.Tokyo Institute of Technology)

[BBC03-12] Climate and litter C/N ratio constrain soil organic carbon accumulation

Guoyi Zhou[1], *Shan Xu[2], Ciais Philippe [3], Manzoni Stefano [4,5] (1.Institute of Ecology, Jiangsu Key Laboratory of Agricultural Meteorology, Nanjing University of Information Science & Technology, Nanjing 210044, China, 2.Guangdong Institute of Eco-environmental and Soil Sciences, 3.Institut Pierre Simon Laplace, Laboratoire des Sciences du Climat et de l'Environnement, CEA CNRS UVSQ UPSaclay, 91191 Gif sur Yvette, France, 4.Department of Physical Geography, Stockholm University, Stockholm SE-10691, Sweden, 5.Bolin Centre for Climate Research, Stockholm SE-10691, Sweden)

[E] Oral | B (Biogeosciences)：B-PT Paleontology

[B-PT04] Biomineralization and Geochemistry of Proxies

convener:Takashi Toyofuku(Japan Agency for Marine-Earth Science and Technology (JAMSTEC)), Jelle Bijma(Alfred-Wegener-Institut Helmholtz-Zentrum für Polar- und Meeresforschung), Hiroshi Kitazato(Tokyo University of Marine Science and Technology (TUMSAT)), Kotaro Hirose(Faculty of Science and Engineering, Waseda University)

[BPT04-01] **Shell formation of foraminifera -marine unicellular calcifiers-**

*Takashi Toyofuku[1,2], Yukiko Nagai[1,3] (1.Japan Agency for Marine-Earth Science and Technology (JAMSTEC), 2.Tokyo University of Marine Science and Technology (TUMSAT), 3.National Museum of Nature and Science,Tokyo (NMNS))

[BPT04-02] Effect of euxinic conditions on planktic foraminifers: results from laboratory culture experiments and implications for oceanic anoxic events

*Azumi Kuroyanagi[1], Takashi Toyofuku[2], Yukiko Nagai[2], Katsunori Kimoto[2], Hiroshi Nishi[1], Reishi Takashima[1], Hodaka Kawahata[3] (1.The Center for Academic Resources and Archives, Tohoku University, 2.JAMSTEC, 3.Atmosphere and Ocean Research Institute, The university of Tokyo)

[BPT04-03] Effects of larger benthic foraminifers from global warming analysed by Micro-X-ray CT

*Shunichi Kinoshita[1], Azumi Kuroyanagi[2], Hiroshi Nishi[2], Osamu Sasaki[2], Kazuhiko Fujita[3], Atsushi Suzuki[4], Hodaka Kawahata[5] (1.Tohoku University, Graduate School of Science, 2.The Tohoku University Museum, 3.University of the Ryukyus, 4.Geological Survey of Japan National Institute of Advanced Industrial Science and Technology, 5.the University of Tokyo)

[BPT04-04] Foraminiferal calcification, CO_2, precipitation rates and element incorporation

*Lennart Jan de Nooijer[1], Takashi Toyofuku[2], Esmee Geerken[1], Gert-Jan Reichart[1] (1.Netherlands Institute for Sea Research, 2.JAMSTEC)

[BPT04-05] **The coral reef-dwelling *Peneroplis pertusus* brought to light: recalcification during culture experiments**

*Laurie Charrieau[1], Takashi Toyofuku[1], Yukiko Nagai[1], Katsunori Kimoto[2], Kazuhiko Fujita[3] (1.X-STAR, JAMSTEC, 2.RIGC, JAMSTEC, 3.Department of Physics and Earth Sciences, University of the Ryukyus)

[BPT04-06] Variations in carbon and oxygen isotope composition and trace element concentrations of the modern brachiopod shells collected off Okinoshima

*Kazuma Oikawa[1], Hideko Takayanagi[1], Ryuichi Shinjo[2], Kazuyoshi Endo[3], Masa-aki Yoshida[4], Yasufumi Iryu[1] (1.Institute of Geology and Paleontology Graduate School of Science Tohoku University, 2.Department of Physics and Earth Sciences, University of the Ryukyus, 3.Department of Earth and Planetary Science, Tokyo University, 4.Shimane University Faculty of Life and Environmental Science)

[E] Oral | B (Biogeosciences)：B-PT Paleontology

[B-PT04] Biomineralization and Geochemistry of Proxies

convener:Takashi Toyofuku(Japan Agency for Marine-Earth Science and Technology (JAMSTEC)), Jelle Bijma(Alfred-Wegener-Institut Helmholtz-Zentrum für Polar- und Meeresforschung), Hiroshi Kitazato(Tokyo University of Marine Science and Technology (TUMSAT)), Kotaro Hirose(Faculty of Science and Engineering, Waseda University)

[BPT04-07] Validation and calibration of proxies to reconstruct past oxygenation using foraminifera: Shell Mn/Ca and porosity.

*Inge van Dijk[1,2], Christine Barras[2], Aurelia Mouret[2], Grit Steinhöfel[1], Emmanuelle Geslin [2], Jelle Bijma[1] (1.Marine Biogeosciences, Alfred-Wegener-Institut Helmholtz-Zentrum für Polar- und Meeresforschung, Bremerhaven, Germany, 2.LPG UMR CNRS 6112, University of Angers, UFR Sciences, Angers, France)

[BPT04-08] Development of new proxies using macromolecular structures of marine palynomorphs

*Takuto Ando[1], Kazumi Matsuoka[2], Karin Zonneveld[3], Gerard Versteegh[3,4] (1.Estuary Research Center, Shimane University, 2.Institute for East China Sea Research, Nagasaki University, 3.Center for Marine Environmental Sciences (marum), Bremen University, 4.Department of Earth and Environmental Science, Jacobs University Bremen)

[BPT04-09] Lipid biomarker analysis of culture samples of genus *Tetraparma* of the Parmales (Bolidophyceae)

*Ken Sawada[1], Yuki Hattori[1], Mutsuo Ichinomiya[2], Akira Kuwata[3] (1.Department of Earth and Planetary Sciences, Faculty of Science, Hokkaido University, 2.Prefectural University of Kumamoto, 3.Tohoku National Fisheries Research Institute)

[BPT04-10] Seasonal variation in assemblage of planktic foraminifera from the sediment trap samples in the Bay of Bengal

*Ayumi Maeda[1,2], Azumi Kuroyanagi[3], Hiroshi Nishi[3], Birgit Gaye[4], Hodaka Kawahata[2,1] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 2.Atmosphere and Ocean Research Institute, The University of Tokyo, 3.The Tohoku University Museum, Tohoku University, 4.Institute of Biogeochemistry and Marine Chemistry, University of Hamburg)

[BPT04-12] Recent changes of the diatom assemblages in relation to human-induced pollution in Baltic Sea coastal inlets.

*Kotaro Hirose[1], Hanna Nilsson[3,2], Karin Rengefors[3], Olof Berglund[3], Filipsson F. Helena[2] (1.Faculty of Science & Engineering, Waseda University, 2.Dept. of Geology, Lund University, Lund, Sweden, 3.Dept. of Biology, Lund University, Lund, Sweden)

[E] Oral | B (Biogeosciences)：B-PT Paleontology

[B-PT05] Biotic History

convener:Isao Motoyama(Faculty of Science, Yamagata University), Takao Ubukata(Division of Geology & Mineralogy, Department of Earth & Planetary Sciences, Kyoto University), Kazuyoshi Moriya(Department of Earth Sciences, Faculty of Education and Integrated Arts and Sciences, Waseda University)

[BPT05-01] Adaptive evolution of marine cyanobacteria to the climate in the Neoproterozoic inferred from ancestral proteins

*Nao Masuda[1], Mariko Harada[2], Sota Yagi[3], Ryutaro Furukawa[4], Akihiko Yamagishi[5], Shin-ichi Yokobori[5] (1.Department of Biological Sciences, Graduate School of Science, The University of Tokyo, 2.Faculty of Life and Environmental Sciences, University of Tsukuba, 3.Center for Biosystems Dynamics Research, RIKEN, 4.Faculty of Human Sciences, Waseda University, 5.Department of Applied Life Sciences, Tokyo University of Pharmacy and Life Sciences)

[BPT05-02] Ontogenetic transformations and re-interpretation of Ediacaran Trilobozoa

*Maria Zakrevskaya[1], Andrey Ivantsov[1] (1.Paleontological Institute of the Russian Academy of Sciences, Moscow, Russia)

[BPT05-03] Natural assemblages of the platform-type conodont in lowermost Triassic deep-sea black claystone from northeastern Japan, with probable soft-tissue impressions

*Satoshi Takahashi[1], Satoshi Yamakita[2], Noritoshi Suzuki[3] (1.Department of Earth and Planetary Science, University of Tokyo, 2.Department of Earth Science, Faculty of Culture, Miyazaki University, 3.Institute of Geology and Paleontology, Graduate school of Tohoku University)

[BPT05-04] Tephrochronological study of the Yezo Group (uppermost Albiane-basal Campanian) in Hokkaido, Japan

*Hiroshi Nishi[1], Reishi Takashima[1], Keiichi Hayashi[2], Kuwabara Sato[2], Yuji Orihashi[3], Toshiro Yamanaka[4] (1.The Center for Academic Resources and Archives, The Tohoku Museum Tohoku University, 2.Geological Survey of Hokkaido, 3.Hirosaki University, 4.Tokyo University of Marine Science and Technology)

[BPT05-05] Molecular mechanism which controls the shell microstructure depending on environmental changes in the Japanese pearl oyster

*Kei Sato[1], Davin H.E. Setiamarga[2], Hiroshi Yonemitsu[2], Keita Higuchi[3], Yasunori Iwahashi[3], Kiyohito Nagai[3] (1.Faculty of Education and Integrated Arts and Sciences, Waseda University, 2.National Institute of Technology, Wakayama College, 3.MIKIMOTO Pearl REsearch Laboratory)

[BPT05-06] From artisanship to amateur: the challenge to identify large fossils using deep learning

*Ryuichiro Hataya[1], Kumiko Matsui[2], Tomoki Karasawa[3] (1.The University of Tokyo, 2.The Kyushu University Museum, 3.The Mikasa City Museum)

[E] Oral | B (Biogeosciences)：B-CG Complex & General

[B-CG06] Decoding the history of Earth: From Hadean to the present

convener:Tsuyoshi Komiya(Department of Earth Science & Astronomy Graduate School of Arts and Sciences The University of Tokyo), Yasuhiro Kato(Department of Systems Innovation, Graduate School of Engineering, University of Tokyo), Katsuhiko Suzuki(Submarine Resources Research Center, Japan Agency for Marine-Earth Science and Technology), Kentaro Nakamura(Department of Systems Innovation, School of Engineering, University of Tokyo)

[BCG06-01] REY-rich mud in the modern and past oceans

*Yasuhiro Kato[1,2], Kazutaka Yasukawa[1,2], Junichiro Ohta[1,2], Koichiro Fujinaga[2,1], Kentaro Nakamura[1] (1.Graduate school of Engineering, Univ. of Tokyo, 2.ORCeNG, Chiba Institute of Technology)

[BCG06-02] Fish debris and rare-earth deposition caused by topographically induced upwelling in the latest Eocene

★Invited Papers

*Junichiro Ohta[1,2,3], Kazutaka Yasukawa[1,3,2], Tatsuo Nozaki[3,1,4,2], Yutaro Takaya[5,2,3], Kazuhide Mimura[1], Koichiro Fujinaga[2,1], Kentaro Nakamura[1], Yoichi Usui[3], Jun-Ichi Kimura[3], Qing Chang[3], Yasuhiro Kato[1,2,3] (1.The University of Tokyo, 2.Chiba Institute of Technology, 3.Japan Agency for Marine-Earth Science and Technology, 4.Kobe University, 5.Waseda University)

[BCG06-03] Diversity of acritarchs from the 3.0 Ga Farrel Quartzite, Pilbara Craton, Western Australia

*Kenichirio Sugitani[1] (1.Nagoya University)

[BCG06-04] **The MIF-Sulfur record suggests the oxygenated atmosphere and sulfate-rich oceans through geologic time**

*Hiroshi Ohmoto[1] (1.The Pennsylvania State University)

[BCG06-05] Mantle data imply that secular oxidation can drive oxygenation of the atmosphere

★Invited Papers

*Shintaro Kadoya[1], David C Catling[1], Robert W Nicklas[2], Igor S Puchtel[3], Ariel D Anbar[4] (1.Department of Earth and Space Sciences / cross-campus Astrobiology Program, University of Washington, 2.Geosicence Research Division, Scripps Institution of Oceanography, 3.Department of Geology, University of Maryland, 4.School of Earth and Space Exploration and School of Molecular Sciences, Arizona State University)

[BCG06-06] Ankaramite-andesite-basalt (ANANBA) model of arc evolution

*Yoshihiko Tamura[1], Tomoki Sato[1], Osamu Ishizuka[1], Yasuhiro Hirai[1], Takashi Miyazaki[1] (1.Research Institute for Marine Geodynamics, Japan Agency for Maine-Earth Science and Technology)

[E] Oral | B (Biogeosciences)：B-CG Complex & General

[B-CG06] Decoding the history of Earth: From Hadean to the present

convener:Tsuyoshi Komiya(Department of Earth Science & Astronomy Graduate School of Arts and Sciences The University of Tokyo), Yasuhiro Kato(Department of Systems Innovation, Graduate School of Engineering, University of Tokyo), Katsuhiko Suzuki(Submarine Resources Research Center, Japan Agency for Marine-Earth Science and Technology), Kentaro Nakamura(Department of Systems Innovation, School of Engineering, University of Tokyo)

[BCG06-07] Hydrogen isotope analysis of apatite inclusions in the Hadean to early Archean zircon

Daiki Tanaka[1], *Shinji Yamamoto[1], Shoichi Itoh[2], Shuhei Sakata[3] (1.Graduate School of Environment and Information Sciences, Yokohama National University, 2.Graduate School of Faculty of Science, Kyoto Uiversity, 3.Earthquake Research Institute)

[BCG06-08] Occurrence and chemical composition of carbonate rocks in the Nuvvuagittuq supracrustal belt, Quebec, Canada: Implications for chemical composition of the Eoarchean hydrothermal fluid

★Invited Papers

*Yoshida Satoshi[1], Yusuke Sawaki[2], Tsuyoshi Komiya[2] (1.Department of Earth & Planetary Science, Graduate School of Science, The University of Tokyo, 2.Department of Earth Science & Astronomy, Graduate School of Arts and Sciences, The University of Tokyo)

[BCG06-09] Depositional setting and biological activity highlighted by Cr concentration, 3.2 Ga Moodies Group, Barberton Greenstone Belt

*Yoko Ohtomo[1], Daizo Yamauchi[1], Tsubasa Otake[1], Tsutomu Sato[1] (1.Faculty of Engineering, Hokkaido University)

[BCG06-10] Effect of Hydrocarbon Haze on Climate Stability under Mildly Oxidized Late-Archean Environment

★Invited Papers

*Yasuto Watanabe[1], Eiichi Tajika[1], Kazumi Ozaki[2], Peng Hong[3] (1.The University of Tokyo, 2.Toho University, 3.Chiba Institute of Technology)

[BCG06-11] The demise of the positive carbon isotope excursion in the Paleoproterozoic Francevillian Basins, Gabon

*Tomohiko Sato[1], Yusuke Sawaki[2], Shigenori Maruyama[1], Karen Bakakas[3], Mathieu Moussavou[3], Ambroise Edou-Minko[3] (1.Tokyo Institute of Technology, 2.The University of Tokyo, 3.University of Sciences and Technology in Masuku)

[BCG06-12] Sponge-like grains and negative excursion of carbon isotopes in late Cryogenian

*Akihiro Kano[1], Yuki Eguchi[1] (1.Graduate School of Science, The University of Tokyo)

[E] Oral | B (Biogeosciences)：B-CG Complex & General

[B-CG07] Phanerozoic biodiversity change: radiation and extinction

convener:Yukio Isozaki(Department of Earth Science and Astronomy, Multi-disciplinary Sciences - General Systems Studies, Graduate School of Arts and Sciences, The University of Tokyo), Yusuke Sawaki(The University of Tokyo)

[BCG07-01] Hierarchy in mass extinction causes: from direct kill mechanism to ultimate cause

*Yukio Isozaki[1] (1.Department of Earth Science and Astronomy, Multi-disciplinary Sciences - General Systems Studies, Graduate School of Arts and Sciences, The University of Tokyo)

[BCG07-02] A relationship between paleomagnetic data and biodiversity during the Phanerozoic

*Yasushi Harada[1], Yuto Kikuzawa[1] (1.School of Marine Science and Technology, Tokai University)

[BCG07-03] The oldest arthropod body fossils from the Cambrian Stage 1 (Fortunian) in South China

*KONO SENA[1], Yukio Isozaki[1], Tomohiko Sato[2], Xingliang Zhang[3], Wei Liu[3] (1.The University of Tokyo School of Arts &Sciences, 2.Department of Earth and Planetary Sciences, Tokyo Institute of Technology, 3.Northwest university, China)

[BCG07-04] Graptolite biostratigraphy of the Ordovician to Silurian boundary succession in the Khao Nui area, southern peninsular Thailand

*Ippei Katakura[1], Sachiko Agematsu[1], Apsorn Sardsud[2] (1.University of Tsukuba, 2.Department of Mineral Resources)

[BCG07-05] Permian Panthalassan Sr budget change

*Tomomi Kani[1], Yukio Isozaki[2], Keiji Misawa[3], Akira Ishikawa[4], Shigekazu Yoneda[5] (1.Department of Earth and Environmental Sciences, Kumamoto University, 2.The University of Tokyo, 3.National Institute of Polar Research, 4.Tokyo Institute of Technology, 5.National Museum of Nature and Science)

[BCG07-06] Marine osumium isotope records during the Carnian (Late Triassic) “pluvial episode” in the pelagic bedded cherts

*Yuki Tomimatsu[1], Tatsuo Nozaki[2,3,4,5], Honami Sato[5], Yutaro Takaya[6], Jun-Ichi Kimura[7], Chang Qing[7], Hiroshi Naraoka[8], Manuel Rigo[9], Tetsuji Onoue[8] (1.Graduate school of Science and Technology, Kumamoto University, 2.Submarine Resources Research Center, Research Institute for Marine Resources Utilization, Japan Agency for Marine-Earth Science and Technology, 3.Frontier Research Center for Energy and Resources (FRC- ER), Graduate School of Engineering, Tokyo University, 4.Department of Planetology, Graduate School of Science, Kobe University, 5.Ocean Resources Research Center for Next Generation, Chiba Institute of Technology, 6.Department of Resources and Environmental Engineering School of Creative Science and Enginerring, Waseda University, 7.Department of Solid Earth Geochemistry, Japan Agency for Marine-Earth Scienc and Technology, 8.Department of Earth and Planetary Sciences, Faculty of Sciences, Kyushu University, 9.Department of Geosciences, University of Padova)

[E] Oral | B (Biogeosciences)：B-CG Complex & General

[B-CG07] Phanerozoic biodiversity change: radiation and extinction

convener:Yukio Isozaki(Department of Earth Science and Astronomy, Multi-disciplinary Sciences - General Systems Studies, Graduate School of Arts and Sciences, The University of Tokyo), Yusuke Sawaki(The University of Tokyo)

[BCG07-07] Upper Triassic (Rhaetian) conodont biostratigraphy of the Panthalassa Ocean and the final extinction of conodonts at the end-Triassic

*Tetsuji Onoue[1], Kanna Yamasaki[2], Yuki Tomimatsu[2,1], Yixing Du[3], Daisuke Yamashita[4], Katsuhito Soda[2], Manuel Rigo[3] (1.Kyushu Univ., 2.Kumamoto Univ., 3.Univ. Padova, 4.Satsumasendai City Office)

[BCG07-08] **The Carbon-Silicon cycle coupling: insight from in situ $\delta^{30}Si$ in Mesozoic radiolarites.**

*Maximilien Bole[1], Masayuki Ikeda[1], Rie Hori, S.[2], Peter O. Baumgartner[3] (1.Department of Earth and Planetary Sciences, Tokyo University, Japan, 2.Department of Earth Science, Ehime University, Japan, 3.Institute of Earth Science (ISTE), Université de Lausanne, Switzerland)

[BCG07-09] Geology and paleontology of the Tetori Group distributed in the Shokawa area, Gifu prefecture

*WATABE SERIE[1], Sachiko Agematsu[1] (1.University of Tsukuba)

[BCG07-10] Marine Os isotopic evidence for multiple submarine volcanic activities during Aptian, mid-Cretaceous

*Hironao Matsumoto[1], Junichiro Kuroda[1], Rodolfo Coccioni[2], Fabrizio Frontalini[2] (1.Department of Earth and Planetary Science, The University of Tokyo, 2.DiSPeA, University of Urbino)

[BCG07-11] Cu- or Ag-enriched grains in the K-Pg boundary clays: New evidence for acid rain immediately after the meteorite impact

*Teruyuki Maruoka[1], Yoshiro Nishio[2], Tetsu Kogiso[3], Katsuhiko Suzuki[4] (1.University of Tsukuba, 2.Kochi University, 3.Kyoto University, 4.Japan Agency for Marine-Earth Science and Technology)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

[M-IS01] Tsunami deposit

convener:Daisuke Ishimura(Department of Geography, Tokyo Metropolitan University), Takashi Chiba(Faculty of Bioresource Sciences, Akita Prefectural University), Masaki Yamada(Department of Geology, Faculty of Science, Shinshu University), Takashi Ishizawa(International Research Institute of Disaster Science, Tohoku University)

[MIS01-01] Evaluation for transport processes of paleo-tsunami by organic geochemical analyses of peat sediments in eastern Hokkaido, Japan

*Hiroyasu Asahi[1], Ken Sawada[2], Satoshi Furota[3] (1.Graduate School of Science, Hokkaido University, 2.Department of Earth and Planetary Science, Facility of Science, Hokkaido University, 3.National Institute of Advanced Industrial Science and Technology)

[MIS01-02] **Paleotsunami record in Hachinohe, Aomori Prefecture, northern Japan.**

*Erick Velasco R.[1], Kazuhisa Goto[2], Daisuke Sugawara[3], Yuichi Nishimura[4], Takahiro Shinohara[1], Takashi Chiba[5] (1.Earth Science Department, Graduate Faculty of Science, Tohoku University, 2.Department of Earth and Planetary Science, Graduate School of Science, the University of Tokyo, 3.Museum of Natural and Environmental History, Shizuoka, 4.Institute of Seismology and Volcanology, Graduate School of Science, Hokkaido University, 5.Faculty of Bioresource Sciences, Akita Prefecture University.)

[MIS01-03] Geological features of tsunami deposits associated with the 1983 Nihonkai-chubu earthquake in pine-based windbreak forests of Noshiro City and Happo Town in Akita Prefecture, Japan

*Takashi Chiba[1], Yuichi Nishimura[2] (1.Faculty of Bioresource Sciences, Akita Prefectural University, 2.Institute of Seismology and Volcanology, Faculty of Science, Hokkaido University)

[MIS01-04] Identification of tsunami, storm, and river flood deposits besed on the multi-proxy evidence on the coastal lowland of Odaka District, Minamisoma City, Fukushima Prefecture, Northeast Japan

*Shiori Uchiyama[1], Junichi Machida[1], Koichi Hoyanagi[1] (1.Shinshu University)

[MIS01-05] Literature review and numerical modeling for updating physical identification criteria of tsunami and storm deposit

★Invited Papers

*Masashi Watanabe[1], Kazuhisa Goto[2], Fumihiko Imamura[3] (1.Chuo University, 2.The University of Tokyo, 3.Tohoku University)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

[M-IS01] Tsunami deposit

convener:Daisuke Ishimura(Department of Geography, Tokyo Metropolitan University), Takashi Chiba(Faculty of Bioresource Sciences, Akita Prefectural University), Masaki Yamada(Department of Geology, Faculty of Science, Shinshu University), Takashi Ishizawa(International Research Institute of Disaster Science, Tohoku University)

[MIS01-06] Relationship between the distribution of crevasse-splay deposits and the inundation distance of the October 2019 flooding of the Chikuma River, central Japan

*Masaki Yamada[1], Hajime Naruse[2], Yuhei Matsuda[1], Tetsuya Shinozaki[3], Tetsuya Tokiwa[1] (1.Faculty of Science, Shinshu University, 2.Faculty of Science, Kyoto University, 3.Center for Research in Isotopes and Environmental Dynamics, University of Tsukuba)

[MIS01-07] Numerical method for constraining maximum local size of paleotsunamis using storm boulder deposits

*Kenta Minamidate[1], Kazuhisa Goto[2], Hironobu Kan[3] (1.Department of Earth Science, Tohoku University, 2.Department of Earth and Planetary Science, The University of Tokyo, 3.Graduate School of Integrated Sciences for Global Society, Kyushu University)

[MIS01-08] Preservation and weathering of tsunami deposits formed during the eruption of Anak Krakatau volcano, Indonesia, on December 22, 2018

*Yuichi Nishimura[1], Purna Sulastya Putra[2], Septriono Hari Nugroho[2], Eko Yulianto[2], Takashi Chiba[3] (1.Graduate School of Science, Hokkaido University, 2.Research Center for Geotechnology, Indonesian Institute of Sciences (LIPI), 3.Faculty of Bioresource Sciences, Akita Prefectural University)

[MIS01-09] **Reconstruction of Hydraulic Conditions from Tsunami Deposits: Inverse Modeling using Deep-Learning Neural Network**

*Rimali Mitra[1], Hajime Naruse[1], Tomoya Abe[2] (1.Kyoto University, Graduate School of Science, 2.Research Institute of Geology and Geoinformation, Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST), Tsukuba, Japan)

[MIS01-10] Tsunami source estimation from tsunami deposit and numerical simulation

★Invited Papers

*Kenji Satake[1], Satoshi Kusumoto[2] (1.Earthquake Research Institute, University of Tokyo, 2.JAMSTEC)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

[M-IS02] Environmental, socio-economic and climatic changes in Northern Eurasia

convener:Pavel Groisman(NC State University Research Scholar at NOAA National Centers for Environmental Information, Asheville, North Carolina, USA), Shamil Maksyutov(National Institute for Environmental Studies), Evgeny P Gordov(Institute of Monitoring of Climatic and Ecological Systems SB RAS), Akiyo Yatagai(Hirosaki University)

[MIS02-01] Change in metals speciation in waters of Arctic lakes (1975-2018): climate, anthropogenic loads, geochemical feature

★Invited Papers

*Marina I Dinu[1] (1.Russian, Vernadsky Institute of geochemistry and analytical chemistry)

[MIS02-02] Revised methane emission estimate for West Siberia based on Landsat mapping of wetland types

*Shamil Maksyutov[1], Irina E Terentieva[2], Alexander F Sabrekov[2], Ilya Filippov[3], Mikhail V Glagolev[4,5] (1.National Institute for Environmental Studies, Tsukuba, Japan, 2.Institute of Ecology and Evolution, RAS, Moscow, Russia, 3.Yugra State University, Khanty-Mansyisk, Russia, 4.Institute of Forest Science, RAS, Uspenskoe, Russia, 5.M.V. Lomonosov Moscow State University, Moscow, Russia)

[MIS02-03] A climatological study on freezing rain, freezing drizzle, and freezing fog in northeastern China

Yang Bai[1], *Tetsuya Hiyama[2], Hatsuki Fujinami[2] (1.Graduate School of Environmental Studies, Nagoya University, 2.Institute for Space-Earth Environmental Research, Nagoya University)

[MIS02-04] Economic Assessment of Permafrost Degradation Effects on Road Infrastructure Sustainability under Climate Change in the Russian Arctic

*Dmitry Olegovich Eliseev[1], Boris Nikolaevich Porfiriev[2], Dmitry Andreevich Streletskiy[3] (1.Russian New University (RosNOU), Moscow, Russia; Sochi scientific research center, Russian Academy of Sciences, Sochi, Russia, 2.Institute of Economic Forecasting, Russian Academy of Sciences, Moscow, Russia, 3.George Washington University, Washington, United States; Earth Cryosphere Institute, Tyumen' Scientific Center, Siberian Branch, Russian Academy of Sciences, Tyumen', Russia)

[MIS02-05] Informal use of linear road infrastructure of the extraction of natural resources in Eastern Siberia.

*Viktor Bogdanov[1] (1.Institute of geography V.B. Sochava Siberian Branch of the Russian Academy of Sciences)

[MIS02-06] **Characterization of contemporary fire regimes in Russian boreal forest under impact of climate change and anthropogenic alterations: Thematic study of the Sakha Republic (Yakutia)**

*Kiunnei Kirillina[1], Wanglin Yan[1] (1.Graduate School of Media and Governance, Keio University SFC)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

[M-IS02] Environmental, socio-economic and climatic changes in Northern Eurasia

convener:Pavel Groisman(NC State University Research Scholar at NOAA National Centers for Environmental Information, Asheville, North Carolina, USA), Shamil Maksyutov(National Institute for Environmental Studies), Evgeny P Gordov(Institute of Monitoring of Climatic and Ecological Systems SB RAS), Akiyo Yatagai(Hirosaki University)

[MIS02-07] Analysis of CMIP6 Multi-model Climate Change Smulations and Projections Over Northern Eurasia

★Invited Papers

*Qingyun Duan[1], Xuewei Fan[2], Chenwei Shen[2], Chiyuan Miao[2] (1.Hohai University, 2.Beijing Normal University)

[MIS02-08] Evaluation of a snow scheme in Integrated Land Simulator

*Tomoko Nitta[1], Kei Yoshimura[1] (1.Institute of Industrial Science, the University of Tokyo)

[MIS02-09] **Closing water budgets of the three great Siberian River Basins**

*Pavel Shabanov[1], Ambroise Dufour[1], Olga Zolina[2], Sergey Gulev[1], Martin Wegmann[3] (1.Shirshov Institute of Oceanology, Russian Academy of Sciences, 2.Institut des Géosciences de l'Environnement, Université Grenoble Alpes, 3.World Meteorological Organisation, Geneva)

[MIS02-10] Evaluation of orographical precipitation over Central Asia and its super-ensemble and downscaling simulations to evaluate precipitation change under the warming environment

*Akiyo Yatagai[1], Saki Yanagisawa[1], Kumar Vinay[2], Ayano Senda[1], Minami Masuda[1] (1.Hirosaki University, 2.Texas A&M University)

[MIS02-11] **ENVIRONMENT CHANGES IN THE EURASIAN ARCTIC**

*Pavel Groisman[1,2,3], Sergey Gulev[2], Ambroise Dufour[2], Ge Peng[1], Dmitry Streletskiy[4], Nina Speranskaya[5], Nadezhda Tchebakova[6] (1.North Carolina Institute for Climate Studies, North Carolina State University, USA, 2.Institute of Oceanology, Russian Academy of Sciences, Russia, 3.Hydrology Science and Services Corporation, USA, 4.George Washington University, USA, 5.State Hydrologic Institute, Russia, 6.Forest Institute of the Siberian Branch of the Russian Academy of Sciences, Russia)

[MIS02-12] How much variation in land surface phenology can seasonal climate oscillations explain at pasture scale in Kyrgyzstan?

*Monika Anna Tomaszewska[1], Geoffrey M. Henebry[1,2] (1.Center for Global Change and Earth Observations, Michigan State University, East Lansing, MI 48823, USA, 2.Department of Geography, Environment, and Spatial Sciences, Michigan State University, East Lansing, MI, 48824, USA)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

[M-IS03] Structure and deformation in the overlying plate due to subduction and related feedbacks

convener:Hiroshi Sato(Earthquake Prediction Research Center, Earthquake Research Institute, The University of Tokyo), David A Okaya(University of Southern California), Eh Tan(Institute of Earth Sciences, Academia Sinica), Masahiro Ishikawa(Graduate School of Environment and Information Sciences Yokohama National University)

[MIS03-01] **Crustal structure of the Nankai subduction zone revealed by two decades of onshore-offshore and ocean-bottom seismometer data**

*Dan Bassett[1], Adrien Arnulf[2], Shuichi Kodaira[3], Ayako Nakanishi[3], Alistair Harding[4] (1.GNS Science, 2.University of Texas at Austin, 3.JAMSTEC, 4.Scripps Institution of Oceanography)

[MIS03-02] Lower lomit of seismogenic zone beneath Japan based on hyopocenter catalog determined with 3D seismic velocity structure

*Makoto MATSUBARA[1], Tomoko Elizabeth Yano[1], Hiroshi Sato[2] (1.National Research Institute for Earth Science and Disaster Resilience, 2.Earthquake Research Institute, the University of Tokyo)

[MIS03-03] Thermal structure of the Honshu arc deduced from high P-T ultrasonic experiments and seismic tomography

*Masahiro Ishikawa[1], Shigeki Sugita[1], Satoshi Fukunaga[2] (1.Graduate School of Environment and Information Sciences, Yokohama National University, 2.College of Engineering Science, Yokohama National University)

[MIS03-04] Back-arc spreading induced by weakening in the overriding plate and mantle wedge

*Eh Tan[1], Chi-Chin Lee[2] (1.Institute of Earth Sciences, Academia Sinica, 2.Department of Geosciences, National Taiwan University)

[MIS03-05] Origin of seismogenic source faults in the backarc of Honshu, Japan.

*Hiroshi Sato[1], Tatsuya Ishiyama[1], Tetsuo No[2], Makoto MATSUBARA[3], Shuichi Kodaira[2] (1.Earthquake Research Institute, The University of Tokyo, 2.Japan Agency for Marine-Earth Science and Technology, 3.National Research Institute for Earth Science and Disaster Resilience)

[MIS03-06] Stress loading on crustal source faults due to megathrust coupling: the Nankai Trough and the Kuril trench

*Akinori Hashima[1], Hiroshi Sato[1], Tatsuya Ishiyama[1], Andrew M. Freed[2], Thorsten W. Becker[3] (1.Earthquake Research Institute, University of Tokyo, 2.Purdue University, 3.The University of Texas at Austin)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

[M-IS03] Structure and deformation in the overlying plate due to subduction and related feedbacks

convener:Hiroshi Sato(Earthquake Prediction Research Center, Earthquake Research Institute, The University of Tokyo), David A Okaya(University of Southern California), Eh Tan(Institute of Earth Sciences, Academia Sinica), Masahiro Ishikawa(Graduate School of Environment and Information Sciences Yokohama National University)

[MIS03-07] Collapse of fore-arc crust: Cretaceous Japan case

*Yukio Isozaki[1] (1.Department of Earth Science and Astronomy, Multi-disciplinary Sciences - General Systems Studies, Graduate School of Arts and Sciences, The University of Tokyo)

[MIS03-08] First stage to reveal the structure of the Fujikawa-kako Fault Zone by the integrated seismic experiments across the northwestern region of the Izu collision zone, central Japan

*Tanio Ito[1], Ken'ichi Kano[2], Toshiki Watanabe[3], Shintaro Abe[1], Hiroshi Sato[4], Takaya Iwasaki[4], Tatsuya Ishiyama[4], Makoto MATSUBARA[5], Akira Fujiwara[6], Susumu Abe[7], Motonori Higashinaka[7] (1.Association for the Development of Earthquake Prediction, 2.Shizuoka University, 3.Nagoya University, 4.University of Tokyo, 5.NIED, 6.Geosys, 7.JGI, Inc.)

[MIS03-09] The shape of Philippine sea plate and the subsurface structure near Mt. Fuji

*Yasushi Harada[1], Hinako Nomachi[1], Kenya Yamanaka[1] (1.School of Marine Science and Technology, Tokai University)

[MIS03-10] Quaternary back-arc strain localization of Northeast Japan accommodated by fault-related folding

*Tatsuya Ishiyama[1], Hiroshi Sato[1], Naoko Kato[1], Shin Koshiya[2] (1.Earthquake Research Institute, University of Tokyo, 2.Department of Civil and Environmental Engineering, Faculty of Science and Engineering, Iwate University)

[MIS03-12] Tectonostratigraphic evolution of the North Pyrenean Fold and Thrust Belt and the Aquitaine foreland basin: constraint along a SSW-NNE cross-section (West Comminges – Mirande basins).

*Larissa NGOMBI MAVOUNGOU[1], Mary FORD[2], Frédéric CHRISTOPHOUL[3] (1.Department of Earth and Planetary Systems Science, Graduate School of Science, Hiroshima University, 2.CRPG, 15 Rue Notre Dame des Pauvres, 54 501 Vandoeuvre lès Nancy, Cedex, France, 3.GET, 14 Avenue Edouard Belin, 31 400 Toulouse, France)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

[M-IS04] An asteroid impact in SE Asia at 0.8 Ma and its effect on the environment and biota

convener:Ryuji Tada(Department of Earth and Planetary Science, Graduate School of Science, The Univeristy of Tokyo), Paul A Carling(University of Southampton), Wickanet Songtham(Nakhon Ratchasima Rajabhat University, Thailand), Kerry Sieh(Nanyang Technological University)

[MIS04-01] Converging lines of evidence for burial of the Australasian impact crater within the Bolaven volcanic field, Southern Laos

★Invited Papers

Kerry Sieh[1], *Jason S Herrin[1], Dayana Angel Schonwalder[1], Vanpheng Sihavong[2], Brian Jicha[3], Brad Singer[3], Weerachat Wewegwin[4], Paramesh Banerjee[1], Tawachai Chualaowanich[4], Punya Charusiri[5] (1.Earth Observatory of Singapore, Nanyang Technological University, Singapore, 2.Department of Geology and Mines, Ministry of Energy and Mines, Vientiane, Lao People's Democratic Republic, 3.Department of Geoscience, University of Wisconsin–Madison, Madison, Wisconsin, USA, 4.Department of Mineral Resources, Ministry of Natural Resources and Environment, Ratchatewi, Bangkok, Thailand, 5.Department of Geology, Chulalongkorn University, Khet Pathumwan, Bangkok, Thailand)

[MIS04-02] A terrestrial mafic component in Australasian tektites and associated strata; Geochemical record of the Bolaven impact.

*Jason S Herrin[1], Dayana Schonwalder[1], Kerry Sieh[1], James D. P. Moore[1], Tawatchi Chualaowanich[2], Brian Jicha[3], Brad Singer[3], Vanpheng Sihavong[4], Weerachat Wiwegwin[5], Punya Charusiri[5] (1.Earth Observatory of Singapore, Nanyang Technological University, 639798 Singapore, 2.Department of Mineral Resources, Ministry of Natural Resources and Environment, Ratchatewi, 10400 Bangkok, Thailand, 3.Department of Geoscience, University of Wisconsin–Madison, Madison, WI 53706, 4.Department of Geology and Mines, Ministry of Energy and Mines, Vientiane, Lao People's Democratic Republic, 5.Department of Geology, Chulalongkorn University, Khet Pathumwan, 10330 Bangkok, Thailand)

[MIS04-03] Identification of Ejecta Deposit formed by Australasian Tektite Event based on Discovery of Shocked Quartz and *in situ* Tektite Fragments in North Eastern Thailand

*Toshihiro Tada[1], Ryuji Tada[1,2,3], Paul Carling[4], Wickanet Songtham[5], Praphas Chansom[5], Toshihiro Kogure[1], Yu Chang[1], Eiichi Tajika[1] (1.Department of Earth and Planetary Science, The University of Tokyo , 2.Planetary Exploration Research Center, Chiba Institute of Technology, 3.Research Center for Earth System Science, Yunnan University, 4.Geography and Environmental Science, University of Southampton, 5.Northeastern Research Institute of Petrified Wood & Mineral Resources, Nakhon Ratchasima Rajabhat University)

[MIS04-04] Regionally-extensive ejecta layer of the Australian tektite strewn-field: the MIS 20 large meteorite impact in Indochina

*Paul A Carling[1,2], Toshihiro Tada[3], Ryuji Tada[3,4], Wickanet Songtham[5], Alan Cresswell[6], David Sanderson[6], Naomi Porat[7], Jaroon Duangkrayom[5], Luba Meshkova[2], Ian Croudace[2], Stephen Darby[2], Xuanmei Fan[1] (1.Chengdu University of Technology, 2.University of Southampton, 3.Chiba Institute of Technology, 4.Yunnan University, 5.Nakhon Ratchasima Rajabhat University, 6.Scottish Universities Environmental Research Centre, 7.Geological Survey of Israel)

[MIS04-05] Did Javan *Homo erectus* suffer a damage from an asteroid impact event?

★Invited Papers

*Masayuki Hyodo[1] (1.Research Center for Inland Seas, Kobe University)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

[M-IS05] Cenozoic Evolution of the Asian Monsoon and the Indo-Pacific Paleoclimates

convener:Masanobu Yamamoto(Faculty of Environmental Earth Science, Hokkaido University), Steven C Clemens(Brown University), Hongbo Zheng(Research Center for Earth System Science, Yunnan University), Ryuji Tada(Department of Earth and Planetary Science, Graduate School of Science, The Univeristy of Tokyo)

[MIS05-01] **The Western Pacific Warm Pool hydrology during the last 1.68 million years**

*Masanobu Yamamoto[1], Sohei Kikuchi[1], Yoji Yamamoto[1], Samantha Bova[2], Yair Rosenthal[2] (1.Faculty of Environmental Earth Science, Hokkaido University, 2.Rutgers University)

[MIS05-02] **Indonesian Throughflow variability during the Mid Pleistocene Transition (IODP 363 Site U1483)**

★Invited Papers

*Kenji Matsuzaki[1], Li Gong[2], Ann Holbourn[2], Wolfgang Kuhnt[2] (1.Atmosphere and Ocean Research Institute, The university of Tokyo, 2.Institute of Geoscience, Christian Albrechts University of Kiel)

[MIS05-04] Influences of East Asian summer and winter monsoons on the millennial-scale color alternation of Japan Sea sediment

★Invited Papers

*Takuya Sagawa[1], Yusuke Narita[2], Takuya Matsuzaki[3], Masafumi MURAYAMA[4], Takashi Hasegawa[1], Akiko Goto[1], Takeshi Nakagawa[5] (1.Institute of Science and Engineering, Kanazawa University, 2.Graduate School of Natural Science and Technology, Kanazawa University, 3.Center for Advanced Marine Core Research, Kochi University, 4.Faculty of Agriculture and Marine Science, Kochi Univeristy, 5.Ritsumeikan University)

[MIS05-05] Variations in sea surface environments recorded by algal biomarkers in the Japan Sea off the western Hokkaido (IODP Site U1422) over the last 700 ky

*Asako Suzuki[1], Ken Sawada[1], Saki Yanou[1], Satoshi Furota[2], Tomohisa Irino[3] (1.Graduate School of Science, Hokkaido University, 2.National Institute of Advanced Industrial Science and Technology, 3.Graduate School of Environment, Hokkaido University)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

[M-IS05] Cenozoic Evolution of the Asian Monsoon and the Indo-Pacific Paleoclimates

convener:Masanobu Yamamoto(Faculty of Environmental Earth Science, Hokkaido University), Steven C Clemens(Brown University), Hongbo Zheng(Research Center for Earth System Science, Yunnan University), Ryuji Tada(Department of Earth and Planetary Science, Graduate School of Science, The Univeristy of Tokyo)

[MIS05-06] Pleistocene Water Isotope Reconstructions from the Indian Monsoon Region

*Steven C Clemens[1], Masanobu Yamamoto[2], Sarah McGrath[1], Kaustubh Thirumalai[3], Yongsong Huang[1], Kerr Katrina [4], Richey Julie [5], Rosenthal Yair[6] (1.Brown University, 2.Hokkaido University, 3.University of Arizona, 4.Open University, 5.USGS, 6.Rutgers University)

[MIS05-07] Depositional environment at IODP Site U1445 in the northeastern Indian Ocean based on the litho- and isotope-stratigraphy

*Tomohisa Irino[1], Masanobu Yamamoto[1], Liviu Giosan[2], Steven Clemens[3] (1.Faculty of Environmental Earth Science, Hokkaido University, 2.Woods Hole Institution of Oceanography, 3.Brown University)

[MIS05-08] Reconstruction of asian dust flux variability since 10 Ma based on grain size specific mineral composition at IODP Site U1425 in the Japan Sea

*Mui Fa Alison Lee[1], Tomohisa Irino[1] (1.Faculty of Environmental Earth Science, Hokkaido University)

[MIS05-09] Changes in Tibetan Plateau latitude as an important factor for understanding East Asian climate since the Eocene: A modeling study

*Ran Zhang[1] (1.Institute of Atmospheric Physics, Chinese Academy of Sciences, Beijing, China)

[MIS05-10] From Desert to Monsoon: Irreversible Climatic Transitionat ~36 Ma in Southeastern Tibetan Plateau

*Hongbo Zheng[1], Qing Yang[1], Shuo Cao[3], Peter Dominic Clift[4], Mengying He[2], Akihiro Kano[5], Ryuji Tada[5], Fred Jourdan[6] (1.Research Center for Earth System Science, Yunnan University, 2.School of Geography Science, Nanjing Normal University, 3.School of Earth Sciences, China University of Geosciences, 4.Department of Geology and Geophysics, Louisiana State University, 5.Department of Earth and Planetary Science, University of Tokyo, 6.Western Australian Argon Isotope Facility, Department of Applied Geology and JdL Centre, Curtin University)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

[M-IS06] Dust

convener:Ishizuka Masahide(Kagawa University), Yasunori Kurosaki(Arid Land Research Center, Tottori University), Thomas Sekiyama(Meteorological Research Institute), Kana Nagashima(Japan Agency for Marine-Earth Science and Technology, Research and Development Center for Global Change)

[MIS06-01] Assessing health risks of exposure to Asian dust among healthy individuals

★Invited Papers

*Kazunari Onishi[1], Masanori Nojima[2], Tsuyoshi Thomas Sekiyama[3], Masato Shinoda[4], Youichi Kurozawa[5], Yasunori Kurosaki[6] (1.Graduate School of Public Health, Support Unit for Conducting Clinically Essential Studies, St.Lukes International University, 2.Center for Translational Research, The Institute of Medical Science Hospital, The University of Tokyo, 3.Meteorological Research Institute, 4.Graduate School of Environmental Studies, Nagoya University, 5.Division of Health Administration and Promotion, Department of Social Medicine, Faculty of Medicine, Tottori University, 6.Arid Land Research Center, Tottori University)

[MIS06-02] Implications of overestimates in mineral dust emissions from Australia on labile iron concentrations in aerosols

*Akinori Ito[1], Morgane M. G. Perron[2], Bernadette C. Proemse[2], Michal Strzelec[2], Melanie Gault-Ringold[2], Philip W. Boyd[2], Andrew R. Bowie[2] (1.Japan Agency for Marine-Earth Science and Technology, 2.University of Tasmania)

[MIS06-03] Low dust generation from active sand dunes

*Itzhak Katra[1], Nitzan Swet[1], Jasper Kok[2], Raleigh Martin[2], Yue Huang[2], Hezi Yizhaq[1] (1.Ben-Gurion University, 2.University of California, Los Angeles)

[MIS06-04] What are the main land-surface processes affecting saltation activities in a dust hotspot of the Mongolian desert steppe?

*Kaman Kong[1], Banzragch Nandintsetseg[1,2], Masato Shinoda[1], Masahide Ishizuka[3], Yasunori Kurosaki[4] (1.Graduate School of Environmental Studies, Nagoya University, 2.School of Arts and Sciences, National University of Mongolia, 3.Faculty of Engineering and Design, Kagawa University, 4.Arid Land Research Center, Tottori University)

[MIS06-05] Effects of various vegetation factors on sand saltation from the viewpoint of roughness

*Akito Kono[1], Toshiya Okuro[1] (1.Graduate School of Agricultural and Life Sciences, The University of Tokyo)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

[M-IS07] Aqua planetology

convener:Yasuhito Sekine(Earth-Life Science Insitute, Tokyo Institute of Technology), Hidenori Genda(Earth-Life Science Institute, Tokyo Institute of Technology), Keisuke Fukushi(Institute of Nature & Environmental Technology, Kanazawa University), Tomohiro Usui(Japan Aerospace Exploration Agency)

[MIS07-01] The Mystery of Unexpected Seasonal Rise in Oxygen on Mars

★Invited Papers

*Sushil K Atreya[1], Melissa G Trainer[2], Paul R Mahaffy[2], Michael H Wong[1] (1.University of Michigan Ann Arbor, 2.NASA-GSFC)

[MIS07-02] Water vapor vertical profiles on Mars: Results from the first full Mars Year of TGO/NOMAD science operations

*Shohei Aoki[1,2], Ann Carine Vandaele[1], Frank Daerden [1], Geronimo Luis Villanueva[3], Giuliano Liuzzi [3], Ian Thomas [1], Justin Erwin [1], Loïc Trompet [1], Lori Neary [1], Robert Todd Clancy[4], Michael Doyle Smith[3], Séverine Robert [1], Arianna Piccialli [1], Sébastien Viscardy [1], Bojan Ristic [1], Miguel Angel Lopez Valverde [5], Manish Patel [6], Giancarlo Bellucci [7], Jose Juan Lopez Moreno [5] (1.Royal Belgian Institute for Space Aeronomy, 2.Université de Liège, 3.NASA Goddard Space Flight Center, 4.Space Science Institute, 5.Instituto de Astrofísica de Andalucía, 6.Open University, 7.Istituto di Astrofisica e Planetologia)

[MIS07-03] Explanation for the increase in high altitude water on Mars observed by NOMAD during the 2018 global dust storm

*Lori Neary[1], Frank Daerden[1], Shohei Aoki[1], James Whiteway[2], Robert Todd Clancy[3], Michael Smith[4], Sébastien Viscardy[1], Justin Tyler Erwin[1], Ian Thomas[1], Geronimo Villanueva[4], Giuliano Liuzzi[4], Matteo Crismani[5], Michael Wolff[3], Stephen Lewis[6], James Holmes[6], Manish Patel[6], Marco Giuranna[7], Cedric Depiesse[1], Arianna Piccialli[1], Séverine Robert[1], Loic Trompet[1], Yannick Willame[1], Bojan Ristic[1], Ann Carine Vandaele[1] (1.Royal Belgian Institute for Space Aeronomy, Brussels, BE, 2.Centre for Research in Earth and Space Science, York University, Toronto, ON, CA, 3.Space Science Institute, Boulder, CO, USA, 4.NASA Goddard Space Flight Center, Greenbelt, MD, USA, 5.NPP/USRA, NASA Goddard Space Flight Center, Planetary Systems Laboratory, Code 693, Greenbelt, MD, USA, 6.School of Physical Sciences, The Open University, Milton Keynes, UK, 7.Instituto di Astrofisica e Planetologia Spaziali, Instituto Nazionale di Astrofisica, Rome, IT)

[MIS07-04] Stability of atmospheric redox states of early Mars inferred from time response of the regulation of H and O losses

*Shungo Koyama[1], Naoki Terada[1], Hiromu Nakagawa[1], Takeshi Kuroda[1] (1.Tohoku university)

[MIS07-05] In-situ detection of early Noachian nitrogen-bearing organics from Martian carbonates

*Mizuho Koike[1], Ryoichi Nakada[2], Kajitani Iori[1,3], Tomohiro Usui[1,4], Yusuke Tamenori[5], Haruna Sugahara[1], Atsuko Kobayashi[4,6] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency , 2.Kochi Institute for Core Sample Research, Japan Agency for Marine-Earth Science and Technology, 3.Department of Earth and Planetary Science, The University of Tokyo, 4.Earth-Life Science Institute, Tokyo Institute of Technology, 5.Research and Utilization Division, Japan Synchrotron Radiation Research Institute, 6.Division of Geological and Planetary Sciences, California Institute of Technology)

[MIS07-06] Liquid Groundwater on Mars Across Time & Implications for Subsurface Habitability

★Invited Papers

*Vlada Stamenkovic[1], Ana-Catalina Plesa[2], Doris Breuer[2], Jack Mustard[3], Jesse Tarnas[3] (1.Jet Propulsion Laboratory, 2.DLR Berlin, 3.Brown University)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

[M-IS07] Aqua planetology

convener:Yasuhito Sekine(Earth-Life Science Insitute, Tokyo Institute of Technology), Hidenori Genda(Earth-Life Science Institute, Tokyo Institute of Technology), Keisuke Fukushi(Institute of Nature & Environmental Technology, Kanazawa University), Tomohiro Usui(Japan Aerospace Exploration Agency)

[MIS07-07] Potential Positive Feedback Mechanisms in an Anoxic Environmental System of a Planet with CO_2-CH_4 Atmosphere

*Yasuto Watanabe[1], Eiichi Tajika[1], Kazumi Ozaki[2], Peng Hong[3] (1.The University of Tokyo, 2.Toho University, 3.Chiba Institute of Technology)

[MIS07-08] Sulfur species in carbonates of a 4.1-billion-year old Martian meteorite constraining conditions of water on ancient Mars

*Kajitani Iori[1,2], Ryoichi Nakada[3], Mizuho Koike[1], Gaku Tanabe[4], Tomohiro Usui[1,5], Tetsuya Yokoyama[4], Keisuke Fukushi[6] (1.Institute of Space and Astronautical Science, 2.The University of Tokyo, 3.Japan Agency for Marine-Earth Science and Technology (JAMSTEC), 4.Tokyo Institute of Technology, 5.Earth-Life Science Institute, Tokyo Institute of Technology, 6.Kanazawa University)

[MIS07-09] Experimental and thermodynamic approach on aqueous alteration of synthetic chondrite under reducing and low temperature conditions: Implication for aqueous alteration in meteorite parent bodies

*Sakiko Kikuchi[1], Takazo Shibuya[1] (1.Japan Agency for Marine-Earth Science and Technology)

[MIS07-10] Geo-electrochemical Decomposition of Amino Acids on Icy Planetesimals Reproduces Organics in Carbonaceous Meteorites

*LI Yamei[1], Norio Kitadai[1,2], ryuhei nakamura[1], Yasuhito Sekine[1] (1.Earth-Life Science Institute, Tokyo Institute of Technology, 2.Japan Agency for Marine-Earth Science and Technology)

[MIS07-11] Reduction of U(VI) to U(IV) by Fe(II)-bearing smectite

*Yoshio Takahashi[1], Jing Sun[1], Takafumi Hamamoto[2], Takayuki sasaki[3] (1.The University of Tokyo, 2.NUMO, 3.Kyoto University)

[MIS07-12] Fluorescence spectroscopy is a tool for tracing dissolved organic carbon in hot spring ecosystems

*Hilairy Ellen Hartnett[1], Joshua Nye[1] (1.Arizona State University)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

[M-IS07] Aqua planetology

convener:Yasuhito Sekine(Earth-Life Science Insitute, Tokyo Institute of Technology), Hidenori Genda(Earth-Life Science Institute, Tokyo Institute of Technology), Keisuke Fukushi(Institute of Nature & Environmental Technology, Kanazawa University), Tomohiro Usui(Japan Aerospace Exploration Agency)

[MIS07-13] **Coupling Geochemistry to Magnetic Induction, Gravity, and Seismology in Icy Ocean Worlds**

★Invited Papers

*Steven Douglas Vance[1], Bruce G Bills[1], Mark P Panning[1], Corey Cochrane[1], Krista Soderlund[2], Tom Nordheim[1], J. Michael Brown[3], Baptiste Journaux[3], Marshall Styczinski[3], Carol Paty[4], Saikiran Tharimena[1], Mohit Melwani Daswani[1], Marc Neveu[5], Keith Chin[1] (1.NASA Jet Propulsion Laboratory, California Institute of Technology, 2.University of Texas, Austin, 3.University of Washington, Seattle, 4.University of Oregon, Eugene, 5.NASA Goddard Space Flight Center)

[MIS07-14] The Effect of Pore Structure on Water Infiltration under Different Gravity

*Yasushi Mori[1], Long Thanh Bui[1] (1.Graduate School of Environmental and Life Science, Okayama University)

[MIS07-15] Deep-seated hydrothermal circulation beneath the rdige axis: a case study of crustal diopsidite from Oman ophiolite

*Norikatsu Akizawa[1], Akira Miyake[2], Akira Tsuchiyama[3,4], Yusuke Yokoyama[1], Takahiro AZE[1], Hisashi Asanuma[5] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Graduate School of Science, Kyoto University, 3.Research Organization of Science and Technology, Ritsumeikan University, 4.Guangzhou Institute of Geochemistry, Chinese Academy of Sciences, 5.Geochemical Research Center, The University of Tokyo)

[MIS07-16] Constraint of salt compositions on Europa's surface from observations using Subaru telescope and laboratory experiments

*Shuya Tan[1,2], Yasuhito Sekine[1], Masayuki Kuzuhara[3,4], Taisei Kurosaki[5], Takashi Kikuchi[5], Hisayuki Suematsu[5], Tetsuya Hama[6], Yoshio Takahashi[2] (1.Earth-Life Science Institute (ELSI), Tokyo Institute of Technology, 2.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 3.Astrobiology Center, NINS, 4.National Astronomical Observatory of Japan (NAOJ), 5.Extreme Energy-Density Research Institute (EDI), Nagaoka University of Technology, 6.Komaba Institute for Science, The University of Tokyo)

[MIS07-17] Field investigation on capturing of lake water salts within surface ice on ice-covered saline lakes in Mongolia: Implications for icy shell compositions of Solar System icy bodies.

*Masahiro Yoda[1,2], Yasuhito Sekine[1,3], Keisuke Fukushi[3,4], Takuma Kitajima[4], Baasansuren Gankhurel[4], Davaadorj Davaasuren[5], Daigo Shoji[1], Yoshio Takahashi[2] (1.Earth-Life Science Institute of Tokyo Tech, 2.Department of Earth and Planetary Science, The University of Tokyo, 3.Institute of Nature and Environmental Technology, Kanazawa University, 4.Graduate School of Natural Science and Technology, Kanazawa University, 5.National University of Mongolia)

[MIS07-18] Water vapor plumes at Jupiter’s moon Europa - what we know and what we do not know

★Invited Papers

*Lorenz Roth[1] (1.KTH Royal Institute of Technology, Stockholm, Sweden)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

[M-IS08] Paleoclimatology and paleoceanography

convener:Yusuke Okazaki(Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University), Benoit Thibodeau(University of Hong Kong), Akitomo Yamamoto(Japan Agency for Marine-Earth Science and TechnologyAtmosphere and Ocean Research Institute), Hitoshi Hasegawa(Faculty of Science and Technology, Kochi University)

[MIS08-01] **Beryllium isotopes from marine and lake sediments indicate melting of the West and East Antarctic Ice Sheet during the 4.2 Ka BP climate event**

★Invited Papers

*Adam David Sproson[1,2], Yusuke Yokoyama[1,2], Yoshinori Takano[2], Rebecca Totten Minzoni[3], Bethany Behrens[1], Yosuke Miyairi[1], Takahiro AZE[1] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Department of Biogeochemistry, Japanese Agency for Marine-Earth Science and Technology, 3.Department of Geological Sciences, The University of Alabama)

[MIS08-02] **Reconstruction of the ice sheet history based on glacial geomorphology and surface exposure dating on the Soya Coast, Lützow-Holm Bay, East Antarctica**

*Moto Kawamata[1], Yusuke Suganuma[2,1], Koichiro Doi[2,1], Keiji Misawa[2,1], Motohiro Hirabayashi[2], Akihisa Hattori[1], Takanobu Sawagaki[3] (1.Department of Polar Science, School of Multidisciplinary Science, SOKENDAI (The Graduate Unversity for Advanced Studies), 2.National Institute of Polar Research, 3.Hosei University)

[MIS08-03] A portable system for acquisition of low-distortion sediment core images using computer vision and deep learning for post-processing

*Stephen Obrochta[1], Szilárd Zsolt Fazekas[2], Morén Jan[3] (1.Akita University Graduate School of International Resource Science, 2.Akita University Engineering Department, 3.Okinawa Institute of Science and Technology)

[MIS08-04] **Paleoenvironmental evolution and diagenesis of the Miocene Onnagawa Formation from mineral and elemental fluctuations**

*Jumpei Yoshioka[1], Junichiro Kuroda[2], Ryuji Tada[1,3], Kenji Matsuzaki[2] (1.Department of Earth and Planetary Science, the University of Tokyo, 2.Department of Ocean Floor Geoscience, Atmosphere and Ocean Research Institution, the University of Tokyo, 3.Yunnan University)

[MIS08-05] Reconstruction of paleoclimatic signals from groundwater in large aquifers-a case study in Leizhou peninsula, Southern China

*Shaoheng Li[1], Jianyao Chen[1], Dioni Cendon[2], Florian Freundt[3], Zongyu Chen[4], Guomin Yang[5], Shuang Xiao[2] (1.School of Geography and Planning, Sun Yat-sen University, Guangzhou, China, 2.Australian Nuclear Science and Technology Organisation, Kirrawee, Australia, 3.Institute of Environmental Physics, Heidelberg University, Im Neuenheimer Feld 229, 69120 Heidelberg, Germany, 4.Institute of Hydrogeology and Environmental Geology, Chinese Academy of Geological Sciences, Shijiazhuang, China, 5.Hefei National Laboratory for Physical Sciences at the Microscale, University of Science and Technology of China, Hefei, China)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

[M-IS08] Paleoclimatology and paleoceanography

convener:Yusuke Okazaki(Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University), Benoit Thibodeau(University of Hong Kong), Akitomo Yamamoto(Japan Agency for Marine-Earth Science and TechnologyAtmosphere and Ocean Research Institute), Hitoshi Hasegawa(Faculty of Science and Technology, Kochi University)

[MIS08-06] **Climate conditions of the past 200 years recorded in a tufa from Tokunoshima, Kagoshima Prefecture**

*Akira Murata[1], Hirokazu Kato[1], Akihiro Kano[1] (1. Department of Earth and Planetary Science, The University of Tokyo)

[MIS08-07] **Preliminary results of 10.5 m core record from lake Olgoy, Valley of the Lake in Mongolia**

*Uyangaa Udaanjargal[1], Noriko Hasebe[1], Davaadorj Davaasuren, Yudai Igarashi[1], Keisuke Fukushi[1], Hitoshi Hasegawa[2], Baasansuren Gankhurel[1], Nagayoshi Katsuta, Shuuhaaz Ganbat, Ichinnorov Niiden (1.Kanazawa University, 2.Kochi University)

[MIS08-08] Sea Levels and coastal evolutions during the Medieval Climate Anomaly related to the construction and the abandonment of the ancient harbor “Tangseong”, western coast of Korea Peninsula, presumed by diatom analysis

*Kaoru Kashima[1], Dong-Yoon Yang[2], MIn Han[2] (1.Department of Earth and Planetary Sciences, Kyushu University, 2.Korea Institute of Geoscience & Mineral Resources (KIGAM))

[MIS08-09] **Diatom composition and distribution in surface sediments of the Laptev and East-Siberian seas and their changes during last decades**

*Mariia Sergeevna Obrezkova[1], Ira Borisovna Tsoy[1], Anastasiya Evgenievna Kolyada[1,2], Aleksandr Nikolaevich Kolesnik[1], Aleksandr Nikolaevich Charkin[1] (1.Pacific Oceanological Institute, Far Eastern Branch, Russian Academy of Sciences, 2.Far Eastern Federal University)

[MIS08-10] **Impact of catastrophic natural events on accumulation of diatoms in sediments of Amur Bay, Sea of Japan**

*Irina Aleksandrovna Prushkovskaya[1], Ira Borisovna Tsoy[1] (1.Pacific Oceanological Institute, Far Eastern Branch, Russian Academy of Sciences)

[MIS08-11] Carbon, oxygen and neodymium isotope characterization of recent benthic foraminifers around Okinawa-jima, southwestern Japan.

*Andros Daniel Cruz Salmeron[1], Hideko Takayanagi[1], Shigeyuki Wakaki[2], Hitomi Uchimura Wakaki[3], Takuya Itaki[4], Tsuyoshi Ishikawa[2], Yasufumi Iryu[1] (1.Tohoku University, 2.JAMSTEC, 3.Kochi University, 4.AIST)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

[M-IS08] Paleoclimatology and paleoceanography

convener:Yusuke Okazaki(Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University), Benoit Thibodeau(University of Hong Kong), Akitomo Yamamoto(Japan Agency for Marine-Earth Science and TechnologyAtmosphere and Ocean Research Institute), Hitoshi Hasegawa(Faculty of Science and Technology, Kochi University)

[MIS08-12] Ecosystem response to Cretaceous OAEs - the continental perspective

★Invited Papers

*Ulrich Heimhofer[1] (1.Leibniz University Hannover, Germany)

[MIS08-13] Carbon and hydrogen isotopes of C_{40} alkenones and C_{41} *n*-alkane from OAE2 interval of IODP Site U1516 in southern high latitude

*Takashi Hasegawa[1], Akiko S. Goto[1] (1.Faculty of Geoscience and Civil Engineering, Institute of Science and Engineering, Kanazawa University)

[MIS08-14] Millennial-scale climate instability in 'hothouse' state: implication from mid-Cretaceous and Quaternary lacustrine records in Mongolia

*Hitoshi Hasegawa[1] (1.Faculty of Science and Technology, Kochi University)

[MIS08-15] The history of Earth's biospheric productivity: a biogeochemical modeling perspective

★Invited Papers

*Kazumi Ozaki[1] (1.Toho University)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

[M-IS08] Paleoclimatology and paleoceanography

convener:Yusuke Okazaki(Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University), Benoit Thibodeau(University of Hong Kong), Akitomo Yamamoto(Japan Agency for Marine-Earth Science and TechnologyAtmosphere and Ocean Research Institute), Hitoshi Hasegawa(Faculty of Science and Technology, Kochi University)

[MIS08-16] Change in the Atlantic Meridional Overturning Circulation over the last 1,500 years

★Invited Papers

*Benoit Thibodeau[1] (1.The University of Hong Kong, Division of Earth and Planetary Sciences & SWIRE Institute of Marine Science)

[MIS08-17] Simulating the Atlantic Meridional Overturning Circulation of the glacial period with comprehensive climate models

★Invited Papers

*Sam Sherriff-Tadano[1] (1.Atmosphere and Ocean Research Institute, the University of Tokyo)

[MIS08-18] **Deglacial productivity changes reflect XRF Br fueled by Cordilleran Ice Sheet dynamics**

*Md Nurunnabi Mondal[1], Keiji Horikawa[2], Katsuya Nejigaki[3], Hideki Minami[4], Masafumi MURAYAMA[5], Osamu Seki[6], Yusuke Okazaki[7] (1.a. Graduate School of Science and Engineering for Education, University of Toyama, Japan, b. Department of Fisheries Management, Bangabandhu Sheikh Mujibur Rahman Agricultural University, Bangladesh, 2.Graduate School of Science and Engineering for Research, University of Toyama, Japan, 3.Graduate School of Integrated Arts and Sciences, Kochi University, Japan, 4.School of Biological Science and Engineering, Tokai University, Japan, 5.Faculty of Agriculture and Marine Science, Kochi University, Japan, 6.Institute of Low Temperature Science, Hokkaido University, Japan, 7.Graduate School of Science, Kyushu University, Japan)

[MIS08-19] Ventilation change in the southern Bering Sea since the last glacial maximum

*Yusuke Okazaki[1], Hirofumi Asahi[2] (1.Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University, 2.Center for Advance Marine Core Research, Kochi University)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

[M-IS08] Paleoclimatology and paleoceanography

convener:Yusuke Okazaki(Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University), Benoit Thibodeau(University of Hong Kong), Akitomo Yamamoto(Japan Agency for Marine-Earth Science and TechnologyAtmosphere and Ocean Research Institute), Hitoshi Hasegawa(Faculty of Science and Technology, Kochi University)

[MIS08-21] Planktonic foraminiferal analysis of the Plio-Pleistocene sequence at IODP Site U1499: Response of the northern South China Sea environment to the intensity of the East Asian monsoon after Pliocene

*Mizuki Kitamura[1], Akira Furusawa[1], Hiroki Hayashi[1] (1.SHIMANE University)

[MIS08-22] Rapid and precise carbon dioxide clumped isotope composition analysis by tunable infrared laser differential absorption spectroscopy

*David L Dettman[1], Zhennan Wang[1], Jay Quade[1], David D Nelson[2], J Barry McManus[2], Katharine W Huntington[3], Andrew J Schauer[3], Saburo Sakai[4] (1.Univ. of Arizona, Dept. of Geosciences, 2.Aerodyne Research Inc., Boston, Massachusetts, 3.Univ. of Washington, Dept. of Earth and Space Sciences, 4.Japan Agency for Marine-Earth Science and Technology, Inst. of Biogeochemistry)

[MIS08-23] Holocene biomass burning history reconstructed from the Lake Suigetsu sediments

*Song Lu[1], Yoshie Nakai[1], Youhei Yamashita[2], Tomohisa Irino[2], Yuzo Miyazaki[3], Ryuji Tada[4], Takeshi Nakagawa[5] (1.Graduate School of Environmental Science, Hokkaido University , 2.Faculty of Environmental Earth Science, Hokkaido University, 3.Institute of Low Temperature Science, Hokkaido University , 4.Department of Earth and Planetary Science , Graduate School of Science, The University, of Tokyo , 5.Research Center for Palaeoclimatology, Ritsumeikan University)

[MIS08-24] Pollen isotope records from Lake Suigetsu, Japan

★Invited Papers

*Keitaro Yamada[1], Takayuki Omori[2], Ikuko Kitaba[3], Yamasaki Akiteru[4], Takeshi Nakagawa[3] (1.Research Organization of Science and Technology, Ritsumeikan University, 2.The University Museum, The University of Tokyo, 3.Research Centre for Palaeoclimatology, Ritsumeikan University, 4.Fukui Prefectural Satoyama-Satoumi Reserch Institute)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

[M-IS09] Interdisciplinary studies on pre-earthquake processes

convener:Katsumi Hattori(Department of Earth Sciences, Graduate School of Science, Chiba University), Dimitar Ouzounov(Center of Excellence in Earth Systems Modeling & Observations (CEESMO) , Schmid College of Science & Technology Chapman University, Orange, California, USA), Jann-Yenq LIU(Department of Space Science and Engineering, National Central University, Taiwan), Qinghua Huang(Peking University)

[MIS09-01] Prediction of Geomagnetic Daily Variations

*Suqin Zhang[1] (1.Institute of Geophysics, China Earthquake Administration)

[MIS09-02] **Evaluation of the 2017 *M* 6.6 Jinghe earthquake epicenter based on the Parkinson vector**

*aisa yisimayili[1,2], Chieh-Hung Chen[1], Zhiqiang Mao[1] (1.China University of Geosciences, 2.Earthquake Agency of Xinjiang Uygur Autonomous Region)

[MIS09-03] Seismogenic structures in western Yunnan revealed by three-dimensional magnetotelluric imaging

Tao Ye[1,2], Xiaobin Chen[2], *Qinghua Huang[1] (1.Peking University, 2.Institute of Crustal Dynamics, China Earthquake Administration)

[MIS09-04] **Seismo-conductivity anomaly associated with the 2017 M_S 7.0 Jiuzhaigou earthquake**

*Zhiqiang Mao[1], Chieh-Hung Chen[1], Suqin Zhang[2], Aisa Yisimayili[3] (1.China University of Geosciences, 2.Institute of Geophysics, China Earthquake Administration, 3.Earthquake Agency of Xinjiang Uygur Autonomous Region)

[MIS09-05] The ULF waves possibly related to earthquakes in geomagnetic field from CSES and SWARM satellites

★Invited Papers

*Xuemin Zhang[1], Yulin Zhou[1] (1.Institute of Earthquake Forecasting, China Earthquake Administration)

[MIS09-06] Statistical analysis of pre-earthquake electromagnetic anomalies in the Ultra Low Frequency (ULF) range

★Invited Papers

*Sheldon Dwight Warden[1,2], Laura MacLean[1], Jim Lemon[1], Dan Schneider[1] (1.QuakeFinder, 250 Cambridge Avenue (Suite 204), Palo Alto, CA 94306-1555, United States, 2.Hyperion Geophysical Services, 7 rue de Châtenois, 67100, Strasbourg, France.)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

[M-IS09] Interdisciplinary studies on pre-earthquake processes

convener:Katsumi Hattori(Department of Earth Sciences, Graduate School of Science, Chiba University), Dimitar Ouzounov(Center of Excellence in Earth Systems Modeling & Observations (CEESMO) , Schmid College of Science & Technology Chapman University, Orange, California, USA), Jann-Yenq LIU(Department of Space Science and Engineering, National Central University, Taiwan), Qinghua Huang(Peking University)

[MIS09-07] Statistical analysis of AETA geo-acoustic signal based on Fractal Theory

*Jing Wang[1,2], Shanshan Yong[1,2], Xin'an Wang[1,2], Binyan Ma[1,2], Qinmeng Guo[1,2], Binghui Jiang[1,2], Chao Yang[1,2] (1.Earthquake Monitoring and Prediction Technology Research Center, Peking University Shenzhen Graduate School, Shenzhen, China, 2.The Key Laboratory of Integrated Micro-Systems Science and Engineering Applications, Peking University Shenzhen Graduate School, Shenzhen, China)

[MIS09-08] Statistical study on correlation between AETA electromagnetic signals and earthquakes

*Qinmeng Guo[1,2], Shanshan Yong[1,2], Xin'an Wang[1,2], Binghui Jiang[1,2], Jing Wang[1,2], Chao Yang[1,2] (1.Earthquake Monitoring and Prediction Technology Research Center, Peking University Shenzhen Graduate School, Shenzhen, China, 2.The Key Laboratory of Integrated Micro-Systems Science and Engineering Applications,Peking University Shenzhen Graduate School, Shenzhen, China)

[MIS09-09] Negentropy anomaly analysis of the borehole strain data associated with the *M*s 7.0 Lushan earthquake

*Zining Yu[1,2], Hattori Katsumi[2], Kaiguang Zhu[1], Chengquan Chi[1], Xiaodan He[1] (1.Key Laboratory of Geo-Exploration Instrumentation, Ministry of Education, Jilin University, Changchun, China, 2.Graduate School of Science, Chiba University, Chiba, Japan)

[MIS09-10] Observations of Backstops in the Overriding Plate During the Megathrust Earthquake Cycle

*Rob Govers[1], Taco Broerse[1], Matthew Herman[1] (1.Utrecht University, Netherlands)

[MIS09-11] **Relationships between seismogenic areas and crustal vibration before earthquakes**

★Invited Papers

*Chieh-Hung Chen[1], Yang-Yi Sun[1], Strong Wen[2], Peng Han[3], Li-Ching Lin[4] (1.Institute of Geophysics and Geomatics, China University of Geosciences, Wuhan, Hubei, China, 2.Department of Earth and Environmental Sciences, National Chung Cheng University,Chia-Yi, Taiwan, 3.Department of Earth and Space Sciences, Southern University of Science and Technology, Shenzhen, China, 4.Science and Technology Policy Research and Information Center Taiwan, Taipei, Taiwan)

[MIS09-12] **Statistical Test of Spatio-Temporal Variation of b Value in Japan**

*weiyun xie[1], Peng Han[2], Katsumi Hattori[1] (1.chiba university, 2.Southern University of Science and Technology)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

[M-IS09] Interdisciplinary studies on pre-earthquake processes

convener:Katsumi Hattori(Department of Earth Sciences, Graduate School of Science, Chiba University), Dimitar Ouzounov(Center of Excellence in Earth Systems Modeling & Observations (CEESMO) , Schmid College of Science & Technology Chapman University, Orange, California, USA), Jann-Yenq LIU(Department of Space Science and Engineering, National Central University, Taiwan), Qinghua Huang(Peking University)

[MIS09-13] The latest results of CSES mission

★Invited Papers

*Zeren Zhima[1], Xuhui Shen[1], Jianping Huang[1] (1.Institute of Crustal Dynamics, China Earthquake Administration)

[MIS09-14] Seismo-ionospheric precursors (SIPs) of the TEC associated with the 21 September 1999 M7.3 Chi-Chi earthquake and the statistical analyses on SIPs in Taiwan

*YUN-CHENG WEN[1], JANN-YENQ Liu[1] (1.Institute of Space Science, National Central University, Taiwan)

[MIS09-15] **The three-dimensional ionospheric tomography in Japan using the adaptive Kalman Filter algorithm**

*Rui Song[1], Katsumi Hattori[2], Xuemin Zhang[3], Chie Yoshino[2] (1.Graduate School of Science and Engeering, Chiba University, 2.Graduate School of Science, Chiba University, 3.Institute of Earthquake Forecasting, China Earthquake Administration)

[MIS09-16] **FORMOSAT-5/AIP observe seismo-ionospheric precursors and ionospheric storms**

*JANN-YENQ Liu[1,2,3], FU-YUAN CHANG[1,2], YUN-CHENG WEN[2], Yuh-ING Chen[4], Chi-Kuang Chao[1,2], Loren Chang[1,2] (1.Center for Astronautical Physics and Engineering, National Central University, TAIWAN, 2.Graduate Institute of Space Science and Engineering, National Central University, TAIWAN, 3.Center for Space and Remote Sensing Research, National Central University, TAIWAN, 4.Graduate Institute of Statistics, National Central University, TAIWAN)

[MIS09-17] Transient Effects in Atmosphere and Ionosphere Associated with January 2020 Caribbean Earthquakes

*Dimitar Ouzounov[1], Sergey Pulinets[2], Alexander Rozhnoi[3], Maria Solovieva[3], Katsumi Hattori[4], Menas Kafatos[1], Patrick Taylor[5] (1.Center of Excellence in Earth Systems Modeling & Observations (CEESMO) , Schmid College of Science & Technology Chapman University, Orange, California, USA, 2.Space Research Institute, Russian Academy of Sciences, Moscow, Russia, 3.The Schmidt Institute of Physics of the Earth, Russian Academy of Sciences, Moscow, Russia, 4.Department of Earth Sciences, Graduate School of Science, Chiba University, Chiba, Japan, 5.NASA Goddard Space Flight Center, Greenbelt, MD, USA)

[MIS09-18] Earth’s outgoing longwave radiation variability prior to M ≧ 6.0 earthquakes in the Taiwan area during 2009-2016

★Invited Papers

*Ching-Chou FU[1], Lou-Chuang Lee[1], Dimitar Ouzounov[2] (1.Institute of Earth Sciences, Academia Sinica, 2.Chapman University, One University Drive, Orange, CA, USA)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

[M-IS10] Coupling between the atmosphere, ionosphere and magnetosphere above thunderstorms

convener:Pasko Victor P(Pennsylvania State University Main Campus), Yukihiro Takahashi(Department of Cosmosciences, Graduate School of Science, Hokkaido University), Mitsuteru Sato(Department of Cosmoscience, Hokkaido University), Teruaki Enoto(RIKEN)

[MIS10-01] One TGF and two elves produced by the same thunderstorm system

★Invited Papers

*Nikolai Ostgaard[1], Steve Cummer[4], Andrey Mezentsev[1], Torsten Neubert[2], Victor Reglero[3], Olivier Chanrion[2], Martino Marisaldi[1], Pavlo Kochkin[1], Nikolai Lehtinen[1], David Sarria[1], Carolina Maiorana[1], Chris Skeie[1], Anders Lindanger[1], Yunjiao Pu[4], Chris Eyles[3], Freddy Christiansen[2], Kjetil Ullaland[1], Georgi Genov[1] (1.Birkeland Centre for Space Science, University of Bergen, Norway, 2.National Space Institute, Technical University of Denmark, Denmark, 3.University of Valencia, Spain, 4. Duke University, North Carolina, US)

[MIS10-02] The Global Distribution and Photometric Characteristics of the Intense Lightning and Their Association With Transient Luminous Events

★Invited Papers

*Alfred Bing-Chih Chen[1], Chiawen Chuang[1], Han-Tzong Su[1], Rue-Ron Hsu[1] (1.National Cheng Kung University)

[MIS10-03] Detailed temporal structure of multiple ELVES recorded at the Pierre Auger Observatory

*Roberto Mussa[1,2], Kevin-Druis Merenda[3,2], Lawrence Wiencke[2,3], Collaboration Pierre Auger[2] (1.Istituto Nazionale Fisica Nucleare - Sezione di Torino, Italy, 2.Observatorio Pierre Auger, Malargue, Mendoza , Argentina, 3.Colorado School of Mines, Golden, Colorado , USA)

[MIS10-04] Upward TGF observations with TARANIS XGRE

*Kazuhiro Nakazawa[1], Yuuki Wada[2], Philippe Laurent[3,4], Pierre-Louis Blelly[5], Sébastien Célestin[6], Jean-Louis Pinçon[6] (1.Nagoya University, 2.RIKEN, 3.CEA Saclay, 4.APC, 5.IRAP, Toulouse, 6.LPCEE, Orléans)

[MIS10-05] Downward Terrestrial Gamma-ray Flashes Coincident with Enegetic In-cloud Pulses

*Yuuki Wada[1], Teruaki Enoto[1], Takeshi Morimoto[2], Yoshitaka Nakamura[3], Mitsuteru Sato[4], Tomoo Ushio[5], Kazuhiro Nakazawa[6], Takayuki Yuasa[7], Daisuke Yonetoku[8], Tatsuya Sawano[8], Masashi Kamogawa[9], Hideo Sakai[10], Yoshihiro Furuta[11], Kazuo Makishima[1,12], Harufumi Tsuchiya[11] (1.RIKEN, 2.Kindai University, 3.KCCT, 4.Hokkaido University, 5.Osaka University, 6.Nagoya University, 7.Private Company, 8.Kanazawa University, 9.University of Shizuoka, 10.University of Toyama, 11.Japan Atomic Energy Agency, 12.University of Tokyo)

[MIS10-06] Photodetachment of electrons at sprite altitudes by visible radiation of tropospheric lightning discharges as a mechanism of initiation of sprite streamers

*Victor P Pasko[1], Reza Janalizadeh[1] (1.Pennsylvania State University Main Campus)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

[M-IS11] Expedition Earth: discovering our planet's past and future through scientific drilling

convener:Junichiro Kuroda(Department of Ocean Floor Geoscience, Atmosphere and Ocean Research Institute, the University of Tokyo), Katsuyoshi Michibayashi(Department of Earth and Planetary Sciences, Nagoya University), Kohtaro Ujiie(Graduate School of Life and Environmental Sciences, University of Tsukuba), Clive Robert Neal(University of Notre Dame)

[MIS11-01] Exploring the Arctic deep biosphere and its linkage to carbon cycling and climate variation with Chikyu

*Fumio Inagaki[1], Steffen L. Jørgensen[2], Yasuhiro Yamada[1], Rolf Birger Pedersen[2], ArcDB Project Team (1.Japan Agency for Marine-Earth Science and Technology (JAMSTEC), 2.University of Bergen, Norway)

[MIS11-02] Exploring the World's Largest LIP: Testing the Ontong Java Nui hypothesis

*Takashi Sano[1], Maria Luisa Tejada[2], Clive R. Neal[3], Millard Coffin[4], Masao Nakanishi[5], Peter J. Michael[6], Jörg Geldmacher[7], Takeshi Hanyu[2], Seiichi Miura[2], Christian Timm[8], Anthony A. P. Koppers[9], Daisuke Suetsugu[2], Takashi Tonegawa[2], Akira Ishikawa[10], Kenji Shimizu[2], Paterno Castillo[11] (1.National Museum of Nature and Science, 2.Japan Agency for Marine-Earth Science and Technology, 3.University of Notre Dame, USA, 4.University of Tasmania, Australia, 5.Chiba University, 6.The University of Tulsa, USA, 7.GEOMAR Helmholtz Centre for Ocean Research Kiel, Germany, 8.GNS Science, New Zealand, 9.Oregon State University, USA, 10.Tokyo Institute of Technology, 11.Scripps Institution of Oceanography, UCSD, USA)

[MIS11-03] Pre-prososal 951: The middle aged upper crust penetration on the North Arch off-Hawaii MoHole candidate site

*Susumu Umino[1,2], Tomoaki Morishita[1,2], Jun-Ichi Kimura[2], Mikiya Yamashita[3,2], Nobukazu Seama[4], Shigeaki Ono[2], Natsue Abe[2,1], Katsuyoshi Michibayashi[5,2] (1.Kanazawa University, 2.JAMSTEC, 3.Geological Survey of Japan, 4.Kobe University, 5.Nagoya University)

[MIS11-04] The crustal and upper mantle structure of the Hawaiian-Emperor Seamount Chain from marine seismic data

★Invited Papers

*Brian Boston[1], Philip Cilli[2], Robert Dunn[3], Donna J. Shillington[4], Anthony B. Watts[2], Ingo Grevemeyer[5], Laura Gómez de la Peña[5], Garrett Ito[3], Paul Wessel[3], Uri ten Brink[6], Nathan Miller[6] (1.Lamont-Doherty Earth Observatory, 2.University of Oxford, 3.University of Hawaii at Manoa, 4.Northern Arizona University, 5.GEOMAR, 6.USGS)

[MIS11-05] Drilling a Heterogeneous Lower Ocean Crust and Mantle

★Invited Papers

*Henry J Dick[1] (1.Woods Hole Oceanographic Institution)

[MIS11-06] Overview of IODP Exp. 376: hydrothermal systems and submarine eruption processes of Brothers volcano, Kermadec Arc

*Iona McIntosh[1], Cornel de Ronde[2], Susan Humphris[3], Tobias Höfig[4], Agnes Reyes[2], the IODP Expedition 376 Scientists (1.Japan Agency for Marine-Earth Science and Technology, 2.GNS Science, New Zealand, 3.Woods Hole Oceanographic Institution, USA, 4.International Ocean Discovery Program, Texas A&M University, USA)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

[M-IS11] Expedition Earth: discovering our planet's past and future through scientific drilling

convener:Junichiro Kuroda(Department of Ocean Floor Geoscience, Atmosphere and Ocean Research Institute, the University of Tokyo), Katsuyoshi Michibayashi(Department of Earth and Planetary Sciences, Nagoya University), Kohtaro Ujiie(Graduate School of Life and Environmental Sciences, University of Tsukuba), Clive Robert Neal(University of Notre Dame)

[MIS11-07] IODP/ICDP Expedition 364: Using Geophysical Data to Map Suevite and Impact Melt in the Chicxulub Impact Crater

★Invited Papers

*Gail Lynn Christeson[1], Joanna Morgan[2], Sean Gulick[1] (1.University of Texas at Austin, 2.Imperial College London)

[MIS11-08] Cretaceous paleoceanographic events recorded in sedimentary sequences from IODP Exp. 369 at southern high latitude: Oxygen and carbon isotope stratigraphy and implications from biomarkers

*Takashi Hasegawa[1], Akiko S. Goto[1], Scientists of IODP Exp. 369 (1.Faculty of Geoscience and Civil Engineering, Institute of Science and Engineering, Kanazawa University)

[MIS11-09] **Preliminary results of IODP Expedition 379 (Amundsen Sea West Antarctic Ice Sheet History)**

*Keiji Horikawa[1], Masahiro Noda[2], Masao Iwai[3], Masako Yamane[4], Karsten Gohl[6], Julia S Wellner[7], Scientists IODP Expedition 379[5] (1.Graduate School of Engineer and Science for Research, University of Toyama, 2.Graduate School of Engineer and Science for Education, University of Toyama, 3.Center for Advanced Marine Core Research, Kochi University, 4.Institute for Space-Earth Environmental Research, Nagoya University, 5.IODP Expedition 379 Scientists, 6.Alfred Wegener Institute Helmholtz—Center for Polar and Marine Research, Germany, 7.Earth & Atmospheric Sciences, University of Houston)

[MIS11-10] **Foraminiferal Na/Ca suggests decreased seawater Ca concentration over the past 40 Myr.**

★Invited Papers

*Yair Rosenthal[1], Xiaoli Zhou[1], Weimin Si[2] (1.Rutgers University, 2.Brown University)

[MIS11-11] **Deep microbial proliferation at the basalt interface in aged oceanic crust**

*Yohey Suzuki[1] (1.Graduate School of Science, The University of Tokyo)

[MIS11-12] IODP Expedition 385: Guaymas Basin Tectonics and Biosphere

*Yuki Morono[1], Andreas Teske[2], Daniel Lizarralde[3], Tobias W Höfig[4], IODP EXPEDITION 385 SCIENTISTS[5] (1.Kochi Institute for Core Sample Research, Japan Agency for Marine-Earth Science and Technology, 2.Department of Marine Sciences, University of North Carolina at Chapel Hill, 3.Department of Geology and Geophysics, Woods Hole Oceanographic Institution, 4.International Ocean Discovery Program, Texas A&M University, 5.Full list of Exp. 385 Scientific Participants: http://iodp.tamu.edu/scienceops/precruise/guaymas/participants.html)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

[M-IS11] Expedition Earth: discovering our planet's past and future through scientific drilling

convener:Junichiro Kuroda(Department of Ocean Floor Geoscience, Atmosphere and Ocean Research Institute, the University of Tokyo), Katsuyoshi Michibayashi(Department of Earth and Planetary Sciences, Nagoya University), Kohtaro Ujiie(Graduate School of Life and Environmental Sciences, University of Tsukuba), Clive Robert Neal(University of Notre Dame)

[MIS11-13] The next step following the accomplished drilling into seismogenic zones of M2.0-5.5 earthquakes in South African gold mines (ICDP DSeis)

★Invited Papers

*Hiroshi Ogasawara[1], Bennie Liebenberg[2], Yasuo Yabe[3], Takatoshi Ito[3], Jim Mori[4], Tetsuro Hirono[5], Yuhji Yamamoto[6], Tullis C Onstott[7], Tom L. Kieft[8], Ray J. Durrheim[9], Musa S.D. Manzi[9], Martin Ziegler[10], Thomas Wieresberg[11], Serge Shapiro[12], Surendra N. Samala[13], Esta van Heerden[14], Julio Castillo[15], Phil Dight[16] (1.Faculty of Science and Engineering, Ritsumeikan University, 2.Moab Khotsong mine, 3.Tohoku Univ., 4.Kyoto Univ., 5.Osaka Univ., 6.Kochi Core Center, Kochi Univ., 7.Princeton Univ., 8.New Mexico Inst., 9.Univ. Witwatersrand, 10.ETH, Zurich, 11.GFZ, Potsdam, 12.Berlin Free Univ., 13.Indian Inst. Tech., Hyderabad, 14.iWater, 15.Free State Univ., 16.W. Australia Univ.)

[MIS11-15] **Constraints on paleo-stress magnitude in Hikurangi Margin, New Zealand, at Site U1518, Expedition 375**

*Yoshitaka Hashimoto[1], Ryo Nishimori[1], Annika Greve[2], Julia Morgan[3] (1.Kochi University, 2.Utrecht University,, 3.Rice University)

[MIS11-16] Can subducting Kyushu-Palau Ridge weaken Hyuga-nada subduction interface, western Nankai Trough: A Proposal to IODP

*Rie Nakata[1], Masataka Kinoshita[1], Yoshitaka Hashimoto[2], Yusuke Yamashita[3] (1.University of Tokyo, 2.Kochi University, 3.Kyoto University)

[MIS11-17] Overview of drilling active backarc basin, Okinawa Trough: ongoing rifting of Eurasian continental margin

*Makoto Otsubo[1] (1.Geological Survey of Japan, Research Institute of Earthquake and Volcano Geology)

[MIS11-18] Outline of JBBP (Japan Beyond-Brittle Project) to drill into supercritical geothermal systems

★Invited Papers

*Hiroshi Asanuma[1] (1.AIST)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

[M-IS12] Developments and applications of XRF-core scanning techniques in natural archives

convener:Huang Jyh-Jaan Steven(Institute of Geology, University of Innsbruck), Atsuko Amano(National institute of Advanced Industrial Science and Technology), Masafumi MURAYAMA(Faculty of Agriculture and Marine Science, Kochi University), Liang-Chi Wang(National Chung Cheng University)

[MIS12-01] Bromine (Br) counts measured by XRF core scanner (ITRAX) as a proxy of marine organic carbon content in the hemiperagic sediments of the Japan Sea

★Invited Papers

*Arisa Seki[1], Ryuji Tada[2,3,4], Shunsuke Kurokawa[4], Masafumi Murayama[5] (1.Faculty of Science, Shinshu University, 2.Chiba Institute of Technology, 3.Yunnan University, 4.Graduate School of Science, The University of Tokyo, 5.Faculty of Agriculture and Marine Science, Kochi University)

[MIS12-02] The advantages and limits of ITRAX core scanner: Learning by comparison with destructive element and isotope data from the Gulf of Alaska sediment core

★Invited Papers

*Keiji Horikawa[1], Nurunnabi MD Mondal[2], Masafumi MURAYAMA[3], Katsuya Nejigaki[4], Osamu Seki[5], Yusuke Okazaki[6] (1.Graduate School of Engineer and Science for Research, University of Toyama, 2.Graduate School of Engineer and Science for Education, University of Toyama, 3.Faculty of Agriculture and Marine Science, Kochi University, 4.Graduate School of Integrated Arts and Sciences, Kochi University , 5.Institute of Low Temperature Science, Hokkaido University, 6.Graduate School of Science, Kyushu University)

[MIS12-03] Quantitative micro-XRF scanning spectroscopy of freshwater lake sedimentary sequences based on the X-ray absorption and emission theories

★Invited Papers

*Nagayoshi Katsuta[1] (1.Faculty of Education, Gifu University)

[MIS12-04] The characteristics of turbidites beds of southwestern Ryukyu Trench floor: A new approach from the X-ray fluorescence core scanning analysis

*KanHsi Hsiung[1], Kiichiro Kawamura[2], Toshiya Kanamatsu[1], Ken Ikehara[3], Kazuko Usami[4], Chorng-Shern Horng[5], Naohiko Ohkouchi[1], Nanako O. Ogawa[1], Saneatsu Saito[1], Masafumi MURAYAMA[6] (1.Japan Agency for Marine-Earth Science and Technology, 2.Yamaguchi University, 3.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology, 4.Japan NUS Co., Ltd., 5.Institute of Earth Sciences, Academia Sinica, 6.Faculty of Agriculture and Marine Science, Kochi University)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

[M-IS13] Integrated Analysis of Geoscience Observations from the Floor to Surface of the Ocean

convener:Keisuke Ariyoshi(Japan Agency for Marine-Earth Science and Technology), Joan S Gomberg(USGS Earthquake Science Center), Narumi Takahashi(National Research Institute for Earth Science and Disaster Resilience), Motoyuki Kido(International Research Institute for Disaster Science, Tohoku University)

[MIS13-01] **Relationship between Kuroshio's meander and crustal deformation around Nankai Trough**

*Keisuke Ariyoshi[1], Akira Nagano[1], Takuya Hasegawa[1,2], Hiroyuki Matsumoto[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.Graduate School of Science and Faculty of Science, Tohoku University)

[MIS13-02] **An integrated observation system from the ocean bottom to the atmosphere to study air-sea interaction in the Kuroshio region south of Shionomisaki**

★Invited Papers

*Kosei Komatsu[1,2], Akira Kuwano-Yoshida[3], Keisuke Ariyoshi[4] (1.GSFS, Univ. Tokyo, 2.AORI, Univ. Tokyo, 3.DPRI, Kyoto Univ., 4.Japan Agency for Marine-Earth Science and Technology)

[MIS13-03] Isolating oceanic contributions to ocean bottom pressure observations by using numerical ocean models to detect transient seafloor displacements

★Invited Papers

*Yoichiro Dobashi[1], Daisuke Inazu[1] (1.Tokyo University of Marine Science and Technology)

[MIS13-04] Continuous buoy observation of ocean bottom pressure and sea surface height and the system revision

*Narumi Takahashi[1,2], Kentaro Imai[2], Motoyuki Kido[3], Yusaku Ohta[3], Tatsuya Fukuda[2], Yasuhisa Ishihara[2], Hiroshi OCHI[2], Ryota Hino[3] (1.National Research Institute for Earth Science and Disaster Resilience, 2.Japan Agency for Marine Earth Science and Technology, 3.Tohoku University)

[MIS13-05] Improvement in estimation of seafloor crustal deformation from ocean bottom pressure observations at the Hikurangi subduction zone offshore New Zealand

*Tomohiro Inoue[1], Tomoya Muramoto[2], Daisuke Inazu[3], Yoshihiro Ito[4], Ryota Hino[5], Kazuaki Ohta[6], Syuichi Suzuki[5] (1.Kyoto University, 2.National Institute of Advanced Industrial Science and Technology, 3.Tokyo University of Marine Science and Technology, 4.Disaster Prevention Research Institute, 5.Tohoku University, 6.National Research Institute for Earth Science and Disaster Resilience)

[MIS13-06] Earthquake-triggered Submarine Sediment Gravity Flows in Action

★Invited Papers

*Joan S Gomberg[1], Keisuke Ariyoshi[2], Paul Johnson[3], Susan Hautala[3] (1.USGS Earthquake Science Center, USA, 2.JAMSTEC, Japan, 3.University of Washington, USA)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

[M-IS14] Evolution of Pelagic Realm

convener:Atsushi Matsuoka(Department of Geology, Faculty of Science, Niigata University), Toshiyuki Kurihara(Graduate School of Science and Technology, Niigata University), Tetsuji Onoue(Department of Earth and Planetary Sciences, Faculty of Science, Kyushu University), XIN LI(State Key Laboratory of Palaeobiology and Stratigraphy, Nanjing Institute of Geology and Palaeontology, Chinese Academy of Sciences)

[MIS14-01] Permian radiolarians from chert distributed in the Hashidate area, Itoigawa City, Niigata Prefecture, central Japan

*Toshiyuki Kurihara[1], Urara Murakami[2], Atsushi Matsuoka[2] (1.Graduate School of Science and Technology, Niigata University, 2.Faculty of Science, Niigata University)

[MIS14-02] Myr-scale monsoon records paced with Milankovitch cycles during Triassic-Jurassic

*Masayuki Ikeda[1], Kazumi Ozaki[2], Shintaro Kadoya[3] (1.Shizuoka University, 2.Toho University, 3.Washington University)

[MIS14-03] The oldest oceanic plate and Minami Tori Shima: Minato Project

★Invited Papers

*Yoshihiko Tamura[1], Tomoki Sato[1], Yasuhiro Hirai[1], Kenta Yoshida[1], Mathieu Rospabé[1], Osamu Ishizuka[1], Takashi Miyazaki[1], Qing Chang[1] (1.Research Institute for Marine Geodynamics, Japan Agency for Maine-Earth Science and Technology)

[MIS14-04] Detailed stratigraphy around the Jurassic–Cretaceous boundary in the Bosso Valley section, central Italy and international correlation based on radiolarian biostratigraphy

*Atsushi Matsuoka[1], Xin Li[2], Marco Chiari[3], Angela Beritinelli[4] (1.Department of Geology, Faculty of Science, Niigata University, 2.Nanjing Institute of Geology and Palaeontology, Chinese Academy of Sciences, 3.Institute of Earth Sciences and Georisources, Florence, Italy, 4.University of Perugia, Italy)

[MIS14-05] **Ocean Plate Stratigraphy and accretionary process of the Yarlung-Tsangpo suture zone based on radiolarian biostratigraphy of mélanges near Najiu, southern Tibet**

*XIN LI[1], Matsuoka Atsushi[2], Yalin Li[3] (1.State Key Laboratory of Palaeobiology and Stratigraphy, Nanjing Institute of Geology and Palaeontology, Chinese Academy of Sciences, 2.Department of Geology, Faculty of Science, Niigata University, 3.China University of Geosciences, Beijing)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

[M-IS15] Global climate change driven by the Southern Ocean and the Antarctic Ice Sheet

convener:Osamu Seki(Institute of Low Temperature Science, Hokkaido University), Akira Oka(Atmosphere and Ocean Research Institute, The University of Tokyo), Yoshifumi Nogi(National Institute of Polar Research), Robin Elizabeth Bell(Lamont Doherty Earth Observatory)

[MIS15-01] **Shallow Sea Trial of the Under Ice AUV “MONACA”**

*Hirokazu Yamagata[1], Toshihiro Maki[1], Hiroshi Yoshida[2], Yoshifumi Nogi[3] (1.Institute of Industrial Science, The University of Tokyo, 2.Japan Marine Science and Technology Cente, 3.National Institute of Polar Research)

[MIS15-02] **Modeling warm water intrusion into Lützow-Holm Bay, East Antarctica**

*Kazuya Kusahara[1], Daisuke Hirano[2], Masakazu Fujii[3], Alexander D. Fraser[4], Takeshi Tamura[3] (1.Japan Agency for Marine-Earth Science and Technology, 2.Hokkaido University, 3.National Institute of Polar Research, 4.University of Tasmania)

[MIS15-03] Estimation of the Antarctic ice sheet surface mass balance using the polar regional climate model NHM-SMAP

*Masashi Niwano[1], Akihiro Hashimoto[1], Shun Tsutaki[2], Hideaki Motoyama[2], Naohiko Hirasawa[2], Ayako Abe-Ouchi[3] (1.Meteorological Research Institute, 2.National Institute of Polar Research, 3.Atmosphere Ocean Research Institute, University of Tokyo)

[MIS15-04] Accurate chronology and climatic reconstruction around MIS 11 from the Dome Fuji ice core

*Kenji Kawamura[1,2,3], Ikumi Oyabu[1], Shuji Aoki[4], Takakiyo Nakazawa[4], Ayako Abe-Ouchi[5], Fuyuki SAITO[3] (1.National Institute of Polar Research, Research Organization of Information and Systems, 2.Graduate School for Advanced Studies, SOKENDAI, 3.Japan Agency for Marine-Earth Science and Technology (JAMSTEC), 4.Tohoku University, 5.University of Tokyo)

[MIS15-05] **Deglaciation history of the East Antarctic Ice sheet revealed by exposure ages and marine-lake sedimentary records in Lutzow-Holm Bay**

*Yusuke Suganuma[1,2], Moto Kawamata[2], Yuki Haneda[1], Takeshige Ishiwa[1], Kota Katsuki[5], Takuya Itaki[3], Osamu Seki[4], Jun'ichi Okuno[1,2] (1.National institute of Polar Research, 2.The Graduate University for Advanced Studies (SOKENDAI), 3.Geological Survey of Japan, AIST, 4.Hokkaido University, 5.Shimane University)

[MIS15-06] Cross-check of dust-magnetic correlation and oxygen isotope stratigraphy in the Southern Ocean

*Hiroki Matsui[1], Minoru Ikehara[1], Yusuke Suganuma[2,3], Osamu Seki[4], Jun'ichi Okuno[2,3], Ikumi Oyabu[2], Kenji Kawamura[2,3] (1.Center for Advanced Marine Core Research, Kochi University, 2.National Institute of Polar Research, 3.Department of Polar Science, School of Multidisciplinary Sciences, The Graduate University for Advanced Studies (SOKENDAI), 4.Institute of Low Temperature Science, Hokkaido University)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

[M-IS15] Global climate change driven by the Southern Ocean and the Antarctic Ice Sheet

convener:Osamu Seki(Institute of Low Temperature Science, Hokkaido University), Akira Oka(Atmosphere and Ocean Research Institute, The University of Tokyo), Yoshifumi Nogi(National Institute of Polar Research), Robin Elizabeth Bell(Lamont Doherty Earth Observatory)

[MIS15-07] **IODP Expedition 382 (Iceberg Alley) – Preliminary results on dust-climate couplings**

★Invited Papers

*Michael E Weber[1], Maureen E Raymo[2], Victoria L Peck[3], Trevor Williams[4], Osamu Seki[5], Yuji Kato[6], Mutsumi Iizuka[5], and IODP 382 Scientists (1.Steinmann Institute, University of Bonn, Bonn, Germany, 2.Lamont-Doherty Earth Observatory of Columbia University, Palisades, New York, USA, 3.British Antarctic Survey, Cambridge, UK, 4.International Ocean Discovery Program, Texas A&M University, College Station, USA, 5.Institute of Low Temperature Science, Hokkaido University, Japan, 6.Center for Advanced Marine Core Research, Kochi University, Japan)

[MIS15-08] Property of eddy and AABW observed off Cape Pointset

*Kitade Yujiro[1], Kohei Mizobata[1], Daisuke Hirano[2], Keishi Shimada[1], Shigeru Aoki[2], Takeshi Tamura[3] (1.Tokyo University of Marine Science and Technology, 2.Hokkaido University, 3.National Institute of Polar Research)

[MIS15-09] Antarctic Bottom Water and global ocean meridional overturning circulation

★Invited Papers

*Katsuro Katsumata[1] (1.JAMSTEC)

[MIS15-10] Temporal variation of the Antarctic Bottom Water revealed by the mooring measurements off the Vincennes Bay

*Kohei Mizobata[1], Yujiro Kitade[1], Keishi Shimada[1], Daisuke Hirano[2], Yoshimasa Matsumura[3], Cheng Lingqiao[4], Shigeru Aoki[2], Takeshi Tamura[5] (1.Tokyo University of Marine Science and Technology, 2.Institute of Low Temperature Science, Hokkaido University, 3.Atmosphere and Ocean Research Institute, The University of Tokyo, 4.Shanghai Ocean University, 5.National Institute of Polar Researc)

[MIS15-11] Foraging movements and prey of short-tailed shearwaters in the Southern Ocean

★Invited Papers

*Yutaka Watanuki[1], Sarara Azumi[1], Akinori Takahashi[2], Nobuo Kokubun[2], Yasuhiro Ando[1], Masato Moteki[3], Fernando Arce, Mary-Anne Lea, Mark Hindell (1.Faculty of Fisheries Science, Hokkaido University, 2.National Institute of Polar Research, 3.Tokyo University of Marine Science and Technology)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

[M-IS17] Astrobiology

convener:Hikaru Yabuta(Hiroshima University, Department of Earth and Planetary Systems Science), Seiji Sugita(Department of Earth and Planetary Science, Graduate School of Science Sciece, The University of Tokyo), Misato Fukagawa(National Astronomical Observatory of Japan), Fujishima Kosuke(Tokyo Institute of Technology, Earth-Life Science Institute)

[MIS17-01] Observations and modelling of exoplanetary atmospheres

★Invited Papers

*Giovanna Tinetti[1] (1.UCL)

[MIS17-02] Astrochemistry in planetary system formation: from molecular clouds to protoplanetary disks and planetary system material

★Invited Papers

*Yuri Aikawa[1] (1.Department of Astronomy, Graduate School of Science, University of Tokyo)

[MIS17-03] Formation of Complex Amino Acid Precursors by Cosmic Rays in Interstellar Environments

★Invited Papers

*Kensei Kobayashi[1], Soushi Kuramoto[1], Tomohito Sato[1], Miki Nakayama[2], MITA Hajime[2], Satoshi Yoshida[3], Hitoshi Fukuda[4], Yoshiyuki Oguri[4], Hiromi Shibata[5], Yoko Kebukawa[1] (1.Department of Chemistry, Yokohama National University, 2.Fukuoka Institute of Technology, 3.National Institutes for Quantum and Radiological Science and Technology, 4.Tokyo Institute of Technology, 5.Osaka University)

[MIS17-04] Ground-based transmission spectroscopy of TRAPPIST-1g

*Mayuko Mori[1], Akihiko Fukui[1], Norio Narita[2], Hannu Parviainen[4], Yui Kawashima[3], John H. Livingston[1], Kiyoe Kawauchi[1], Motohide Tamura[1,2,5] (1.The University of Tokyo, 2.Astrobiology Center, NINS, 3.Netherlands Institute for Space Research, 4.Instituto de Astrofisica de Canarias, 5.National Astronomical Observatory of Japan)

[MIS17-05] UV irradiation and organic synthesis on growing dust particles in protoplanetary disks

*Kazuaki Homma[1], Satoshi Okuzumi[1] (1.Tokyo Institute of Technology)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

[M-IS17] Astrobiology

convener:Hikaru Yabuta(Hiroshima University, Department of Earth and Planetary Systems Science), Seiji Sugita(Department of Earth and Planetary Science, Graduate School of Science Sciece, The University of Tokyo), Misato Fukagawa(National Astronomical Observatory of Japan), Fujishima Kosuke(Tokyo Institute of Technology, Earth-Life Science Institute)

[MIS17-06] Everyone's an Astrobiologist

★Invited Papers

*Mary A Voytek[1,2] (1.NASA Headquarters, 2.Earth-Life Science Institute, Tokyo Institute of Technology)

[MIS17-07] New strategies for extraterrestrial life exploration compatible to planetary protection

★Invited Papers

*Yohey Suzuki[1] (1.Graduate School of Science, The University of Tokyo)

[MIS17-08] Polyester microdroplets, coacervates, and other membraneless non-biological assemblies as primordial compartments

★Invited Papers

*Tony Z Jia[1], Kuhan Chandru, Yayoi Hongo, Rehana Afrin, Tomohiro Usui, Kunihiro Myojo, H. James Cleaves (1.Earth-Life Science Institute, Tokyo Institute of Technology)

[MIS17-09] Reconstruction of the original core of RNA polymerase from short peptide

*Sota Yagi[1], Aditya K. Padhi[2], Kam Y. J. Zhang[2], Shunsuke Tagami[1] (1.Laboratory for Advanced Biomolecular Engineering, RIKEN Center for Biosystems Dynamics Research, 2.Laboratory for Structural Bioinformatics, RIKEN Center for Biosystems Dynamics Research)

[MIS17-10] Screening RNA-binding peptides using restricted set of amino acids

*Shota Nishikawa[1], Hidenori Watanabe[2], Naohiro Terasaka[3], Takayuki Katoh[3], Kosuke Fujishima[2] (1.School of Life Science and Technology, Tokyo Institute of Technology, 2.Earth Life Science Institute, Tokyo Institute of Technology, 3.Department of Chemistry, Graduate school of Science, The University of Tokyo)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

[M-IS17] Astrobiology

convener:Hikaru Yabuta(Hiroshima University, Department of Earth and Planetary Systems Science), Seiji Sugita(Department of Earth and Planetary Science, Graduate School of Science Sciece, The University of Tokyo), Misato Fukagawa(National Astronomical Observatory of Japan), Fujishima Kosuke(Tokyo Institute of Technology, Earth-Life Science Institute)

[MIS17-11] Formation of organic compounds by hypervelocity impacts on terrestrial planets

*Yoshihiro Furukawa[1], Yuto Takeuchi[1], Takamichi Kobayashi[2], Toshimori Sekine[3], Naoki Terada[1], Takeshi Kakegawa[1] (1.Tohoku University, 2.NIMS, 3.Center for High Pressure Science & Technology Advanced Research)

[MIS17-12] Following the fundamentals of serpentinization: an experimental approach to mineral and organic reaction pathways at serpentinizing conditions

*Kristin N Johnson-Finn[1,2], Akira Yamaguchi[2], Ryuhei Nakamura[1,3] (1.Earth-Life Science Institute, 2.Tokyo Institute of Technology, 3.RIKEN Center for Sustainable Resource Science)

[MIS17-13] Third year results and current status of Tanpopo: Capture and exposure experiment of micrometeoroids and microbes on Exposure Facility of International Space Station

*Akihiko Yamagishi[1,2], Hirofumi Hashimoto[2], Hajime Yano[2], Yuko Kawaguchi[9], Shin-ichi Yokobori[1], Kensei Kobayashi[3], Mita Hajime[4], Hikaru Yabuta[5], Masumi Higashide[6], Makoto Tabata[7], Eiichi Imai[8] (1.Tokyo University of Pharmacy and Life Science, Department of Molecular Biology, 2.ISAS/JAXA, , 3.Yokohama National University, , 4.Fukuoka Institute of Technology, , 5.Hiroshima University, 6.Japan Aerospace Exploration Agency, 7.Chiba University, 8.Nagaoka University of Technology, 9.Chiba Institute of Technology)

[MIS17-14] THE BIOPAUSE PROJECT: SCIENTIFIC BALLOON EXPERIMENTS FOR SAMPLING STRATOSPHERIC BIOAEROSOL

*Sohsuke Ohno[1], Norimune Miyake[1], Ko Ishibashi[1], Yuko Kawaguchi[1], Osamu Okudaira[1], Keisuke Maeda[1], Issei Iijima[2], Yuya Kakehashi[2], Manabu Yamada[1], Akihiko Yamagishi[3], Kazuhiko Yamada[2], Yusuke Takahashi[4], Satoshi Nonaka[2], Segawa Takahiro[5], Hideyuki Fuke[2], Tetsuya Yoshida[2], Takafumi Matsui[1] (1.Chiba Institute of Technology, 2.Japan Aerospace Exploration Agency, 3.Tokyo University of Pharmacy and Life Sciences, 4.Hokkaido University, 5.University of Yamanashi)

[MIS17-15] Microscope for Life-signature Detection in Venus Cloud

*Satoshi Sasaki[1], Akihiko Yamagishi[2,5], Yoshitaka Yoshimura[3], Keigo Enya[5], Sosuke Ohno[4], Atsuo Miyakawa[2], Tomohiro Usui[5], Kazuhisa Fujita[5], Sanjay Limaye[6] (1.Tokyo University of Technology, 2.Tokyo University of Pharmacy and Life Sciences, 3.Tamagawa University, 4.Chiba Institute of Technology, 5.JAXA, 6.University of Wisconsin)

[MIS17-16] Discussion

*Hikaru Yabuta[1] (1.Hiroshima University, Department of Earth and Planetary Systems Science)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

[M-IS19] Conservation of geoparks, natural geosites, and cultural heritage: weathering and damage assessment

convener:Luigi Germinario(Saitama University), Celine Schneider(University of Reims-Champagne-Ardenne), Chiaki T. Oguchi(Institute for Environmental Science and Technology, Graduate School of Science and Engineering, Saitama University), Tetsuya Waragai(Graduate School of Science and Engineering, Nihon University), Miguel Gomez-Heras(Universidad Autonoma de Madrid), Patricia Vazquez(GEGENAA EA 3795 University of Reims Champagne-Ardenne), Magdalini Theodoridou(Cardiff University), Wonsuh Song(Waseda University)

[MIS19-01] **Representation of three-dimensional cave structure using point cloud data by terrestrial and airborne laser scanning**

★Invited Papers

*Yuichi S. Hayakawa[1,3], Takuro Ogura[2], Yasuhiko TAMURA[3], Chiaki T. Oguchi[4] (1.Faculty of Environmental Earth Science, Hokkaido University, 2.Graduate School of Frontier Sciences, The University of Tokyo, 3.Center for Spatial Information Science, The University of Tokyo, 4.Graduate School of Science and Engineering, Saitama University)

[MIS19-02] Detection of microcracks in rock specimens due to thermal changes using the acoustic emission method

*Tetsuya Waragai[1] (1.Graduate School of Science and Engineering, Nihon University)

[MIS19-03] **Coupled capillary water uptake and Infrared Thermography to assess crack evolution**

★Invited Papers

Thomas Junique[1], *Patricia Vazquez[1], Céline Thomachot-Schneider[1], Myrlène Jean Baptiste[1], Issra Hassoun[1] (1.GEGENAA EA 3795, University of Reims Champagne-Ardenne, France)

[MIS19-04] Study on groundwater quality inside of the Taya cavern

*Chiaki T. Oguchi[1], Sohyun Ahn[1], Yasuhiko TAMURA[2] (1.Institute for Environmental Science and Technology, Graduate School of Science and Engineering, Saitama University, 2.Exective Committee for the prevention of Taya Cavern)

[MIS19-05] Unveiling the underground cultural heritage of Yokohama, Japan – the contribution of geosciences

*Luigi Germinario[1], Chiaki T. Oguchi[1] (1.Saitama University)

[MIS19-06] Reproducing typical strains of a monument through aging tests to anticipate stone weathering.

*Emilie Huby[1], Céline Thomachot-Schneider[1], Patricia Vázquez[1], Gilles Fronteau[1] (1.Université de Reims Champagne-Ardenne, GEGENAA EA 3795, 51097 Reims, France)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-GI General Geosciences, Information Geosciences & Simulations

[M-GI33] Data assimilation: A fundamental approach in geosciences

convener:Shin ya Nakano(The Institute of Statistical Mathematics), Yosuke Fujii(Meteorological Research Institute, Japan Meteorological Agency), Takemasa Miyoshi(RIKEN), SHINICHI MIYAZAKI(Graduate School of Science, Kyoto University)

[MGI33-01] Inference of Hidden States by Coupled Thermosphere-Ionosphere Data Assimilation: Applications to Observability and Predictability of Neutral Mass Density

★Invited Papers

*Tomoko Matsuo[1], Chih-Ting Hsu[2] (1.University of Colorado Boulder, 2.National Center for Atmospheric Research)

[MGI33-02] Weight Structure of the Local Ensemble Transform Kalman Filter: A Case with an Intermediate AGCM

★Invited Papers

*Shunji Kotsuki[1], Pensoneault Andrew[3], Okazaki Atsushi[4], Takemasa Miyoshi[2] (1.Center for Environmental Remote Sensing, Chiba University, 2.RIKEN Center for Computational Science, 3.University of Iowa, 4.The Pennsylvania State University)

[MGI33-03] Local Particle Filter Implemented with Minor Modifications to the LETKF Code

*Takemasa Miyoshi[1], Shunji Kotsuki[1,2], Keiichi Kondo[1,3], Roland Potthast[4] (1.RIKEN, 2.Chiba University, 3.Meteorological Research Institute, 4.German Weather Service (DWD))

[MGI33-04] Combining data assimilation and machine learning to predict chaotic dynamics with imperfect observations and models

*Futo Tomizawa[1], Yohei Sawada[1] (1.The University of Tokyo)

[MGI33-05] Socio-hydrologic data assimilation: Analyzing human-flood interactions by model-data integration

*Yohei Sawada[1], Risa Hanazaki[1] (1.University of Tokyo)

[MGI33-06] Observing System Simulation Experiments for Tidal Motion from Wide-Swath Ocean Satellite Altimeter Data

*CAO Jiangwei[1], Naoki HIROSE[2], Osamu ISOGUCHI[3] (1.Interdisciplinary Graduate School of Engineering Sciences, Kyushu University, 2.Research Institute for Applied Mechanics, Kyushu University, 3.Remote Sensing Technology Center of Japan)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-GI General Geosciences, Information Geosciences & Simulations

[M-GI33] Data assimilation: A fundamental approach in geosciences

convener:Shin ya Nakano(The Institute of Statistical Mathematics), Yosuke Fujii(Meteorological Research Institute, Japan Meteorological Agency), Takemasa Miyoshi(RIKEN), SHINICHI MIYAZAKI(Graduate School of Science, Kyoto University)

[MGI33-07] Development of an ensemble Kalman filter-based regional ocean data assimilation system

*Shun Ohishi[1,2], Tsutomu Hihara[3], Hidenori AIKI[2], Joji Ishizaka[2], Yasumasa Miyazawa[3], Misako Kachi[4], Takemasa Miyoshi[1] (1.RIKEN, 2.Nagoya Univ., 3.JAMSTEC, 4.JAXA)

[MGI33-08] Dealing with Model Uncertainty and Deficiencies when Assimilating Thermal Breakthrough Observations

★Invited Papers

*Elvar Karl Bjarkason[1], Anna Suzuki[1] (1.Tohoku University)

[MGI33-10] EnKF estimation of the viscoelastic deformation and the viscosity

*Makiko Ohtani[1] (1.Earthquake Research Institute, the University of Tokyo)

[MGI33-11] Ensemble Kalman Filter estimation of frictional parameters and slip evolution on L-SSE faults : application to the Bungo Channel L-SSE fault

★Invited Papers

Megumi Fujita[1], Takuya NISHIMURA[2], *Kazuro Hirahara[3,4], Mamoru Hyodo[5], SHINICHI MIYAZAKI[1] (1.Graduate School of Science, Kyoto University , 2.Disaster Prevention Research Institute, Kyoto University , 3.Institute of Education, Research and Regional Cooperation for crisis Management Shikoku, Kagawa University , 4.Riken AIP center, 5.JAMSTEC)

[MGI33-12] Iterative ensemble variational methods and its application for the prediction of geomagnetic secular variation

*Shin ya Nakano[1], Takuto Minami[2], Futoshi Takahashi[3], Masaki Matsushima[4], Hisayoshi Shimizu[5], Hiroaki TOH[6] (1.The Institute of Statistical Mathematics, 2.Graduate School of Science, Kobe University, 3.Faculty of Science, Kyushu University, 4.Department of Earth and Planetary Sciences, School of Science, Tokyo Institute of Technology, 5.Earthquake Research Institute, the University of Tokyo, 6.Data Analysis Center for Geomagnetism and Space Magnetism, Graduate School of Science, Kyoto University)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-GI General Geosciences, Information Geosciences & Simulations

[M-GI34] Near Surface Investigation and Modeling for Groundwater Resources Assessment and Conservation

convener:Jui-Pin Tsai(National Taiwan University, Taiwan), Hwa-Lung Yu(National Taiwan University), Makoto Taniguchi(Research Institute for Humanity and Nature), Ping-Yu Chang(National Central University)

[MGI34-01] Conjunctive Use Simulation and Applications with MODFLOW-OWHM

*Scott E Boyce[1], Claudia C Faunt[1], Wesley Henson[1], Marisa M Earll[1], Randall T Hanson[1] (1.U.S. Geological Survey, California Water Science Center)

[MGI34-02] Estimating the specific yields and groundwater variations with the resistivity method in the northern Pingtung Plain

*Ping-Yu Chang[1,2] (1.National Central University, 2.Earthquake Disaster Evaluation and Management Center, National Central University)

[MGI34-03] Development of a multi-level groundwater monitoring system using fiber Brag grating approach

*Jui-Pin Tsai[1], Yen-To Ho[2], Liang-Cheng Chang[3] (1.National Taiwan University, Taiwan , 2.Citpo technology, Taiwan, 3.National ChiaoTung University, Taiwan)

[MGI34-04] **Objective Modeling Method of Hydrogeological Structure Applied in MODFLOW Modeling – A Case Study of Taipei Basin**

*Ting Hua Tseng[1], Hwa-Lung Yu[1] (1. National Taiwan University)

[MGI34-05] Master Plan of Water Resources Management for Central Taiwan

*Chih Chao Ho[1], TA-WEI CHIEN[2] (1.Feng Chia University, 2.Taiwan Hsin-Chu Irrigation Association)

[MGI34-06] **Geotemperature distributions due to surface temperature variations and groundwater flow in a stratum with a convection boundary**

*Chia-Hao Chang[1], Jui-Pin Tsai[1] (1.National Taiwan University, Taiwan)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-GI General Geosciences, Information Geosciences & Simulations

[M-GI36] Open Science in Progress: Data Sharing, e-Infrastructure, and Transparency in International Contexts

convener:Yasuhisa Kondo(Research Institute for Humanity and Nature), Baptiste Cecconi(LESIA, Observatoire de Paris, CNRS, PSL Research University), Yasuhiro Murayama(Strategic Program Produce Office, National Institute of Information and Communications Technology), Shelley Stall(American Geophysical Union)

[MGI36-01] Metadata from findable to searchable at PADC

★Invited Papers

*Pierre Le Sidaner[1], Stephane Erard[1,2,3], Baptiste Cecconi[1,2,3] (1.Observatoire de Paris, 2.PSL, 3.CNRS)

[MGI36-02] FAIR and Open Data: Current progress within the Earth, Space, and Environmental Sciences to Share Our Data (and Software)

*Shelley Stall[1] (1.American Geophysical Union)

[MGI36-03] Multi-source, Multi-wavelength FAIR Data and Science-driven E-infrastructure challenges toward OpenScience in Earth, Planetary and Astronomy Sciences: an overview of the CNRS-INSU ongoing initiatives

★Invited Papers

*Jean-Pierre Vilotte[1] (1.Institut de Physique du Globe de Paris)

[MGI36-04] The Path Toward Open Collections and Samples

★Invited Papers

*Kerstin Lehnert[1], Jens F Klump[2], Lesley Wyborn[3], Sarah Ramdeen (1.Columbia University, 2.CSIRO, Perth, Australia, 3.Australian National University, Canberra, Australia)

[MGI36-05] Open Science Policy and its Implementation in Japan: Trials of Monitoring and Developing an Advanced Data Management

★Invited Papers

*Kazuhiro Hayashi[1] (1.National Institute of Science and Technology Policy)

[MGI36-06] Five key elements to enable open science for society

*Yasuhisa Kondo[1,2], Kei Kano[3,2,1], Terukazu Kumazawa[1], Satoe Nakahara[1], Ken'ichiro Nakashima[4,1], Noboru Okuda[1], Hideyuki Onishi[5,1], Takeshi Osawa[6,1], KAZUHIKO OTA[1] (1.Research Institute for Humanity and Nature, 2.National Institute of Science and Technology Policy, 3.Shiga University, 4.Hiroshima University, 5.Doshisha Women's College of Liberal Arts, 6.Tokyo Metropolitan University)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-GI General Geosciences, Information Geosciences & Simulations

[M-GI36] Open Science in Progress: Data Sharing, e-Infrastructure, and Transparency in International Contexts

convener:Yasuhisa Kondo(Research Institute for Humanity and Nature), Baptiste Cecconi(LESIA, Observatoire de Paris, CNRS, PSL Research University), Yasuhiro Murayama(Strategic Program Produce Office, National Institute of Information and Communications Technology), Shelley Stall(American Geophysical Union)

[MGI36-07] Looking back on World Data System and WDS International Programme Office in the last decade from Japan

*Yasuhiro Murayama[1], Takashi Watanabe[2] (1.Strategic Program Produce Office, National Institute of Information and Communications Technology, 2.World Data System International Programme Office)

[MGI36-08] The World Data System – Building Trust in Scientific Data

*Rorie Edmunds[1] (1.World Data System of the International Science Council)

[MGI36-09] Active Data Product Archive Tracking (ADAPT) and the Future of Heliophysics Data Access

*Lee Frost Bargatze[1] (1.Earth, Planetary, and Space Sciences, Institute of Geophysics and Planetary Physics, University of California Los Angeles)

[MGI36-10] Introduction of TG-Data: IPCC Task Group on Data Support for Climate Change Assessments

*Michio Kawamiya[1] (1.Japan Agency for Marine-Earth Science and Technology)

[MGI36-11] Issues and progress of Open Science in geodesy

*Yusuke Yokota[1], Tadashi Ishikawa[2], Basara Miyahara[3], Toshimichi Otsubo[4] (1.Institute of Industrial Science, The University of Tokyo, 2.Hydrographic and Oceanographic Department, Japan Coast Guard, 3.Geospatial Information Authority of Japan, 4.Hitotsubashi University)

[MGI36-12] Open Data for Seismology

*Yasuyuki Kano[1] (1.Earthquake Research Institute, The University of Tokyo)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-GI General Geosciences, Information Geosciences & Simulations

[M-GI37] Integration of Earth Observations and Multiple Use for Earth Science and Benefits to Societies - GEO

convener:Hiroyuki Muraoka(River Basin Research Center), Kentaro Ando(Japan Agency for Marine and Earth Science and Technology), Osamu Ochiai(Japan Aerospace Exploration Agency), Shinichi Sobue(Japan Aerospace Exploration Agency)

[MGI37-01] Development and current status of Group on Earth Observation (GEO) and Asia-Oceania GEO (AOGEO)

*Kentaro Ando[1], Hiroyuki Muraoka[2] (1.Japan Agency for Marine and Earth Science and Technology, 2.Gifu University)

[MGI37-02] Strengthening governance and investment for water-related disaster resilience under climate change in Asia

★Invited Papers

*Toshio Koike[1] (1.International Centre for Water Hazard and Risk Management)

[MGI37-03] GEOGLAM Asia Rice Crop Monitoring Activity

*Shinichi Sobue[1], Kei Oyoshi[1], Youichiro Kato[2] (1.Japan Aerospace Exploration Agency, 2.Unversity of Tokyo)

[MGI37-04] Preliminary Study of Water Quality Determination using Spectro-polarimetric Bidirectional Reflectance Factor

*Ahmad Shaqeer Mohamed Thaheer[1], Yukihiro Takahashi[1] (1.Department of Cosmosciences, Graduate School of Science, Hokkaido University)

[MGI37-05] Earth observation data utilization for Global Forest Observation Initiative (GFOI)

*Osamu Ochiai[1] (1.Japan Aerospace Exploration Agency)

[MGI37-06] **Climate and land use changes will degrade the distribution of Rhododendrons in China**

*Fangyuan Yu[1], Tiejun Wang[2], Thomas A Groen[2], Andrew K Skidmore[2], Xuefei Yang[3], Keping Ma[4], Zhifeng Wu[1] (1.Guangzhou University, 2.University of Twente, 3.Laboratory of Biogeography and Biodiversity, Kunming Institute of Botany, Chinese Academy of Sciences, Kunming , 4.State Key Laboratory of Vegetation and Environmental Change, Institute of Botany, Chinese Academy of Sciences)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-AG Applied Geosciences

[M-AG42] CTBT IMS Technologies for Detecting Nuclear Explosion and Their Applications to Earth Science

convener:Ozel Nurcan Meral(Comprehensive Nuclear-Test-Ban Treaty Organization), Hiroyuki Matsumoto(Japan Agency for Marine-Earth Science and Technology), Noriko Kamaya(Earthquake Research Institute, The University of Tokyo), Yosuke Naoi(Japan Atomic Energy Agency)

[MAG42-01] **CTBT International Monitoring System (IMS) Reaches the Milestone of 300 Certified Facilities**

*Nurcan Meral Ozel[1], Georgios Haralabus[1], Hideaki Komiyama[1] (1.Comprehensive Nuclear-Test-Ban Treaty Organization)

[MAG42-02] **Offshore real-time monitoring system and its application to disaster resilience**

★Invited Papers

*Yoshiyuki Kaneda[1,2,3], Narumi Takahashi[3,2], Hiroyuki Matsumoto[2] (1.Kagawa University, 2.Japan Agency for Marine-Earth Science and Technology (JAMSTEC), 3.National Research Institute for Earth Science and Disaster Resilience (NIED))

[MAG42-03] Beyond the antipode: Hydroacoustic detection of earthquake activity along the Middle America Trench

*Dirk Metz[1], Julien Vergoz[2] (1.Japan Agency for Marine-Earth Science and Technology, 2.French Alternative Energies and Atomic Energy Commission)

[MAG42-04] Tremendous damage of I30JP by typhoon “FAXAI”

Takanari Fujii[1], Takayuki Otsu[1], Toyomi Sakamoto[1], Soshi Iwata[1], RYOHEI EMURA[1], Mami Nogami[1], Makiko Iwakuni[1], *Masashi Motohashi[1] (1.Japan Weather Association)

[MAG42-05] Observation results of the Fukushima Daiichi accident at CTBT radionuclide monitoring stations

*Yoichi Yamamoto[1], Yuichi Kijima[1], Yutaka Tomita[1] (1.Japan Atomic Energy Agency)

[MAG42-06] **A synthesis of worldwide sediment source tracing research including fallout radiocesium (^{137}Cs)**

*Olivier Evrard[1], Pierre-Alexis Chaboche[1], Rafael Ramon[1,2], Anthony Foucher[1], J. Patrick Laceby[3] (1.Laboratoire des Sciences du Climat et de l'Environnement (LSCE, joint laboratory CEA-CNRS-UVSQ), University Paris-Saclay, France, 2.Graduate Program in Soil Science, Federal University of Rio Grande do Sul, Porto Alegre, Rio Grande do Sul, Brazil, 3.Environmental Monitoring and Science Division (EMSD), Alberta Environment and Parks (AEP), Calgary, Alberta, Canada)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-SD Space Development & Earth Observation from Space

[M-SD46] Effects of lightning, severe weather and tropical storms

convener:Mitsuteru Sato(Department of Cosmoscience, Hokkaido University), Yoav Yair(Interdisciplinary Center Herzliya), Xiushu Qie(Institute of Atmospheric Physics, Chinese Academy of Sciences), Yukihiro Takahashi(Department of Cosmosciences, Graduate School of Science, Hokkaido University)

[MSD46-01] Is there a "weekend effect" in precipitation and lightning activity during winter thunderstorms over the Tel-Aviv, Israel metropolitan area?

*Yoav Yair[1], Mordecai Yaffe[1] (1.Interdisciplinary Center (IDC) Herzliya, Israel)

[MSD46-02] An unusual multiple-stroke positive cloud-to-ground lightning flash with different terminations

*Xiushu Qie[1], Shanfeng Yuan[1], Rubin Jiang[1] (1.Institute of Atmospheric Physics, Chinese Academy of Sciences)

[MSD46-03] **Cell-Scale Analysis of Convective Cloud Merging in a Squall Line and the Associated Lightning Behaviour**

★Invited Papers

*Jingyu Lu[1,2], Xiushu Qie[1,2], Rubin Jiang[1], Dongxia Liu[1], Dongfang Wang[1], Shanfeng Yuan[1], Zhixiong Chen[1,2], Jinliang Li[3], Xian Xiao[4,5], Xiaoyuan Yi[6] (1.Key Laboratory of Middle Atmosphere and Global Environment Observation (LAGEO), Institute of Atmospheric Physics, Chinese Academy of Science, Beijing, China., 2.College of Earth and Planetary Science, University of Chinese Academy of Science, Beijing, China., 3.Key Laboratory of Semi-Arid Climate Change, Ministry of Education, College of Atmospheric Sciences, Lanzhou University, Lanzhou, China., 4.Institute of Urban Meteorology, China Meteorological Administration, Beijing, China., 5.Beijing Urban Meteorological Engineering Research Center, Beijing, China., 6.Tianjin Meteorological Observatory, Tianjin, China.)

[MSD46-04] On-going development of ground observation system for typhoon and thunderstorm activities connected to real-time micro-satellite operation

*Yukihiro Takahashi[1,2], Mitsuteru Sato[1,2], Hisayuki Kubota[1,2], Tetsuro Ishida[1,2], Kozo Yamashita[4], Ellison Caparas Castro[3], Loren Jay Estrebillo[1], Purwadi Purwadi[1], Gay Perez[3], Joel Marciano[3], Jun Matsumoto[5], Jun-Ichi Hamada[5] (1.Department of Cosmosciences, Graduate School of Science, Hokkaido University, 2.Faculty of Science, Hokkaido University, 3.University of the Philippines, Diliman, 4.Ashikaga University, 5.Tokyo Metropolitan UNniversity)

[MSD46-05] **Summer monsoon experiment in Metro Manila of Philippines in 2019**

*Hisayuki Kubota[1], Yukihiro Takahashi[1], Mitsuteru Sato[1], Glenn Vincent Lopez[2], Joel Marciano[2] (1.Hokkaido University, 2.Advanced Science and Technology Institute)

[MSD46-06] Implementation of the ULAT Project : Quasi-Real Time Monitoring of Lightning and Weather in the Philippines

*Mitsuteru Sato[1], Glenn Vincent C. Lopez[2], Yukihiro Takahashi[1], Hisayuki Kubota[1] (1.Department of Cosmoscience, Hokkaido University, 2.Advanced Science and Technology Institute, DOST)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-SD Space Development & Earth Observation from Space

[M-SD46] Effects of lightning, severe weather and tropical storms

convener:Mitsuteru Sato(Department of Cosmoscience, Hokkaido University), Yoav Yair(Interdisciplinary Center Herzliya), Xiushu Qie(Institute of Atmospheric Physics, Chinese Academy of Sciences), Yukihiro Takahashi(Department of Cosmosciences, Graduate School of Science, Hokkaido University)

[MSD46-07] Lightning Geolocation using a Ground-based Lightning Observation Network in the Western North Pacific

*Loren Joy De Vera Estrebillo[1], Mitsuteru Sato[1], Yukihiro Takahashi[1], Hisayuki Kubota[1] (1.Hokkaido University)

[MSD46-08] **Typhoon energy input estimation using lightning data and backtracing technique**

★Invited Papers

*Purwadi Purwadi[1,2], Yukihiro Takahashi[1], Mitsuteru Sato[1], Hisayuki Kubota[1], Kozo Yamashita[3] (1.Department of Cosmosciences, Hokkaido University, Sapporo 0600810, Japan, 2.National Laboratory for Weather Modification Technology, Agency for Assessment and Application of Technology, Jakarta 10340, Indonesia, 3.Division of Electrical and Electronic Engineering, Dept. of Innovative engineering, Ashikaga University, Tochigi 3268558, Japan)

[MSD46-09] Estimation of relationship between tropical cyclone intensity and electrical properties of lightning

*Shunsuke Niwa[1], Mitsuteru Sato[1], Yukihiro Takahashi[1], Hisayuki Kubota[1] (1.Department of Cosmoscience, Hokkaido University)

[MSD46-10] Infrasound multi-site observation of thunders 4: regional testing process for SATREPS

*Masa-yuki Yamamoto[1], Taisei Yamamoto[1] (1.Department of systems engineering, Kochi University of Technology)

[MSD46-12] **3D Reconstruction of Typhoon and Thunderstorm Cloud Top Using Airborne and Satellite-borne Camera**

★Invited Papers

*Meryl Regine Llenaresas Algodon[1], Yukihiro Takahashi[1], Hisayuki Kubota[1], Joel Joseph Marciano[2] (1.Hokkaido University, 2.DOST - Advanced Science and Technology Institute)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-TT Technology & Techniques

[M-TT48] Cryoseismology - A new proxy for detecting surface environmental variations of the Earth -

convener:Masaki Kanao(National Institute of Polar Research), Seiji Tsuboi(JAMSTEC, Center for Earth Information Science and Technology), Genti Toyokuni(Research Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University), Yoshihiro Hiramatsu(School of Geosciences and Civil Engineering, College of Science and Engineering, Kanazawa University)

[MTT48-01] **Seismic tremors and their candidate origins in relation to cryosphere dynamics in Lützow-Holm Bay, Antarctica**

*Masaki Kanao[1], Yoshihiro Hiramatsu[2] (1.National Institute of Polar Research, 2.Kanazawa University)

[MTT48-02] An effort to utilize the infrasound monitoring network data for understanding surface environment of Antarctica

*Takahiko Murayama[1], Masaki Kanao[2], Masa-yuki Yamamoto[3], Yoshiaki Ishihara[4], Takeshi Matsushima[5], Yoshihiro Kakinami[6] (1.Japan Weather Association, 2.National Institute of Polar Research, 3.Kochi University of Technology, 4.National Institute for Environmental Studies, 5.Kyushu University, 6.Hokkaido Information University)

[MTT48-03] Locating earthquakes around Antarctica by using neural networks based on deep learning

*Seiji Tsuboi[1], Daisuke Sugiyama[1], Masaki Kanao[2], Yoshiaki Ishihara[3], Takahiko Murayama[4] (1.JAMSTEC, Center for Earth Information Science and Technology, 2.National Institute of Polar Research, 3.National Institute of Environmental Studies, 4.Japan Weather Service)

[MTT48-04] Ice dynamics inferred from the detection of icequake seismicity near the Princess Elisabeth base, eastern Dronning Maud Land, East-Antarctica

★Invited Papers

[U-11] Planetary Metabolism: The Science of Living Worlds

convener:Anbar Ariel D(Arizona State University), John W Hernlund(Earth-Life Science Institute), Hilairy Ellen Hartnett(Arizona State University), ryuhei nakamura(Tokyo Institute of Technology, Earth-Life Science Institute), Chairperson:Ariel D Anbar(Arizona State University), Hilairy Ellen Hartnett(Arizona State University), John W Hernlund(Earth-Life Science Institute), ryuhei nakamura(Tokyo Institute of Technology, Earth-Life Science Institute)

The geosciences are poised for transformation because of the convergence of two rapidly emerging revolutions: The advent of the Anthropocene, and the radical realization that Earth is one of countless planets in the Universe. These twin revolutions expose major gaps in our understanding of the integrated Earth-life system. The gaps are apparent when we realize that we cannot answer fundamental questions now confronting us: What are Earth's most likely future trajectories? What are the prospects for life on even the most Earth-like extrasolar worlds? The solution is to develop a truly integrated science of living worlds. Building on - 250 years of investigation across an ever-increasing range of subdisciplines, we now know the evolution of life and of Earth's biogeochemical cycles are inextricably linked to the evolution of the solid Earth. The emergence of life, the rise of an aerobic biosphere, biological radiations, mass extinctions, and even human evolution-these events and their placement in time are shaped by the trajectory of Earth's internal differentiation and dynamics, and their expression in surface tectonics and volcanism. From this vantage point, life emerged as an epiphenomenon of geophysics, and will remain coupled to the solid Earth far into the Anthropocene. Hence our greatest questions can only be answered through integration of our subdisciplines, considering the entire planet as a system. We must develop a quantitative, predictive "theory" of the Earth system that describes the mechanistic links between the interior and the surface, and how they have changed with time. Without such a theory, we cannot readily generalize from our understanding of the modern Earth system to forecast its future state, nor can we reliably model the likely states of Earth-like worlds beyond our own.

Syngeosis: Application of the Principles of Symbiosis to Geological Processes

*John W Hernlund[1]

1. Earth-Life Science Institute

The ultimate aim of geology is to understand the role of natural processes in shaping a terrestrial planet. A process is that which animates and transforms matter, driven by available energy. Rock deformation, tectonics, mantle convection, partial melting, differentiation, orogeny, weathering, erosion, geodynamo, and even life are all processes that operate on a living planet, which involve many of the same materials and energy sources. Symbiosis, the intricate interplay of the collective processes carried out by a community of organisms, is widely established in ecological science. Less well-understood, however, is the extension of these emergent communal behaviors to include non-biological processes operating across the planet scale through deep time, something I term "syngeosis." In this presentation I will examine the interplay of abiotic processes from the viewpoint of ecological dynamics, and attempt to establish the difference between "life on a planet" and a "living planet."

Redox Revolutions on Earth and Beyond

*Ariel D Anbar[1]

1. Arizona State University

The molecule O_2 looms large in the search for life on extrasolar planets, because Earth's O_2-rich atmosphere is a consequence of biology. Commonly, it is assumed that an Earth-like planet on which oxygenic photosynthesis evolves will inevitably accumulate O_2 in its atmosphere and pervasively alter the surface environment –that biological redox innovations inexorably lead to environmental redox revolutions. However, close examination of Earth's environmental redox history challenges this assumption.

Increasingly, it appears that evolution of the solid Earth played a key role in modulating the oxygenation of Earth's surface environment. Multiple lines of evidence now suggest that O_2 was being produced biologically hundreds of millions of years before its accumulation in the atmosphere during the Great Oxidation Event (GOE), ca. 2.4 Ga, and hence that Earth's surface redox revolution was substantially delayed. This delay can be accounted for by interactions between the atmosphere and the solid planet, because the biological production of O_2 is ultimately balanced by consumption through reaction with reductants derived from Earth's interior. In particular, recent examinations of oxygen fugacity during the formation of Precambrian basalts and komatiites suggest that large volumes of the mantle underwent a secular increase of oxygen fugacity through the Archean and early Proterozoic. The cause(s) of this secular shift remain unclear, but when translated into a secular evolution of the redox state of volcanic gases, the observed mantle trend can account for a shift from net O_2 consumption to net O_2 production at about 2.4 Ga.

This emerging understanding of Earth's redox revolution raises important questions about the likelihood of similar revolutions on other worlds even in the presence of large biospheres powered by oxygenic photosynthesis. Even modest differences in mantle compositions or tectonics might substantially alter the timing of surface oxygenation. On some worlds, atmospheric O_2 accumulation might be impossible. This realization highlights the need for far better understanding of solid Earth processes - and how these processes might operate on other nominally "Earth-like" worlds - as a key part of a new science of living worlds.

The future life span of Earth's oxygenated biosphere and its controlling factors

*Kazumi Ozaki[1], Christopher Reinhard[2]

1. Toho University, 2. Georgia Institute of Technology

Detecting atmospheric biosignatures on Earth-like exoplanets is one of the primary objectives of ongoing and future exoplanetary observational surveys. Significant gaps, however, remain in our understanding of the atmospheric evolution of exoplanets, and in particular the cause-and-effect relationships with an evolving biosphere. Many of these gaps arise from a lack of quantitative frameworks for interpreting atmospheric biosignatures. Construction of such a framework is a subject of broad inter-disciplinary interest. Numerous potential atmospheric biosignatures have been proposed, but molecular oxygen (O_2) (and commensurately abundant ozone, O_3) is still on top of the list of remotely detectable exoplanet biosignatures. However, a fundamental question of how much longer the remotely observable O_2/O_3 in Earth's atmosphere would be sustained on Earth remains uncertain. Solving this question has great ramifications not only for the future of our planet but also for the search for life beyond our planet. Here, we examine this problem using an Earth system model of biogeochemistry and climate that tracks the coupled carbon, oxygen, phosphorus, and sulfur cycles, and captures the global redox (O_2) budget between the exogenic system (atmosphere, ocean, and crust) and the mantle. Our model, which builds upon previous similar Earth system models, incorporates a variety of biogeochemical processes, such as biological productivity in the surface oceans and on land, a series of respiration pathways under oxic and anoxic conditions, an explicit calculation of carbonate system in the seawater, and terrestrial weathering processes, allowing an examination of biogeochemical response to changes in the O_2 levels over geologic timescales. We also include a global biogeochemical CH_4 cycle (methanogenesis, methanotrophy, a parameterized O_2-O_3-CH_4 photochemistry, and the radiative impact of CH_4 on global energy balance) in this study. The model is designed to capture the major components of the biogeochemistry and climate of Earth (and Earth-like planets more broadly) with oxic/anoxic biosphere, but is abstracted enough to allow for a stochastic approach involving large model ensembles that are run for billions of years. Implementation of a stochastic approach reveals that the mean lifespan of Earth's oxygenated biosphere (atmospheric pO_2 >1% of the present atmospheric level, PAL) is $0.81^{+0.08}_{-0.10}$ Gyr (1*sigma*), with a most probable value of 0.78 Gyr. The model predicts that a 'great deoxygenation' of atmosphere, with atmospheric pO_2 dropping sharply to levels reminiscent of the Archaean Earth (<<0.01% PAL), could conceivably be triggered within the next 1 Gyr. We also find that the future lifespan of oxygenated atmosphere depends mainly on an exchange flux of reducing power between the mantle and the exogenic (i.e., ocean-atmosphere-crust) system. We estimate that total duration of Earth's oxygenated biosphere would be ~1.5 Gyr, or roughly 25% of Earth's whole history as an inhabited planet, emphasizing the need for robust atmospheric biosignatures for anoxic exoplanet atmospheres.

Water worlds may be habitable, but not detectable

*Hilairy Ellen Hartnett[1], Group ASU NExSS Team

1. Arizona State University

Water worlds and pelagic planets with extensive surface liquid water, are intriguing types of planet to consider in the search for life beyond Earth. They fall squarely within the traditional definition of habitable because they have surface oceans. However they may have many times more water than the Earth, which has implications for their biogeochemical cycles. We define a Detectability Index to quantify the likelihood that oxygen (O_2) could be assigned a biological vs. non-biological origin and apply it to the case of O_2 on Earth-like planets with varying amounts of water. On Earth-like exoplanets with just 0.2wt% water, i.e., no exposed continents, a reduced flux of bioessential phosphorus limits O_2 production by photosynthesis to levels indistinguishable from abiotic O_2 production due to photolysis of water vapor plus hydrogen escape. Higher water contents, > 1wt%, lead to high-pressure ice mantles and even lower rates of oxygen production. The counter-intuitive conclusion that planets with more water may be more difficult targets for life detection, highlights the importance of a biogeochemical framework for assessing biological process rates in context with geochemical and geophysical process rates.

CHALLENGES TO PREDICTING PLANETARY DIVERSITY

*Steven J Desch[1], Hilairy Ellen Hartnett[1], Cayman T Unterborn[1]

1. Arizona State University/CSPO

Current strategies for detecting life on exoplanets rely on finding (e.g., by transmission spectroscopy) atmospheric oxygen and/or CH_4 in abundances that demand production rates that cannot be explained by purely abiotic processes. To predict their abundances on a lifeless planet requires several inputs from many fields. Host star elemental abundances constrain the starting composition of the protoplanetary disk, especially H (H_2O), C, and S. Subsequent disk processes like snow lines can fractionate these, leading to planetary materials with different H:C:S ratios. Disk processes also are important for setting the redox state of planetary materials; e.g., by modifying the FeO/Fe^0 ratio by reaction of Fe metal with H_2O vapor in the disk. Within a planet, elements are further fractionated by sequestration in the core. Although H, C, and S do not dominate the density deficit of Earth's core, most of the H, C, and S on Earth nonetheless may reside in the core. This process depends on the mantle redox during core formation. Core formation in turn can affect the mantle redox state, e.g., through reactions like 3 Fe + SiO_2 àFeSi + 2 FeO, which can oxidize the mantle. Oxygen is produced abiotically by photolysis of H_2O vapor, but consumed by reduced gases (H_2S, CO) and minerals (Fe_2S) brought up from the planet interior. Translating O_2 abundance into a production rate requires fixing the speciation of S (H_2S vs. SO_2), and C (CH_4 vs. CO vs. CO_2), i.e., constraining the redox state of the near-surface interior. Likewise, CH_4 is destroyed by photolysis, but its production rate depends on the speciation of C. Predicting production rates of O_2 and CH_4, or just identifying the most important determinants, means combining results from stellar astronomy, astrophysical modeling of planet formation, geophysical modeling of core formation, and mineral and aqueous geochemistry.

We consider C; extension to S and N would be similar. Stellar abundances suggest a factor-of-2 variations in C/Mg and thus C/rock ratios in disks [1]. Earth's mantle has up to 120 ppm C, yielding 8×10^{-5} M_E or $40{,}000 \times 10^{18}$ moles of C in the mantle, plus 7000×10^{18} moles of C is in the crust and surface [3]. This represents a decrease by a factor of 40,000 below the solar C/rock ratio [3.5], due to a combination of disk processes and sequestration of C in the core. The plausible range of C contents of Earth's core, ~0.1 - 1wt% C [4,5], suggests a mass 3×10^{-4} –3×10^{-3} M_E, so C in the Earth's mantle was reduced by a factor of 4-40 during core formation. Solubility of C in metal is sensitive to the pressure of core formation, varying by a factor of 3 for pressures between 0 and 44 GPa [6]. Variations in mantle oxygen fugacity during core formation likely lead to significant differences in the C partitioning [5]. The partitioning of N into the core decreases by two orders of magnitude across the plausible range of mantle oxygen fugacities, ΔIW=-5 to 0 [7]. Mantle redox must play a role in setting the CH_4/CO_2 ratio of outgassed C. We conclude that the largest determinants of C content and CH_4 outgassing are snow line-like disk processes, followed by a planet's mantle redox. Stellar abundances, circumstances of core formation, near-surface mineralogies, and mode of volatile exchange (stagnant lid vs. plate tectonics) also play important roles.

Understanding the geochemical cycles of a nominally Earth-like exoplanet requires constraining its formation history and its redox state. This demands an interdisciplinary approach to solve.

Planetary Dyspepsia: Finding Planets that work by understanding the planets that don’t

*Cayman T Unterborn[1], Steven J Desch[1]

1. Arizona State University/CSPO

In our search for life outside of our solar system, the all-important question is “Where to look?” With more than 4000 exoplanets discovered, nature has revealed a diversity of rocky worlds. From exo-Mercuries to super-Earths, the vast majority of rocky planet discovered to date are unlike anything found in our Solar System. Our current data set reveals planets with masses smaller than Mercury to ten times that of Earth. For these rocky planets, the diversity increases even more so with the relative abundances of rock-building elements in stars showing factors of two difference relative to the Sun and Earth. In the building a predictive model of the trajectory a planet can take, the Earth offers our best data set to benchmark these models. The Earth, however, is unique, even in our Solar System as it undergoes plate tectonics, underwent remelting to produce continental crust and, of course, is abundant with life. We are presented with a problem: how to reconcile the need to know where to best point our telescopes to find life, the large and decidedly non-Earth parameter space of rocky exoplanet and our best source of benchmark data for any predictive models of exoplanet evolution being exceedingly complex and unique in the Earth. Given the problem’s scale coupled with the inherent need for a cross disciplinary approach to solve it, where do we start? Underlying each of these questions is a want to search for “Earth-like,” habitable planets with temperate climates over geologic timescales. As such, knowing which planets based on their observable properties are less likely to produce these conditions tell us where not to look for life. Here I present a series of examples of rocky planet compositions, ages and formation environments that outline the parameter space of planetary conditions over which emergence should be explored. By taking an “outside-in” approach to mapping the parameters for which planets stop behaving in an Earth-like manner, many of the complexities present in our models for the Earth evolution are much less relevant. By concentrating on only the most basic aspects of a planet’s evolution, we can quickly trace the planets with trajectories that are not fruitful for expensive observational follow up time in our search for life. Indeed, by mapping those planets which are more likely to be non-Earth-like can provide us with a much more robust data set to understand the population of planets to which Earths and non-Earths belong.

[U-13] Open Colloquium-NASA/JAXA: Our advance and future load in Heliophysics

convener:Yusuke Iida(Niigata University), Mariko Teramoto(Kyushu Institute of Technology), Chun Ming Mark Cheung(Lockheed Martin Advanced Technology Center), Chairperson:Yusuke Iida(Niigata University), Mariko Teramoto(Kyushu Institute of Technology), Chun Ming Mark Cheung(Lockheed Martin Advanced Technology Center)

The connection between the Sun and the earth is becoming a more critical issue in the modern era of space use. Recent advances in the satellite observation have brought breakthroughs in our understanding of the solar-terrestrial system and also the solar activity itself. In this session, the researchers who played a central role in the NASA and JAXA heliophysics missions introduce their achievements to the Geoscience community members and discuss the future payload of the heliophysics missions. We have discussion time not only in each talk but also at the end of the session. Open discussions are very welcomed from both space science and other fields.

Geospace Explorations: Toward cycle 25

*Yoshizumi Miyoshi[1]

1. Institute for Space-Earth Environmental Research, Nagoya University

In this presentation, we will show current research activities and future perspectives of geospace, mainly focusing on magnetosphere and ionosphere. During solar cycle 24, new satellites NASA/THEMIS, Van Allen Probes, MMS and JAXA/Arase are operated and provide many new findings about geospace. Besides these in-situ observations, ground-based observations such as SuperDARN, EISCAT, global magnetometer etc provide global view of geospace phenomena, convection, global current, plasma wave distributions. Coordinated observations between in-situ satellite measurements and ground-observations are very useful to understand cause and consequence occurred in different regions. For solar cycle 25, new missions for geospace imaing are planned, which provides new view of geospace.

The State and Vision for the Future of Heliophysics at NASA

*James F Spann[1]

1. NASA Headquarters

NASA is a mission driven agency whose science mission is focused on discovering the secrets of the universe, looking for life elsewhere, and safeguarding and improving life on Earth. Heliophysics plays a key role in every aspect of the NASA science mission and focuses on increasing our knowledge of the dynamic nature of our star, and its impact on Earth, and throughout the Solar System to the boundary of interstellar space. This includes advancing our understanding of drivers of and enabling the prediction of space weather. Heliophysics has an established research program that motivates and funds solar and space physics, which is the essence and foundation of space weather research. This talk will provide an overview of the Heliophysics Program and how the science investigations through missions, technology, and R&A address all aspects of solar and space physics, and its relation to space weather.

The Solar-C_EUVST Mission and Solar Observations in 2020s

*Toshifumi Shimizu[1]

1. Institute of Space and Astronautical Science, JAXA

High resolution observations with advanced techniques of the Sun have been improving our knowledge on fundamental physics working in solar dynamical atmosphere, which is full of MHD processes including waves, magnetic reconnection, magneto-convection, and instability. The Solar-C_EUVST mission is a JAXA competitive M-class mission to be developed with participations from NASA and European space agencies. The mission will carry EUV High-Throughput Spectroscopic Telescope, which is an EUV imaging spectrometer with slit-jaw imaging system that will simultaneously observe the solar atmosphere from the photosphere/chromosphere up to the corona with seamless temperature coverage, high spatial resolution, and high throughput for the first time. The mission is designed to comprehensively understand how mass and energy are transferred throughout the solar atmosphere, which would provide an answer to the most fundamental questions in solar physics: how fundamental processes lead to the formation of the solar atmosphere and the solar wind, and how the solar atmosphere becomes unstable, releasing the energy that drives solar flares and eruptions. This is a fundamental step towards answering how the plasma universe is created and evolves, and how the Sun influences the Earth and other planets in the heliosphere. In 2020s, we will acquire new observations from a large variety of new instruments, such as DKIST for high-spatial solar surface observations, Indian and Chinese satellites, Parker Solar Probe to reach less than 10 solar radius, Solar Orbiter in an inclined orbit, PUNCH for polarimetric observations of the outer corona. The Solar-C_EUVST will provide spectroscopic measurements to fill a gap from the solar surface to the outer corona and the heliosphere.

[U-21] Frontiers of Antarctic Environmental Research

convener:Kenji Kawamura(National Institute of Polar Research, Research Organization of Information and Systems), Carol Finn(USGS), Osamu Seki(Institute of Low Temperature Science, Hokkaido University), Yusuke Suganuma(National institute of Polar Research), Chairperson:Kenji Kawamura(National Institute of Polar Research, Research Organization of Information and Systems), Carol Finn(USGS), Osamu Seki(Institute of Low Temperature Science, Hokkaido University), Yusuke Suganuma(National institute of Polar Research)

Antarctica and the Southern Ocean play important roles in the global climate system, with their crucial influences on, e.g., sea level, ocean circulation and heat/carbon storage. They are also the least known components because the precise understanding of the processes requires observations of various interactions, such as those between ocean, ice shelf and ice sheet, in the harshest conditions on the Earth's surface. Recent advancements in direct and satellite observations and data analyses have suggested significant changes in the Antarctic. However, as the spatial and temporal scales of the changes are diverse (from sub-annual to over millennial), significant challenges remain in their understanding and modeling.

This session will invite several presentations that address the Antarctic environmental changes in the past, present and potential future, and the importance of interdisciplinary and international observations and modeling for better understanding and projection of the Antarctic and their influences on the global environments.

2:15 PM - 2:17 PM JST | 5:15 AM - 5:17 AM UTC

Introduction

2:17 PM - 2:39 PM JST | 5:17 AM - 5:39 AM UTC

[U21-01] Oceanographic and geophysical observation campaign off Sabrina Coast, East Antarctica, in 2019/2020

★Invited Papers

*Shigeru Aoki[1], Takeshi Tamura[2], Yoshihiro Nakayama[1], Kazuya Ono[1], Pat Wongpan[1], Kaihe Yamazaki[1], Takuya Itaki[3], Yuki Tokuda[4], Satoshi Sasaki[5], Daisuke Hirano[1], Yuichi Aoyama[2] (1.Hokkaido University, 2.NIPR, 3.AIST, 4.Tottori University of Environmental Studies, 5.Shimane University)

Totten Glacier is one of the fastest-flowing glaciers in East Antarctica. The glacier's drainage system as a whole has a potential of 3.5m rise of global sea level. Recent various researches have revealed Totten Glacier and nearby glaciers are changing, which has some similarity with the situation in West Antarctica. Totten Glacier is now losing its ice mass and has a potential of contributing to a significant sea level rise in the future. Warm water of the ocean off Sabrina Coast, flowing through a deep channel under the glacier, is considered as the major driver of the rapid ice melting, but yet little is known about the oceanic role in melting the ice. Although this region has been attracting growing attention, in-situ observational understandings are still inadequate because of its heavy sea ice cover.

Based on Icebreaker Shirase, we conducted oceanographic and geophysical observations off Sabrina Coast, East Antarctica, during Dec. 2019 and Feb.-Mar. 2020 as a program of 61st Japanese Antarctic Research Expedition (JARE61). Hydrographic measurements, including CTD (Conductivity-Temperature Depth profiler)/MS (Multi-water Sampler) and XCTD (eXpendable CTD), revealed the ubiquitous presence of deep warm water in this region, which is the source of the large thermal forcing. Air-borne XCTD and XBT(eXpendable BathyThermograph) helped enhance the spatial sampling in difficult access area, and largely expand the distribution of water mass property. At the same time, sediments and their cores were taken for the first time in this region. Bathymetric survey with multi-narrow beam was effective and describes new and detailed topographic features in the least explored area. Sea ice research including wave motion measurements were conducted at the marginal ice zone off Dolton Polynya. International cooperation was effective in filling gaps of our observational systems. Further analysis of these data enables us to decipher a detailed pathway of warm water and meltwater discharge to and from the Totten Glacier Ice Shelf and its historical evolution.

Hot-water drilling for exploring subglacial environment of the Antarctic ice sheet

*Shin Sugiyama[1], Masahiro Minowa[2]

1. Institute of Low Temperature Science, Hokkaido University, 2. Instituto de Ciencias Físicas y Matemáticas, Universidad Austral de Chile

Subglacial environment of the Antarctic ice sheet is one of the least investigated areas on the Earth. Base of the ice sheet forms an important boundary, which controls ice dynamics and thermal conditions. Existence of subglacial channels and lakes poses important questions about basal hydrology and microbial ecosystem under several-kilometer-thick ice. Recent mass loss of the ice sheet is driven by the melting of ice shelves, which occurs at the basal boundary of floating ice. Sensing physical properties beneath the ice is possible by using seismic and electromagnetic waves, but in-situ measurements and sampling are required to answer many of the questions. Hot-water drilling is a powerful tool to provide an access to the bed of glaciers and ice sheets. In this contribution, I introduce recent progress in our understanding of subglacial environment of the Antarctic ice sheet based on direct observations through boreholes, including our project in Langhovde Glacier in East Antarctica.

Langhovde Glacier is a 3-km wide outlet glacier located 20 km south of the Japanese Syowa Station in East Antarctica. Lower 2–3 km of the glacier forms a floating tongue, which feeds into the Lützow-holm bay. To study basal melting and subshelf ocean environment, we drilled four boreholes in January 2018 using a hot-water drilling system. The boreholes were utilized to measure spatial variations of temperature, salinity and current under the ice. Two of the boreholes were equipped with a temperature and CTD/current sensors for year-round observations. Potential temperature of the seawater underneath the ice was between −1.4 and −1.1˚C, approximately 1˚C warmer than the freezing temperature. Water temperature within several hundred meters from the grounding line was −1.2˚C in January 2018. Temperature dropped to −1.6˚C from January to May, which was followed by gradual warming to −1.55˚C in December. The temperature in January 2018 (−1.2˚C) was significantly warmer than that in the summer 2019 (−1.55˚C), as well as temperature measured at the same location in 2012 and 2013 (−1.55˚C). A possible interpretation of the unusually warm water in 2018 was break-up of land-fast sea ice in the Lü tzow-holm bay in 2016. Presumably, open water near the glacier front facilitated transport of heat to the grounding line. Our subshelf observations implied significant amount of basal melting occurs under the entire ice shelf of Langhove Glacier, and thermal conditions near the grounding line is susceptible to changes in the ocean.

Modelling the Stability of Antarctic ice sheet in the past interglacials and its implication on future projection.

*Ayako Abe-Ouchi[1], Takashi Obase[1], Ralf Greve[4], Sam Sheriff-Tadano[1], Fuyuki SAITO[2], Kenji Kawamura[3]

1. Atmosphere and Ocean Research Institute, The University of Tokyo, 2. JAMSTEC, 3. NIPR, 4. Hokkaido University

Ice sheet volume changes are the largest potential source of sea level change in the past and future. Projection of the ice sheet in future has been challenging and requires different approach from other components of climate system for model validation because of two main reasons. One is its millennial-scale long response time to external forcing which leads to its long commitment. The other is the existence of threshold or tipping point in the system which characterizes the irreversible behavior under climate changes. It can make a large difference in Antarctica ice sheet volume even under a small change in forcing. Here we show the case studies of the last interglacial climate and Antarctic ice sheet compared to the present interglacial. Multiple lines of evidence show that the sea level was higher at the last interglacial than today and the Antarctica ice sheet mass loss may have contributed substantially to it. One study using NCAR CCSM3 climate model and another one using MIROC 4m both simulate the climate change from the penultimate glacial maximum to the last interglacial and are compared with ice core studies and paleoceanography studies. Several ice sheet modelling studies show a mass loss of Antarctica ice sheet at the last interglacials under a few degree warmer conditions than our current interglacial. It is shown in many models that subsurface ocean warming and the marine ice sheet instability are the key processes. There are still many steps needed to link the lessons from modelling the interglacials to the model validation for future projection through both domestic and international collaboration.

Looking to the Future Collaborative Antarctic Science with Global Impacts

*Robin Elizabeth Bell[1], Terry Wilson[2]

1. Lamont Doherty Earth Observatory, 2. Ohio State University, Columbus ,OH, USA

Antarctica is stunning in its vast whiteness. It remains a continent encased in ice and long just an empty space on maps. Filling in this blank space has been a collaborative international effort. Over sixty years ago in 1958 nations came together as international collaboration blossomed in the International Geophysical Year (IGY). Two lasting impacts of the IGY are the discovery that the Antarctic ice sheet was over two miles thick and the concept that Antarctica should be a continent dedicated to science. The Scientific Committee for Antarctic Research became the hub for fostering collaboration in the challenging Antarctic environment where collaboration is essential.

In 2002, just as Larsen B ice shelf broke up catastrophically, the international community recognized the essential need to address the emerging evidence for change in the polar regions using the framework of collaboration fostered by the IGY. A small group of scientists launched the concept of the International Polar Year 2007-9 (IPY). Over 65,000 scientists collaborated and succeeded in reaching places that had not been visited for over 50 years. Using new technologies and leveraging shared logistical assets, scientists discovered everything from subglacial water networks that run uphill to glacial isostatic uplift at rates over 40 mm/year. These discoveries were only possible due to the collaborative framework of the IPY.
The Antarctic Ice Sheet is changing at rates greater than IGY scientists could have imagined. The rapidly changing ice has pushed the driving motivation for Antarctic science beyond simple awe and discovery to science that is critical for coastal residents around the globe. Suddenly change in Antarctica matters. The challenge for SCAR and the global science community will be to build truly inclusive teams to improve our understanding of how fast the ice sheet will change and how much sea level will rise. Antarctic science has an opportunity to move beyond the image of the frosty bearded explorer to embracing international teams where data is openly shared and leaders reflect the diverse population of the cities that will be impacted by the future Antarctic change.

Discussion

Lessons learned from emission fluctuation of greenhouse gases and air pollutants due to restrictions associated with the COVID-19 pandemic

*Toshihiko Takemura[1]

1. Research Institute for Applied Mechanics, Kyushu University

The decrease in the concentration of air pollutants due to the limitation of socio-economic activities associated with the COVID-19 pandemic has been detected by ground-based and satellite observations. Since most of the air pollutants originate from fossil fuels, it is thought that the emission of carbon dioxide, which is a greenhouse gas, has also been reduced. However, as behavior restrictions have been lifted, air pollutant concentrations have returned to their original levels. Although it was a very short period of time, it is a fact that there was a rapid global reduction in their emissions that could not have been normal situations. What should we learn from this experience toward mitigating future climate change and air pollution? I will provide a few perspectives based on my public articles posted to Yahoo Japan News (sorry, but only in Japanese) (https://news.yahoo.co.jp/byline/takemuratoshihiko/) for discussion.

<Mitigating global warming by reducing carbon dioxide vs. Accelerating global warming by reducing air pollutants>
Both carbon dioxide and air pollutant emissions were reduced globally in the first few months of this year. Carbon dioxide reduction works to mitigate global warming, of course. On the other hand, climate change caused by aerosols is quantitatively large among the air pollutants, and its reduction brings about positive radiative forcing, and therefore accelerates global warming. Most of the air pollutants have short lifetimes in the atmosphere, then as soon as the amount of emission changes, the concentration also changes significantly. In the case of carbon dioxide, even if the amount of emission changes temporarily, the concentration in the atmosphere does not immediately change. Therefore, temporary reductions in fossil fuel consumption may have resulted in temperature increases of the order of months in some regions. An international project with climate models is underway to analyze how the climate change caused by the COVID-19 pandemic was. Regarding the long-term relationship between air pollution and climate change, developed countries that have continued to increase greenhouse gas emissions by only reducing particulate matter that cools the
atmosphere to mitigate air pollution have accelerated global warming. Air pollution control and global warming mitigation had to proceed simultaneously.

<Sustainable behavior change is effective in mitigating global warming>
Improving the atmospheric environment and reducing carbon dioxide emissions associated with the COVID-19 pandemic is only temporary. Although it was only temporary, we were able to experience that if the consumption of fossil fuels is reduced, the carbon dioxide emissions will decrease and the atmospheric environment will improve. It was analyzed that the largest reduction in carbon dioxide emissions due to this behavior change was in the transportation sector. It was proved that individual commuting by foot or bicycle, and reduction of going to office and business trips by remote work were effective. We tend to have the impression that we have to put up with something to mitigating global

©2020. Japan Geoscience Union. All Right Reserved.

warming (especially Japanese people). “Patience” of behavior restriction does not become an essential solution to global warming and air pollution, but we have experienced that sustainable behavioral change by each person is effective in achieving a decarbonized society. I think that what we have done is of great significance.

Satellite Observations of Aerosols during COVID-19 Pandemic

*Pawan Gupta[1,2], Robert C. Levy[3]

1. Universities Space Research Association Greenbelt, 2. MSFC, 3. GSFC

As a result of an ongoing COVID-19 pandemic, global human activities have been limited or completely halted in many parts of the world. As a result of reduced anthropogenic emissions, this has created a natural experiment to observe the changes in atmospheric composition at different temporal and spatial scales. Some of these changes will be short-term, and some will last over a more prolonged period. Aerosols, however, are produced by not only human activities, but also natural sources such as dust, sea salt and biomass burning. As we now have a good-quality, stable, satellite-derived, global aerosol dataset from the past two decades, we can evaluate the recent COVID-19 impacts on aerosols. In this study, we will present results of satellite data analysis from around the world, focusing on urban centers as well as regions where significant changes were observed.

Seasonal sensitivity of COVID-19: perspectives from viral-host interactions

*Miyu Moriyama[1], Akiko Iwasaki[1]

1. Yale University

Coronavirus disease 2019 (COVID-19) has emerged in December 2019 and continues to spread throughout over 200 countries and territories. To flatten the epidemic curve of COVID-19 cases, prolonged strict restriction of movement has been applied which has unfortunately led to severe economic crises in many countries. COVID-19 is caused by respiratory tract infection with a newly emerging coronavirus, severe acute respiratory syndrome-related coronavirus 2 (SARS-CoV2). Other members of the coronaviruses are well known to cause the common cold, which has seasonality in winter. Therefore, whether the seasonal changes impact on COVID-19 outbreak is of great importance. In this presentation, we will discuss the seasonal sensitivity of COVID-19 by focusing on the key determinants of the seasonality of other respiratory viral infections. In particular, we will highlight the effects of seasonal changes in the environmental factors on the host antiviral immune responses. Further, we will discuss the latest studies on seasonal effects on the COVID-19 pandemics.

Air pollution, COVID-19, and public health: What we know and don’t know

*Susan Anenberg[1]

1. George Washington University

Air pollution, COVID-19, and public health intersect in several ways. Air pollution may contribute to both spread of SARS-CoV-2 and severity of COVID-19 infection. Rapid declines in personal vehicle activity during stay-at-home orders and physical distancing have also affected ambient air pollution levels. This talk will address what we know and don’t know about how air pollution, COVID-19, and public health interact, drawing from the rapidly evolving body of research on these topics. Understanding these interactions can inform the public health response to COVID-19, as well as longer-term environmental policies.

Discussion

Large-scale survey of work and life in scientific and technological profession in Japan under Emergency Declaration caused due to COVID-19 and requests to Japanese government

*Noriko Hirata-Kohno[1], Misa Shimuta[2,3]

1. Nihon University, 2. EPMEWSE, 3. The Jikei University School of Medicine

In Japan , since the ratio of female professionals in science, technology, engineering and mathematics (STEM) field is far behind other developed countries, "The Japan Inter-Society Liaison Association Committee for Promoting Equal Participation of Men and Women in Science and Engineering (EPMEWSE in short)" was established in 2002. Around 100 academic societies belong to the association and do working for gender equality.

As some JpGU member may already know, the major roll of EPMEWSE could be summarized as: 1) large Scale Survey for every five years to know the actual conditions of gender equality in STEM field in Japan, 2) proposals and requests to Japanese Government based on the survey results, 3) light survey the activities and female ratio of each member societies associated with EPMEWSE and 4) support STEM Programs for high school girls.
In this talk, we discuss our actual situation under Emergency Declaration caused due to COVID-19 based on our recent "Large-scale survey of work and life in scientific and technological profession" in Japan as well as related requests to Japanese government.

The impacts of COVID-19 and how racism is hindering our diversity and inclusion efforts

*Robin E Bell[1,2]

1. American Geophysical Union, 2. Lamont-Doherty Earth Observatory

AGU has recently established an updated Strategic Plan which outlines three primary strategic goals to: (1) catalyze discovery and solutions to scientific and societal challenges; (2) promote and exemplify an inclusive scientific culture; and (3) partner broadly with other organizations and sectors to effectively address scientific and societal challenges. AGU has also adopted a diversity and inclusion strategic plan in 2018 and put in place a Diversity and Inclusion Advisory Committee to help assure progress towards our diversity equity and inclusion goals. Many new initiatives are underway across AGU programs and metrics are in development to help publicly track progress. The recent COVID-19 impacts and simultaneous major social protest in response to long-standing U.S. racial issues are now creating additional challenges for scientific societies' awareness and resolve to assure accomplishing our objectives across all programming, including for diversity and inclusion. This talk will highlight several of the impacts, challenges and opportunities, and will discuss strategies and action to help AGU and others move forward with intention and purpose towards achieving our diversity, equity and inclusion goals.

New challenges and opportunities for equality, diversity and inclusivity under COVID-19 and beyond

*Alberto Montanari[1]

1. University of Bologna

Diversity, equality and inclusivity are topical issues in science at large. While diversity is unanimously recognised to be an essential ingredient of science, it is still difficult to find a successful strategy to ensure diversity in the widest sense. Meanwhile, the tragedy of coronavirus, with more than 400, 000 deaths to date, is going to broadly change our lifestyle, including research targets and avenues. While COVID-19 has been initially seen as an additional obstacle to diversity, it has been later observed that virtual networking may actually offer unexpected opportunities.
In particular, I believe that virtual connections may allow us to remove barriers to inclusivity therefore moving forward to an improved diversity. Furthermore, strategies and actions to support economic recovery of countries during COVID-19 and beyond may also contribute to improve equality in science. In fact, the current crisis has created a window of opportunity to change the way we organise scientific activities. In this talk we will discuss the conditions, strategies and attitude that may help geoscientists to improve equality, diversity and inclusivity under the current health emergency

Discussion

Collaborative, Inclusive, Connected Earth and Space Science for our Future

*Robin E Bell[1]

1. American Geophysical Union

The COVID-19 pandemic has impacted lives and communities around the world, including upending much scientific research. But it has also served to reveal the underlying inequities and institutionalized racism inherent in our health care, economic and other systems.

Unfortunately, the global crisis of human-induced climate change continues unabated and will also have outsized effects on our most vulnerable populations.

In the face of these twin challenges, scientific societies must act, but how? We can foster both discovery-based and solutions-focused science to address massive societal problems. We can build meetings accessible on all seven continents so that we work truly globally to address these planet-wide issues.

We can support programs for STEM students and early career scientists and be more deliberate in fostering diversity and inclusion in the sciences, for we cannot hope to solve the problems of the 21st century without the skills, knowledge, and ideas of all of society. We can expand our partnerships with governments, non-governmental organizations, and companies and collaborate with communities to make our science not just useful but used. And we can act individually and collectively to reduce our contribution to climate change by decreasing our own carbon footprints.

In this time of uncertainty, it is the passionate, generous spirit of the Earth and space science community that will help keep us connected.

A new mission for the geosciences in an age of pandemics and beyond

*Alberto Montanari[1], Helen Glaves[2]

1. University of Bologna, 2. British Geological Survey, Environmental Science Centre

Geoscience aims to address key environmental challenges that are relevant to society. Some of these challenges, such as climate change, overexploitation of water resources and the water-food-energy nexus, have a global dimension. Recently science at large has been profoundly impacted by COVID-19. The tragedy of coronavirus, with more than 400, 000 deaths to date, is going to broadly change our lifestyle, including research avenues and the way we organize and manage scientific activities. Science will also be pivotal to ensuring a prompt recovery from the pandemic and transforming this crisis into an opportunity. Working for a brighter future is the most appropriate way to honour the memory of those who lost their life. In particular, I believe the expertise of geoscientists can support a synergetic approach to mitigating the risk of global crises. Strategies and actions to support economic recovery of countries during COVID-19 and beyond may also contribute to reducing the hazard and impact of other global threats that geoscientists are currently investigating. To reach this goal, we have to look at our research targets and organize our scientific activities with a new vision. The current crisis has created a window of opportunity to increase public trust in science and improve wider interaction between scientists and policy makers in general. In this talk we will discuss the conditions, strategies and attitude that may help geoscientists to achieve this target.

A Borderless World of Geoscience in Asia after COVID-19… for Asia and the World

*David Laurence Higgitt[1]

1. Lancaster University College at Beijing Jiaotong University, Weihai, China

Rapid economic growth, massive R&D spending, technological innovation, high participation in STEM postgraduate education and an emerging number of top-ranked universities are characteristic of many Asian countries. The lifetime of AOGS (founded in 2003) has witnessed the rapid expansion of geoscience research in many Asian countries, growing confidence and internationalisation as well as a burgeoning amount of science output. Will the impact of COVID-19 be a road bump in the continuing rise of Asian geosciences or fundamentally adjust the relationships between science and society? The principal mission of Asia Oceania Geosciences Society is to promote the application of geosciences for the benefit of humanity. Asia is a continent of diversity with uneven access to resources between and within countries. In a region where natural hazards are prevalent, sharing an understanding of risk management through scientific, social and technological means is vital. Constraints on fieldwork and travel because of COVD-19 hinder international cooperation but also provide an opportunity for reimagining digital technologies, remote monitoring and adjusted responsibilities in research teams. Coupled with flashpoints of racial inequality how can an inclusive diverse and sustainable geoscience emerge from COVID-19. And (using the tagline for AOGS) how can geoscience in Asia serve Asia and the World?

Borderless World of Geoscience after COVID-19 (Challenges for the future)

*Yue-Gau Chen[1]

1. Research Center for Environmental Changes, Academia Sinica

Now we are facing the international travel restrain, hindered international exchange of field survey, promotion of non-contact, remote and/or automatic operation technology, open data policy on the submission of experimental data on COVID-19, and other many issues such as health, education, equality, environment and international cooperation related to the infection. After COVID-19, it is highly likely that a new world will emerge without returning to the previous world. The Earth and Planetary Science is essential to the well-being of the humankind and sustainable environments. Therefore the session would like to discuss what kind of the challenges we should do for the future after overcoming the infection

Contribution by JpGU to the future global development of Earth and Planetary Science –by overcoming COVID-19 -

*Hodaka Kawahata[1]

1. Atmosphere Ocean Research Institute, the University of Tokyo

The origins of the JpGU trace back to joint meetings held by 5 societies concerned with Earth sciences in Japan in 1990, when the first Western Pacific Geophysics Meeting (WPGM) of AGU was held in Kanazawa, shortly after the Japanese Association of Earth and Planetary Science Societies (JAEPSS) was formed. Closer relationship started to develop between AGU and JAEPSS through participation in biennial WPGM meetings. The chemistry of crossing the disciplinary borderlands and national borders seems to have worked to gain support from the communities. We share common cause with AGU in promoting Earth and space science in fundamental ways. And then JpGU was established in the fall of 2005 as the organization to represent all the Societies within Earth and planetary sciences in response to the renovation of the Science Council of Japan. It started as a general juridical person, Japan Geoscience Union on December 1, 2009 and developed to be as a public corporation 2 years later in 2011. In 2017, JaGU and AGU held its first joint Meeting in Chiba. Currently 51 societies with the total member of 13,000 join JpGU and around 8,000 participants attend annual meeting of JpGU at Makuhari Messe, Chiba in May. We aim to promote research activities, provide a platform for communications among the members, coordinate internationally, and reach out to the public by representing earth planetary science societies in Japan. Especially JpGU supports international discussion and exchange that contributes to moving forwards the leading of science and will help invigorate the global Earth and planetary science community.

Investments in Earth and Planetary science research and education have greatly benefited the economic well-being of nations by understanding of distractive environmental hazards, sustainable use of resources, safer and healthier environment for a changing world. Scientists and their partners from many countries has worked together, share ideas and data, which has established the international network of a variety of cultures. This will be vital in confronting the challenges facing humanity and the Earth in the coming years and decades. In particular, Japan is a country prone to various geo-hazards and it is necessary for us to make vital contributions in understanding and overcoming these calamities.

JpGU has concluded MOU with AGU, EGU and AOGS to promote mutual collaboration and exchange in information and co-organization of scientific conferences and to foster mutual cooperation. In addition, policymakers can maximize the positive impacts of Earth and Planetary science for economies, health, sustainability and security around the globe by investing in scientific research. This time JpGU-AGU will have a joint meeting 2020 "For a Borderless World of Geoscience". We firmly believe that the advancement and dissemination of Earth and Planetary science will contribute to the well-being of the humankind and sustainable environments. We will make further global progress through open and transparent scientific collaboration and clear and timely science communication globally.

Due to the global spread of the Corona virus and outbreak of COVID-19, JpGU-AGU 2020 is held as a virtual format using the internet. Even if we overcome the corona infection, we will encounter a new world without getting back where we started from. We would like to highlight some of the science-influenced phenomena caused by COVID-19: the relationship of panedemic infection with science, global cooperation, open science, Society (Economic crises against long-term issues), and Dystopia. We hope that the new corona epidemic will be an opportunity for all human beings to understand that global

©2020. Japan Geoscience Union. All Right Reserved.

disruption poses a serious danger, as is clear from the case that everyone should cooperate in the development of vaccines.

The Corona virus problem may be a significant opportunity for us to think about current status of our world and future direction.

[U-02] Assessment and Accountability of Scientific Knowledge Creation

convener:Michiyo SHIMAMURA(Japan Agency for Marine-Earth Science and Technology), Yasuhiro Yamanaka(Faculty of Environmental Earth Science, Hokkaido University), Kiyoshi Suyehiro(Japan Agency for Marine-Earth Science and Technology), Brooks Hanson(American Geophysical Union), Chairperson:Michiyo SHIMAMURA(Japan Agency for Marine-Earth Science and Technology)

Scientific indices such as the number of citations or impact factor have been widely adopted in Japan and elsewhere to gauge scientific outputs without sufficient deliberations on their relationships to the true value of science and researchers' efforts or the harm and perverse incentives that result. If such disconnect exists, overreliance to these indices may lead to biases in research including in aiming for shorter-term goals. They are often requested by the solution-seeking stakeholders as well.

In the field of geoscience, a wide latitude of research styles exists and forms our community, from a focus on urgent societal needs to intellectual curiosity about our Earth. Such characteristics vary among fields making general comparisons across fields not straightforward. The adoption of simple evaluation indices as above may hinder the truly useful assessment of research. This trend influences gravely the research environment and thus the behavior of early-career researchers. What is the right direction for science and how should science be assessed?

In this session, we invite the members of the geoscience research community to discuss "ideal" science, recognize its diversity and identify the needs for changes. We welcome reports from different parts of the world and novel ideas to evaluate our own research activities that may lead to creating a culture that fulfills accountability to society. We envision this session to have infuse lively discussion and invite the audience to interactive exchanges.

Research Evaluation in Japan: Basic and Solution-Oriented Science, Their Perceptions and Realities, and a Future Vision

*Tateo Arimoto[1]

1. Japan Science and Technology Agency

The research evaluation has been changing with the society in Japan. In this presentation, the value of the basic scientific research in the face of societal expectations and requirements, and its historical developments are overviewed, followed by a future perspective in the changing global landscape of science and technology.

The Critical Importance of Earth and Space Science, Public Perceptions, Global Funding, and What Societies and the Global ESS Community Can Do

Robin Elizabeth Bell[2], *Brooks Hanson[1]

1. American Geophysical Union, 2. Lamont-Doherty Earth Observatory of Columbia University

Earth and Space Science is the critical science for the 21st Century. Nearly all major challenges we are facing locally to globally depend on robust Earth and space science and its convergence with other sciences—from addressing climate change and converting from fossil fuels, to feeding a world population that may reach 10 billion, to addressing health issues including clean air and water, to managing other resources on the Earth sustainably, to mitigating natural hazards. And all parts of our science are engaged in some way with these challenges and thus need to be nurtured, including for their curiosity. Public perception and awareness of these issues are growing, but larger, real engagement with the public is needed at all scales. In the U.S., the latest budget proposal would cut support for the sciences while these needs grow, and increased nationalism worldwide, which has also seen signs of expanding, is a persistent threat. AGU and other societies have a key role to play in leading and helping the global scientific community address both the core science and these important scientific and societal challenges. AGU has just developed a new strategic plan reflecting this awareness, based on broad input from the community, and we must as a community think of, develop, and leverage new connections with partners and the global public and policy makers and increase and scale up already successful efforts.

[U-15] Open Colloquium-NASA/JAXA: Earth Science focusing on Climate Change

convener:Yamaji Moeka(Japan Aerospace Exploration Agency), Kosuke Yamamoto(Japan Aerospace Exploration Agency), Paula S Bontempi(NASA Headquarters), Sandra Alba Cauffman(NASA Headquarters), Chairperson:Riko Oki(Japan Aerospace Exploration Agency), Sandra Alba Cauffman(NASA Headquarters), Paula S Bontempi(NASA Headquarters), Yamaji Moeka(Japan Aerospace Exploration Agency), Kosuke Yamamoto(Japan Aerospace Exploration Agency)

Climate Change brings us serious impacts in the form of droughts and floods in recent years. It is quite important to understand the nature of the Earth to evaluate and manage our limited resources. Spaceborne observations have provided fundamental information to understand the large-scale Earth environment.
In this session, we will introduce recent achievements and discuss future collaborations with researchers who play a central role in these fields from the U.S. and Japan, focusing on two of the key topics with respect to the Climate Change. One is "to what extent and where are gases causing Global Warming emitted?". The achievement by monitoring Green House Gases (GHGs) using OCO series by NASA and GOSAT series by JAXA will be presented. The other topic is "how can we predict more realistic impacts by the Climate Change?". One of the most uncertain factors in numerical prediction models is related to water cycles, such as aerosol-cloud-precipitation interactions. To better understand this topic, NASA and JAXA have jointly developed and operated the Global Precipitation Measurement (GPM) Mission following the successes of the Tropical Rainfall Measuring Mission (TRMM). Recently, NASA and JAXA have started the collaboration in a new mission called Aerosol, Cloud, Convection and Precipitation (ACCP). Status of the GPM and ACCP missions will be presented and discussed.

Past, Current and Future NASA-JAXA Partnership in Earth System Observations from Space

*Arlindo da SIlva[1]

1. NASA Goddard Space Flight Center

NASA and JAXA have enjoyed a long standing partnership in earth observations from space. In this talk we will present science highlights from current and past key US-Japan joint endeavors such as AMSER-E/AMSR-2 on EOS platforms, carbon science missions (OCO-2/OCO-3/GOSAT/GOSAT-2), and the precipitation missions (TRMM, GPM). Going forward, the 2017 Decadal Survey (DS) highlighted Earth System Science themes, science and application questions, and several high priority objectives that have led to the inclusion of Aerosols (A) and Clouds-Convection-Precipitation (CCP) as *Designated Observables* (DOs). On July 17, 2018, several NASA centers (GSFC, LaRC, JPL, MSFC, GRC and ARC) submitted a joint Study Plan to the NASA Earth Science Division for the Aerosol (A) and Cloud, Convection, and Precipitation (CCP) Pre-formulation Study (A-CCP). In addition to NASA centers, ACCP includes strong international partnership with JAXA playing an important role on active remote sensing from space. We will conclude the presentation with a brief overview of the ACCP and the opportunities it offers for continued US-Japan collaboration.

US-Japan collaboration toward accurate flux estimation of greenhouse gases from space: Intercomparison between US OCO and Japanese GOSAT

*Akihiko Kuze[1], David Crisp[2], Carol Bruegge[2], Laura Iraci[3], Florian Schwandner[3], Fumie Kataoka[4], Kei Shiomi[1], Nobuhiro Kikuchi[1], Hiroshi Suto[1]

1. Japan Aerospace Exploration Agency, 2. JPL CALTECH, 3. NASA AMES, 4. RESTEC

Since the beginning of OCO and GOSAT programs, US and Japan has been collaborating to demonstrate the effectiveness of greenhouse gases monitoring from space. Before OCO and GOSAT launch, we exchanged our radiometric standards to calibrate to calibrate OCO and GOSAT integrating spheres at the JPL and JAXA calibration laboratories in 2008. Since GOSAT launch in 2009, every summer near summer solstice, both teams have worked together in vicarious calibration campaigns at the Railroad Valley (RRV) playa. This field campaign has been improved by adding validation such as coincident spiral flight by NASA Alpha Jet and portable ground-based FTS. After OCO-2 launch, radiance spectra measured and CO_2 column amount retrieved from two independent measurements can now be compared. These data agree well within measurement uncertainties for both land and ocean. Our mission is to estimate anthropogenic emissions from different source sectors using satellite data. We will present our challenges how to validation global and local flux.

JAXA-NASA collaborations toward a better understanding of the global water and energy cycle: From TRMM and GPM to ACCP

*Hirohiko Masunaga[1], Riko Oki[2], Moeka Yamaji[2], Kosuke Yamamoto[2]

1. Nagoya University, 2. Japan Aerospace Exploration Agency (JAXA)

The Tropical Rainfall Measuring Mission (TRMM) was a joint US-Japan mission marking a milestone in the history of rainfall measurement from space. The TRMM satellite was launched in late 1997, carrying the Precipitation Radar, the first spaceborne radar to measure precipitation, provided by JAXA and other instruments including the TRMM Microwave Imager (TMI) by NASA. Unprecedented 17-year observations from the TRMM PR and TMI substantially updated our knowledge of tropical and mid-latitude rainfall and opened new pathways for the practical applications including numerical weather forecast and disaster prevention. The Global Measurement Mission (GPM) core observatory, with its operation started in 2014, has expanded the TRMM observational capability in many ways, for instance, the enhanced detectability of solid precipitation by the Dual-frequency Precipitation Radar (DPR) over a latitudinal coverage extended to 65˚S/N. A multi-satellite precipitation data product or the Global Satellite Mapping of Precipitation (GSMaP), developed as a part of the JAXA GPM program, is exploited for broad applications, most notably in aid of the infrastructure development and protection in the Asia-Pacific countries.

Meanwhile, the blueprint of new satellite missions is being developed in a NASA-led initiative called the Aerosol, Cloud, Convection, and Precipitation (ACCP). The ACCP teams are looking into a range of possibilities in the satellite instrumentation optimal for advancing our understanding of the physical processes involved in the atmospheric water and energy cycle. The science goals of ACCP are highly multi-disciplinary, bridging the gap among past and current satellite programs such as TRMM, GPM, CloudSat, and CALIPSO. JAXA has been working with their science team to discuss a next-generation spaceborne precipitation radar with enhanced (e.g., Doppler) capabilities, whose unique potential is being renewed in light of the scientific and technological demands of ACCP. In this talk, we will present selected scientific achievements from recent satellite observations and discuss the new horizon of scientific knowledge expected to be opened by ACCP.

[U-19] A deep dive into planetary habitability as related to subsurface architecture, energy, and water.

convener:Graham Heather Valeah, Vlada Stamenkovic(Jet Propulsion Laboratory), Shino Suzuki(Japan Agency for Marine-Earth Science and Technology), Atsuko Kobayashi(Earth-Life Science Institute), Chairperson: Heather Valeah

Investigations of the three-dimensional structure of the Earth and other planetary bodies are transforming our understanding of the distribution and age of water, fluxes of elements like carbon in and out of the subsurface, character and density of energy and the nature of habitability and its limits. We are poised to frame the important fundamental questions concerning the complexities of chemical, physical, and biological interactions in the Earth's subsurface, and by inference planetary bodies like Mars and Europa. This session considers questions related to the subsurface architecture of planets by exploring geophysical and geochemical results from experiments and observations in deep mines and boreholes as well as modeling efforts. This session addresses the nature and diversity of crustal subsurface environments and our understanding of how the subsurface changes with geographic location and depth. this could encompass studies on the variability and cycling of carbon, water, and subsurface volatiles including brines, ices, clathrates, salts, methane, and oxidants. Of particular interest are studies related to the physical and chemical controls on planetary subsurface architecture that determines the storage, transport, and interaction of fluids and gases in the interiors of Earth and other moons and planets. We also invite contributions on models of the novel subsurface energy systems required to sustain life as well as studies exploring the origin, evolution, and dispersal of subsurface life (microbial, viral, and multicellular) as compared with the surface biosphere. We welcome abstracts that consider the potential for extant life in subsurface conditions as well as the preservation of biosignatures

1. Tokyo Institute of Technology, 2. National University of Mongolia, 3. Kanazawa University

Knowledge on dynamics and cycles of water on present-day Mars is central to understand the surface environments and habitability of this planet. The present study focuses on recurring slope lineae (RSL). Recurring slope lineae are dark, narrow features that appear on steep slopes in warm seasons and fade in cold seasons. Although the formation mechanism of RSL remains in debate, RSL could provide unique insights into dynamics and cycles of water on Mars. Unlike the previous studies that analyzed remote sensing data of RSL, the present study constrains the formation mechanism of RSL based on search, classification, and field survey of terrestrial RSL analogues. Based on the investigations of the terrestrial RSL analogues, we aim to constrain the dynamics and cycles of water on Mars.
We first search for terrestrial RSL analogues in a global scale using available satellite images. We first discover twelve RSL analogues, which exhibit similar morphological features to Martian RSL, in cold and (semi-)arid areas on Earth. These analogues are classified into three types (types A, B, and C) based on their morphological characteristics. We then conduct the field survey for these terrestrial RSL analogues near the Khangai mountains in Mongolia, where all type of the terrestrial RSL analogues appears. We find that the type-A RSL analogue is formed by exposure of dark soil through removal of surface bright sand grains due to transient surface runoff in warm seasons. The type-B RSL analogue is generated by continuous surface runoff possibly due to melting of subsurface ice in warm seasons. The type-C RSL analogue is formed due to physical weathering of bedrocks on the slopes. We suggest that the type-A RSL analogue can explain all of the characteristics of Martian RSL, including the absence of infrared absorption due to liquid water on RSL and their appearance on steep slopes. To form type-A RSL on Mars, transient surface runoff with high flow velocity needs to occur in warm seasons. Based on modeling of upwelling groundwater from aquifer through rock fractures, we suggest that such surface runoff can occur if aquifer is located at ~500 m below the surface or deeper with a volume less than ~10^4 m^3. This suggests that RSL would be supported by a small, localized water source, rather than a large, global-scale groundwater source. RSL sites could be a potential habitat for chemo-autotrophic microbial life. Our results of microbial community structure analysis for terrestrial RSL analogue suggest that chemoautotrophic methanotroph could exist in the RSL sites. The measured number density of methanotroph in the terrestrial RSL analogue in warm seasons is detectable using existing life-detection techniques for Mars missions. Recurring slope lineae could be a promising target for landing in future missions to find extraterrestrial life.

Prospects for Subsurface Energy, Water, and Life on Mars

*Joseph Michalski[1,2]

1. Division of Earth and Planetary Science, University of Hong Kong, Hong Kong, 2. CIFAR, Toronto, Canada

From the perspective of a terrestrial geologist, Mars is a planet with familiar features including polar caps, glaciers, volcanoes, and a vast sedimentary rock record, as well as dried river beds, ancient lake basins, and evidence for long lost seas. Given the richness of the geologic record exposed to remote sensing instruments, it is easy to focus our attention and exploration efforts on that 2D surface world. But, small glimpses of subsurface materials and environments in terrains exhumed by impact craters, in addition to theoretical models and simple deductive geologic work all point to a vast and perhaps more intriguing subsurface environment on Mars. The upper (~10 km of) crust is likely composed of relatively porous volcaniclastic and impactite rocks and, because of the planet's lower surface gravity (38% of Earth's), a large amount of pore volume probably exists to much greater depth than occurs on Earth. This vast, 3D subsurface environment contains subsurface water and ice, and would have been (or still is) an excellent environment for the interaction between reactive rocks with various types of fluids, both containing various nutrients and possibilities for energy sources to drive a subsurface biosphere. In fact, the subsurface environment has probably always been the most habitable part of Mars since the magnetic field shut off c.a. 4.1 billion years ago, exposing the surface to an intense batch of UV radiation, solar energetic particles and cosmic rays. Life may have never had the chance to get started at the Martian surface and if it did, it might have retreated necessarily to the subsurface environment. It is not unreasonable to suggest that microbial life could survive or thrive there even today. But the subsurface is not critical for microbial life only –it could be the key to human exploration as well. When humans colonize Mars, we will require many natural resources, chief among them H_2O. One of the driving factors for planning future human missions is proximity to water resources in 3D space. Surface water resources are too high latitude (i.e. the poles), but subsurface ice exists to much lower latitudes. In addition, hydrated rocks in the shallow crust (e.g. hydrous sulfates, clays and carbonates) could provide huge amounts of extractable water. A key element of future mission planning will be resolving how to choose a site for major exploration build-up in a location that meets the requirements for resource extraction, but also honors the most inspiring science agenda possible.

Life on serpentinized setting on the Earth and beyond

*Shino Suzuki[1]

1. Japan Agency for Marine-Earth Science and Technology

Almost all the microbial ecosystems on present-day Earth are supported by photosynthesis including the subsurface biosphere. Organic carbons from the photosynthesis have been accumurated and delivered into the deep subsurface ecosystem. Oxygen and oxidative compounds also have distributed everywhere on the Earth through the water and contributed to creating chemical gradients that can support microbial energy metabolisms. Therefore, opportunities are rare to address microbial ecosystems that are isolated from the effects of photosynthesis, but those are canceled in several settings, one of which includes a serpentinized ecosystem.

Serpentinization is a process whereby water interacts with reduced mantle rock called peridotite to produce a new suite of minerals (e.g., serpentine), a highly alkaline fluid, and hydrogen. The hydrogen and carbon dioxide present in the system are thought to react under the highly reducing and alkaline conditions, leading to the formation of methane and hydrocarbons and the concomitant production of carbon monoxide, formate, formaldehyde and methanol. Given that the reduced compounds delivered from the water-rock reaction can support microbial energy metabolisms, such serpentinization systems have been viewed as potential habitats for early life or the other planetary bodies.

Studies of serpentinizing environments to date have shown that these ecosystems host extremely low-abundance microbial communities, which is presumably attributed to the multiple extremes: 1) the highly-alkaline condition of the fluid; 2) the extremely low concentrations of oxidants (electron acceptors); and, 3) the low levels of and nutrients (available carbon and phosphate). The Cedars located in northern California is one of the active terrestrial serpentinization sites. While there are about a hundred of springs in The Cedars area with a variety of differences in geochemistry (Figure 1), spring waters discharged from The Cedars generally have extremely high pH (11-12), very low Eh (−900 mV - −550 mV) values and are rich in Ca^{2+} (~1 mM), hydrogen and methane gas, and contain low levels of dissolved organic carbon, total inorganic carbon, ammonium, phosphate and electron acceptors (oxygen, nitrate, sulfate)
Here I present a diversity of unusual metabolisms and life strategies seen in the early Earth or other planetary bodies' analogue sites, those of which have been identified through the studies of geochemistry, microbial cultivation, genome centric metagenomics of The Cedars microbial communities. Furthermore, I discuss the constraints and driving forces lying in the deep subsurface serpentinized settings to make a living.

Subseafloor biosphere in the ancient Earth: constraint from multiple S isotopes records

*Aoyama Shinnosuke[1]

1. Yokohama National University

Subseafloor environment linked to hydrothermal systems has been proposed as the cradle of life, though the ancient activity of the subseafloor biosphere is poorly understood. Furnes et al., (2004) reported micrometer-scale mineralized tubes in ca. 3.5 Ga pillow lava rims from the Barberton Greenstone Belt, South Africa, which putatively trace microbial activity below Archean seafloor. However, these textures may also originate from metamorphic processes; thus, their microbial origin is still being debated (e.g., Lepot et al., 2011). Moreover, the putative microbial textures may have been produced on the seafloor. Therefore, such structure may not be useful for the subseafloor biosphere.
Microbial sulfate reduction (MSR) is a metabolism in which sulfate is reduced into sulfide and among the most ubiquitous metabolic processes on earth. Traditionally the activity of MSR was detected by sulfur isotopes (delta-S-34) because MSR is characterized by large sulfur isotopic fractionation up to −65‰ (Sim et al., 2011). Microbial cultivation studies reported not only the traditional delta-S-34 but also minor sulfur isotopes (capital-delta-S-33&36) are useful for MSR (e.g., Johnston et al., 2007). The oldest activity of MSR was evidenced by multiple sulfur isotopes of sulfate and sulfide minerals deposited on the ancient seafloor from ca. 3.5 Ga Dresser Formation in the North Pole area of Pilbara Craton in Western Australia (Ueno et al., 2008).
To verify the activity of MSR below the ancient seafloor, multiple sulfur isotopic compositions of sulfide minerals within hydrothermally altered seafloor basalt and basaltic komatiite collected from the ca. 3.5 Ga North Pole area were analyzed. The results suggested (1) capital-delta-S-33 values of the sulfide minerals were non-zero negative, demonstrating that sulfate reduction occurred below the Archean seafloor, (2) sulfate below seafloor before reduction was different from seafloor sulfate (i.e., barite deposit), and more rich in a mass-dependent component which was probably produced by local hydrothermal processes and (3) The maximum delta-S-34 fractionation between the putative substrate sulfate and the observed sulfide minerals was −35‰, suggesting MSR was involved below ca. 3.5 Ga seafloor. In this case, MSR may have occurred ~1000 meters below the Archean seafloor based on the geologically reconstructed depth below seafloor.

International Center for Deep Life Investigation: A global platform for the entire deep life community

*FengPing Wang[1,2]

1. School of Oceanography, Shanghai Jiao Tong University, Shanghai, China, 2. State Key Laboratory of Microbial Metabolism, School of Life Sciences and Biotechnology, Shanghai JiaoTong University, Shanghai, China

Life persists and thrives in the dark subsurface of the Earth in the absence of surface light energy. More than 50 years of investigations on the so-called “Deep Life” (or the “deep biosphere”) has revolutionized various aspects of our understanding of life and its origin and evolution. Still, large research gaps remain, e.g. what are the fundamental mechanisms of deep life persisting and evolving in the low-energy environments? What are the relationship and Interaction of deep life with the surface life and the environment? What are the ecological fundamentals governing the origin, distribution, and dispersal of the deep life? Aiming to resolve these large research questions through international joint efforts, the Deep Life community announced the inauguration of the **I**nternational **C**enter for **D**eep **L**ife **I**nvestigation (**IC-DLI**) on October 2018 (https://icdli.sjtu.edu.cn/). The **IC-DLI** will seek domestic and international funding resources to assist researchers to organize projects related to Deep Life within the scope of the Deep Carbon Research beyond 2020. The **IC-DLI** is an open platform that welcomes constructive ideas and suggestions that will lead to a world-class hub for Deep Life investigators from around the world.

Opportunities and Exploration: A Panel Discussion on Planetary Subsurface Science

*Heather Valeah Graham[1], Vlada Stamenkovic[2], Shino Suzuki[3], Ken Takai[3], Tomohiro Usui[4]

1. NASA Goddard Space Flight Center, 2. NASA Jet Propulsion Laboratory, 3. Japan Agency for Marine-Earth Science and Technology, 4. Japan Aerospace Exploration Agency

Investigations of the three-dimensional structure of the Earth and other planetary bodies are transforming our understanding of the distribution and age of water, fluxes of elements like carbon in and out of the subsurface, character and density of energy and the nature of habitability and its limits. We are poised to frame the important fundamental questions concerning the complexities of chemical, physical and biological interactions in the Earth’ s subsurface, and by inference planetary bodies like Mars and Europa. This panel seeks to explore questions related to the subsurface architecture of planets by exploring geophysical and geochemical results from experiments and observations in deep mines and boreholes as well as modeling efforts. This panel discussion addresses the nature and diversity of crustal subsurface environments and our understanding of how the subsurface changes with geographic location and depth. This cencompasses studies on the variability and cycling of carbon, water, and subsurface volatiles including brines, ices, clathrates, salts, methane, and oxidants. Our panel will also discuss studies related to the physical and chemical controls on planetary subsurface architecture that determines the storage, transport, and interaction of fluids and gases in the interiors of Earth and other moons and planets.

[U-20] "Open Colloquium" Exploring the Earth's interior using cutting edge science and technology

convener:Hiroko Watanabe(Research Center for Neutrino Science, Tohoku University), William F McDonough(Department of Earth Science and Research Center for Neutrino Science, Tohoku University, Sendai, Miyagi 980-8578, Japan), Kenta Ueki(Japan Agency for Marine-Earth Science and Technology), Eiichiro Araki(Japan Agency for Marine-Earth Science and Technology), Chairperson:Hiroko Watanabe(Research Center for Neutrino Science, Tohoku University)

New advances in technology are being used to explore the Earth. These include, but are not restricted to, neutrino geophysics, drilling the deep oceanic biosphere, and drilling to the Moho. Application of these new technologies to studies of the Earth provide critical new constraints and hopefully, new and unimagined insights. Recent technological advances, as well as advances in experimental and theoretical studies are revealing clues of how the Earth operates at a wide range of scales (microns to mega-meters). We seek to understand links from the core to atmosphere that connects the biosphere and geosphere through time. Near-future exploration of the Earth's interior with these new technologies will provide much-needed data on the internal structure of our planet and potentially its habitability. We anticipate presentations on recent advances in science and technologies that provide insights into physical, chemical, and biological processes and structures on and in the Earth. We welcome contributions from science and engineering.

Undestanding the Earth's deep interior with geo-neutrino measurements

*Hiroko Watanabe[1]

1. Research Center for Neutrino Science, Tohoku University

Anti-neutrinos emitted from radioactive isotopes inside the Earth, geo-neutrinos, bring unique and direct information on the Earth’s composition, which relate to the fundamental mysteries of its heat balance and thermal evolution. KamLAND has been stably observing geo-neutrinos with highest sensitivity since it made the world’s first observation in 2005. Understanding of the Earth using geo-neutrinos is a research field that is originally started and has been led by Japan. To date, we have set limits on the global flux of geo-neutrino that has in turned constrained the range of acceptable models for the Earth’s composition, but distinguishing the mantle flux by current detectors, which are all locate on the crust is a challenge, as the crust signal is about 70 % of the total flux plus uncertainties. Given that the oceanic crust is thin and simple, geo-neutrino detector in the ocean makes it sensitive to geo-neutrinos originating from Earth’s mantle. Ocean bottom geoneutrino detector represents a breakthrough, which goes beyond the impossibilities of the modern land-based detector, providing transformative insights into the deep Earth. In this presentation, current situation and future prospects of experimental studies will be dicscussed.

Deep seafloor cable observation technologies towards future ocean bottom neutrino detector experiment.

*Eiichiro Araki[1], Taichi Sakai[2], Hiroko Watanabe[2], Takashi Yokobiki[1]

1. Japan Agency for Marine-Earth Science and Technology, 2. RCNS, Tohoku Univ.

Long-term neutrino observation at the bottom of deep ocean will open the window to investigate the neutrino source in deep earth’ s interior by escaping from the effect of sources in continental crust and those from anti-neutrinos from reactors. Ocean Bottom neutrino Detector (OBD) was first conceived in University of Hawaii to realize such a geoneutrino observation in the ocean floor in 2005, though only conceptual study and preliminary tests were conducted, and its feasibility is yet remain very uncertain. We now formed a joint research group with collaborators with background of deep seafloor cabled observation network development (such as off-Japan coast DONET seafloor cabled network for earthquake and Tsunami monitoring) and geoneutrino detector in Kamioka (KamLAND), trying to establish a new OBD concept and put it into practice in the future.
From our initial preliminary study of new OBD concept, three stage plans are suggested to develop matured scientific ocean bottom detector with scintillator volume of 10-50 k tons as the third and final stage. The first step is 1-10 tons OBD to demonstrate element technologies for OBD systems. The second stage 1.5 k tons OBD is aiming the first detector to achieve estimation of mantle geo-neutrinos from 3 years observation expecting 8.5 geo-neutrino events a year.
To facilitate long-term multi-year continuous observation in near the deep seafloor, necessitated from the small number of the mantle geo-neutrino events a year, we consider a seafloor cable connection as an indispensable part of the OBD system. There are existing cable technologies designed for long-term observation for earthquake and Tsunamis (DONET: Dense Ocean-floor Network for Earthquake and Tsunamis). In DONET, seafloor sensors distributed in 100 km+ wide area are linked to a submarine cable, which feeds electric power and precision time reference to each seafloor sensors. The cable also supports two-way high-speed communication to each sensor for command and data link. Power distribution is one of key important technical features in seafloor cable network if multiple stations are to share the same submarine cable. In DONET, each 8 sensors can receive up to 45 W power distributed from the Node equipment, which receives 500 W power from the submarine cable. In recent development, we developed a new Node equipment to accommodate more power hangry sensors, which can deliver each 250 W power to four individual sensors. In the current estimation, 1.5 tons OBD will need a lot more power than that, although low power PMT driver and ADC development would make the power demand closer to the ~ 10kVA limit of power feeding by telecom standard land equipment, if the OBD receives all power without any power distribution mechanism. In the new Node equipment, users can connect to seafloor sensors via a fiber optic link which can give 1 Gbps speed and very high precision time synchronization, which would support communication needs for OBD system.
We are currently planning for seafloor experiment of a 1-10 tons class OBD to demonstrate technical elements for the first stage. Primary candidate site for such demonstration experiment is 1100 m deep seafloor in Sagami Bay, Japan, where submarine cable connection is available to that deep seafloor. The technical elements to be demonstrated include PMT detector package that functions at high ambient pressure (10~60 MPa) in deep seafloor, high performance liquid scintillator in low temperature and high ambient pressure, as well as reliable and low power data acquisition and telemetry system which support OBD operation for many years. With the demonstration OBD in the deep seafloor, we also expect to obtain in-situ seafloor environmental information necessary to design a larger scale OBD, such as the flux of neutron and muon in deep sea as well as radioactive material concentration in deep seawater. For the

planned 1-10 tons class detector, we also estimated the level of expected neutron background for different structure of the detector vessel.

Direct sampling and measurement at deep crust through scientific ocean drilling

*Shin'ichi Kuramoto[1]

1. Japan Agency for Marine-Earth Science and Technology

The Kola superdeep borehole is well known as the deepest scientific drilled hole on our planet locates at Kola peninsula, Russia. It took about 20 years and reached approximately 12km deep in the crust. High temperature and pressure refused the drilling operation. KTB drilling project reached about 9km deep in Germany in 1994. Both projects have set a monumental milestone in scientific onshore drilling, and also showed the limitation of drilling technology at the same time. The technological difficulties are caused by borehole instability and high temperature even using drilling fluid circulation. However, ocean drilling is much difficult than onshore drilling. Because ocean drilling is conducting unstable conditions using a floating platform/vessel. Therefore, vertical drilling depth may have some limitations around 10km deep and temperature may lower than 300℃ in general.

The scientific ocean drilling vessel Chikyu has been started scientific ocean drilling operation since 2005 and reached about 3.3km below the seafloor in 2019. It is the current world record of the deepest borehole as scientific ocean drilling conducted at the Nankai accretionary wedge. Achieving mantle drilling by “Chikyu” that has never reached humanity is her next challenge. In addition, a mantle observation and experiment system using boreholes will be planned. The Mantle drilling will provide a fundamental understanding of the Earth system, such as the compositional distribution from the oceanic crust to the upper mantle, rheology, life and chemical evolution processes, and the behavior of thermal and environmental variables. Deepwater and deep penetration technology are under development. We are discussing the first target of Mantle drill at off Hawaii where relatively low temperature and reachable depth to the upper-most mantle by ocean drilling. Scientific drilling cut core samples and measure and/or monitor physical/chemical properties in the borehole. That is the only way to do material science and in-situ high-resolution measurements and monitoring, and it is the uniqueness of ocean drilling.
Chikyu has been completed relatively shallow depth drilling campaigns to understand the mechanism of large earthquakes and Tsunamis, the deep life under extreme conditions and the marine mineral resources so far. The scientific results will be presented in addition to future technology developments for the deep drilling into our planet.

Hadean geodynamo origin and Ediacaran inner core growth preserved Earth’s habitability

*John Anthony Tarduno[1,2], Rory D Cottrell[1], Francis Nimmo[3], Hirokuni Oda[4], Axel Hofmann[5]

1. University of Rochester, Department of Earth and Environmental Sciences, Rochester, New York, United States, 2. University of Rochester, Department of Physics and Astronomy, Rochester, New York, United States, 3. University of California –Santa Cruz, Department of Earth and Planetary Sciences, Santa Cruz, California, United States, 4. National Institute of Advanced Science and Technology, Geological Survey of Japan, Tsukuba, Ibaraki, 305-8567, Japan, 5. University of Johannesburg, Department of Geology, Johannesburg, South Africa

In a complex balance between deflection and capture of charged particles (Tarduno et al., PEPI, 2014; Blackman and Tarduno, MNRAS, 2019), the geomagnetic field provides net shielding of the solar wind which might otherwise erode the atmosphere and lead to a long-term drying of the planet, threatening habitability. Here we discuss two intervals when core chemical processes and their relationship to powering the geodynamo were crucial for preserving a habitable Earth: i. Hadean-Eoarchean times when solar winds were most intense and ii. the Ediacaran, when a thermally-driven geodynamo had become inefficient. Defining the oldest geodynamo is arguably the greatest technical challenge for paleomagnetism: only single crystal paleointensity (SCP) - the use of silicate crystals bearing magnetic inclusions - is suitable, and this requires use of the world’s most sensitive SQUID magnetometers. The recent optical and electron microscope documentation of primary magnetite inclusions in Jack Hills zircons (Tarduno et al., PNAS, 2020), previously predicted by paleomagnetic unblocking temperatures, together with microconglomerate test results, Pb-Pb radiometric age data and Li-diffusion constraints support a geodynamo as old as 4.2 billion-years-old. High paleofield values recorded by these zircons of Late Hadean age (ca. 4.0 Ga) may be a signal of core chemical precipitation. After the Paleoarchean, field strengths from global data show a long-term decrease spanning some 2 billion years. Ultralow field strengths, some 10 times lower than those of the modern, at ca. 565 Ma (Bono et al., Nat. Geo., 2019) are defined by SCP analyses and attest to a near collapse of the geodynamo. However, this appears to be the time of nucleation of the inner core which provided a new energy source for the geodynamo, rejuvenating magnetic shielding just as changes in composition were making the atmosphere increasingly more vulnerable to solar wind erosion.

Earth's deep interior revealed by high-pressure experiments

*Kei Hirose[1,2]

1. Earth-Life Science Institute, Tokyo Institute of Technology, 2. Dept. Earth and Planetary Science, The University of Tokyo

The interior of the Earth is under high pressure and temperature (*P*-*T*). Static compression experiments using a laser-heated diamond-anvil cell (DAC) can generate high *P*-*T*conditions, greater than 364 GPa and ~5000 K that correspond to the condition at the center of the Earth. Using such DAC techniques, we are now able to synthesize any materials that are possibly present inside our planet. Combining a DAC with synchrotron x-rays, crystal structures and phase transitions that occur in the deep Earth have been extensively explored up to inner core conditions. Sound velocities of liquid and solid, mantle and core materials have been also obtained by these high *P*-*T*experiments as well as recent theoretical calculations. These results on phase change and seismic wave velocities tell about structures and chemical compositions inside the Earth. In addition, chemical evolution of the mantle and the core has been of great interest in recent DAC studies. After melting experiments in a DAC, tiny samples (10–100 μm scale) were recovered and examined for textures and chemical compositions, demonstrating liquidus phase relations and element partitioning between coexisting liquid and solid. On the basis of these melting studies, I will discuss 1) exsolution of oxides from liquid core, which may have driven core convection and geodynamo since early Earth, and 2) the formation of bridgmanite-enriched ancient mantle structures (BEAMS) upon solidification of a deep magma ocean, which could still be present in the present-day lower mantle.

Imaging subducted slabs in the mantle through inversion of seismic waveforms

*Kenji Kawai[1], Anselme F. E. Borgeaud[1,2], Yuki Suzuki[1], Robert J. Geller[1]

1. Department of Earth and Planetary Science, School of Science, University of Tokyo, 2. Academia Sinica

Seismic tomographic studies (e.g., Romanowicz 2002; Dziewonski et al. 2010) have inferred the three-dimensional seismological structure of the Earth’s deep interior. Some subducted slabs have been found to be stagnant above or below the 660 km discontinuity, while others fall through into the lower mantle and reach the core-mantle boundary (CMB) (Fukao et al. 2009), suggesting whole-mantle convection rather than layered mantle convection. Recent seismic waveform inversion studies with better resolution, especially for low velocity anomalies, have found vertically continuous low-velocity columns in the lower mantle and suggested that thermochemical plumes rooted in the D" region are associated with prominent hotspots (French and Romanowicz 2015). Hence, seismic tomographic studies have contributed much to understanding mantle convection.

It has been, however, difficult to estimate how long it takes for material in the Earth’s mantle to migrate between the Earth’s surface and the CMB, since seismic tomography studies provide information only on the current Earth’s deep interior. In order to better understand the Earth’s evolution and dynamics, dating inside the Earth is essential. Therefore, we have inferred the detailed seismic velocity structure in the mantle transition zone and D" region beneath Central America and the Northern Pacific, where continuous subduction of oceanic plates beneath the North and South American plates has been taking place since more than 200 Ma (Muller et al. 2016). We investigate the fate of subducted oceanic lithosphere and the thermal and chemical evolution of the Earth.

Waveform inversion studies

Our group’s waveform inversion studies were conducted as follows. The events used are deep- and intermediate-focus events recorded at broadband seismic stations of the USArray, Canadian Northwest Experiment (CANOE), Global Seismographic Network (GSN-IRIS/USGS), Southern California Seismic Network (SCSN), Pacific Northwest Seismic Network (PNSN), Berkeley Digital Seismic Network (BDSN), and Canadian National Seismograph Network (CNSN). The data are filtered in the period range of 8 or 12.5 to 200 s using a Butterworth bandpass filter. The 3D model is obtained by linearized inversion with respect to a spherically symmetric initial model.

We formulated the inverse problem of waveform inversion for localized 3-D seismic structure, computing the partial derivatives of waveforms with respect to the elastic moduli at arbitrary points in space for anisotropic and anelastic media using the methods of Geller and Hara (1993). We applied our methods to the assembled dataset to invert for 3-D shear wave structure. The methods used were presented by Kawai et al. (2014) and refined in our groups’ subsequent papers.

The inferred model shows the presence of two distinct slabs at the CMB beneath Central America and Venezuela and one prominent slab beneath the Northern Pacific due to subduction ~200 Ma (Muller et al. 2016). These slabs appear to modulate the formation of passive upwelling (called “passive plume”) of

©2020. Japan Geoscience Union. All Right Reserved.

hot basal mantle material (Suzuki et al. 2016; Borgeaud et al. 2017; Suzuki 2020). High-resolution seismic images (Borgeaud et al. 2019) show that such plumes interact with slabs subducting in the upper mantle and that some tearing of the subducted slab is taking place.

The inferred images beneath Central America enable us to date the slab at various depths, taking into account the geological events investigated based on plate reconstructions. We estimate a viscosity contrast between the upper and lower mantle of 9-12, which is about 5 times smaller than that estimated from post-glacial rebound (Hager 1984; Forte and Mitrovica 2001). This implies that subduction from the Earth’s surface down to the base of the mantle affects the surface environment in two ways. 1) Intermittent and localized subduction to the base of the mantle cools the CMB, influencing convection in the outer core, and thus the geodynamo and geomagnetic field. Increased heat flux from the core to the mantle might trigger geomagnetic reversals. 2) Subduction to the CMB modulates the formation of passive plumes which, if they reach the Earth’s surface, can lead to volcanism that can affect the composition of the atmosphere and the temperature of the Earth’s surface. These results suggest the importance of coupling between the Earth’s deep mantle and the Earth’s surface.

[U-01] Great Debate: Geoscience and societal leadership in support of planetary stewardship

convener:Fumio Inagaki(Japan Agency for Marine-Earth Science and Technology), William F McDonough(Department of Earth Science and Research Center for Neutrino Science, Tohoku University, Sendai, Miyagi 980-8578, Japan), Susanne Buiter(Geological Survey of Norway), Chairperson:Fumio Inagaki(Japan Agency for Marine-Earth Science and Technology), William F McDonough(Department of Earth Science and Research Center for Neutrino Science, Tohoku University, Sendai, Miyagi 980-8578, Japan)

Since its emergence some 4.6 billion years ago, the Earth has experienced remarkable environmental changes. Life on this planet has adapted and evolved to these changes, maintaining itself despite several catastrophic perturbation events. Compared to the long history of the planet and life, humanity's brief history (Homo sapiens), about 300,000 years, represents a quasi-instantaneous event. Further, with the development of civilization and its agricultural and industrial revolutions, and in particular, since the 18th century with the use of fossil fuels as the primary energy source, the atmosphere, oceans, cryosphere, and biosphere have all changed at an unprecedented rate. This latter era -the Anthropocene- documents an epoch of change in the global system that is irrevocably recorded in the geological record of the planet. What will happen to our future, because the planet will continue to evolve? The geoscience community must continue and enhance its connections with society as it integrates fundamental knowledge into the stewardship of the Earth. Likewise, industrial leaders have a great responsibility in the stewardship of the planet, particularly in shaping policies and human response. The Great Debate will provide a range of viewpoints and disciplines the opportunities to discuss the global planetary stresses that are imposed on humans. We will address questions that focus on the role (code) of geoscience and society in planetary stewardship. Participants will be invited to share their latest knowledge, views, and perspectives on these questions. Please actively contribute to this interdisciplinary discussion during the JpGU-AGU Joint Meeting 2020.

Challenges of the Anthropocene

*Will Steffen[1]

1. Climate Council of Australia

The Anthropocene is a unique point in time, where human history collides with Earth history. This talk will explore the origins of the Anthropocene, both as a concept and a term. Using Earth System and geological/stratigraphic frameworks, we’ ll outline the trajectory of the Anthropocene in the context of recent and longer term Earth history, with a focus on both the physical climate system and the biosphere. However, it is humanity that now plays the dominant role in the trajectory of the Earth System, which demands an exploration of the human dimensions of the Earth System. As we look to possible future directions of the planet in the Anthropocene, a clear picture is yet to emerge. Where on Earth are we going?

Climate change: from security perspectives

*Yasuko Kameyama[1]

1. National Institute for Environmental Studies, Japan

Climate change is widely recognized as one of the most serious threats to human beings and ecosystems. As our understanding of the climate change problem has increased, we have also witnessed a vast increase in the use of terms “climate security” by experts and practitioners worldwide. Numerous publications have addressed the issue of climate security, and many other studies have aimed at categorizing definitions and approaches of climate security. Four types of approaches emerged by reviewing existing literature; (1) long-term irreversible planetary changes, (2) short-term abrupt risks to individuals, (3) cause of conflict and violence, and (4) impacts on military and defense organizations. Table1 summarizes what is assumed as threat and what is assumed to be protected from the threat so that the differences become clearer. The four approaches also send different messages on how insecure conditions can be mitigated.The first approach considers the long-term climate change to be a serious threat, not to the national security of any one country, but to future generations and the global ecosystem. Advocates of this approach are worried that the progression of climate change could render Earth uninhabitable. The only way to avoid the crisis is to mitigate climate change by reducing GHG emissions. The long-term temperature goal such as 2˚C needs to be achieved from the viewpoint of this approach. The second approach considers extreme weather events and other impacts of climate change at the regional level as a threat to individuals. Extremely high temperatures and epidemics of diseases could have serious health implications, and the food and water supply could be limited by serious droughts. All these concerns are less relevant to national security and much more related to human security, food security, and water security. Adaptation actions are required to improve the situation. The third approach focuses on the interactions between the impacts of climate change and conflict between people. With this approach, “threat” originates from people outside of your own community. Displaced people may immigrate due to damages caused by climate change, and the immigration could raise tensions between various groups of people. As the impacts of climate change do not always lead to conflict, regions need to increase social stability by improving the level of governance and building resilience to natural hazards. The fourth approach employs a narrower definition of security, one in which national security is conducted by the military. National security has been concerned with other countries’ armed forces to a nation state. With “climate security”, however, the threat has been expanded to include a wide variety of impacts of climate change. To avoid these losses, those using this approach emphasize the importance of military and national security strategies to take into account the impacts of climate change.Categorization of climate security concept is useful to recognize various types of threats we need to take into account, and to check if each country is well prepared for them.

Keywords: climate change, security, conflict, social instability

Table 1: Summary of the four categories of climate security discourse

Category	Threat	Objects of protection	Means to improve level of security
Long-term irreversible planetary changes	Global changing climate, warming world	The planet, human beings, and the ecosystem	GHG emission reduction at global level
Short-term abrupt climate change risks	Extreme weather events and other impacts of climate change to individuals	People's daily life, including stable supply of basic human needs	Adaptation measures, building resilience
Cause of conflict and violence	Migration and other causes of conflict between groups	Own group	Reduction of social instability
Military and defense implications	Long- and short-term damages (i.e. sea level rise, extreme weather events)	National territory, military facilities, and defense forces	Adaptation in the area of defense and other military operations

Multiscale stewardship for water-food-energy nexus

*Makoto Taniguchi[1]

1. Research Institute for Humanity and Nature

Water, energy, and food are fundamental resources for human beings and sustainable society with livelihood including agriculture and industries, and these resources are interlinked each other beyond the boundaries of single resource management. Therefore, integrated management and governance for water-energy-food (WEF) nexus is important by increasing synergies and reducing trade-offs among the three resources, environment/society/economy factors, and local/national/global scale. However, there are many disconnections of governances between not only three resources and different spatial scales, but also between sectors of production and consumption, and agencies of protection of environment and development of economy. Who should take responsibility of stewardship for multiscale water-food-energy nexus ? How to manage the tradeoff between carbon footprint as global environmental impact and water footprint as local environmental impact through multiscale WEF nexus ? Belmont Forum SUGI project “METABOLIC” has been analyzing the multiscale WEF nexus for sustainable resources management. Scenario and impact assessments by using system dynamics model and footprints analyses have been made for understanding how each area is inter- and intra- connected on WEF nexus by using three databases of resources, interlinkage, and scenario in multi-spatial scale. Analyses of the change in WEF nexus structure also have been made, and assessments of the changes in three resources, carbon emission, environmental and economic impacts are analyzed. These analyses with stakeholders can help to make future policies for sharing the roles of governance, land intensive policy and others to increase synergy for sustainable future.

Planetary Stewardship in AGU

*Robin E Bell[1]

1. American Geophysical Union

Society today is facing many challenges, and opportunities, that critically depend on the Earth and space sciences. Planetary stewardship is intertwined throughout these topics as many of the challenges and opportunities in the 21st century are at the global scale. Societies, by catalyzing, leveraging, and engaging members the our science, play a key role in addressing these. Leadership is needed through strategic efforts, mobilizing our science, policy positions, programming, communication and engaging the public in new ways, expanding our scientific community and providing a welcoming culture that rewards planetary stewardship, and also developing partnerships with new stakeholders. Examples at AGU include our new strategic plan; position statements, for example on Addressing Climate Change and on Open FAIR data; and programs such as the Thriving Earth Exchange, Ethics, and Voices for Science.

Australian National University, 6. Research Institute for Humanity and Nature, 7. National Institute for Environmental Studies, 8. AGU President, 9. EGU President, 10. JpGU President

Since its emergence some 4.6 billion years ago, the Earth has experienced remarkable environmental changes. Life on this planet has adapted and evolved to these changes, maintaining itself despite several catastrophic perturbation events. Compared to the long history of the planet and life, humanity’ s brief history (Homo sapiens), about 300,000 years, represents a quasi-instantaneous event. Further, with the development of civilization and its agricultural and industrial revolutions, and in particular, since the 18th century with the use of fossil fuels as the primary energy source, the atmosphere, oceans, cryosphere, and biosphere have all changed at an unprecedented rate. This latter era—the Anthropocene—documents an epoch of change in the global system that is irrevocably recorded in the geological record of the planet. What will happen to our future, because the planet will continue to evolve? The geoscience community must continue and enhance its connections with society as it integrates fundamental knowledge into the stewardship of the Earth. Likewise, industrial leaders have a great responsibility in the stewardship of the planet, particularly in shaping policies and human response. The Great Debate session during the JpGU-AGU Joint Meeting 2020 will provide a range of viewpoints and disciplines the opportunities to discuss the global planetary stresses that are imposed on humans. We will address questions that focus on the role (code) of geoscience and society in planetary stewardship.

[U-03] Sustainable global groundwater management for human security

convener:Yoshihide Wada(International Institute for Applied Systems Analysis), Makoto Taniguchi(Research Institute for Humanity and Nature), Chairperson:Yoshihide Wada(International Institute for Applied Systems Analysis), Chairperson:Makoto Taniguchi(Research Institute for Humanity and Nature)

Sustainable management of water resources is an overwhelming task, when faced with a growing population that is increasing its demand for food, energy and water. Except frozen ice, groundwater is world's largest fresh water resource, but increasing over-exploitation of groundwater resources has been reported over intensely irrigated regions. Groundwater is the prime source for drinking water supply and irrigation, hence critical to global water, food and energy security contributing to human security. But also for sustaining low flow requirements and ecological values of groundwater dependent ecosystems, the contribution by groundwater flow is essential. Groundwater therefore needs to be managed wisely, protected and especially sustainably used. In itself this is a challenge, however under a changing environment including climate, land use, population growth, this task becomes a challenge especially in the light of limited data availability and consequential uncertainties. From arid over humid to arctic regions, in every type of climate changing environmental conditions become apparent and have very different effects. In this session we invite contributions, which report on research on the consequences of a changing environment for future management, protection, and sustainable use of groundwater. Methodologies, strategies, case studies as well as quantitative techniques for dealing with uncertainty and limited data availability are of interest for this session. We welcome studies describing how groundwater resources benefit from an Integrated Water Resources Management approach. Furthermore, contributions describing case studies and new techniques for active management and protection of groundwater resources such as artificial recharge and conjunctive use are welcome.

Groundwater governance for global sustainability

*Makoto Taniguchi[1], Sanghyun Lee[1], Naoki Masuhara[1]

1. Research Institute for Humanity and Nature

Groundwater governance is important, in particular in Asia, for global sustainability, because more than 70 percent of groundwater depletion occurs in Asia, and more than 55 percent of groundwater footprint for food production is produced in Asia. Groundwater, energy and food are interlinked each other beyond the boundaries of each shed as well as trans-spatially through the food and energy trades. Interactions between groundwater-food-energy nexus under the limited land and climate change, and environmental/economical/social impacts, are analyzed in terms of multi-scale integrated management and governance of the nexus by increasing synergies and reducing trade-offs. An integrated model for decision support is developed to analyze the nexus and assess environmental and economic impacts, with three databases of resources, interlinkage, and scenario in multi-spatial scale. Tradeoffs are analyzed between economy and environment as well as local and national scale.

Global Economic Limits of Groundwater used for Irrigation

*Marc FP Bierkens[1,2], Inge E.M de Graaf[3], Scott Jasechko[4], Debra Perrone[4], Rens L.P.H van Beek[1]

1. Utrecht University, 2. Deltares, 3. University of Freiburg, 4. University of California at Santa Barbara

Under pressure of population growth and increasing food demand, irrigated agriculture has expanded into semi-arid areas with limited surface water resources. As a consequence, irrigation has become increasingly dependent on groundwater, which has resulted in high rates of aquifer depletion in many aquifers around the globe. As groundwater decline leads to increasing costs of groundwater pumping, an important question is at which groundwater depth pumping costs will exceed revenues from crop production. Here, we assess globally the maximum economic depth of groundwater extraction for the irrigated areas overlying productive aquifers under current crop cover and current climate. To this end we combine globally available data on crop cover, crop yield and crop prices with crop water requirements and groundwater level estimates from a global hydrological and groundwater model. The estimating maximum economic depths are consistent with well depths obtained from a rich well dataset over the U.S. Our results show that the maximum economic depth greatly varies between regions with times to reach this depth varying greatly as well. We estimate the global volume of economically extractable groundwater, which is only a small fraction of the estimated fresh groundwater resources underlying irrigated areas, but nevertheless represents a significant economic value. Although globally the time to complete economic depletion is large, the remaining value of economically recoverable groundwater shows a sharp decline over the coming decades. Our results provide a global time horizon for transformation to a more sustainable use of groundwater resources.

Net inflow –a key quantity for defining pathways towards sustainability in heavily stressed aquifers

*James J Butler[1], Geoffrey C Bohling[1], Donald O Whittemore[1], Blake B Wilson[1]

1. Kansas Geological Survey, University of Kansas, Lawrence, KS USA

The depletion of aquifers that support irrigated agriculture is a pressing problem across the globe. A frequently asked question is how to redirect these heavily stressed systems on to more sustainable paths. If alternative water supplies are not available, the only viable option for the near term (few to several decades) is to reduce pumping. The key issues therefore become how much should pumping be reduced to significantly extend the lifetime of an aquifer and what is the likelihood of attaining a sustainable state for the system. We have developed a new water-balance approach to glean insights into these issues and give water managers a convenient tool for application in seasonally pumped aquifers supporting irrigated agriculture. This approach, which can be used to assess the impact of pumping reductions and to chart pathways towards more sustainable states, shows that the response to pumping reductions heavily depends on the net inflow (all inflows to the aquifer minus all outflows except pumping) component of an aquifer’ s water budget, both in terms of its magnitude and how it changes with time in response to the reductions. The net inflow will decrease in response to pumping reductions; prospects for sustainability will depend on the proportion of the various components making up the net inflow (e.g., how much is natural recharge versus how much is irrigation return flow) and their sensitivity to the reductions. If a pumping reduction leads to a pumping rate that is above the net inflow at the time of the reduction, the aquifer lifespan can often be extended by a factor of two or more but depletion will be the final outcome. If a reduction results in a pumping rate equal to the net inflow, the aquifer lifespan will be extended further but again depletion will be the end result. In contrast, if a reduction results in a pumping rate below (>10-15%) the net inflow at that time, sustainability may be achievable. At the very least, there will be a lengthy period of apparent sustainability during which water levels remain above the level at the time of the reduction. In any case, the aquifer lifespan will be lengthened to such an extent that other options, such as large-scale water transfers, may become viable. These concepts will be demonstrated using examples based on data from an ongoing large-scale (256 km^2) experiment in pumping reductions in the High Plains aquifer in the state of Kansas in the central United States; the role of climate change will be incorporated into the analysis using regional-scale projections. These results indicate that field monitoring of net inflow and its changes through time must become a higher priority for the water resources community. As we have shown in earlier work (Butler et al., GRL, 2016), this can be readily done when reliable pumping and water-level data are available. Although efforts to parse out the individual contributors to net inflow will ultimately provide the clearest picture of what the future holds, many useful insights of practical importance can be obtained through greater attention to this quantity.

Human-groundwater interactions in a changing environment: modeling stressed global aquifer systems

*Yadu Pokhrel[1], Farshid Felfelani[1], Sanghoon Shin[1], Tamanna Kabir[1]

1. Michigan State University

Groundwater storages in many of the world’ s major aquifer systems have been declining at an alarming rate. While in-situ measurements and satellite observations provide crucial information on the past changes, hydrological models serve as indispensable tools for attributing the observed changes to climate variability and human actions, and thereby better predicting future dynamics under climate change. Concerted efforts have been made by the hydrologic sciences community over the past decade in better understanding evolving aquifer dynamics in response to climate change and increased groundwater use by humans; however, imperfect or missing groundwater parameterizations in large-scale hydrology models still pose critical challenges in realistically simulating climate-human-groundwater interactions, hindering path forward to sustainable management of groundwater resources. This study presents improved simulations of groundwater flows and storages in the major global aquifer systems using multiple global hydrological models including the Community Land Model version 5 (CLM5). Simulations are conducted at 5km grids over the contiguous United States considering lateral groundwater flow, surface water-groundwater interactions, and aquifer pumping, and at 50km grids globally under simplified settings. Changes in water table depth and terrestrial water storage (TWS) are analyzed and validated using a synthesis of ground- and satellite-based datasets including those from the gravity Recovery and Climate Experiment (GRACE) satellite mission. Results suggest that groundwater depletion in the stressed aquifer systems can be better simulated when lateral flow is represented, especially in models that operate at relatively fine grid sizes (~5km). Further, results from future projections suggest that TWS in many of the stressed global aquifer systems will reduce under future climate, exacerbating groundwater sustainability issues in many regions.

Global salinization risk in irrigated areas

*Sayaka Yoshikawa[1], Kota Higashiyama[1], Shinjiro Kanae[1]

1. Tokyo Institute of Technology

Building a sustainable agricultural production system might be necessary for increasing population in the future. In this study, we focused on salinization which is one of the factors that threaten sustainable agricultural production in cropland, especially irrigated area. Throughout literature review in terms of salinization mechanism, we determined five factors which are soil type, dryness, irrigation method, groundwater use and groundwater level. Then risk areas of salinization were clarified. The high risk was shown more than 20% areas in irrigated areas. In almost 80% of the irrigated areas, there are some risk. Comparing with previous study, more detailed and more accurate risk of salinization were identified.

Gender differences in water insecurity

*Kaoru Kakinuma[1,2], Yoshihide Wada[3]

1. Shanghai University, 2. Tohoku University, 3. International Institute for Applied Systems Analysis

Universal and equitable access to safe water for all is central to achieving the 2030 Sustainable Development Goals (SDGs). Billions of people have gained access to basic water services since 2000, but around 600 million people still don’ t have adequate accesses to safe water. Moreover, impacts of water insecurity, that defined as the limited or uncertain availability of safe water, are different by gender. For example, water collections are often tasks for women especially in many parts of rural Africa, and they often spend more than 30 minutes per day for collecting water. Thus gender information are important to assess impacts of water insecurity on societies and livelihoods. However, there are often gaps between water resource assessments and gender researches. Most research that focus on gender differences in water access are conducted at local scales while most global water resource assessments don’ t include gender information. On the other hand, recent developments of population datasets enable us to use detail population distribution information that include gender and age in the world. Here we integrate these population datasets into water resource assessments to examine the gender differences in water insecurity around the globe. Our interdisciplinary approach between hydrology and demography would contribute to assess social impacts of water insecurity in the world.

1. NIES National Institute of Environmental Studies

Groundwater is an important water resource in the world. In recent decades, the observation of excessive groundwater depletion raised public concerns in many areas, highlighting the urgent need for sustainable management of groundwater resources. The over reliance on groundwater resources is primarily due to excess in water demand for recharge rate and limitation in alternative water source options. Therefore, in order to solve the groundwater problem, it is necessary to understand not only groundwater but also the entire hydrological cycle, including overall water use and surface water dynamics. The Global Water Resources Model H08 has been developed over the past 15 years to elucidate the overall picture of global water use and hydrological cycle. In this presentation, we will introduce some of the latest research achievements of H08 that will be potentially beneficial toward sustainable groundwater management. Then we will describe the prospects for the development and application of global water resources models.

H08 is currently focusing on the following research themes. The first is reservoir operation. Reservoir operation reduces the seasonal and interannual variability in surface water availability, but its expression in global hydrological models is still in infancy. After intensive investigation, we have succeeded in combining a global hydrological model with a global flood inundation model which brings us to the new horizon of expressing global surface water dynamics including human interventions. The second theme is agricultural productivity and irrigation. Most of the world's water is used for irrigation, hence estimating the requirement and understanding the effects of irrigation is key to global water resources modeling. We have focused on the productivity of biofuel crops and their irrigation and succeeded in expressing them in H08 which enables us to investigate the trade-offs among social decarbonization (bioenergy production), terrestrial ecosystem conservation (land use), and sustainable water use. The third theme is the enhancement of the accuracy and spatial resolution of the model. As many previous studies have suggested, in application to specific basins, the reproducibility of global water resources models is significantly poorer than that of basin-based hydrological models. By preparing high-precision input data and performing parameter calibration, in the Chao Phraya River in Thailand and other multiple basins in various climate zones, we have succeeded in achieving good performance of H08 which satisfy practitioners. Based on these research results, I would like to describe how the global water resources models can contribute to the solution of groundwater problems and enhancing water security, and what should be added in the future.

Impacts of Global Groundwater Depletion to Regional Hydroclimatology in 37 Major Aquifers

*Pat J.-F. Yeh[1], Chong Zhang[2], MinHui Lo[3], Yoshihide Wada[4], James S. Famiglietti[5]

1. School of Engineering, Monash University, Malaysia, 2. Beijing Normal University, China, 3. Department of Atmospheric Sciences, National Taiwan University, Taipei, Taiwan, 4. International Institute for Applied Systems Analysis, Laxenburg, Austria, 5. School of Environment and Sustainability and Global Institute for Water Security, University of Saskatchewan, Saskatoon, Canada

Global groundwater pumping (GWP) introduces dormant fossil waters into the active land-atmosphere-ocean water cycle and alters the combined land and atmosphere water budgets. Despite its adverse environmental impacts on regional water resources management and global seas level rises have been well recognized, the underlying physical mechanisms and paths are poorly understood due to the lack of large-scale GWP and long-term global hydrometeorological data to estimate these impacts. In this study, two sets of global-scale model simulations conducted for the 1900-1999 period by a fully-coupled climate-hydrologic model, one with GWP and one without, are used to investigate the effects of GWP in affecting the land and atmospheric water budgets over 37 major aquifers worldwide. The internally-consistent simulated water budget components, includ precipitation, evaporation, runoff, atmospheric vapor convergence, and water storage changes in land, ocean and atmosphere, are analyzed and their differences between two simulations are considered as the effects in changing regional hydroclimates due to long-term GW depletion. The analyses ranging from monthly to decadal timescales are focused on estimating the pumping sensitivity on various hydrologic stores and fluxes over these 37 aquifers. Lastly, the contribution of GWP to global sea level rise (GSLR) as a result of the changes in the land and atmospheric water budgets is also estimated via (1) the direct R contribution from land to ocean and (2) the indirect C contribution via atmospheric interactions.

Divergent effects of climate change on future groundwater availability in key mid-latitude aquifers

*Min-Hui Lo[1], Wen-Ying Wu

1. National Taiwan University

Groundwater provides critical freshwater supply, particularly in dry regions where surface water availability is relatively limited. Climate change impacts on groundwater storage could affect the availability and sustainability of freshwater resources. Here, we used a fully-coupled climate model to investigate changes in groundwater storage over seven critical aquifers that have been identified as significantly distressed by satellite observations. We assessed the potential climate-driven impacts on groundwater storage changes throughout the 21st century under the business-as-usual scenario (RCP8.5). Results show that the climate-driven impacts on GWS (groundwater storage) changes do not necessarily reflect the long-term trend in precipitation; instead, the trend may result from changes in transpiration, enhancement of evaporation, and reduction in snowmelt, which collectively lead to divergent responses of GWS across different aquifers. While two of them (the Southern Plains and the Middle East) are projected to become more stressed with climate change, our results also suggest the potential for enhanced future groundwater use in some of the currently most overstressed aquifers. Finally, we compare the climate-driven and anthropogenic pumping impacts. The reduction in GWSs is mainly due to the combined impacts of over-pumping and climate effects; however, the contribution of pumping could easily far exceed the natural replenishment.

Uncertainty of global hydrologic simulations: associated with data and physics including groundwater capillary flux

*Hyungjun Kim[1], Sujan Koirala[2]

1. The Univ. of Tokyo, 2. Max Planck Institute for Biogeochemistry

Numerical simulation has three major sources of uncertainty: 1) boundary conditions, 2) model physics, and 3) physical parameters. In this study, we introduce a few examples of uncertainty estimations from those aspects. First, it was shown how the uncertainty in forcing data translates into evapotranspiration and runoff calculations. To quantify the uncertainty, ensemble simulation was carried out using five different observational precipitation datasets, and the uncertainty was estimated based on Omega index which quantifies relative similarity of ensemble members. The uncertainty in the boundary condition was relatively amplified and damped in runoff and evapotranspiration calculations, respectively. Second, as an example to estimate the uncertainty associated with model physics, the simulation sensitivity due to parameterizations of the GW capillary flux and depth of interaction interface were tested. It has been found that the capillary flux parameterization affects the magnitude of GW-supported ET and GW recharge significantly, and the biggest sensitivities were related with the dependency of the capillary flux simulation on water table depth. Third, we tested the effect of soil texture classification on the partitioning of the water balance components. The sensitivity test concluded that the uncertainty associated with soil parameters mainly affects partitioning of sub-components rather than the first order water balance. In other words, the balance between transpiration-evaporation and surface-subsurface runoff were changed significantly, while the changes in the balance between evapotranspiration and runoff were negligible.

Higher-resolution mapping of regional aquifer storage parameters using a GRACE spherical harmonic inversion method

*Yun Pan[1], Yalin Ma[1], Pat J.-F. Yeh[2], Huili Gong[1]

1. Capital Normal Univ., 2. Monash Univ. Malaysia

The aquifer storage parameter, i.e. the specific yield (storativity) for unconfined (confined) aquifers, is crucial for estimating groundwater storage changes, and for hydrological and land surface model simulations. Despite that it can be quantified through pumping test or ground gravity measurement at local scale, obtaining distributed values at large scale is still of great challenge. In this study, we propose a GRACE (Gravity Recovery and Climate Experiment) spherical harmonic inversion (SHI) method, which reconciles GRACE and in situ groundwater level observations and enables distributed estimation of the storage parameters with higher-resolution at large scales. Through a case study in the plain area (346, 000 km^2) of the Yellow River basin, Huaihe River basin, and Haihe River basin (YHH), with a validation dataset of 120 pumping test data, we demonstrate that the overall performance (the R between SHI and pumping test) can reach 0.75 at the resolution of 1 km×1 km, though major limitations still exist in the uncertainties associated with selecting the best (true) one from multiple inversion results. Our study provides a potential new solution for estimating aquifer storage parameters at large scale, and highlights the additional value of spherical harmonic data on higher-resolution studies related with groundwater storage changes.

Potential misrepresentation of hydrological extremes using transient climate rather than stabilized climate given identical levels of global warming

*Julien Eric Boulange[1], Naota Hanasaki[1]

1. National Institute for Environmental Studies

The Paris Agreement aims to limit global warming well below 2˚C and encourage participants to pursue effort to further limit global warming to 1.5˚C. Models combining energy–economy–environment systems have provided crucial insight to how the future could evolve and how present decisions could affect long-term global warming. However, while many scenarios attempted to limit end-of-century radiative forcing to specific levels (e.g. +1.5˚C, +2˚C), these stabilized levels of global warming were frequently temporally exceeded during the mid-21st (Fig. 1A), owning to strong reduction in greenhouse gas emissions (Fig. 1B).

Such scenarios were used extensively to identify the different options available for limiting climate change and informing international climate policy. However, since stabilized levels of global warming for the end-of-century were not always available due to time requirements for stabilizing global warming, most analysis were conducted given a 30-year period centered on the year the global temperature exceed a specific levels (Fig. 1A)[1]. While the level of global warming for this 30-year period is identical to the stabilized global warming, it is not clear if the variables used in previous analysis behave identically between the two periods, hereinafter referred to as transient and stabilized climates.

In this study, using the ISIMIP2b[2] framework which provides outputs for various global hydrological models forced by the same bias corrected GCMs in a consistent manner, we extract extreme hydrological events obtained in the two climates and assess (i) whereas a statistical difference can be detected at the global scale, and (ii) if specific regions are more susceptible to being misrepresented by using solely the transient period in an analysis.

Our results (Fig. 2) indicate that while a statistical difference in extreme discharge obtained for the transient and stabilized climates could be detected globally, the difference was generally small. Overall, on average, significant differences in low and high discharges obtained in the transient and stabilized climates were identified for 6.82 and 3.27% of the land grid cells, respectively. Note that these findings were robust to the choice of indices. The extreme discharges in central Asia and the Amazon regions were consistently highlighted by the ensemble members as behaving differently in the transient and stabilized climate given identical level of global warming. For such regions, the conclusions drawn from previous analysis using only the transient climate may not be applicable in the far future exhibiting a stabilized climate.

To better understand the reasons behind the differences among GHMs in extreme discharge behaving differently for the transient and stabilized periods, it might be important to pay close attention to processes related to snow. Last two additional GHMs are currently being processed to further increase the number of members in the ensemble.

[U-04] International Efforts Supporting Global Navigation Satellite System-Enhanced Tsunami Early Warning

convener:Rundle John B(University of California Davis), Kazuyoshi Nanjo(University of Shizuoka), Eiichi Fukuyama(Kyoto University / National Research Institute for Earth Science and Disaster Resilience), Chairperson:Kazuyoshi Nanjo(University of Shizuoka), Chairperson:John B Rundle(University of California Davis), Chairperson:Eiichi Fukuyama(Kyoto University / National Research Institute for Earth Science and Disaster Resilience)

With little to no warning more than 230,000 lives were lost to the Great Indian Ocean Tsunami of December 26, 2004. This devastating loss of life focused the efforts of scientists, engineers and politicians to strengthen tsunami early warning systems beginning with an accurate and rapid estimate of tsunami potential. A combined network of seismic and geodetic sensors quickly emerged as an accurate, efficient, and cost effective enhancement to tsunami early warning systems for those at risk communities nearest the earthquake epicenter. In the months following the Great Indian Ocean Tsunami, geophysicists demonstrated that analysis the GPS network of the Global Geodetic Observing System could have provided warning within 15 minutes after the Sumatran earthquake if the network data were available in real time. On March 11, 2011, the Tohoku-oki earthquake and tsunami unleashed another terrible tragedy upon the Japanese people and posed great challenges to the Japanese government. The Tohoku-oki earthquake occurred off shore from the world's most advanced GPS network, the GEONET, designed and operated by The Geospatial Information Authority of Japan (GSI). The Tohoku-oki earthquake did underscore the potential and extraordinary societal value of Global Navigation Satellite Systems (GNSS) to tsunami warning systems. Several retrospective studies of the Tohoku-oki earthquake deformation captured by the GEONET demonstrated that accurate tsunami inundation predictions could be provided within 5 minutes of the earthquake occurrence.

In this session, we solicit papers on topics related to the realization of such a system, including instrumentation, data collection and availability, modeling, forecasting/nowcasting, and software development, as well as capacity building and linkages to international organizations, the Sendai Framework for Disaster Risk Reduction, and UN Sustainable Development Goals.

Operation of REGARD: Real-Time GNSS analysis system in Japan

*Hiroki MURAMATSU[1], Satoshi ABE[1], Satoshi KAWAMOTO[2], Yusaku Ohta[3]

1. GSI of Japan, 2. Cabinet Office of Japan, 3. Research Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University,

The displacement data produced by GNSS observations never saturate for large earthquakes in contrast to seismometer data that has a limitation of instrument saturation. Geospatial Information Authority of Japan (GSI) and Tohoku University developed a real-time GNSS analysis system named REGARD (Real-time GEONET Analysis System for Rapid Deformation monitoring), which estimated finite fault models based on the Japanese nationwide GNSS CORS network named GEONET.

REGARD has three subsystems: (1) the real-time positioning subsystem, (2) the event detection subsystem and (3) the fault model inversion subsystem. This system always conduct real-time kinematic analysis of ~1200 stations of GEONET. If REGARD receives an earthquake information from earthquake early warning system managed by the Japan Meteorological Agency or detect large displacement using RAPiD algorithm (Ohta et al., 2012), the inversion subsystem is started. Two types of finite-fault model are automatically estimated by a single rectangular fault model, which is available for both inland and subduction zone earthquakes and slip distribution model, which is suitable for grate subduction zone earthquakes. Estimated Mw from each fault model are sent to the relevant people.

REGARD has already detect several earthquake events. 2016 Kumamoto earthquake (Mw 7.0 (GCMT)) was the first time to estimate GNSS-based fault model in real-time in Japan. The system estimated Mw 6.96 and VR 96.2% within 5 minutes after the event occurred. Although REGARD could not estimate approximate fault model because of the small displacement, it successfully detected crustal deformation in many events. This system is useful for monitoring crustal deformation as well as estimating fault parameter.

Although REGARD shows potential for estimating fault model supporting early tsunami warning, the system has not yet been optimized. We keep trying to improve REGARD for operating under less cost and robustness conditions.

Tsunami early warning system in Japan and plans towards practical uses of GNSS data to tsunami warning operation of the JMA

*NISHIMAE Yuji[1], ISHIKAWA Norihiko[2]

1. Japan Meteorological Agency, 2. Geospatial Information Authority of Japan

A tsunami warning must be issued immediately after occurrence of an earthquake because many earthquakes occur near coasts and a tsunami hits coasts in a short time in Japan. The Japan Meteorological Agency (JMA) issues a tsunami warning in about three minutes. Numerical tsunami simulation is a powerful tool to predict a tsunami. Numerical tsunami simulation takes a long time and the time are not adequate to terminate calculation up to issuance of a tsunami warning. For this reason, the JMA calculates a lot of tsunami simulations to various source models in advance and creates a database of tsunami scenarios. And when an earthquake actually occurs, the closest scenario are chosen from the database based on the hypocenter and magnitude of the earthquake, and a tsunami warning can be issued in about 3 minutes. The magnitude called JMA magnitude (Mjma) is used the first warning to ensure issuance of a tsunami warning in about 3 minutes. The amplitude of seismic waves with short periods is used for quick estimation of Mjma. Mjma based on the short-period waves is saturated in case of a huge earthquake. As a result, the size of the earthquake is likely underestimated. Actually, in case of the Great East Japan Earthquake, the JMA could quickly obtain Mjma and could issue a tsunami warning in about 3 minutes. The estimated Mjma was 7.9 and it was by far smaller than moment magnitude (Mw) of 9.0 and that led underestimation of the tsunami heights. The JMA have developed several methods how to evaluate underestimation of Mjma. And if underestimation of Mjma is evaluated using those methods, the JMA will issue a tsunami warning based on the largest assumed tsunami heights or the largest size of the earthquake in the region. And then, after the accurate Mw will be obtained by CMT analysis or W-phase analysis, the tsunami warning will be updated. The JMA have also updated or lifted the tsunami warning using sea level changes observed by offshore and coastal tide gauges besides the earthquake data. The Meteorological Research Institute of the JMA developed the new method called tsunami Forecasting based on Inversion for initial sea-Surface Height (tFISH) to predict more accurate tsunami heights. tFISH is a method for predicting tsunami heights along coasts from distributions of initial tsunami heights at the tsunami source estimated by inverse analysis of tsunami waveforms observed at offshore tsunami meters. tFISH has been used to update a tsunami warning since March 2019.

The Geospatial Information Authority of Japan (GSI) has operated GNSS Earth Observation Network System (GEONET) which consists of more than 1000 GNSS sites. The GSI recently developed the REal-time GEONET Analysis system for Rapid Deformation monitoring (REGARD) (Kawamoto et al., 2017). REGARD can rapidly and automatically estimate a rectangular fault model or slip distributions on plate boundaries based on permanent displacements which are generated at the GNSS sites by an earthquake. In post-evaluation of the Great East Japan Earthquake, REGARD could estimate Mw 8.8 in about three minutes (Kawamoto et al., 2017). If Mw by REGARD could be obtained in time up to issuance of a tsunami warning, the Mw might be used for evaluation of underestimation of Mjma.

The JMA has considered criteria and procedures for utilization of Mw by the REGARD in cooperation with the GSI and has used to update tsunami warning as a trial in tsunami warning operation since March 2019 if solutions of all of CMT analysis are estimated in low quality. The JMA has plan to use a rectangular fault model or slip distributions estimated by REGARD as the initial source of real-time numerical tsunami simulation. The JMA is now exploring potential for abovementioned utilizations of REGARD.

The GTEWS 2017 workshop reported that Global Navigation Satellite Systems (GNSS) will enhance tsunami early warning systems with an accurate and sustainable system that could bring additional economic benefits to coastal societies and island nations of the Indo-Pacific region. GNSS analysis systems can provide an accurate estimate of earthquake magnitude and the associated finite fault displacement within 2 minutes of a major earthquake. This information can be used to predict the likelihood and the scale of a resulting tsunami within 5 minutes of the earthquake occurrence. Within ten to fifteen minutes of the earthquake occurrence, GNSS based ionospheric imaging can identify and track tsunami development from onset to propagation across the ocean basin. Implementation of GNSS Tsunami Early Warning Sensor (GTEWS) enhancement to existing systems will bring accuracy, affordability and sustainability to tsunami risk reduction for the Indo-Pacific.

Though seventeen agencies of twelve nations have endorsed GTEWS enhancement within the Global Geodetic Observing Systems Geohazards Initiative, there is much to be done to take full advantage of this new technology for the Indo-Pacific region. The challenges to GTEWS implementation include national policies on data sharing, commercial and agency programmatic decisions, communications and computing resource allocations, and the technical challenges of integrating GTEWS into existing tsunami warning systems. The Group on Earth Observations has adopted GTEWS enhancement as a goal of its Geodesy4Sendai community activity in response to the UNDRR call to implement the recommendations of the Sendai Framework for Disaster Risk Reduction. This presentation will discuss the recommendations of the GTEWS 2017 workshop and the follow-on GTEWS 2020 workshop focused upon the implementation of GTEWS for the Indo-Pacific.

Coupled Earthquake-Tsunami-TEC Simulator in a Parallel HPC Environment

*John B Rundle[1], David Grzan[1], John Wilson[1], Kasey Schultz[1], Steven Ward[2]

1. University of California Davis, 2. University of California Santa Cruz

We describe the implementation of a tsunami simulator code in a parallel High Performance Computing environment using the Tsunami Squares method first proposed by SN Ward. Due to the destructive nature of tsunamis, early warning systems are necessary to avoid loss of human life. This talk outlines the groundwork for such a system that will link Total Electron Content signatures of tsunamis detected by GNSS satellites to maps of inundated areas along the coast. The tsunami simulator that will be used for this early warning system is called Tsunami Squares, a simulator that utilizes a numerical method of solving the shallow water approximation equations over a grid of cells. To validate its accuracy, it was compared to the Regional Ocean Modeling System tsunami simulator, a simulator that solves the Navier-Stokes equations using a finite-difference method. The two simulation techniques showed good agreement over a variety of tests using several different initial conditions. As a preliminary step to creating the early warning method, many earthquakes off the coast Japan were simulated and from those earthquakes, tsunamis were simulated. From the simulated tsunamis, the runup heights along the coast were averaged and mapped, giving us a catalog of earthquakes and inundated locations. Examples of simulation movies for both Pacific Basin-wide and local inundation on the Sanriku coast are available. Unlike purely hydrodynamic codes, Tsunami Squares has the advantage that inundation and runup can be computed directly.

In future works, we plan to combine these methods with our earthquake and tsunami nowcasting methods to enable forecasting of both tsunami occurrence in tsunamigenic zones, as well as forecasting of potential coastal runups.

GNSS Total Electronic Content (TEC) measurements provide an additional coverage of GNSS ground motion measurements to estimate the tsunami risk and tsunami amplitude off-shore. Geometrically, the ionospheric TEC measurements (sounding the ionosphere at 300 km of altitude along the station-satelite ray-path, so called ionospheric piercing points) extents the monitoring zone up to two thousands of km from the physical location of the GNSS ground stations enabling therefore remote measurements offshore. In addition, theories and modeling of the ionospheric signals have now reached a maturity to allow estimation of oceanic displacement produced by the tsunami, with errors of about 10%. Those results include moderate tsunamis with less than 5 cm of oceanic displacement. GNSS TEC measurements are therefore complementing nicely land-surface, sea-surface and sea-floor seismic, geodetic and pressure networks. Additionally, to extend the coverage, GNSS stations can be easily installed on airbornes, vessels or buoys as dual frequency ionospheric sounding are not sensitive to the displacement of the GNSS receiver .

We review first the state of the art of observations, for both ground based GNSS networks and space GNSS occultations (e.g., COSMIC), as well as the efficiency in the to reproduce the tsunami sisgnature in the ionosphere. Numerical modeling are shown with various technics, such as tsunami normal modes summation or spectral elements methods, compared to data and then used to estimate the sea-level height waveform, with excellent waveform matching compared to those recorded by DARTs.

We present observations and modeling close to the epicenter –where the ionospheric TEC perturbation is visible at 7 minutes after the rupture- in order to estimate the tsunami risk; as well as in the far-fiel, off-shore, where we show that the TEC measurement can strongly support the tsunami high estimation during oceanic propagation. We discuss also the impact of the ionospheric dynamics in the signal to noise ratio. We finally conclude by the perspectives offered by TEC measurements in the improvements of oceanic monitoring and tsunami warning systems.

GNSS-TEC-based tsunami early warning system: Tsunami ionospheric hole identification, 2D initial tsunami height estimation, and tsunami simulation

*Masashi Kamogawa[1], Toshiyasu Nagao[2]

1. Global Center for Asian and Regional Research, University of Shizuoka, 2. Institute of Oceanic Research and Development, Tokai University

Tsunami-generated ionospheric plasma disturbances have been measured by the total electron content (TEC) between a satellite and its ground-based receivers in Global Navigation Satellite System (GNSS). TEC depression lasting for a few minutes to tens of minutes, i.e., tsunami ionospheric hole (TIH), is formed above the tsunami source area. According to Kamogawa et al. [Scientific Reports, 2016], the quantitative relationship between the maximum initial tsunami height and the TEC depression rate caused by the TIH was shown. In addition, the largest TEC depressions appeared 10 to 20 minutes after the main shocks. These imply that the TIH measurement using the existing ground GNSS receiver networks were potentially used in an early warning system for near-field tsunamis. Applying our knowledge to space-based early warning system, we are developing the feasible warning system.

In the presentation, we show the procedure of our systems: 1) Identification of TIH from the tsunami-generated ionospheric plasma disturbances. 2) Estimation of 2-D initial tsunami height from 2-D TEC depression rate in the TIH. 3) Tsunami simulation based on the estimated initial tsunami height. In our tsunami calculation, we used JAGURS code [Baba et al., Pure Appl. Geophys., 2015].

[U-05] Advanced understanding of Quaternary and Anthropocene hydroclimate changes in East Asia

convener:Chuan-Chou Shen(High-Precision Mass Spectrometry and Environment Change Laboratory, Department of Geosciences, National Taiwan University), Yusuke Yokoyama(Atmosphere and Ocean Research Institute, University of Tokyo), Kaoru Kubota(Graduate School of Human Development and Environment, Kobe University), Li Lo(Department of Geosciences, National Taiwan University), Chairperson:Chuan-Chou Shen(High-Precision Mass Spectrometry and Environment Change Laboratory, Department of Geosciences, National Taiwan University), Chairperson:Yusuke Yokoyama(Atmosphere and Ocean Research Institute, University of Tokyo), Chairperson:Kaoru Kubota(Kochi Institute for Core Sample Research, JAMSTEC), Chairperson:Li Lo(Department of Geosciences, National Taiwan University)

For the sustainability of biosphere and human society, it is crucial to in-depth understand Earth climate system changes on different timescales in Quaternary. Anthropogenic forcing is also strongly affecting different aspects of human living environments, natural ecological through physical and chemical climatic perturbations, especially in East Asia with swift economic takeoff in the recent decades. We welcome climate and environmental reconstructions based on natural archives, proxy data, numerical simulations especially on the topics of monsoon, precipitation belt shifting, typhoon, and drought histories in Quaternary and Anthropocene. Atmospheric and oceanic interactions, greenhouse gases radiative forcing and anthropogenic forcing impact from regional to global scale are also welcomed.

Meaning of stalagmite oxygen isotopes

*Akihiro Kano[1]

1. Graduate School of Science, The University of Tokyo

Stalagmite oxygen isotope records have been reported from elsewhere in the world, and explained by intensity of the monsoonal rainfall during Late Quaternary. For example, the records from China where it rains mainly in summer indicate the variability in East Asian summer monsoon (EASM). However, there has been counterstatements that other factors certainly reflect on the stalagmite oxygen isotopes.

Well-dated stalagmites collected from Hiroshima, Gifu and Mie prefectures in Japan appear a similar trend but much smaller amplitude of oxygen isotopic ratio than the Chinese stalagmite. A prominent feature of the 83 kyr record of Mie stalagmite is a long-term trend that follows the change in seawater oxygen isotopes. This is because the seawater is the main moisture source of the meteoric water for the Mie stalagmite. Considering the change in the seawater oxygen isotope, the residual variability can be ascribed to a presumable temperature change in the last 83 kyr. Estimated difference between the mid-Holocene and the last glacial maximum and cooling of Heinrich events were 9ºC and < 3ºC, respectively (Mori et al. 2018). Thus, the intensity of EASM was rather a minor factor for the oxygen isotopes of the Japanese stalagmite.

Stalagmites from Niigata prefecture reveal another example showing importance of the seawater oxygen isotopes. The cave at Itoigawa where moisture from the Japan Sea delivers heavy snow in winter, is unique in an aspect of the stalagmite records. Unusually low oxygen isotopic ratio during the last glacial cannot be explained by lowered temperature neither by intensified East Asian winter monsoon. The most likely factor is the lowered oxygen isotope of the Japan Sea surface water during the last glacial, which has been suggested in the marine isotopic records. Comparison with the Pacific side records, the evaluated amplitude of the lowering was around 3‰.

Control of the monsoonal intensity, i.e. the amount effect is disputable for the Japanese stalagmites, and it should be re-examined for the Chinese records. An understated factor for the oxygen isotopes of the Chinese stalagmite is continentality, i.e. the distance from coast. Because the Chinese coast side of the East China Sea is a shallow shelf, the continentality of the Chinese caves is sensitive to the sea-level change, which amplifies the changes in stalagmite isotopes.

Late-Holocene anthropogenic impact on tropical climate

*Yair Rosenthal[1], Samantha Claudia Bova[1], Zhengyu Liu[2], Mi Yan[3]

1. Rutgers University, 2. Ohio State University, 3. Nanjing Normal University

Climate models indicate that rising *preindustrial* greenhouse gas (GHG) levels since 7 ka caused increase in mean annual temperatures (MAT) comparable to that observed since the industrial revolution. However, geochemical temperature proxies offer inconsistent evidence, which was termed “*The Holocene Conundrum*”. Specifically, Mg/Ca records in planktonic foraminifera from the Western Pacific warm pool (WPWP) record cooling in direct opposition to alkenone derived temperature records from the South China Sea and to simulated trends. Here, we present a new, centennially resolved record of planktic foraminifer (*G. ruber ss*) Mg/Ca-derived sea surface temperatures (SSTs) spanning the current*and* last interglacial (LIG) periods from the WPWP and compare these data to two transient climate simulations. Taking advantage of a stronger seasonal contrast during the LIG, we demonstrate that Mg/Ca-derived SSTs reflect late Fall SSTs, rather than mean annual. Applying this seasonal relationship to the Holocene, we reconcile the proxy record with model output, assess the WPWP SST sensitivity to GHGs, and ultimately confirm that preindustrial warming has doubled the anthropogenic total. We will also examine possible effects on precipitation in the Western Pacific warm pool.

Evolution of meridional and zonal sea surface temperature gradients in the Pacific Ocean during the Quaternary period

*Takuya Sagawa[1], Risako Makino[2], Yukimi Kubota[2], Yoshimi Kubota[3], Yair Rosenthal[4]

1. Institute of Science and Engineering, Kanazawa University, 2. School of Science and Engineering, Kanazawa University, 3. National Museum of Nature and Science, 4. Rutgers University

Long-term change of meridional and zonal temperature gradients in the Pacific Ocean is key to understanding the evolution of the global climate change. The asymmetric zonal SST pattern in the modern tropical Pacific, i.e. warm pool in the west and cold tongue in the east, has been gradually evolved since the Plio-Pleistocene climate transition. This zonal SST gradient has been attributed to a strengthening of the Walker Circulation. Here, we conduct planktonic foraminiferal Mg/Ca temperature reconstruction in the western Pacific warm pool (WPWP) using two species, Globigerinoides ruber sensu stricto and Trilobatus trilobus. In the modern tropical Pacific, both species calcify in mixed layer and show similar Mg/Ca temperature with a bit deeper signature in T. trilobus. Our temperature reconstruction using T. trilobus is consistent with that of ODP806, which is also in WPWP region, indicating regional representativeness. Temperature reconstruction using G. ruber is significantly higher than that using T. trilobus before 1.7 Ma, suggesting a deepening of the western thermocline at that time. This vertical temperature gradient change is accompanied by SST drop in the eastern equatorial Pacific. Therefore, our data support the strengthening of the Walker Circulation. Further, both northern and southern subpolar SST dropped at similar timing, which indicates a steepening of the meridional temperature gradient. We infer that the strengthening of the Walker Circulation at 1.7 Ma was induced by the steepening of meridional temperature gradient in the course of Northern Hemisphere Glaciation.

How do marine microplankton survive during global warming?

*Yurika Ujiie[1], Kyoko Hagino[1], Tatsuhiko Hoshino[2], Jeremy R. Young[3], Ian Probert[4], Richard Jordan[5]

1. CMCR, Kochi University, 2. JAMSTEC, 3. University College London, 4. Roscoff Biological Station, 5. Yamagata University

Global warming has been accelerating since the 1990s and has dynamically changed the global environment, often leading to climate hazards. Marine microplankton, particularly phytoplankton, play important roles in driving biogeochemical cycles because they are CO_2consumers in the atmosphere–ocean CO_2 exchange, and exporters of organic and inorganic compounds in the water column through the biological pump. There is growing concern that global warming significantly modifies the habitats of microplankton, and so their biogeochemical functions could be impaired resulting in reduced CO_2 absorption by the marine ecosystem. However, the impact of anthropogenic climate change on marine microplankton has been poorly investigated based on actual measurements. The present study enables us to directly observe the photic biosphere before the acceleration of global warming. The Okada & McIntyre collection of filter (0.8–64 μm) samples from ~6000 sites across the world ocean in the 1960–1970s represents a unique resource for the investigation of microplanktic diversity from half a century ago. We are employing both morphological and molecular techniques to these collections to unveil species diversity. Extracted DNA from the filter samples are enough quality to be used for Next Generation Sequencing (NGS) metabarcoding. This metabarcoding can be compared with those of the TARA-Oceans expeditions, which provided the database of the current genetic diversity of plankton communities in the world ocean.
Our first priority is to study the calcifying phytoplankton coccolithophores among the microplankton, because they crucially contribute to the carbon, nitrogen and other cycles via the calcification of coccoliths and their symbiotic relationship with bacteria. Morphological studies of modern coccolithophores have provided knowledge on their ecology, physiology, and geochemical roles. A comprehensive survey of morphological-genetic approaches can reveal the changes of species composition and geographic distribution of coccolithophores in the late Anthropocene. These changes will be related to the actual response of marine microplankton to global warming and will help to improve our prediction of the future impact of climate change on the marine biosphere.

Periodical enhancements of multi-decadal hydroclimate variations in central Japan and its implication for the 2600-year East Asian history

*Takeshi Nakatsuka[1]

1. Nagoya University

In general, it is not easy to extract low-frequency climate signals from tree rings because they usually overlap with biological age trends. Although oxygen isotope ratio ($\delta^{18}O$) of tree-ring cellulose, a novel proxy of summer hydroclimate in monsoonal Asia, is often free from the age effect, conifer trees sometimes show significant $\delta^{18}O$ age trends. Here, we propose a new method to reconstruct past hydroclimate variations seamlessly from annual to millennial time scales by integrating tree-ring cellulose oxygen and hydrogen ($\delta^{2}H$) isotope ratios (Nakatsuka et al., 2020; https://doi.org/10.5194/cp-2020-6). By analyzing many old conifers, we have found that there are always positive correlations between short-periodicity $\delta^{18}O$ and $\delta^{2}H$ variations and sometimes negative correlations between long-periodicity $\delta^{18}O$ and $\delta^{2}H$ variations, reflecting climatological and physiological factors, respectively. Because the gradual $\delta^{18}O$ decrease and $\delta^{2}H$ increase can be explained by growth-related physiological changes, we can cancel the physiological effect and extract the climatological component ($\Delta\delta^{18}O_{cel(climate)}$) in tree-ring cellulose $\delta^{18}O$ by solving simultaneous equations of $\delta^{18}O$ and $\delta^{2}H$. We apply this procedure to a 2600-year chronology of tree-ring $\delta^{18}O$ and $\delta^{2}H$ made of 67 samples of excavated wooden artifacts, old architectural woods, and naturally buried logs in addition to old living trees in central Japan and demonstrate that long-periodicity variations in $\Delta\delta^{18}O_{cel(climate)}$ agree well with multi-millennial summer hydroclimate variations reconstructed by other global and regional low-frequency proxies. It indicates that the $\Delta\delta^{18}O_{cel(climate)}$ can be a seamless proxy of long- and short-periodicity summer hydroclimate variations in East Asia.

So far, the short-periodicity climate variations in ancient eras have been seldom discussed either from natural or historical viewpoints. Because the $\Delta\delta^{18}O_{cel(climate)}$ chronology may contain many undiscovered information in all frequencies, it is worth analyzing its short-periodicity variations in the distant past. Here, we propose a new analytical framework to identify vulnerability of historical societies against climate changes with special focus on climate periodicity. First, we make a simple model to describe "climate-production-storage-population" dynamics for pre-modern agricultural societies and propose a working hypothesis that multi-decadal climate variations are most critical for human societies because neither crop storage nor demographic adjustment can function for the multi-decadal variations. Second, we investigate periodicity of the 2600-year $\Delta\delta^{18}O_{cel(climate)}$ chronology in central Japan and find that multi-decadal variations are enhanced every 400 years, possibly caused by multi-centennial solar cycles, corresponding to the so-called dynastic cycle in China and the quasi-simultaneous political regime shifts in surrounding countries like Japan and Korea. Third, we compare the chronology with various historical societal parameters in East Asia (yearly data on agricultural productions, famines and peasant uprisings during 16-19th CE centuries in Japan and decadal frequency on internal wars during 3rd BCE –20th CE centuries in China). Statistical analyses on the climate-society relationships clearly demonstrate that crop failures due to large multi-decadal hydroclimate variations actually caused famines and social conflicts and often resulted in political regime shifts in East Asia. There are also substantial exceptions where people could avoid social collapse due to the multi-decadal hydroclimate variations, from which we can extract important lessons, applicable to contemporary global environmental issues, by spatiotemporal comparisons of social vulnerability against hydroclimate variations in the long East Asian history.

Benthic biotic response to Quaternary climate changes in the Sea of Japan and other Asian regions

*Moriaki Yasuhara[1]

1. University of Hong Kong

The Sea of Japan is a marginal sea, connecting to adjacent seas by four shallow straits (water depths <130 m). Marginal seas are ideal for studying biotic responses to large-scale environmental changes as they often are sensitive to glacial-interglacial and stadial-interstadial climatic cycles. However, only a limited number of studies cover time periods beyond the last two glacial-interglacial cycles. In this presentation, I will show long Quaternary records of benthic biotic response to paleoceanographic changes in the southern Sea of Japan, covering many glacial-interglacial cycles, based on ostracode assemblages at the Integrated Ocean Drilling Program (IODP) Site U1427 and U1426. The results indicate that orbital-scale oxygen variability in the bottom water has been the major control impacting the marginal-sea biota, and secular-scale faunal transitions are likely associated with the mid-Brunhes event (~0.43 Ma) and the onset of the Tsushima Warm Current (~1.7 Ma). Benthic ecosystems in marginal seas are sensitive and vulnerable to both short- and long-term climatic changes, and the mid-Brunhes event is suggested to be a global biotic event affecting benthic ecosystems substantially. I will also introduce other recent examples of Asian biotic response studies.

[U-06] Open Access, Open Data, and FAIR Data in Geosciences

convener:Hirokuni Oda(Institute of Geology and Geoinformation, Geological Survey of Japan, AIST), Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Brooks Hanson(American Geophysical Union)

Scientific products including journal publications, reports and data are invaluable resources for human beings. These days, open access, open data, and FAIR data policies are becoming more and more important for sustainable society and research developments. In the proposed session, we discuss the topics in Geosciences following the presentations by the keynote speakers invited from leading organizations.

Discussion

Discussion

Open access and open data: the publisher perspective

*Paola Teti[1], Toby Charkin[1], Samuel Winthrop[1]

1. Springer Nature

The publishing landscape is going through many changes in policy and culture. The future of research development is based on the concept of open research, aiming to publish research results with immediate open access in a transparent and economically sustainable way.

Many initiatives have been undertaken to facilitate the transition of journals to open access. Transformative agreements embraced by funders, research institutions, publishers and scientific societies, will ultimately enable researchers to publish their work openly through sustainable models that take into account different policies and market influences.

Another key component of this transformation towards open research is ‘open data’. In 2019 a Springer Nature white paper (Lucraft et al. 2019), based on a survey of more than 11,000 international researchers, set out key challenges in data management and data sharing. While data sharing is increasing, and the majority of researchers see data sharing as important and a priority, the majority of researchers are not yet managing or sharing data in ways that make them FAIR (Findable, Accessible, Interoperable, and Reusable) - a growing requirement for many global research funders.

In this presentation we will discuss the initiatives publishers are launching to help researchers in this journey towards open research, and the measures they are taking to make data sharing the norm.

Enabling FAIR Data in the Earth, Space, and Environmental Sciences: Encouraging all Researchers to Document, Share, and Cite Scientific Data

*Shelley Stall[1]

1. American Geophysical Union

AGU’ s data position statement, recently updated, affirms that **“Earth and space science data are a world heritage, and an essential part of the science ecosystem. All players in the science ecosystem—researchers, repositories, publishers, funders, institutions, etc.—should work to ensure that relevant scientific evidence is processed, shared, and used ethically, and is available, preserved, documented, and fairly credited.”**
(https://www.agu.org/Share-and-Advocate/Share/Policymakers/Position-Statements/Position_Data)

The statement includes key objectives for the Geosciences:
Champion Open and Transparent Data Enable a Robust Science Ecosystem Create Effective Culture Change
Our research ecosystem is diverse and interconnected involving researchers, publishers, editors, repositories, institutions, librarians, societies, funders and more. The effort to evolve practices for open and FAIR data sharing in support of Open Science requires all participants.

At the American Geophysical Union we are convening and encouraging adoption of updated data practices across the ecosystem to support open and FAIR data and the resources needed by researchers to comply with this updated guidance. The Enabling FAIR Data Commitment Statement gives a path specific to each stakeholder to support progress.
(https://copdess.org/enabling-fair-data-project/commitment-statement-in-the-earth-space-and-environmental-sciences/)

With JpGU, EGU, and AOGS as partners in this effort, we continue to steadily make progress toward making open and FAIR data a common practice in the Geosciences. We will share the current progress and provide recommendations for how participants can encourage incremental actions in their own organizations.

Preprint is ready, data sharing is still difficult, what scholarly community should do in 2020’s?

*Kazuhiro Hayashi[1]

1. National Institute of Science and Technology Policy

Open Science is aiming digital transformation of Science, Society including Industry, and Science and Society. Open Science Policy has encouraged researchers to share their data as much as possible to accelerate their research, collaboration, and innovation. However, current activities are lack of incentives to drive research data sharing directly, it also needs some time to have them change their culture. For example, the 2nd survey of NISTEP in 2018 with comparison of 2016 to monitor research data sharing revealed that Japanese researchers are still reluctant to share research data, while they promote open access to share their research papers.

While research data sharing is still difficult to implement, current established scholarly communication based on journal and article is changing significantly. Especially, preprint server is now getting popular even in the medical field to get their priority. Furthermore, as series of publication regarding Coronavirus (COVID-19) indicates, preprint on preprint server is having a certain impact to both of research community and society, casting many issues to scholarly community especially on quality control.

It is obvious that Scholarly journals must be compatible with preprint server and data sharing scheme as of evidence of the paper. However, in 2020’s, scholarly journals is getting more into re-designing whole framework of journal publishing itself, setting preprint as more authorized publishing, changing the process of when and how the preprint should be filtered, and also who should filter it. It also changes the role of editing. These trials could be a transition state towards digital native scholarly communication which is currently understandable but not accepted to all researchers.

An Attempt to Discuss Scientific Outputs including papers and digital data in the Open Science scene

*Yasuhiro Murayama[1]

1. Strategic Program Produce Office, National Institute of Information and Communications Technology

Today's Open Science movement is to re-consider research outputs (papers, data etc.), in particular in the form of digital information in this era with the Internet infrastructure. Traditional styile, culture and scholarly community norm of conducting scientific research, publishing research outputs and evaluating/rewarding their results have been successful in advancing science, technology and innovation. In the change concerned, from the printing technology to the electronic (and often digital) infrastructure, we will be able to conduct science in different ways. This doesn't mean necessarily a mandate for scientists to change their daily lives while efficiency and sustainability in an economical and scientific sense would be to a moderate encouragement and better motivation fo scientists to change the way of science. The author's intention is to discuss and promote Open Science in the international policy scene, science academies, and learned societies in order to optimize the way of science to enable better lives of scientists and citizens in the global community.

[U-07] Diversity and equality - Where do we stand on gender equality or equity in the geosciences?

convener:Chiaki T. Oguchi(Institute for Environmental Science and Technology, Graduate School of Science and Engineering, Saitama University), Rie Hori, S.(Department of Earth Science, Faculty of Science, Ehime University), Claudia Jesus-Rydin(European Research Council), Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Chairperson:Rie Hori, S.(Department of Earth Science, Faculty of Science, Ehime University), Chairperson:Claudia Jesus-Rydin(European Research Council)

In the last decades efforts have been made to raise awareness on the under-representation of women in the geosciences. Numerous actions were initiated and supported by geosciences societies across the world, such as AGU, EGU and JpGU. Despite this, the progress is slow and the barriers complex, and the underrepresentation of women remains a reality.
Gender equality is not only a fundamental human right, but a necessary foundation for our society that must tap the potential of every talented mind to develop solutions for a sustainable future. The existence of under-representation of different groups (cultural, national, and gender) remains a reality and a threat to getting maximal value from research investment across STEM fields around the world, including the geosciences.
Professional societies have a privileged position to catalyse change by setting the tone and leading by example. Promoting fairness and inclusion, in a safe environment, to all members are common goals, which require effective concerted actions.
In this session, speakers will present and discuss data showing the evolution of women representation retrospectively. Furthermore, concrete examples of successful actions and future initiatives to bridge the gender gap in the geosciences are presented.

[E] Oral | U (Union)：Union

[U-08] Special session for a borderless World of Geoscience (GEOethics)

convener:Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Brooks Hanson(American Geophysical Union), Takashi Furumura(Earthquake Research Institute The University of Tokyo), Eiichi Tajika(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Chairperson:Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Chairperson:Takashi Furumura(Earthquake Research Institute The University of Tokyo)

JpGU-AGU will have a joint meeting 2020 "For a borderless World of Geoscience". This symposium will present the viewpoint of leaders from the major geoscience societies (JpGU, AGU, EGU and AOGS), which are partner unions, who are also leading scientists representing exciting geoscience fields. The Earth and space science is essential the well-being of the humankind and sustainable environments. Some of the discussion topics will include: How shall we establish more reliance between Earth and planetary science and society ? A joint action plan/communique' is a desired outcome of this symposium.

The key role of Scientific Societies

*Brooks Hanson[1]

1. American Geophysical Union

Forming a borderless world of geoscience is critical for benefiting humanity and forming a vibrant sustainable future. Earth, environmental, and space science are critical for many societal challenges and for guiding decisions on these issues. AGU has recently developed a new strategic plan that includes recognition of the need for deeper engagement with society and the public for a sustainable future and expanded partnerships worldwide. We’ ll discuss the implications for scientific societies and the broader scientific community.

Climate science and social values

*Seita Emori[1]

1. National Institute for Environmental Studies

The Future Earth, a currently operating international platform of sustainability science, calls for trans-disciplinarity, meaning co-designing and co-producing science with various non-academic stakeholders in the society. The need of trans-disciplinarity is justified from three perspectives: the logic of accountability, the logic of impact and the logic of humility (van der Hel, 2016). The logic of humility, which is often overlooked, essentially means that scientists should reflect on their own perceptions and values, which may be biased in various ways, and should appreciate diverse values of various stakeholders in the society.

For example, when we observe climate debates in the society, different opinions based on different values over risk perceptions of climate change or various mitigation options can be identified. The climate issue is inevitably value-laden and climate science cannot be free from values as well. Observational research might look relatively value free, but what to measure and where to measure, for example, already involve some kind of value judgment. Also, continuous measurement needs stable fund, which leads to a situation that research might be influenced by the values of funders.

Typologies and recommendations on how scientists behave in such value-laden research environment have been discussed by social scientists (e.g., Honest Broker, Pielke, 2003). Here I present the idea of Reflective Advocacy (Asayama et al., 2017), which is characterized by transparency, anticipation, reflection, deliberation and responsiveness.

Keywords: climate science, social values

How can we effectively utilize atmospheric forecasts that include uncertainties?

*Hisashi Nakamura[1]

1. Research Center for Advanced Science and Technology, University of Tokyo

Today weather forecasts provide useful information for our daily life. The numerical weather forecast was one of the first applications of a computer invented more than 70 years ago. Since then, in addition to the rapid advance of computing resources, expansion of global satellite measurements and advance of data assimilation methods have contributed to the great improvement of the forecast skill. Today, operational centers offer not only daily weather forecasts but also weekly, monthly and seasonal forecasts, and a weather forecast system has thus become a fundamental infrastructure for the modern society.

The atmospheric circulation system is a highly nonlinear complex system with super high dimensions, and its behavior is therefore essentially chaotic. Thus, tiny observational errors in the initial field can gradually amplify, which will severely degrade the forecast skill within 10 days or so. For the extended or seasonal forecasts the ensemble forecast method therefore becomes essential, where parallel forecasts are performed from a number of slightly different initial fields into which tiny errors have been introduced artificially. The ensemble forecast is therefore probabilistic, and inter-member forecast spread as a measure of uncertainties of the forecast offers quite useful information to the users. The ensemble method is now being introduced even into daily forecasts, which today have high prediction skill but are by no means perfect in a deterministic sense. Furthermore, production of reanalysis data by assimilating observational data accumulated until today into a state-of-the-art forecast system can reproduce the atmospheric state four-dimensionally over the last several decades and thus provide useful data for assessing predictability of extreme weather events in the past.

For the effective risk reduction in case of an imminent disaster by a typhoon/hurricane, torrential rainfall or a snow storm, not only further improvement of forecast skill but also appropriate information of forecast uncertainty is necessary. It should be noted that prediction of behavior of pollutants once emitted into the atmosphere by volcanic eruption or a nuclear plant accident is basically a matter of atmospheric forecast. So, it becomes necessary for the society to understand the meaning and significance of forecasts that always include a certain level of uncertainties for their effective utilization. For this purpose, it is inappropriate to regard a forecast as perfect information by ignoring its uncertainties. It is also absolutely inappropriate to dismiss any forecasts simply because they contain uncertainties. With observations alone one cannot foresee what will happen in the future. Effective combination between observations and forecasts is of essential significance.

Keywords: forecast•prediction, uncertainties

Communicating uncertainty of geoscience for the disaster risk reduction -Geoscience, the ambiguous, and ourselves-

*Satoko Oki[1]

1. Faculty of Environment and information Studies

In Japan, a large earthquake causing casualties occurs once every few years. The 2016 Kumamoto Earthquake, the 2018 Northern Osaka Earthquake, and the 2018 Eastern Iburi Earthquake occurred one after another, even after the 2011 Tohoku Earthquake caused more than 18,000 deaths and missing. In addition, damage from storms and floods, such as heavy rains and storm surges caused by rising sea levels, is also increasing these years. You can't tell where they point when you hear "disaster area" in Japan.

In such situation, geosciences are expected from the society for disaster risk reduction,and geosciences have also tried to meet this expectation. For example, seismology has been making efforts to publish the National Seismic Hazard Maps announced by the government every year since the 1995 Kobe Earthquake. Regarding meteorology or volcanology, they are committing to the introduction and operation of warning levels as well as the improvement of prediction accuracy.

Here I would like to report the results of a survey on how this information from geoscience is perceived by the public, taking the National Seismic Hazard Map as an example.
Since we have earthquake risk everywhere in Japan, it is not enough to make the hazard map of individual scenario earthquake. We therefore calculate the probability of a certain place to be affected by a ground motion of seismic intensity 6 or more within the next 30 years, then color it from yellow to brown on Japan map to overview the earthquake occurrence risk.
We investigated how the public perceives this map (Nagamatsu et.al., 2017) by comparing two groups in areas with low probabilities. Those people in one group are shown this map and the other not shown. The results showed that people seeing the map had lower risk perception. Earthquakes will occur everywhere in Japan, and in fact, some of damaging earthquakes have occurred at the low probability area. It is an ironic result that the map prepared by the government to encourage earthquake countermeasures reduce the public awareness of disaster prevention at least to those who live in areas with low probabilities.

When geoscience gives out useful information to society, it is always accompanied by uncertainty. To express this uncertainty, we introduce probability, but it does not seem to be a good communication to the public. How should we communicate uncertainty? I would like to introduce an activity called "disaster prevention novel" which is being conducted at a junior high school.

The "disaster prevention novel" was introduced into the Shimizu Junior High School in Kochi prefecture. It is the only junior high school in this city of Tosashimizu, which is facing the Pacific Ocean and told to face devastating tsunamis in the forthcoming Nankai-trough Earthquake. The “disaster prevention narratives" are written by the students provided the detailed date and time of the Nankai-trough Earthquake occurrence in about a month by the school teachers. The main characters are themselves, living in their

©2020. Japan Geoscience Union. All Right Reserved.

actual neighborhood. Other characters are real people too. One important requirement is that the stories end with hope.

Let us review this "disaster prevention novel" in terms of communicating the uncertainty of an earthquake. The present earthquake science cannot accurately predict when an earthquake occurs. And, if "When" cannot be designated, the accompanied damage anticipation can also be ambiguous. For example, the degree of fire disaster depends on the time of the earthquake. The uncertainty of earthquake occurrence leads to the uncertainty of damage anticipation.

In the activity of "disaster prevention novel", the school designates the date and time of earthquake occurrence. Nobody thinks this is a true earthquake prediction. It is one of the educational considerations that one can think about his/her own evacuation behavior with the detailed occurrence time. In the novels, the way tsunamis inundate the town is depicted in different ways by students. Some students describe fires, and others write about landslides. The 90 students anticipate and express the damage in 90 ways. This expresses uncertainty and ambiguity of the forthcoming Nankai-trough Earthquake.
In the following year, students wrote the "disaster prevention novel" in different seasons, different times, and different weather settings. This led students, parents, and locals to come up with various assumptions. The unavoidable uncertainties from geosciences can be expressed in this way without introducing probabilities.

In the presentation, I would like to refer to a possible improved communication of geosciences.

Transdisciplinary research on geoscience in society

*Makoto Taniguchi[1]

1. Research Institute for Humanity and Nature

Global environmental issues such as global warming, decrease of biodiversity, global nitrogen contamination are wicked problems with involvement of many stakeholders, wide difference of interests, and some degrees of scientific uncertainties. To solve these wicked problems, global research communities such as Future Earth realize the importance of co-design/co-production/co-delivery with stakeholders in society as transdisciplinary research. As co-design with stakeholders including governors, media, industry, and citizen, Japanese Strategic Research Agenda (JSRA) for global environmental issues had been made, and identified 108 agendas which are important not only for scientists but also for society. These 108 agendas are categorized into ten groups, and prioritization of JSRA has been made in terms of necessity of trasdisciplinary research and character of Japanese research. Recursive and mutual learning with stakeholders are important for science in society. This JSRA are used in some Japanese associations on geoscience under JpGU for making a decision of future research directions.

Geodiversity and its conservation as a framing guideline for Geoethics in 21st Century

*Abhik Chakraborty[1]

1. Wakayama University

Geodiversity refers to the collective abiotic diversity of our planet. It is defined as the natural range (diversity) of geological and geomorphological features, including their assemblages, structures, and interactions that contribute to the heterogeneity of landscapes and sustain the evolution of life. However, geodiversity has been typically undervalued in existing sustianabililty literature as well as in conservation policy frameworks. There is ample evidence of recent pervasive anthropogenic change of key surface processes of our planet, and this phenomenon of humans as earth-movers will leave indelible marks on the fossil record. It therefore becomes imperative to understand that the heterogeneity of abiotic landforms/proceses and their integrity across geological time are fundamental factors underpinning all biodiversity and ecosystem services, and therefore are crucial for the sustenance of our civilization. This insight can be connected to the *intrinsic value* of geodiversity, which in turn should underpin any ethical framework for conserving the abiotic diversity of our planet. This paper posits the important argument for understanding, appreciating, and conserving the spatial and temporal integrity of geodiversity as the backbone for geoethics, and analyzes major challenges for conservation of dynamic earth proceses through insights derived from natural heritage landscapes (such as UNESCO World Natural Heritage Sites and UNESCO Geoparks).

The AGU GeoHealth and Thriving Earth Exchange Programs: Engaging our Geoscience Community for a Sustainable Future

Brooks Hanson[1], Janice Lachance[1], *Billy M Williams[1]

1. American Geophysical Union

The American Geophysical Union, a scientific society of more than 60,000 members worldwide, has undertaken important strategic initiatives to help address important GeoEthics related concerns and opportunities. AGU efforts such as its GeoHealth program and the Thriving Earth Exchange are two such critical initiatives designed to help promote GeoEthics-related needs, and specifically to help promote the well-being of humankind and sustainable environments. This presentation will discuss the progress, impacts and future opportunities in these two AGU programs, and other means to engage and promote Earth and space sciences and society.

[U-09] Special session For a Borderless World of Geoscience (Challenges for the future)

convener:Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Robin Elizabeth Bell(Lamont Doherty Earth Observatory), Alberto Montanari(University of Bologna), David Laurence Higgitt(Lancaster University College at Beijing Jiaotong University, Weihai, China), Chairperson:Brooks Hanson(American Geophysical Union), Chairperson:Simon Richard Wallis(The University of Tokyo)

JpGU-AGU will have a joint meeting 2020 "For a Borderless World of Geoscience". This symposium will present the viewpoint of leaders from the major geoscience societies (JpGU, AGU, EGU and AOGS), which are partner unions, who are also leading scientists representing exciting geoscience fields. The Earth and space science is essential the well-being of the humankind and sustainable environments. Some of the discussion topics will include: What are the challenges for the future ? A joint action plan/communique' is a desired outcome of this symposium.

[U-10] Linking Education and Research Communities in Geosciences: Engaging the Public and Local Communities

convener:Vincent Tong(University College London), Takashi Oguchi(Center for Spatial Information Science, The University of Tokyo), Renee M Clary(Mississippi State University), Keiko Kuge(Department of Geophysics, Graduate School of Science, Kyoto University), Chairperson:Vincent Tong(University College London), Chairperson:Takashi Oguchi(Center for Spatial Information Science, The University of Tokyo), Chairperson:Keiko Kuge(Department of Geophysics, Graduate School of Science, Kyoto University), Chairperson:Renee M Clary(Mississippi State University)

Developing links between research and education is important for maximizing the impact of Earth and Space Sciences and for nurturing a global geoliterate community. Initiatives involving research, education and public engagement abound, building communities that bring educators, researchers and those with dual interests together is, however, not always straightforward. While many researchers are engaged in activities at national and international levels, educators may focus on projects primarily shaped by institutional and national priorities. In this session, we investigate the challenges and opportunities of advancing research-education synergies in Earth and Space Sciences through engaging the general public and local communities. We focus on success stories showcasing educational and outreach initiatives that aim to bring researchers and educators together. Ways of fostering collaborations, evidencing impact and developing leadership will be highlighted. Projects that address the UN Sustainable Development Goals (SDGs) are particularly welcomed.

Resilience and public engagement for advancing sustainability policy, research and education

*Mika Shimizu[1]

1. Kyoto University

In seeking for pathway for overcoming sustainability challenges through policy, research and education, how we design the approach to address will affect our future sustainable society. For the design, given the complex systems around sustainability it is critical to take into account 1) all sustainability challenges are interlinked with the climate change directly or indirectly, and 2) the climate change impacts on human societies systemically, 3) while humans have driven pervasive decline of life on Earth.

Specifically, resilience approach, based on systems approach which recognizes inextricable links between complex and non-linear systems and is characterized by feedback loops and uncertainty (Berkes et al. 2003, is about enabling the capacity to create human, social and natural environments to adapt, recover, or transform even in facing challenges or adverse changes. This is best accomplished by looking at human, social and natural systems as a continuum. In other words, to nurture, strengthen, or create resilience within human, social, and natural systems, the interconnectedness of, or linkages among systems, is critical in operationalizing resilience where collaborative human actions can play a role. More operationally, the resilience approach is applicable for designing resilience, within and through the whole of organizations, communities and public policy, by looking at issues, resources or relevant systems in the context of at least four lenses, e.g. “Linkage”, “Temporal,” “Process” and “Scale” points of views(Shimizu & Clark, 2019).

The resilience approach is critical for addressing Sustainable Development Goals (SDGs) which covers a holistic challenge for human, social and natural systems with complexity and uncertainty. This kind of challenge cannot be addressed separately or through ad-hoc efforts, but requires transforming our human and social ways especially because humans have driven pervasive decline of life on Earth as mentioned in the above. While SDGs list all kinds of human, social and natural systems-related challenges whose holistic picture is critical especially because multiple issues for SDGs are interlinked, the operational approach which can address complex issues systemically and operationally is not provided in the SDGs. For this, the resilience approach can contribute to the operational aspects.

Especially since the resilience approach brings about the nexus views of human, social and natural systems, the views can result in raising public engagement level or creating “commons” at different scales and levels. For example, the author has designed to implement some educational programs or projects by using the resilience approach, such as ” Creating Kyoto Commons: Forests and Resilience toward Sustainability” which was designed to support Kyoto Resilient City (Kyoto City was chosen as one of among 100 resilient cities by the Rockefeller Foundation in 2017) with two-full day sessions. The sessions combined lectures, field work in forests and collaborative works for graduate students across

©2020. Japan Geoscience Union. All Right Reserved.

different schools within Kyoto University, with the major goal of promoting systems views of or capacities for human, social and natural systems for sustainability challenges in SDGs. Although the example event was a small project, the questionnaires for the participants revealed the event influenced their mindsets and views to raise their engagement level in facing the challenges.

As such, the author will present with the focus on 1) what is resilience approach, 2) how the approach can be (or has been) practically linked with public engagement or creating “commons”, and 3) how the approach linked with public engagement or commons can be a pathway for overcoming sustainability challenges to advance policy, research and education for SDGs.

Keywords: Resilience, Sustainable Society, Public Engagement, SDGs, Commons

Japanese Activity in collaboration with the international ocean literacy survey

*Hiroshi Ichikawa[1], Noriko Imamiya[2], Akiko Tsuzuki[2], Geraldine Fauville[3], Craig Strang[4]

1. Ocean Literacy and Education Panel, Oceanographic Society of Japan, 2. Marine Learning Center, 3. Stanford University, 4. University of California, Berkeley

The ocean plays important roles not only in the global climate system but also in the global material cycling through biogeochemical processes, and has close relationships with the daily lives of people through fisheries, marine energy and resources, ocean transportation, marine sports, ocean relaxation activities, and others. The Ocean Literacy movement began in the U.S. in the early 2000s, and has recently become international as shown by the Ocean Literacy Portal website operated by IOC/UNESCO. In Japan, the present national standard course of study at elementary school has not given any room for ocean education while the Oceanographic Society of Japan (JOS) and 34 other academic societies/committees gave a proposal entitled, “On the Setting up of a class named, ‘the role of Ocean’ in the national standard course of study for the 4th grade students in the elementary science education” to the Ministry of Education, Culture, Sports, Science and Technology (MEXT) in April 2016. In the U.S., aiming to serve as a community-based measurement tool that allows the comparison of levels of ocean knowledge across time and location, the International Ocean Literacy Survey (IOLS) project has been started since 2015. Fauville et al. (2018, https://doi.org/10.1080/13504622.2018.1440381) published the results from IOLS Version 2, and the English version IOLS Version 4 was finalized after reviewing the English IOLS Version 3 by IOLS Advisory Board consisting of international marine researchers, communicators, teachers, and psychometricians. The English version of the IOLS Version 4 was translated into 14 languages (Catalan, Chilean, Dutch, Greek, Italian, Japanese, Korean, Polish, Portuguese, Simplified Chinese, Spanish, Tagalog, Thai, and Traditional Chinese) and its field testing was conducted during February and March 2019 with nominal 6945 participants worldwide including nominal 567 participants from Japan. In collaboration with IOLS Version 4 field testing, JOS and the Marine Learning Center took part in correcting the original Japanese draft of IOLS Version 4, sponsored IOLS Version 4 field testing, and made a wide campaign to high-school teachers through sending recommendation letters to academic societies and other ocean-related organizations.

Digital story-telling and video briefs as an approach to enhanced international collaboration and impact

*Brendan Francis Dominic Barrett[1]

1. Osaka University

Universities generate knowledge through qualitative and quantitative methods. This is shared with society primarily via scholarly articles in academic journals. Performative approaches (modelling experience through aesthetic and feeling) are an important part of creative practice in the arts. These two spheres tend to maintain a respectful distance. This presentation will share insights from close to a decade of experience by a small team trying to work across boundaries in an effort to communicate science via creative writing in an online magazine and video briefs (short 5-6 minute documentaries on scientific research generally in the field). The goal was to “create for impact” and to develop an extensive network of international collaborators involved in content production and dissemination. This was not without significant challenges, but it did reveal much broader realms of possibility for effective research communication than originally envisaged.

Keywords: digital story-telling, documentary production, science communication

The International Geography Olympiad and Geography Education in Japan

*Yoshiyasu Ida[1]

1. Faculty of Human Sciences,University of Tsukuba

In Japan, the national curriculum was revised in 2018, and geogaraphy will be compulsory subject for high schools from 2022. Less than 50% of high school students had taken geigraphy for about 30 years in Japan. So it is hoped that high school geogarpy will be restored. The impact of the International Geography Olympiad(iGeo) is one of reasons why geography will be compulsory subject in high school in Japan. Traditional geogarphy education in Japan has focused on understanding the modern world, centered on regional geography and systematic geography. The geography education had been highly evaluated because all students acquire basic knowledge, but has been criticized as a memorable subject. The iGeo was one of the catalysts for curriculum change of school geogarphy in Japan.
In 2006, Japan launched an organization to participate in iGeo. The number of studentas participating in geography olympiad in Japan has increased. The quetions in iGeo test has been much different from those covered in geography education in Japan, following. At first, there are many questions for knowledge in Japan, but test of iGeo consist of quetions for logical thinking. Second, fieldwork test is much important in iGeo. Regarding fieldwork, it has been recommended in Japan, but the implementation rate is low. Third, the propotion of asking for phisical geography is high in iGeo. Because of difference of geography contents between iGeo and Japan, it is difficult for the Japanese team to rank high in iGeo test.
The major impact of iGeo on Japanese geography education is following; in new geography curriculum. the viewpoint, that is how to use geographical knowledge to think logically and consider about the future, is emphasis. The geography of new course of study in Japan incorporates theme learning and uses knowledge and skills to think logically, and aims at future-oriented geography. On the other hand, traditional processes of geography that is regional and systematic geography is emphasis on new curriculum. It is trying to built a new Japanese-style geography education.

Open Dialogue in Geoscience-based Policy Process: Linking Stakeholders and Researchers

*Hidenroi Nakamura[1]

1. Toyama Prefectural University

To realize sustainable and resilient societies, an effective way to manage the complexity and uncertainty in contemporary society and scientific knowldge is needed.This is also the case in the policy process that requires geoscientific knowldge. I argue that researchers could play significant roles in geoscience-based policy process that engages local stakeholders and general public. Their contribution to open dialogue in the policy process with stakeholder/public engagement deals with the constraints of positionality and scientific uncertainty. Two case studies in post-disaster Japan are presented. One is on three-year long capacity development of local volcano disaster resilience and governance in three prefectures in central Japan after Mt Ontake eruption in 2014. The other is on five-year long random-sampling citizen dialogue on geological disposal of nuclear waste in two prefectures in central Japan after Fukushima Dai-ichi nuclear power plant accident in 2011. In the former case, researchers functioned as producers, coordinators, and facilitators of capacity development, in collaboration with local government. In the latter case, researchers played a role of science interpreters with differing views, reflecting dialogue among citizens. These studies suggest that explicit treatment of pluralistic positions and views among stakeholders and researchers would be a key for quality learning and deliveration in geoscience-based policy process.

A few points to be considered when we engaging with a local community for research and practice for sustainability

*Fumiko Noguchi[1]

1. United Nations University

Local community-based and multi-stakeholder approach are considered as essential in a research and practice for achieving sustainable development. This is because governmental policies and conference declarations can create the frame but local community is the only place where we can actually work on and change the things (Fien and Tilbury 2002). Also, many sustainability challenges root in multiple causes, which even are complexly twined. Diversity is required in search for the solution at local community level. People from different fields, sectors, generations, cultural and socio-economic and educational backgrounds should participate in search for the solution of challenges. They share their knowledges and experiences in that process, so that they co-create a new knowledge for making their community sustainable.

Then, how can be multi-stakeholder participation realised truly –not in a tokenism way but in a really inclusive way where everyone, including, the marginalised, has ownership, is empowered and controls over the decision making process? And what role should we, researchers, take there? In my presentation, I would like to look at a few examples of local community practice and discuss the key factors to make community engagement successful and a potential epistemological pitfall of ‘participatory approach’ when everybody is fully believing that they are taking a participatory approach. Finally, I will propose a framework that can facilitate multi-stakeholder participation effectively for further discussion.

Keywords: Multistakeholder and participatory approach, Multiple knowledges and learnings, Epistemological gap

[U-14] Open Colloquium-NASA/JAXA: Planetary science on Mars driving current and future missions

convener:Shunichi Kamata(Faculty of Science, Hokkaido University), Go Murakami(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Mitchell D Schulte(NASA Headquarters), Michael S Kelley(NASA Headquarters), Chairperson:Shunichi Kamata(Faculty of Science, Hokkaido University), Chairperson:Go Murakami(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Chairperson:Mitchell D Schulte(NASA Headquarters), Chairperson:Michael S Kelley(NASA Headquarters)

Today a number of missions to Mars are ongoing or planned by NASA, JAXA, and their partners (Curiosity Rover, InSight, MMX, Mars2020, ExoMars, MRO, Odyssey, Mars Sample Return, etc.). Such missions and other activities are providing us with various kinds of and large amounts of high-quality data, revealing the present and past Mars. In this session, the new views of Mars based on recent missions as well as the scientific backgrounds that connects these missions are presented. Open discussion with speakers, participants, and science leads from NASA/JAXA will be included.

50 Years of Mars Exploration: Past and Ongoing NASA Missions Pave the Way for Determining Whether There Was Life on Mars

*John A Grant[1]

1. Smithsonian National Air and Space Museum, Center for Earth and Planetary Studies, Washington DC

NASA’s 50-plus years of Mars exploration has revealed a planet once more Earth-like and habitable than today. Nevertheless, the Mariner 4 flyby mission in 1965 and the subsequent Mariner 6 and 7 flybys in 1969 imaged mostly cratered surfaces. Mariner 9 entered orbit in 1971, studied the atmosphere and surface, and was the first mission to confirm the diversity of landforms that included volcanoes and channels.

The Viking missions provided the first truly global view of Mars starting in 1976 and included the landing of Viking 1 in Chryse Planitia and Viking 2 in Uptopia Planitia. The orbiters took ~50,000 images and both landers acquired/analyzed soil samples that provided important data on composition and the potential for life. The Viking 1 lander survived until 1982.

Formation of NASA’s Mars Exploration Program in 1993 led to focus on whether life ever arose on Mars, characterizing the planet’s climate and geology, and preparing for human exploration. The first program mission was the Mars Global Surveyor (MGS) orbiter arriving in 1997 and operating until 2006. MGS studied the atmosphere, surface, and interior, and science highlights include global maps of topography and mineralogy, images of gullies and fluvial deltas, and detection of magnetic surface anomalies. Mars Pathfinder and the Sojourner rover also arrived in 1997, demonstrated the feasibility of airbag landing and the value of surface mobility, and characterized rock sizes and textures consistent with water-lain flood deposits. Mars Odyssey arrived in orbit in 2001 and further mapped surface composition, discovered widespread deposits of mid and high latitude ice, and characterized the near-space radiation environment.

The Mars Exploration Rovers (MER) Spirit and Opportunity landed on Mars using airbags in early 2004, with Spirit operating until 2010 and Opportunity end of mission occurring in 2019. MER focused on understanding the geology and role of water in shaping the surface around the landing sites: Spirit was targeted to Gusev Crater, site of a possible former lake in a large impact crater, and Opportunity landed at Meridiani Planum, where orbital detection of hematite at the surface by Odyssey suggested past water activity. Both rovers found evidence of past environments where water was once active at and below the surface and that may have been habitable.

The Mars Reconnaissance Orbiter (MRO) arrived in 2006, enabling a new phase of global, detailed mapping of surface composition, surface morphology, and the atmosphere. MRO is ongoing and results range from mapping clay-rich deposits around Mawrth Vallis to identifying probable polar geysers to characterizing small, recurring slope lineae. The high spatial and spectral resolution of MRO data sets opened a new era of landing site studies crucial to the assessment and certification of the landing site in Gale crater for the Mars Science Laboratory (MSL) Curiosity rover.

MSL landed in 2012 using a “sky crane” system with goals that included understanding past Martian climate and geology and determining whether the landing site ever harbored habitable conditions. Major discoveries include discovery of complex organic molecules and characterization of deposits whose

©2020. Japan Geoscience Union. All Right Reserved.

chemistry and extent confirm the presence of a relatively long-lived lake and associated habitable conditions more than 3 Ga.
Other missions augment our understanding of the evolution of Mars: Phoenix landed in 2008 and explored high northern latitudes; Maven arrived in orbit in 2014 and continues to explore the upper atmosphere to understand climate evolution; and InSight landed in 2018 and is studying the deep interior of Mars. Odyssey, MRO, and Maven also provide data relay from MSL and InSight critical to increasing their science return. Collectively, these missions comprise an organized approach to Mars exploration that pave the way for future missions to cache and return samples and determine whether there was ever life on Mars.

MARS SAMPLE RETURN: A MISSION CAMPAIGN OF INTENSE SCIENTIFIC INTEREST

*David Beaty[1], Brandi L Carrier[1], Michael A Meyer[2], Elliot Sefton-Nash[3]

1. Jet Propulsion Laboratory/California Institute of Technology, 2. NASA Headquarters, 3. ESA ESTEC

Introduction. The transport to Earth of scientifically selected samples from Mars is of compelling scientific interest. This has led to the formulation of the MSR Campaign, which is planned to be carried out by means of a NASA-ESA partnership. This campaign, as it is currently envisioned, would result in the collection of martian samples by NASA's 2020 rover, and their return to Earth as early as 2031.

Technical. Several developments surrounding Mars Sample Return (MSR) have taken place over the past decade or so that have caused the scientific interest in martian samples to increase:
Advances in the study of martian meteorites. As the number of martian meteorites has now grown to well over 100, it has become apparent that of the types of samples which survive the ejection process and the absence of sample context will continue to constrain the insights that may be obtained using this pathway. New mission results from Mars. Fabulous new results have been obtained by the in-situ exploration program (of particular note, MSL and the expected results to come from ExoMars and M2020). These results have served to reinforce the additional value that would come from narrowing the spatial focus, and widening the diversity of instrumentation, both of which would happen by making Mars samples available to terrestrial laboratories. Human exploration. We have a greatly improved understanding of the ways in which the risks, performance, and cost of putting humans on Mars can be improved by acquiring advance information—especially sample-related information. Astrobiology. Although the search for extra-terrestrial life has been key driver of Mars exploration, we now have a much better understanding of the potential for preservation in the geologic record, the evolution of Mars as a planetary object, and (by means of the study of biochemistry on Earth) the details of biological processes. This allows for far more effective search strategies. Instrument developments. We are seeing unprecedented improvements in our collective ability to prepare and analyze very small samples in Earth laboratories. Highly visible examples are the work on Hayabusa asteroid samples (JAXA) and the Stardust comet samples (NASA). Engineering developments. Over the past decade there have been substantial improvements in the capability of the world's space agencies to acquire and preserve samples (most notably, the M-2020 sampling system), the development of the Mars Ascent Vehicle, and critical progress in breaking the chain of contact with Mars.

As recently summarized as the technical conclusion of the 2018 2nd International MSR Conference:

The scientific exploration of Mars and the search for extra-terrestrial life have advanced to the point Mars exploration. Capitalising on major engineering progress in recent years by the world's space agencies and industries, we are technically ready to start the development of the flight missions associated with retrieving the samples. In parallel, planning for the potential receipt and evaluation of the samples has started, and should accelerate, as well as for the processes associated with making the samples available to the world's science community. Given the nature and scope of the Mars Sample Return campaign, we expect that engaging the public early and keeping them involved throughout will be a particularly important component of this effort. We have the opportunity and the motivation to make the Mars Sample Return campaign an international endeavour and a reality for all humankind.

JAXA’s Strategic Mars Exploration Program (JSMEP) for Understanding Origin, Evolution, Inventory of Water on Mars

*Tomohiro Usui[1]

1. Japan Aerospace Exploration Agency

The Mars-moon system is a promising target for exploration in the broad field of planetary science: e.g., geology, geochemistry, astrobiology, and comparative planetology. The international Mars science community has set a long-term goal toward achieving Mars sample return (MSR) and human exploration. MSR will address questions on the origin (e.g., source of building blocks), interior evolution (e.g., crust-mantle differentiation and mantle dynamics), the potential biological history (e.g., nature and extent of habitability and preservation of biosignature), and geologic history of Mars with an emphasis on the role of water. Previous Mars exploration missions have provided compelling evidence for the presence of liquid water during the earliest geologic era (Noachian: >~3.9 Ga) of Mars. Observations of dense valley networks, evaporites (e.g., gypsum) and hydrous minerals (e.g., clays) that are commonly formed by aqueous processes imply that, at some time in the past, Mars had an Earth-like active hydrological cycle with lakes, oceans, possibly also aquifers and groundwater, and had the potential for life.

According to the international trend for Mars exploration and potential significance for understanding the current and past surface/subsurface aqueous environments, JAXA plans a strategic Mars exploration program (JSMEP). JSMEP starts with a Martian moon’s sample return mission (MMX: Martian Moons Exploration) in 2024-2029, followed by a Mars orbiter (MO) in later 2020s and a Mars lander/rover (ML/R) mission in early 2030s. JSMEP’s goals are 1) to address questions of water on Mars [origin and delivery (MMX), distribution and inventory (MO), and chemical evolution (ML/R)], 2) to ensure expansion of the areas of human activities by exploring habitable subsurface world, and 3) to acquires key technologies including EDL (entry-descent-landing) with aerodynamic control, drilling and sampling on the surface, deep space telecommunication, transportation to/from the Mars orbit, and planetary protection.

[U-16] OC:Research Advances in Recent Disaster Studies Using Remote Sensing and Computational Methodologies

convener:Jun Matsumoto(Deaprtment of Geography, Tokyo Metropolitan University), Guido Cervone(Pennsylvania State University Main Campus), Chairperson:Jun Matsumoto(Deaprtment of Geography, Tokyo Metropolitan University), Chairperson:Guido Cervone(Pennsylvania State University Main Campus)

Every year, environmental hazards pose a constant threat to the development and sustainment of our civilization. A single catastrophic event can claim thousands of lives, cause damages for billions of dollars, and destroy natural landmarks. Such potential catastrophic consequences are due to the emergence of megacities, nuclear power plants and nuclear waste storage, and other facilities whose destruction pose an unacceptable risk of global reach.

In recent years, the advances in our ability to observe the Earth and its environment through the use of air, space and ground based sensors has led to the generation of large dynamic, and geographically distributed data. The rate at which geospatial data are being generated exceeds our ability to organize and analyze. New challenges arise from an unprecedented access to massive amounts of Earth science data that can be used to study the complementary nature of different parameters. These developments are quickly leading towards a data-rich but knowledge-poor environment.

This session focuses on the use of remote sensing and data mining techniques to study recent natural hazards, including but not limited to recent earthquakes, hydro-meteorological events, floods, landslides, tsunamis. Of particular interest are contributions that discuss the analysis of large data using novel methodologies. This session will be offered using the hyperwall. Only invited talks are allowed for oral presentations, but we welcome a wide ranges of poster presentations.

Discussion

Expanded Dimensionality Image Spectroscopy Via Machine Learning

*Guido Cervone[1], Mark Salvador, Fangcao Xu[1]

1. Pennsylvania State University Main Campus

The general goal of hyperspectral image analysis is to identify with confidence surface solid materials, liquids, or atmospheric gases. The current state-of-the science approach to hyperspectral imagery collection and exploitation is based on physics and engineering for the development and building of the sensors, and data science for the analysis of the data collected by the sensors. The algorithms and tools used to analyze the very large data collected were developed primarily in the early 1990s, and continues to pervade both operational and research and development.

These concepts and solutions have demonstrated operational success and their methods are ensconced in existing algorithms and software. While these existing solutions are based on sound physics, mathematics, and statistics, they lag behind the revolution in computational power, artificial intelligence, and agile sensors and platforms. Most importantly, they have been shown to fail under varied environmental conditions, obscuration, and target material conditions. Many simplifying assumptions are made in this process and it can be said that today's analysis is effective in performing material identification in optimal collection conditions. It can also be said that in non-optimal conditions, cloudy scenes, shadows, intimate mixtures of materials, liquid spills and residues, or any combination of the above, material identification of solids, liquids, or gases is ineffective, unrepeatable, or subject to unknown levels of uncertainty.

New spectral imagers are being integrated in or on agile collection platforms, such as gimbals, and they are becoming popular in unmanned aerial systems (UAS). This overcomes the fixed nadir looking geometries of past instruments. In addition to imaging a particular scene location, the agile sensor can also image the background and the atmosphere to improve the overall accuracy of the target classification. Additionally, while the previous generation of sensors have a scene revisit time of minutes to days, the current generation, and even more so the next, have a scene revisit time of as little as a few seconds. The ability of collecting rapid sequences of hyperspectral scans under different angles provides an unprecedented dataset. It is theoretically possible to advance the state of the science by developing a more complete and accurate solution by analyzing multiple hyperspectral images simultaneously.

We propose an expansion of the radiance equation to take advantage of multiple hyperspectral images and a solution of this expansion via Deep Learning. The characterization of the components of the radiance equation via the expansion would drive future hyperspectral sensor performance requirements and concepts of operations. The expansion and solution would enable identification of target materials in scenarios and environments that no current or planned hyperspectral image exploitation system is capable of.

At the basis of hyperspectral imaging is the fundamental radiance equation defining the reflective and emissive spectral radiance components of the image scene and its 3-dimensional surroundings. Current

©2020. Japan Geoscience Union. All Right Reserved.

state of the science algorithms and tools analyze each hyperspectral image individually via a simplification of the radiance equation into a single spatial dimension. This individual image analysis was driven primarily by the limits of sensors and collection platforms with optimal scene collection consisting of a nadir looking scan of the target area.

Keywords: remote sensing, target detection, machine learning

Detection of landslides and vegetation recovery from multitemporal UAV and satellite images

*Hitoshi SAITO[1,2], Shoichiro Uchiyama[2], Yuichi S. Hayakawa[3], Hiroyuki Obanawa[4]

1. Kanto Gakuin University, 2. National Research Institute for Earth Science and Disaster Resilience, 3. Hokkaido University, 4. National Agriculture and Food Research Organization

Heavy rainfall and earthquakes are major triggers of landslides. Recently, unmanned aerial vehicles (UAVs) have attracted great interest for use in the creation of high-resolution images for geoscientific studies. This study used this technique to examine the topographic characteristics of coseismic- and rainfall-induced landslides at the Aso volcano in Japan. The study area has frequently experienced coseismic- and rainfall-induced landslide events, such as those in 1990, 2001, 2012, and 2016. The study area is characterized by the typical grassy vegetation landscape of the region. Vegetation recovery at the landslide sites was also monitored using multitemporal UAV and satellite images. We obtained orthorectified images and digital surface models with a spatial resolution of 0.06 m based on UAV surveys conducted between 2014 and 2020. These high-spatial-resolution images show that the coseismic landslides, many of which were initiated near topographic ridges, were typically located on the upside hillslopes of the previous rainfall-induced landslide scars. The UAV and satellite images revealed strong vegetation recovery at both the rainfall-induced and the coseismic landslide sites. However, site-specific vegetation recovery was determined primarily by topographic parameters, such as slope angle and direction at the local scale.

Next-generation alerting system for natural disasters using ground network and micro-satellites

*Yukihiro Takahashi[1,2], Mitsuteru Sato[1,2], Hisayuki Kubota[1,2], Kozo Yamashita[3], Tetsuro Ishida[1,2]

1. Department of Cosmosciences, Graduate School of Science, Hokkaido University, 2. Faculty of Science, Hokkaido University, 3. Faculty of Engineering, Ashikaga University

It is not easy to predict the intensity and location of extreme weathers, such like torrential rainfall by individual thunderstorm or typhoon since low resolution and less coverage of the existing observational methods. We have been developing an observation system for extreme weather monitoring using of 50-kg micro-satellites and with ground network consisting of automated weather stations with ground-based lightning sensor in the projects of a SATREPS “ULAT” and e-ASIA under international cooperation among Japan, Philippines, Indonesia and other SE-Asian countries supported by JST, JICA, PHL-Microsat and other fundings.

We are installing totally 60 AWS stations with lightning sensor over nation-wide of Philippines and concentrating Metro Manila. We operate micro-satellites developed and controlled by our group in order to capture the 3 dimensional structure of the thunderstorms or clouds in typhoon eye by the on-demand operation of 50-kg micro-satellites, including the Philippine-developed satellites, based on real time weather data obtained by the ground based networks and other satellite imaging. Here we show the future strategy of the alerting system for the extreme weathers and other kinds of natural disasters.

The Rise of the Crowd: An Assessment of Crowdsourced Data during Disasters

*Carolynne Hultquist[1]

1. Columbia University

Crowdsourcing is not new, but the scale of environmental monitoring activities is unprecedented due to technological advancements. Innovative technological applications enable the crowdsourcing of massive datasets in short periods of time under difficult disaster conditions. Crowdsourcing methods can prove useful during disasters when the content is confirmed to be of good quality and there is access to streaming sources in real-time. Crowdsourced data from established projects are proven to quantitatively align with environmental measurements from traditional collections and provide timelier information during disaster. Data from individuals may be used in aggregation for decision-making by the public, humanitarian organizations, and government institutions during disasters. However, there is no guarantee that these projects will be active during disasters or provide data where and when information is most needed to improve situational awareness. In addition, it is potentially problematic if vulnerable populations are unaware of this resource or unable to contribute. Crowdsourced data are already used in formal scientific studies, yet further assessment of the availability and usefulness of the data are needed within disaster contexts. Crowdsourced data can provide beneficial content for decision-making when used alongside traditional datasets with an awareness of constraints given data collection and an evaluation of limitations.

[U-17] Open Colloquium: What will we expect from Ryugu and Bennu samples?

convener:Satoshi Kasahara(The university of Tokyo), Aki Takigawa(Department of Earth and Planetary Science, The University of Tokyo)

JAXA's Hayabusa2 and NASA's OSIRIS-REx have been exploring near-Earth carbonaceous asteroids Ryugu and Bennu, and the surface samples will be delivered to the Earth in 2020 and 2023. The returned samples are expected to provide us with copious information on the origin and evolution of the Solar System. We will discuss what we have learned from the asteroids so far and what we expect to know from the samples.

[U17-01] What will we expect from Ryugu and Bennu samples?

*Shogo Tachibana[1,2], Harold C. Connolly Jr.[3] (1.UTokyo Organization for Planetary and Space Science, University of Tokyo , 2.Institute of Space and Astronautical Science, 3.Department of Geology, School of Earth and Environment, Rowan University)

[U17-02] Open discussion: What we expect from Ryugu and Bennu samples

*Satoshi Kasahara[1], Aki Takigawa[2], Shogo Tachibana[1,3], Harold C. Connolly Jr.[4] (1.The university of Tokyo, 2.Kyoto University, 3.Institute of Space and Astronautical Science, 4.Rowan University)

What will we expect from Ryugu and Bennu samples?

JAXA's Hayabusa2 and NASA's OSIRIS-REx are the sample return missions from near-Earth carbonaceous asteroids Ryugu and Bennu, and the surface samples will be delivered to the Earth in 2020 and 2023. Both Ryugu and Bennu are expected to be pristine asteroids that records the origin and early evolution of the Solar System. Hayabusa2 explored near-Earth C-type asteroid Ryugu for 17 months (June 2018–November 2019) including two landing operations for sample collection and is now on the way back home. OSIRIS-Rex has been investigating near-Earth B-type asteroid Bennu since its arrival in December 2018. The spacecraft will make a touch-and-go landing operation for sample collection in August 2020.

Hayabusa2 and OSIRIS-Rex found that both Ryugu and Bennu are dark rubble pile bodies with spinning top shapes. The two asteroids have an almost identical bulk density of 1.19 g/cm3, and their macro porosities are ~50 % assuming they consist of carbonaceous chondrite-like materials. Both asteroids have hydrated silicates at the surfaces although Ryugu likely has less abundant hydrous phases than Bennu, a hypothesis that we will test through analysis of the returned samples.

In the open colloquium, we will review what the spacecrafts found at Ryugu and Bennu especially from the cosmochemical point of view, discuss the similarities and differences between two, and discuss with the audience our expectations of what will learn from Ryugu and Bennu samples after Earth return.

Discussion

Seasonally dependent impact of cloud longwave scattering on the polar climate: why it is a necessity in polar climate modeling?

*Xianglei Huang[1], Yi-Hsuan Chen[1], Ping Yang[2], Chia-Pang Kuo[3], Xiuhong Chen[1]

1. Univ. Michigan Ann Arbor, 2. Texas A&M Univ., 3. Florida State Univ.

The importance of cloud-radiation interactions is well known. Most climate models assume non-scattering clouds in the longwave (LW) because LW scattering is considered negligible compared to strong LW absorption by clouds and greenhouse gases. Here we show that neglecting LW scattering is reasonable for simulations forced by observed sea surface temperature (SST) and sea ice (prescribed SST) and for the simulated extra-polar climate, but is invalid for simulated polar climate when the SST and sea ice are also simulated by the model. The traditional wisdom to ignore LW scattering can be well justified in the tropics and mid-latitudes, but it breaks down in the high-latitudes due to much less water vapor in the atmosphere. As a result, cloud LW scattering is non-negligible anymore. Furthermore, the cloud LW scattering increases downward LW radiation, warming the surface and then further warming and moistening the atmosphere. A prescribed SST run does not allow such ocean-atmosphere LW coupling, another issue that has been overlooked in traditional radiation scheme development. We incorporated a hybrid 4-stream and 2-stream scheme into the NCAR CESM model to handle the ice cloud longwave scattering. Using coupled simulations, we show that warming from LW scattering, especially in the far IR, is largest over the polar winter and can increase winter surface air temperature by 0.8-1.8K in the Arctic and 1.3-1.9K in the Antarctic. Climate models need to include cloud LW scattering to properly simulate polar climate. It is a necessity to have cloud LW scattering for faithfully representing the radiative coupling between atmosphere and surface in the polar regions.

Overview of OMIX project “Ocean mixing processes: impact on biogeochemistry, climate and ecosystems”

*Ichiro Yasuda[1]

1. Atmosphere and Ocean Research Institute, The University of Tokyo

Overview is presented for the project ‘Ocean mixing processes: impact on biogeochemistry, climate and ecosystem (OMIX) from July 2015 to Mar. 2020’.A new turbulence observing system using fast response thermistors (attached to CTD etc.) was developed and contributed to widen microstructure measurements which showed basin-scale surface-bottom turbulence distribution in the western North Pacific. New data, theories and mixing data-assimilation system helped to revise the model turbulence fields of OGCM which reproduced radiocarbon distribution and deep circulation in the North Pacific. Large numbers of in-situ mixing and biogeochemical observations and modelling lead to findings such that enhanced tide-induced turbulence in the subarctic north Pacific especially in the Kuril and Aleutian passes lift up nutrients such as silicate and iron from deep to intermediate waters strengthens biological production with the iron input from the Okhotsk Sea. This silicate- and iron-rich North Pacific Intermediate Water (NPIW) is transported to subtropical waters and to the Kuroshio where several turbulence hot-spots were found in the Kuroshio which flows through the straits and islands (Tokara Str., Taiwan Str. and Izu-ridge) with also enhanced tide-induced turbulence. These turbulent nutrient supply from NPIW changes the Kuroshio view from oligotrophic to productive area where turbulent nutrient flux sustains various kinds of fish in spawning and nursery grounds. Life history of *chub mackerel*, one of the Kuroshio spawning fish, is elucidated by newly developed microscale otolith stable isotope analysis; better growing juvenile tend to migrate cool and food-abundant Oyashio water. The possibility of tide-induced 18.6-year period ocean and climate variability was examined by new mixing scheme and high-resolution models. Such newly spawning mixing science will be discussed.

Meteorological Research Institute, Japan Meteorological Agency, 5. School of Science, Hokkaido University, 6. Meisei Electric Co. Ltd.

A typhoon often brings about severe disaster by strong winds and heavy rainfall in East Asia, thus accurate prediction of typhoon track and intensity is a social requirement. By recent efforts of meteorological agencies, prediction of typhoon tracks has been improved steadily. However, that of typhoon intensity has not been improved for last few decades. Furthermore, the historical data of typhoon (best track data) have large uncertainty between the Joint Typhoon Warning Center (JTWC) and Japan Meteorological Agency (JMA) after the US aircraft reconnaissance of typhoons was terminated in 1987. To improve estimations and forecasts of typhoon intensity as well as its track, we conduct the Tropical cyclone-Pacific Asian Research Campaign for Improvement of Intensity estimations/forecasts (T-PARCII) project.
We utilized a commercial jet aircraft Gulfstream-II (G-II) of Diamond Air Service (DAS). In 2017, we penetrated 3 times into the inner core region (eye) of the intense typhoon Lan (T201721). In 2018, we penetrated 6 time into the eye of the intense typhoon Trami (T201824). Total 9 times penetration into the eye safely without severe turbulence and approximately 90 times dropsonde observations are conducted at the center of the eye and its surrounding region from a height of 13.8 km. Central pressure of typhoons is observed by dropsondes and compared with the estimated value by the JMA (Dovolak method). In the case of the Lan, the observed central pressure slightly increases from 926 hPa on October 21 to 928 hPa on 22. On the other hand, the JMA best-track data indicated that the central pressure decreases from 935 hPa on October 21 to 915 hPa on 22. The observations also shows a significant double warm core structure in the eye. In the case of the Trami, significant weakening of its intensity from September 25 to 26 with a large change of eye diameter from 60 km to 200 km. The thermodynamic structure in the eye of the Trami is quite different from that of the Lan.

[P-PS01] Outer Solar System Exploration Today, and Tomorrow

convener:Jun Kimura(Osaka University), Kunio M. Sayanagi(Hampton University), Fuminori Tsuchiya(Planetary Plasma and Atmospheric Research Center, Graduate School of Science, Tohoku University), Steven Douglas Vance(NASA Jet Propulsion Laboratory, California Institute of Technology)

The giant planets provide many keys to understanding planetary processes. They play an important role in shaping our solar system, and the physical and chemical processes they harbor also provide a unique opportunity to study the phenomena relevant for studying Earth and other planets, including exoplanetary systems. In this session, we discuss a wide range of topics encompassing the giant planets and their moons, including their origins, interiors, atmospheres, compositions, surface features, and electromagnetic fields. To advocate for current and future outer planets exploration (Juno, New Horizons, JUICE, Europa Clipper, Dragonfly and beyond), we also call for discussions on future missions to explore giant planet systems, including how to develop better international cooperation. Discussion in this latter category will include progress in developing a solar sail mission concept for observing the Jupiter system and its trojan asteroids.

The volcanic activity on the Io satellite and the associated outgassing into the Jupiter’s magnetosphere fluctuate dynamically. The fluctuations of plasma densities inside the Io plasma torus (IPT) associated with the volcanic activities on Io were indicated by the spectroscopic observation by the Hisaki satellite. If the supply of plasma from Io increases, the plasma mass-loading enhances, and the magnetospheric dynamics is expected to be affected. The time continuity of the Hisaki observation made it possible to explore the sequence of magnetospheric dynamics from the activation of volcanoes to the recovery for the first time. In this study, we apply the analysis method called plasma diagnosis to the spectroscopic data obtained by Hisaki with the widest slit (140 arc seconds slit). The time variation of plasma densities and temperature has been determined from December 2013 to April 2014, from November 2014 to May 2015, from January 2016 to March 2016, from May 2016 to August 2016, and from November 2016 to December 2016. During the above periods, four significant events of volcanic activation occurred. In each event, there was a common tendency that the density of hot electrons (several hundreds of eV) increased several tens of days after the core electron density increased. The hot electron density can be considered as a tracer for the radial inward transport of magnetic flux tubes. This is because the timescale for thermal relaxation of the hot electrons is at most several days and the outer region is more abundant in the hot electrons. This study revealed the following three facts about the time variation of the hot electron density. Firstly, the radial distribution of mass density showed that the interchange motion of flux tubes inside the IPT subsided before the hot electron density started to increase. This indicates that the cause of the increase in the hot electron density exists in the outside region of the IPT. Secondly, it was found that the timescale from the start of the activation of the volcano to the rise of the hot electron density was 20-30 days at any event. Finally, the hot electron density on the dusk side was higher than that on the dawn side at least with two events of volcanic activation. This suggests that the radial inward transport of flux tubes might reach the dusk side more easily than the dawn side. In this presentation, the dynamics in Jupiter’s magnetosphere will be discussed by using the above findings.

Identifying the particle responsible for energy supply during the IPT brightening event.

*Seiya Nishimura[1], Fumiharu Suzuki[1], Kazuo Yoshioka[1], Reina Hikida[1], Hidetaka Kuniyoshi[1], Fuminori Tsuchiya[3], Go Murakami[2], Ichiro Yoshikawa[1]

1. The university of tokyo, 2. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 3. Planetary Plasma and Atmospheric Research Center, Graduate School of Science, Tohoku University

HISAKI spacecraft witnessed sudden brightenings of the Io plasma torus (IPT) in EUV spectral range not only for volcanic active period of Io but also for quiet times. Yoshikawa et al., 2016 has reported that the IPT brightens about 10 hours after the auroral brightening event which indicates radially inward energy transport. We have measured the relaxation time of the brightenings appearing between 2013 and 2016. We have also calculated the characteristic time for Coulomb collision with test particles (*e-,H+,S+)* in background plasma of IPT condition. By comparing the relaxation time of the brightenings to the characteristic time scale for Coulomb collision, we have determined that electrons supply energy during the brightening events. We also found that ions, which should be transporting to the IPT with electrons, should supply energy but with its low energy supply rate, it could not be observed as brightening.

Origin of delayed rotational periodicity in the inner magnetosphere of Jupiter

*Fuminori Tsuchiya[1], Hiroaki Misawa[1], Masato Kagitani[1], Ryoichi Koga[1], Reina Hikida[2], Kazuo Yoshioka[2], Nick Schneider[5], Peter A Delamere[6], Fran Bagenal[5], Andrew Steffl[4], Tomoki Kimura[1], Yasumasa Kasaba[1], Go Murakami[3], Ichiro Yoshikawa[2], Atsushi Yamazaki[3]

1. Tohoku University, 2. The University of Tokyo, 3. ISAS/JAXA, 4. SwRI, 5. University of Colorado, 6. University of Alaska Fairbanks

Periodic signature of electromagnetic waves from planets has been used to determine planetary rotation period. In the case of Jupiter, four periodicities have been known so far: System I, II, III, and IV periods. System I and II are related with zonal circulations of the atmosphere and System III shows the intrinsic planet rotation period and determined from periodicity of Jovian auroral radio emission. Only the origin of System IV is unknown but it has been found in periodic variation in plasmas in the inner magnetosphere and is a few % delayed from System III, suggesting that the System IV frame is subcorotating around Jupiter. Here, we resolved the origin of the subcorotation by using spatially resolved extreme ultraviolet (EUV) spectrograph onboard the Hisaki satellite. Hisaki observed emission lines from sulfur and oxygen ions which are products of volcanic gases from the satellite Io and provides plasma parameters such as ion composition and electron temperature from the spectral analysis. We found that the plasma parameters showed periodic variation whose periodicity was delayed from System III and the delay depended on the radial distance from Jupiter. The delay was most significant around the radial distance of Io, which is consistent with mass-loading of plasma from neutral cloud distributed along Io’ s orbit. Hisaki also found change in the delay profile after eruptions of Io’ s volcanos. The delay became small around the Io’ s orbit where enhanced mass-loading was expected during the eruption. The change is not consistent with a previous theoretical prediction and updates of the magnetosphere-ionosphere coupling model may be required to resolve this new issue.

Observations of tenuous atmospheres and plumes at the icy Galilean moons: HST and future missions

*Lorenz Roth[1]

1. KTH Royal Institute of Technology, Stockholm, Sweden

In this presentation, we review the UV observations by the Hubble Space Telescope (HST) of the tenuous atmospheres of Jupiter's large icy moons. The detections of the O_2 atmospheres at Europa and Ganymede through auroral emissions and at Callisto through photo-electron emissions are discussed and compared. In addition to the O_2 atmospheres, HST discovered atomic hydrogen coronae at all three moons and measured localized H and O atomic emissions at Europa, interpreted as first evidence for the existence of plumes. At the end, we give an overview on future measurements of the icy moon atmospheres by ESAs JUpiter Icy Moon Explorer (JUICE) and NASAs Europa Clipper mission, with focus on the UVS instruments.

Performance, Operation and their Feasibilities for Jupiter and Icy Moons: High Frequency Receiver of Radio & Plasma Wave Investigation (RPWI) aboard JUICE

*Yasumasa Kasaba[1], Hiroaki Misawa[1], Fuminori Tsuchiya[1], Tomoki Kimura[1], Hajime Kita[3], Atsushi Kumamoto[1], Yuto Katoh[1], Yoshizumi Miyoshi[4], Yoshiya Kasahara[5], Satoshi Yagitani[4], Hirotsugu Kojima[8], Baptiste Cecconi[2], Lukas Wiśniewski[6], Walter Puccio[7], Jan Bergman[7], Jan-Erik Wahlund[7]

1. Tohoku University, 2. Observatoire de Paris, 3. Japan Aerospace Exploration Agency, 4. Nagoya University, 5. Kanazawa University, 6. Astronika, 7. IRF Uppsala, 8. Kyoto University

We are now at the final stage of the development of PFM/FM of Radio & Plasma Wave Investigation (RPWI) aboard the ESA JUICE mission, toward the luanch in 2022. RPWI provides an elaborate suite for electromagnetic fields and plasma environment around Jupiter and icy moons, with 4 Langmuir probes (LP-PWI; 3-axis E-field -1.6 MHz, and cold plasmas), a search coil magnetometer (SCM; 3-axis B-field -20 kHz), and a tri-dipole antenna system (RWI; 3-axis E-field 0.08-45 MHz, 2.5-m tip-to-tip length).

RWI with High Frequency (HF) Receiver have enough sensitivity reaching the galactic background for the highly-resolved Jovian radio emissions from magnetosphere (aurora etc.), atmosphere (lightning), and icy moons. Its direction and polarization capabilities enable us to identify the source locations and characteristics. Their developments are under the collaboration of Japan, France, Poland and Sweden, based on the H/W and S/W designs of Kaguya-LRS, BepiColombo-PWI, Arase-PWE, and Cassini-RPWS. In this paper, we provide the performance and operation concepts with their feasibilities. These are now realistic and enable us to achieve the best performances and quiet environment with enough tolerance for wide temperature range around Venus-Jupiter and harsh plasma environment (charging & intense radiation).

The most difficult parts of the RPWI HF are the sensing of the ionospheres, surface, and subsurface of icy moons duirng the flyby operations and on the orbit around Ganymede. The ionospheres are remotely sensed by the occultation of Jovian radio signals, which has a capability to detect the highest ionopheric density in usual status and expected plume ejection events. The surface and subsurfaces are challenging topics. It is based on the passive subsurface radar (PSSR) concept which sounds the icy crusts of Galilean satellites by the reflections of Jovian radio emissions (HOM/DAM). For continuous and coherent waves, reflector information is determined by spectrum patterns caused by the interference among the direct wave, reflected one from surface, and scattered one by subsurface. For burst waves, the reflection component is determined by cross-correlation of the waveforms for msecs length. It is not easy to reach the top of subsurface ocean directly, because of the strong attenuation in the ice close to its melting temperature just close to the ocean region. However, we arelooking forward to see real data and support the subsurface studies executed by RIME (active radar sounder) and many other payload teams.

Keywords: Jupiter, JUICE, RPWI, Magnetosphere, Icy moons, Subsurface ocean

The giant planets provide many keys to understanding planetary processes. They play an important role in shaping our solar system, and the physical and chemical processes they harbor also provide a unique opportunity to study the phenomena relevant for studying Earth and other planets, including exoplanetary systems. In this session, we discuss a wide range of topics encompassing the giant planets and their moons, including their origins, interiors, atmospheres, compositions, surface features, and electromagnetic fields. To advocate for current and future outer planets exploration (Juno, New Horizons, JUICE, Europa Clipper, Dragonfly and beyond), we also call for discussions on future missions to explore giant planet systems, including how to develop better international cooperation. Discussion in this latter category will include progress in developing a solar sail mission concept for observing the Jupiter system and its trojan asteroids.

Uranus and Neptune are key to understand planets with hydrogen atmospheres

*Tristan Guillot[1,2]

1. Observatoire de la Cote d Azur, 2. JSPS/University of Tokyo

Uranus and Neptune are the last unexplored planets of the Solar System. I show that they hold crucial keys to understand the atmospheric dynamics and structure of planets with hydrogen atmospheres. Their atmospheres are active and storms are believed to be fueled by methane condensation which is both extremely abundant and occurs at low optical depth. This means that mapping temperature and methane abundance as a function of position and depth will inform us on how convection organizes in an atmosphere with no surface and condensates that are heavier than the surrounding air, a general feature of gas giants. Using this information will be essential to constrain the interior structure of Uranus and Neptune themselves, but also of Jupiter, Saturn and numerous exoplanets with hydrogen atmospheres. Owing to the spatial and temporal variability of these atmospheres, an orbiter is required. A probe would provide a reference profile to lift ambiguities inherent to remote observations. It would also measure abundances of noble gases which can be used to reconstruct the history of planet formation in the Solar System. Finally, mapping the planets' gravity and magnetic fields will be essential to constrain their global composition, structure and evolution. [see Guillot 2019, arXiv:1908.02092]

A Possible Formation Scenario of Saturn-Titan System

*Yuri Fujii[1], Masahiro Ogihara[2]

1. Institute for Advanced Research, Nagoya University, 2. Division of Science, National Astronomical Observatory of Japan

Satellite systems around gas giants that have only one large moon, such as Titan around Saturn, are known to be difficult to explain their formation processes. Relatively large moons are thought to form in gaseous circumplanetary disks. The orbits of moons are affected by the interaction between the disk gas, and thus, the final configuration of the system is determined when the disk has dissipated. According to previous N-body simulations, a system tend to have multiple moons or loses all the moons if a simple power-low disk is assumed.

We examine the orbital evolution of satellites in order to find a way to form a single-large-moon system. Because the direction and speed of the orbital migration depend on the properties of circumplanetary disks, we model dissipating circumplanetary disks with considering the effect of temperature structures. We calculate the orbital evolution of Titan-mass moons in the final evolution stage of various circumplanetary disks. We also perform *N*-body simulations of systems with initially multiple satellites to see whether single-moon systems form at the end.

We find that the radial slope of the temperature structure characterized by the dust opacity produces a patch of orbits where the Titan-mass satellites stop inward migration and even migrate outwards in a certain range of the viscosity. The patch assists satellites initially located in the outer orbits to remain in the disk, while others in the inner orbits are lost into the planet. We demonstrated for the first time that systems with only one large moon around giant planet can form. Our results suggest satellite formation was not very efficient in the outer radii of circumplanetary disks.

Variation in Titan’s polar sea distribution due to orbital forcing simulated by a sea balance model

*Tetsuya Tokano[1]

1. University of Cologne

Titan’s polar sea distribution is highly asymmetric about the equator in that most seas and lakes are found near the north pole, while the south polar region has only few lakes, among which Ontario Lacus. This hemispheric dichotomy in the polar sea distribution raised the question as to whether it may be a manifestation of the Croll-Milankovitch-type orbital forcing of Titan’s methane hydrological cycle, which would periodically reverse the hemispheric asymmetry in the polar sea distribution. This study investigates how the lake distribution in Ontario Basin near the south pole may have evolved over the past 45 kyr as a consequence of orbital forcing. The temporal variation in lake distribution is simulated by a lake balance model with meteorological output of a global climate model and considering the topography map measured by Cassini. The long-term variation in lake size is mainly caused by the temporal variation in precipitation rate rather than that in evaporation rate. The lake size of Ontario Lacus changes by a factor of approximately 2. In no epoch do the predicted area and volume of Ontario Lacus become nearly as large as the inferred paleosea in Ontario Basin or the observed present seas near the north pole. This implies that orbital forcing alone is not capable of reversing the hemispheric asymmetry in Titan’s polar sea distribution and a climate with substantially larger precipitation would have been necessary to explain the southern paleoseas.

Forced libration of Ganymede: including visco-elastic tidal deformations

*Shinichiro Kojima[1], Jun Kimura[1], Shunichi Kamata[2]

1. Department of Earth and Space Science, Graduate School of Science, Osaka University, 2. Department of Earth and Planetary Science, Faculty of Science, Hokkaido University

Most of solid bodies which are beyond Jupiter are covered by ice and therefore called icy bodies. Based on previous observations and theoretical works, some of these bodies are presumed to possess a subsurface ocean where extraterrestrial organism might exist.
Jovian moon Ganymede is one of these body and is the main target of a future Jovian exploration mission. A past exploration revealed that Ganymede has a small moment of inertia and an intrinsic magnetic field. These observational facts indicate that Ganymede has a fully differentiated interior composed of a metallic core at the center, rocky mantle, and the outermost ice shell. Although a magnetic observation by the past exploration indicates that the salty subsurface ocean exists within the shell, the existence of the ocean is still ambiguous. Therefore, this study uses libration as an alternative method for presuming the interior of Ganymede.
In recent years, a libration study for Ganymede has included an elastic tidal deformation. Consequently, the deformation strongly reduces a librational amplitude in the case with the ocean. On the other hand, the librational amplitude is comparable even in the case without the ocean. Their study concluded the amplitude cannot provide the information of the existence of the ocean. Although other study for Europa included the effect of viscosity, the viscosity profile in the ice shell of its model is considerably simplified, thus a refined model is needed.
In our study, we apply the refined interior model to calculate librational amplitudes and phase-lag including the amplitude and phase-lag of visco-elastic tidal deformations.
As a result, the librational amplitude reaches 110 m for a case with the ocean.
In contrast, the amplitude is up to 10 m for a case without the ocean. These contrasts provide the information of the existence of the ocean.
Also the librational phase-lag is useful to estimate a melting point viscosity at the bottom of the ice shell. These results will be examined in the next exploration mission named JUICE (JUpiter ICy moons Explorer).

CHARISMA: A space telescope for planetary science

*Cindy Young[1], Kunio M. Sayanagi[2], Michael Wong[3]

1. NASA Langley Research Center, 2. Hampton University, 3. University of California, Berkeley

The Caroline Herschel high-Angular Resolution In-Space assembled Multi-Aperture (*CHARISMA*) telescope is a future mission concept being advocated by the U.S. planetary science community. The telescope addresses the US National Academy Committee on Astrobiology and Planetary Science (CAPS)' s recommendation to study a large/medium-class dedicated space telescope for planetary science. The concept ensures that the high-resolution, high-sensitivity observations of the solar system in visible and UV wavelengths revolutionized by the Hubble Space Telescope will continue after its expected end in the near future. Scientific objectives critically dependent on UV capabilities include studies of exospheric and auroral emissions in planetary atmospheres and plumes. *CHARISMA* will have the greatest impacts on science objectives particularly sensitive to dynamically evolving phenomena with fine-scale structures in planetary rings, active plumes/volcanism, atmospheric energy/momentum transport, and aurora. *CHARISMA* will also revolutionize our understanding of time-dependent phenomena in our solar system currently not supported by programs (in operation or under implementation) intended to observe and visit new targets. The time-domain phenomena to be explored by *CHARISMA* include: interaction of planetary magnetospheres with the solar wind, Venus and giant planet atmospheric dynamics, icy satellite geologic activity and surface evolution, cometary evolution, and evolving ring phenomena. *CHARISMA* also enables a comprehensive survey of the spectral characterization of minor bodies across the solar system, which requires a large time allocation not supported by existing facilities.

CHARISMA' s 10-meter class aperture is enabled by advanced in-Space Assembly (iSA) technologies developed at NASA Langley Research Center (LaRC) and the in-space servicing technologies developed at NASA Goddard Space Flight Center (GSFC). The telescope will be robotically assembled in orbit and will adopt a sparse, distributed-aperture architecture, which is inherently modular in design and conducive to iSA. We will also examine the potential for future servicing and upgrades enabled by the iSA technologies. *CHARISMA* will take advantage of LaRC' s leading role in the Orbital Servicing, Assembly and Manufacturing (OSAM) efforts to perform a series of trade studies spanning a variety of variables. Our design will also utilize lessons from the on-going Astrophysics Decadal Mission Study of a future 20-meter in-Space Assembled Telescope (iSAT) that covers the same wavelength range as *CHARISMA* between FUV and NIR. *CHARISMA* will help mature the technologies identified by the iSAT final report to construct a 20-meter telescope. Thus, while serving as a fully functional, dedicated telescope for planetary science, *CHARISMA* also provides an early demonstration of key technologies needed for future astrophysics telescopes. The *CHARISMA* mission concept has excellent synergy with astrophysical facilities (e.g., JWST, ALMA and SKA). *CHARISMA* will be able to place planetary discoveries made by astrophysics assets in temporal context, and *CHARISMA* discoveries of time-dependent phenomena may trigger detailed observations using larger telescopes. *CHARISMA* will also support future missions to the Ice Giants, Ocean Worlds, and minor bodies across the solar system by placing the results of such targeted missions in the context of longer records of temporal activities and larger sample populations. The CHARISMA notional design, estimated cost, and science objectives will be presented.

Future ultraviolet observation for monitoring Europa and outer planetary systems

*Go Murakami[1], Fuminori Tsuchiya[2], Ryoichi Koga[2], Kazuo Yoshioka[3], Masato Kagitani[2], Tomoki Kimura[4], Atsushi Yamazaki[1], Yudai Suzuki[3], Hajime Kita[1], Masaki Kuwabara[1], Reina Hikida[3], Chihiro Tao[5], Yasumasa Kasaba[2], Ichiro Yoshikawa[3]

1. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2. Planetary Plasma and Atmospheric Research Center, Graduate School of Science, Tohoku University, 3. Graduate School of Frontier Sciences, The University of Tokyo, 4. Frontier Research Institute for Interdisciplinary Sciences, Tohoku University, 5. National Institute of Information and Communications Technology

Ultraviolet observation technique is one of the most powerful tools to investigate space environments of outer planets. Japan’s space telescope Hisaki performed long-term and continuous monitoring of Io plasma torus (IPT) in UV range. The temporal variation of IPT emissions observed by Hisaki showed Jupiter’s magnetospheric dynamics and Io’s volcanic activities. However, due to the low spatial resolution (17 arc-sec) and low sensitivity (effective area of 1-3 cm^2), many science topics are not covered. For example, Hisaki cannot observe Jupiter’s and Saturn’s moons themselves because they are too small. The UV spectroscope onboard Hubble Space Telescope (HST) detected signatures of Europa’s water plume. However, due to the difficulty of long-term and continuous monitoring of Europa by HST, the frequency, periodicity, and driving processes of the plume are still open questions. It is also difficult for NASA’s Europa Clipper mission and ESA’s JUICE mission which will explore Jovian system in late 2020s to perform continuous monitoring due to their capabilities with Europa flyby observations. In order to achieve such observations, we are studying a concept of future ultraviolet spectroscopy mission. The preliminary design shows a Cassegrain telescope with 0.6-1-m primary mirror which can achieve an effective area of 100-200 cm2 and spatial resolution of 0.1-0.2 arc-sec. The baseline instruments are a spectrometer for 115-230 nm range and a wide field-of-view (~9 arc-min) imager. Here we present the overview of our mission concept, science targets, preliminary design of the ultraviolet telescope and instruments, and future plans.

The Europa Clipper Mission: Investigating an Ocean World's Habitability

*Steven Douglas Vance[1], Robert T Pappalardo[1], David A Senske[1], Haje Korth[2], Kate Craft[2], Sam Howell[1], Rachel L Klima[2], Erin J Leonard[1], Cynthia B Phillips[1], Christina Richey[1]

Europa is believed to have a liquid ocean beneath its icy shell, abundant physical energy, and drivers for chemical disequilibrium. The *Europa Clipper* mission will conduct multiple fly-bys of Europa while orbiting Jupiter, with the overarching goal to explore this moon to investigate its habitability. This goal encompasses three Mission Objectives: *I. Characterize the ice shell and any subsurface water, including their heterogeneity, ocean properties, and the nature of surface-ice-ocean exchange; II. Understand the habitability of Europa's ocean through composition and chemistry; and III. Understand the formation of surface features, including sites of recent or current activity, and characterize high science interest localities.* The Europa Clipper addresses these with a capable payload of scientific instruments, plus gravity/radio and radiation science investigations.

NASA selected a payload consisting of both remote-sensing and in-situ-observing instruments. The remote-sensing instruments observe the wavelength range from ultraviolet through radar, which are the *Europa Ultraviolet Spectrograph (Europa-UVS)*, the *Europa Imaging System (EIS),* the *Mapping Imaging Spectrometer for Europa (MISE),* the *Europa Thermal Imaging System (E-THEMIS),* and the *Radar for Europa Assessment and Sounding: Ocean to Near-surface (REASON).* The *in-situ*-measuring particle instruments comprise the *Plasma Instrument for Magnetic Sounding (PIMS),* the *MAss Spectrometer for Planetary Exploration (MASPEX)*, and the *SUrface Dust Analyzer (SUDA)*. These investigations are complemented by the *Europa Clipper Magnetometer (ECM)*, which is a facility instrument contributed by NASA to measure magnetic fields. An additional gravity/radio science investigation can be achieved using the spacecraft's telecommunication system, combined with radar altimetry. Moreover, valuable scientific data could come from the spacecraft’s radiation monitoring system. Working together, the science instruments provide a synergistic framework to address key issues in assessing Europa’s habitability.

Geophysical and astrobiological perspectives for future spacecraft missions to Jovian icy moons

*Yasuhito Sekine[1], Shunichi Kamata[3], Shuya Tan[1], Shintaro Azuma[1], Ikuo Katayama[6], Yoshifumi Saito[2], Kazushi Asamura[2], Keigo Enya[2], Junichi Haruyama[2], Yasumasa Kasaba[4], YASUKO KASAI[5], Ayako Matsuoka[2]

1. Tokyo Institute of Technology, 2. JAXA, 3. Hokkaido University, 4. Tohoku University, 5. NICT, 6. Hiroshima University

Jovian icy moons, Europa, Ganymede, and Callisto, are key objects to understand both of the evolution of early Solar System and habitability beyond Earth. Geologically-inactive Callisto may preserve chemical information (e.g., isotopic compositions of volatiles) of building materials of the Jovian system, which is essential to constrain the formation temperature of proto-Jupiter in the protoplanetary disk. The interior structure is determined by its formation time in the circum-Jovian disk and, thereby, is essential to constrain the accretion rate of solid materials onto proto-Jupiter. Ganymede and Europa are believed to possess subsurface oceans beneath the icy shells. Given the sustainability of liquid water, habitability of these subsurface oceans largely relies on the availability of both reductants and oxidants. Reductants can be found in plume materials erupting from Europa’ s surface, whereas oxidants can be observed on the surface. However, the existence of oxidants and reductants is unconstrained based on observational data.

In this talk, we discuss key observations in future spacecraft missions to constrain the formation of the Jovian system and habitability of Europa and Ganymede. The key observations include the moment of inertia of Callisto (and Ganymede) based on high resolution gravity measurements, lateral heterogeneity of crustal thickness, isotopic compositions of water, the abundance of reductants, H_2 and H_2S, in Europa’ s plume, and the chemical compositions of surface salts on Europa and Ganymede. We discuss how these observations can be used to resolve the key issues on the formation of the Jovian system and habitability in the subsurface oceans.

The Io Volcano Observer (IVO): Investigating the Interior of a Tidally Heated World

*Christopher W. Hamilton[1], Alfred S. McEwen[1], Xianzhe Jia[2], and the IVO Science Team

1. University of Arizona, 2. University of Michigan

NASA's Discovery program recently selected the Io Volcano Observer (IVO) as one of four missions to advance to a Phase A study. Io's proximity to the Jupiter and its Laplace orbital resonances with Europa and Ganymede mean the interior of the moon is flexed by gravitational processes leading to heating and volcanic activity at its surface. This makes Io the quintessential location for investigating processes of tidal heating within the Solar System. The mission will provide fundamental new constraints on Io's interior by assessing whether or not it has an extant magma ocean (i.e., a layer, on the surface or in the interior of a body, that has such a high melt fraction that it behaves like a fluid). One of IVO's prime objectives is therefore to "follow the heat" and determine the degree and distribution of melt within Io's mantle and test whether or not tidal heating maintains a magma ocean inside present day Io.

Magnetometer measurements made by the Galileo spacecraft have provided an important constraint on this problem. Galileo observed an induced magnetic field within Io, which can be accounted for if the moon's upper mantle contains at least 20% melt. However, plasma interactions with an inhomogeneous atmosphere could generate similar magnetic signatures. IVO will address this issue by better constraining Io's plasma environment and conducting multiple flybys that are optimized to the best times and places for measuring variations in Io's magnetic field. Independent measurements will also be used to assess the rigidity of Io's lithosphere and its coupling to the deeper mantle. Specifically, if Io has a detached lithosphere over a globally continuous partial melt layer, then two independent measurements would provide definitive evidence of a magma ocean. One of these measurements is the ratio of imposed gravitational potential from Jupiter (which is well known) and the induced gravitational potential from the deformation of Io (to be measured by IVO), which is known as k_2. The second measurement is libration amplitude of Io.

Combining these lines of evidence, a weak induced magnetic field, low k_2, and low libration amplitude would imply that Io does not include a magma ocean. A strong magnetic induction signal, high k_2, and high libration amplitude would support the existence of a subsurface magma ocean. The accompanying figure summarizes these two end-member scenarios as well as important variations. For instance, dissipation within the solid interior of Io could occur preferentially in the asthenosphere or in deep mantle. Alternatively, melt within Io's interior could either form a magma ocean or a globally connected "magmatic sponge" layer with a lower, but still interconnected melt fraction. Global maps of heat flow, as well as volcanic and tectonic features, would also enable new measurements of lava temperatures and compositions that would provide additional means to discriminate between these interior models, and better understand mechanisms of "heat pipe" magma transport.

IVO will orbit Jupiter at an inclination of ~45°, designed so that the radiation dose per flyby is ~20 krad. IVO's total radiation dose over ten orbits of its nominal mission phase will therefore be less than one tenth that of the Europa Clipper spacecraft. Science instruments will include a narrow-angle camera nearly identical to that of the Europa Imaging System, the Plasma Instrument for Magnetic Sounding, dual fluxgate magnetometers with multi-mission heritage, a thermal mapper with heritage from the BepiColombo spacecraft, and a neutral mass spectrometer in development for JUpiter ICy moons Explorer

©2020. Japan Geoscience Union. All Right Reserved.

(JUICE) spacecraft. In Phase A, we will propose an additional wide-angle stereo camera as a student collaboration instrument. The geometry and timing of each Io encounter are carefully designed to accomplish our science objectives, and will enable IVO to revolutionize our understanding of Io and tidally heated worlds in the Solar System and beyond.

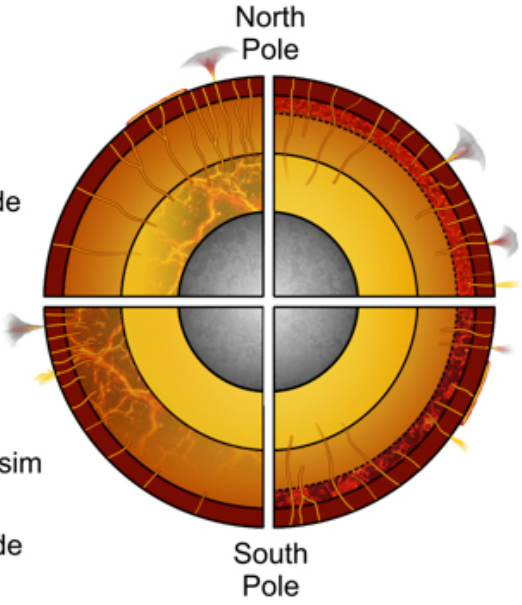
Solid Body Dissipation in Deep Mantle:
- Weak magnetic induction
- Polar focused volcansim
- High temperature magma
- Low k_2 and libration amplitude

Solid Body Dissipation in Asthenosphere:
- Weak magnetic induction
- Low-latitude focused volcansim
- Lower temperature magma
- Low k_2 and libration amplitude



Fluid Body Dissipation in "Magma Ocean":
- Strong magnetic induction
- Volcanism may be focused at low-latitudes with a longitude shift
- High temperature magma
- High k_2 and libration amplitude

Fluid Dissipation in "Magmatic Sponge":
- Strong magnetic induction
- Volcanism may be focused at low-latitudes
- Low to high temperature magma
- Low k_2 and libration amplitude

convener:Masaki N Nishino(Japan Aerospace Exploration Agency, Institute of Space and Astronautical Science), Masahiro KAYAMA(Department of General Systems Studies, Graduate School of Arts and Sciences, The University of Tokyo), Hiroshi Nagaoka(Japan Aerospace Exploration Agency), Yusuke Nakauchi(Japan Aerospace Exploration Agency)

Scientific data sets acquired by Japanese lunar mission SELENE (Kaguya) have become the standard of the lunar sciences. Other missions such as Chandrayaan-1, LRO, GRAIL, LCROSS, LADEE, Artemis, and Chang'e series as well as ground observations are also providing new knowledges of the Moon. Apollo/Luna samples and lunar meteorite analyses are also being advanced. In concurrence with these studies, some countries including Japan are planning near-future lunar missions. In this session, we will discuss scientific results based on newly acquired lunar data, strategies for future missions, lunar sample analyses, and theoretical and experimental studies of lunar sciences.

Energetic Neutral Atom Imaging for Lunar science: Interactions between space plasma, exosphere, and surface

*Yoshifumi Futaana[1]

1. Swedish Institute of Space Physics

More than 99% of all known matters in the Universe is in the plasma state. The behavior of the plasma is therefore a key for understanding how the Universe works. On top of the traditional in-situ measurements of charged particles, energetic neutral atom (ENA) imaging has opened a new channel for space plasma investigations in this two decades. ENA is produced when an ion receives an electron from neighboring matters. Due to its neutrality the ENA do not feel any electromagnetic forces, and therefore, the ENA imaging is possible. We can extract the plasma characteristics from obtained ENA images.

ENA imaging has been utilized first to plasma physics missions, but were applied to lunar and planetary missions. Low energy (~1 keV) ENA instruments deployed at a Moon orbit (by Chandrayaan-1) provided basic physics on the solar wind - Moon surface interaction. For example, a global map of the solar wind proton flux was produced from the orbiter data. The flux is highly dependent on the existence of the magnetic anomaly, distributed globally over the lunar surface. The solar wind proton flux pattern at the surface exhibits a high similarity to the global map of the hydroxyl distribution, independently characterized by the infrared spectroscopy. This coincidence indicates that the solar wind proton is a major source of the surface hydration.

In this talk, we review science outcomes achieved by ENA imaging at the Moon. We further describe a future lunar mission to investigate the origin of the lunar water and its transport, equipped with the ENA imaging technique.

Development of a detection system for new craters using feature-based image registration

*Emi Morikawa[1], Keisuke Onodera[2,3], Kei Shirai[4], Mitsuo Yamamoto[5], Satoshi Tanaka[5]

1. The University of Tokyo, 2. University of Paris / Institut de Physique du Globe de Paris, 3. The Graduate University for Advanced Studies (SOKENDAI), 4. Kobe University, 5. Institute of Space and Astronautical Science (ISAS) / Japan Aerospace Exploration Agency

Finding new craters leads to a better understanding of the lunar surface environment by estimating the contemporary crater-production rate. Moreover, the precise information about the locations of lunar impact flashes would help us investigate the internal structure (e.g. [1]). In particular, little was known about small changes on the lunar surface due to the limitations of image resolution. However Lunar Reconnaissance Orbiter (LRO) Narrow Angle Camera (NAC) images make it possible to find small changes on the lunar surface, because the resolution of the images is 0.5 m per pixel at an altitude of 50 km. Thus, we developed a detection system for new craters using LROC NAC images in order to detect small changes.

Speyerer *et al.,* (2016) proposed a method using pair images (called temporal pair) taken before and after at the same spatial area under similar lightning conditions [2]. Instead of template matching algorithms used in a previous research [2], We used another approach for image registration of temporal pair, feature detection and matching algorithm. In general, feature-based image registration makes it faster and more robust for image scaling, rotation and lightning condition than template matching. In this study, we used SIFT (Scale Invariant Feature Transform; [3]) for feature detection algorithm and FLANN (Fast Library for Approximate Nearest Neighbors; [4]) for feature match algorithm.

A few locations are tying with lunar impact flash events. As a test operation, we applied our detection system to one of the locations, at 17.2˚S, 339.6˚W. Firstly, Temporal pairs were made under similar conditions to the previous study, such as an incident angle of less than 50˚. These data were obtained from NAC ancillary information. Then 7 temporal pairs were made. Regarding this location, our detection system detected 55 spots as surface reflectance changes and the true positive rate was 61.8%. In our detection system, it was possible to compare temporal pairs whose incident angles were over 50˚, which were not applied in the previous research to avoid the influence of shadows [2]. Therefore, more temporal pairs could be created than the previous studies, although more differences between the temporal pairs are detected. As a next step, we try to precisely locate 16 lunar impact flashes observed in period from 2017 to 2019, by collaboration of ISAS/JAXA, The University of Electro-Communications and Nihon University.

Are old continental crusts of the Earth Theia-origin?: Implications for the origin of the Moon

*Masaki Ogawa[1]

1. Division of General Systems Studies, Graduate School of Arts and Sciences, University of Tokyo

Crustal materials in the Archean continents (4-2.5 Gyr ago) often had elevated isotopic ratios of tungsten, i.e. the deviation of $^{182}W/^{184}W$ from its value for today's upper mantle $m^{182}W > 0$ holds, as is the case for the Moon. The elevated $m^{182}W$ together with the rather low content of highly siderophile elements (HSEs) in these materials are suggested to imply that the proto-Earth had high $m^{182}W$ and low HSE-content, that the materials ejected from the proto-Earth by a giant impact (GI) formed the Moon, and that $m^{182}W$ was reduced and HSE-content increased later in the Earth by the chondritic materials that accreted to the Earth as a late veneer [e.g., *Touboul et al.,* 2015]. However, convective current in the Earth's mantle has probably not been vigorous enough to make the upper mantle isotopically homogeneous on the spatial scale of hand specimen today by mechanically mixing the late veneer with the original mantle materials from the proto-Earth. Indeed, convective stirring of the mantle can dissolve its compositional and isotopic heterogeneity only at the spatial scale of 10^3 km or longer, and smaller scale heterogeneities often survive throughout the history of the Earth in my numerical models of mantle evolution caused by a coupled magmatism-mantle convection system [*Ogawa*, 2014]. Here, I propose an alternative model for the isotopic evolution in the Earth: (1) $m^{182}W$ was positive in Theia but was 0 in the proto-Earth before GI. (2) A part of the Theia-materials formed into the Moon, while the rest covered the surface of the proto-Earth at the time of GI. (3) As the continental crusts grow in the early Earth, the materials from Theia contaminated them. (4) The Theia-origin materials on the Earth's surface then recycled into the deep mantle. (5) Continental crusts have further grown after the recycling without contamination from Theia. The different $m^{182}W$ between the proto-Earth and Theia suggested here can be compatible with the classical GI model [e.g., *Canup*, 2014] and the multiple-impact model [*Rufu et al.,* 2017; *Citron et al.*, 2018] for the origin of the Moon, but is at odds with some other models, like synestia [*Lock* et al, 2018].

High-pressure and -temperature experiments simulating the lunar KREEP layer and constraint on its water content

Miki Muranushi[1], *Masahiro KAYAMA[2], Tsuyoshi MIYAMOTO[3], Seiji Kamada[5], Hiroshi Nagaoka[4], Akio Suzuki[1]

1. Department of Earth Science, Graduate School of Science, Tohoku University, 2. Department of General Systems Studies, Graduate School of Arts and Sciences, The University of Tokyo, 3. Center for Northeast Asian Studies, Tohoku University, 4. Japan Aerospace Exploration Agency, 5. Frontier Research Institute for Interdisciplinary Sciences, Tohoku University

KREEP, being the acronyms for **K** (potassium), **R**are **E**arth **E**lements, and **P** (phosphorous), layer is the lunar structure formed between the mantle and crust during the late-stage lunar magma ocean (LMO) differentiation and consequently is thought to be enriched in the incompatibles (Warren and Wasson, 1979). Volatile elements such as H, F, and, Cl are also incompatible in the LMO, and thus they should have been highly concentrated in the latest residuum of the LMO, urKREEP (Greenwood et al., 2017). According to Hui et al. (2013), the urKREEP might contain 1.4 wt% H_2O, based on water content of plagioclase in the Highland anorthosite and the LMO differentiation model. Greenwood et al. (2017) concluded that the urKREEP might reach ~1.3–2.4 wt% H_2O, considering degassing and diffusion of hydrogen through the lunar volcanism and volatile contents obtained from glasses and apatite in KREEPy basalts. However, the estimated water contents of the KREEP layer are model-dependent, because original KREEP rocks have not been returned yet. Here we performed high-pressure and -temperature experiment of the analogue material for KREEP to constrain water content of the KREEP layer.

Terrestrial alkali basalt (Changbaishan) were selected for the starting material, and the powder samples were enclosed in inner graphite and outer Pt capsules with ~ 1.0–6.2 wt% H_2O. The capsules were compressed at 1.0 GPa and heated at ~1050–1300 ˚C for 24 h duration using piston-cylinder apparatus and then were immediately after quenched by cutting power. The recovered samples were measured by SEM and FT-IR analyses for observation of the textures and determination of the chemical compositions and water contents retained in each experiment.

As a result of the SEM analysis, mineral assemblages of the recovered samples were olivine, clinopyroxene, plagioclase, ilmenite, amphibole, apatite, and glass. The minerals occur as an euhedral crystal and have no zoning structure of the chemical compositions within the grains. Furthermore, $K_D^{Cpx-liq}$ [Mg–Fe] values of clinopyroxene against glass quenched from the liquid (=[$FeO^{Cpx}MgO^{liq}$]/[$FeO^{liq}MgO^{Cpx}$]) become 0.24–0.32. These facts demonstrates that almost all of the mineral crystals produced by the present high-pressure and -temperature experiments grew under equilibrium state. In addition, glasses quenched from the liquid show a homogeneous chemical composition in each recovered sample, implying no occurrence of melt immiscibility. Water contents of the glasses and modal abundance of the amphibole crystals obtained from FTIR and SEM analyses revealed that most of water remains in the capsules even after high-pressure and -temperature experiments. Amphibole is absent in the recovered samples below ~3.2 wt% H_2O. Since no hydrous mineral such as amphibole has been discovered in the Apollo/Luna samples and lunar meteorites as well as by remote sensing observation, amphibole is unlikely to form as a major mineral differentiated from the LMO. Therefore, the maximum water content of the KREEP layer can be constrained to ~3.2 wt% because of absence of amphibole in the recovered samples below this value, from the viewpoint of the present experimental conditions and starting materials. Focusing on the Procellarum KREEP terrane volcanism (PKT), existence of 3.2 wt% water leads to 120 ˚C

SLIM (Smart Lander for Investigating Moon) project for pin-point landing demonstration

*Shin-ichiro Sakai[1], Kenichi Kushiki[1], Syujiro Sawai[1], Seisuke Fukuda[1], Tetsuhito Arakawa[1], Hiroo Saito[1], Haruhiko Shimoji[2], Project Team SLIM[1]

1. Japan Aerospace Exploration Agency, 2. Mitsubishi Electric Corporation

“SLIM” is a project in ISAS/JAXA to demonstrate “pin-point” landing on the lunar surface with small spacecraft. Recently, capability to "land anywhere you want” is expected from several viewpoints, such as science or resource exploration. "Pin-point" landing is a key technology for this capability, however, conventional ground-based navigation is not accurate enough. SLIM lander is designed to achieve precise landing whose error ellipse has a radius of 100m, although past lunar landers' error ellipse radius was more than a few km. Image-based onboard navigation system, and autonomous guidance, navigation and control are the breakthrough technology for this next-generation landing accuracy.

Another unique aspect of SLIM lander is its light weight: 200kg in dry mass and 700kg in wet mass. Several new technologies are developed to realize such a light-weight spacecraft,

and they will be useful for future frequent interplanetary missions.

Although the SLIM’s main mission is technological demonstration described above, additional small scientific payloads, Multi-Band Camera, is also employed. Multi-Band Camera is designed to investigate an olivine bearing lithology for understanding their origin and investigating the composition of the lunar unsampled mantle or deep crustal material. SHIOLI crater (13.3degS, 25.2degE) was selected as a target landing point to derive this detailed mineralogy of the olivine-rich exposure. “Two step landing scheme” is another unique landing technology of SLIM to achieve safe landing on a slope, and this target landing point bit close to a crater is a typical example requiring such ability. Image based obstacle avoidance onboard will also take an important role at the final landing stage.

SLIM is scheduled to be launched in Japanese fiscal year 2021, and at this moment, the development is at the end of so-called Phase-C. In the coming joint meeting, development status will be also introduced, including several engineering models test.

[P-PS02] Lunar Science and Exploration

convener:Masaki N Nishino(Japan Aerospace Exploration Agency, Institute of Space and Astronautical Science), Masahiro KAYAMA(Department of General Systems Studies, Graduate School of Arts and Sciences, The University of Tokyo), Hiroshi Nagaoka(Japan Aerospace Exploration Agency), Yusuke Nakauchi(Japan Aerospace Exploration Agency)

Scientific data sets acquired by Japanese lunar mission SELENE (Kaguya) have become the standard of the lunar sciences. Other missions such as Chandrayaan-1, LRO, GRAIL, LCROSS, LADEE, Artemis, and Chang'e series as well as ground observations are also providing new knowledges of the Moon. Apollo/Luna samples and lunar meteorite analyses are also being advanced. In concurrence with these studies, some countries including Japan are planning near-future lunar missions. In this session, we will discuss scientific results based on newly acquired lunar data, strategies for future missions, lunar sample analyses, and theoretical and experimental studies of lunar sciences.

It had been believed that carbon and other volatile elements are depleted in the Moon for the decades, because of early analyses of the Apollo samples. The notion of a volatile-depleted Moon is one of the greatest premises behind the hypothesis that a giant impact occurred between the nascent Earth and a Mars-sized body, which generated high-temperature events. Recently, advanced analyses have determined volatile elements, such as water and carbon, in volcanic lunar glasses. Analyses of meteorites and returned samples are the most precise methods currently available for determining the chemical composition of the parent bodies and investigating their geologic origins and histories, even though it is acknowledged that a small number of samples are potentially biased. The existence of indigenous water in lunar materials has been supported not only by analyses of Apollo samples but also by conducting wide-area observations using neutron spectrometers and neutral mass spectrometers on lunar orbiters. In the case of carbon, however, no such observations have been conducted around the Moon to date because both the neutron interactive properties and brightness in the ultraviolet range are insufficient for spaceborne instruments.
Here, we present observations by the lunar orbiter KAGUYA of carbon ions emitted from the Moon. These emissions were distributed over almost the total lunar surface, but amounts differed with respect to lunar geographical areas. The estimated emission fluxes to space were ~5.0×10^{4} cm^{-2} s^{-1}, which is greater than possible ongoing supplies from the solar wind and micrometeoroids. Our estimates demonstrate that indigenous carbon exists over the entire Moon, supporting the hypothesis of a carbon-containing Moon, where the carbon was embedded at its formation and/or was transported billions of years ago.

Status on Japanese Lunar Polar Exploration Mission

*Dai ASOH[1], Takeshi HOSHINO[1], Makiko OHTAKE[1], Yuzuru KAROUJI[1]

1. Japan Aerospace Exploration Agency

Introduction:

JAXA aims to conduct sustainable lunar exploration activities in the next 50 years, such as operation of lunar base with international partners and private sectors. To realize this goal, we will conduct technology demonstration step-by-step. JAXA envisions our space exploration as the extension from the Low Earth Orbit (LEO) to the Moon and Mars, with our international partners, in order to advance our contribution to intellectual assets.
In October last year, the Japanese government announced its decision to officially join the international space exploration, and to proceed on coordination in the several areas including sharing of data acquired from our lunar exploration missions and technologies for lunar landing site selection.

Japanese lunar exploration missions:

Regarding lunar surface robotic missions, JAXA is developing Smart Lander for Investigating the Moon (SLIM), which aims to demonstrate the high-precision landing technology. The targeted launch year is 2021. Following this SLIM mission, a lunar polar exploration mission is aimed at investigating the water ice resources in the lunar polar region. This is a collaborative mission with Indian Space Research Organisation (ISRO).

Objectives of the lunar polar exploration:

In addition to the scientific interest about the origin and concentration mechanism of the water ice, there is strong interest in using water ice (if present) as an in-situ resources. Specifically, using water ice as a propellant will significantly affect future exploration scenarios and activities because the propellant generated from the water can be used for ascent from the lunar surface.
Because of the existing limited remote-sensed data, we need to find out, by direct measurement on the lunar surface, the presence of water ice, it’ s quantity, quality (pure water or contain other phases such as CO_2 or CH_4), and usability (how deep do we need to drill or how much energy is required to get water) in order to assess if we can use it as resources. Obtaining data to understand the principle of the water distribution and concentration is necessary to estimate the quantity and quality of water across the Moon.

Status on the mission:

ISRO/JAXA are jointly conducting the conceptual design (i.e. Phase-A study) under the Implementation Arrangement (IA) for the lunar polar exploration mission, in which JAXA provides a launch vehicle and a rover while ISRO provides a lander. System Requirement Review (SRR) is scheduled for this year. JAXA selected function and specification of several instruments, which will be loaded on the rover or the lander.

Spacecraft configuration:

The spacecraft system is based on direct communication with the Earth. The target mass of the spacecraft (incl. payload and propellant) is about 6ton and the payload mass is about 350kg. After the spacecraft reaches the Moon, it is inserted into a circular orbit having a 100km altitude via a few orbital changes. During powered-descent phase, the position of the lander is estimated by landmark navigation using shadows created by the terrain. After landing, the rover is deployed on the lunar surface using ramps. The rover then prospects water ice with its observation instruments.

©2020. Japan Geoscience Union. All Right Reserved.

Landing site selection:
We are down-selecting the candidates of landing site of the lunar polar region using the following parameters as constraints:
- Continuous daytime: equal or more than 60days.
- Continuous nighttime: equal or less than 14days.
- Comm. capability: equal or more than 25%.
- Land inclination: equal or less than 10deg.

As a trial of the landing site selection, sunshine is simulated using digital elevation models to obtain the sunlight days per year and the number of continuous sunshine periods at each site. The maps of simulated communication visibility from the Earth and the slope are created.

Conclusion:
In this presentation, we will introduce current status on Japanese lunar exploration missions, focusing on a lunar polar exploration.

Keywords: lunar polar exploration, lunar water, volatile, resource availability

Examination of water observation procedure in lunar polar exploration

*Yuzuru Karouji[1], Makiko Ohtake[1], Hiroaki Shiraishi[1], Hiroshi Kanamori[1], Inoue Hiroka[1], Takeshi Hoshino[1], Dai Asoh[1], Lunar Polar Exploration Pre-Project Team[1]

1. Japan Aerospace Exploration Agency

In recent years, the lunar polar region has been attracting attention as a lunar exploration target. Multiple remote sensing datasets from lunar exploration missions [e.g., 1, 2] suggested that water ice might be widely present in the lunar polar regions. For this reason, several space agencies are investigating the availability of water ice resources that might exist in the lunar polar region. The availability of water ice as propellant is expected to have a significant impact on future lunar exploration scenarios and activities. Also, it is known that some hills and crater rims of the lunar polar region have areas of continuous sunshine for more than half a year and more than 80% sunshine ratio [3], therefore the lunar polar region is considered to a useful base for sustainable activities.
In this situation, Japan Aerospace Exploration Agency (JAXA) is planning a lunar polar exploration mission that aims mainly to confirm the abundance of water ice resources and to establish the technology of planetary surface exploration in collaboration with the Indian Space Research Organisation (ISRO)[e.g., 4]. This presentation describes the examination status of the water ice observation method for this mission.
To achieve the objectives of the mission, the following parameters are listed as constraints for selecting a landing site, taking into account the unique conditions of the lunar polar region; presence of water, surface topography, communication capability, and duration of sunshine. By superimposing these analysis results, the candidate for landing sites is selected [5]. Currently, around 30 sites of the north and the south pole of the Moon have been identified as landing site candidates.
In this mission, the "course observation" will investigate the horizontal distribution of the surface and subsurface of the water ice existing area while traveling with the rover. And the "fine observation" will investigate the vertical distribution of underground of the water ice existing area by excavating with a drill. In the course observation, neutron spectrometer, ground-penetrating radar and imaging spectroscopy camera are being considered as model payload instruments. In the fine observation, regolith is excavated by earth auger and sampling of excavated regolith is carried out by the rover working system. And the concentration of gas generated by sample heating and the molecular species contained in the gas is measured using thermogravimetric analyzer, mass spectrometer and cavity ring-down spectroscopy analyzer, which are assumed to be model payload instruments. By performing these observations in multiple exploration areas (waypoints), ground truth data on water abundance and resource availability around the landing site will be obtained.

The research review on the plasma and dust environment of the moon toward the participation in NASA’s Artemis program

*Hideyuki Usui[1], Masaki N Nishino[2], Noriyuki Namiki[3], Yuko Inatomi[2], Makiko Ohtake[2], Tomokatsu Morota[4], Tomohiro Usui[2]

1. Graduate school of system informatics Kobe University, 2. JAXA/ISAS, 3. NAOJ, 4. School of Science The university of Tokyo

Following the decision by the Japanese government on the participation in the NASA’s Artemis program, the task force members asked by the JAXA’s technical committee on the international space exploration intensively reviewed the research topics and their significance on the lunar environment exploration from the perspectives of science as well as engineering.

The moon which has no atmosphere is directly exposed to the solar wind plasma. The surface is consequently charged due to the deposition of the solar wind as well as the secondary emission of ions and photoelectrons from the surface. The dust particles which are micro grains covering the moon surface are also charged and their dynamics and distribution are to be investigated. Meanwhile, KAGUYA found many crustal magnetic field regions called lunar magnetic anomalies (LMA) scattered on the surface. Due to the solar wind interaction, a small scale magnetosphere is formed over LMA. KAGUYA observed ion reflection and deflection as well as various types of plasma waves when it passed over LMA. The exosphere is also found which is composed of neutral particles originated from the moon surface. In this paper, we will report the current understanding of the lunar plasma environment affected by the solar wind interaction.

In the lunar surface exploration, one of the most important objectives is the quest for evidence of water resources in the surface environment. In terms of solar wind interaction, we are curious to know how the continuous injection of the solar wind proton to the lunar surface can be associated with the generation of water resources. In this paper, we will also touch on this topic.

The altitude of the KAGUYA orbits is limited to approximately between 100km and 20km. To observe the plasma phenomena in detail occurring at low altitudes below 20km, multiple CubeSat released from the GATEWAY station will play an important role.

In this paper, we will report the review on the plasma and dust of the lunar environment summarized by the task force members asked by the JAXA’s technical committee on the international space exploration. We will also discuss the significance of the interactions between the solar wind plasma and the lunar environment from a viewpoint of solar-terrestrial physics.

[P-PS04] Regolith Science

convener:Koji Wada(Planetary Exploration Research Center, Chiba Institute of Technology), Akiko Nakamura(Graduate School of Science, Kobe University), Patrick Michel(Universite Cote D Azur Observatoire De La Cote D Azur CNRS Laboratoire Lagrange), Kevin John Walsh(Southwest Research Institute Boulder)

Recent planetary explorations have revealed that almost all solid bodies in the solar system are covered with small particles, called regolith. The surface geology, especially regolith behavior on the surfaces of solid bodies, becomes increasingly more important as represented by Hayabusa mission and other on-going and planned sample-return missions such as Hayabusa2, OSIRIS-REx, and MMX.
For fully understanding the regolith science, it is required to know and compare the regolith conditions on various celestial bodies, from asteroids to planets, with various methods.
Therefore, this session welcomes broad topics related to regolith on various celestial bodies, such as asteroids, comets, the Moon, the martian moons, Mars, etc. Papers on the formation, evolution, and alteration processes of regolith particles and regolith systems on the surface of planetary bodies, remote and in-situ observational results and techniques, analyses and results of returned samples, and laboratory, numerical, and theoretical studies on the fundamental physical and chemical processes are all welcome.
Note that what we call regolith is not just fine grains: all kinds of materials (more or less loose) that lie on the surface, from cobbles to finer grains, are our targets.

Crater scaling laws in low speed impacts

*Onur Celik[1], Daniel J. Scheeres[2], Yasuhiro Kawakatsu[3]

1. The Graduate University for Advanced Studies (SOKENDAI), 2. University of Colorado Boulder (CU Boulder), 3. Japan Aerospace Exploration Agency (JAXA)

Regolith-covered small bodies have numerous craters in varying sizes across their surfaces. The long-established scaling laws have been successful in large craters arising from astronomical impacts, which occur in orbital speeds of several km/s (Housen et al., 1983). Moreover, it has also recently been observed during OSIRIS-REx mission that material ejection from the active asteroids may be originated through micrometeoroid impacts that occur at similar velocities, but should produce much smaller craters (Lauretta et al., 2019). In that case, the ejecta velocity field of a crater would contain materials with velocities less than the escape speed of small-body, i.e. typically below m/s. Such material would eventually fall back to surface after orbital motion, creating new craters at lower-speed impacts. In a similar case, small lander spacecraft, e.g. the MASCOT and MINERVA rovers onboard Hayabusa2, impact small-body surfaces at cm/s-level speeds and bounce across the surface, essentially making new craters (where regolith is available) at low speeds, before settling on the surface (Thuillet et al., 2018). These two seemingly different phenomena highlight the relevance of understanding low-speed cratering process that primarily occurs in low gravity environments through the interaction of natural and artificial objects with regolith-covered small body surfaces. However, it is currently not known whether the scaling laws developed for high-speed astronomical impacts would hold for impacts of orders of magnitude lower speed.

To test this question, a literature survey was performed on impact experiments in high- and low-speed and under different gravity levels to demonstrate that the scaling law holds for impact speeds from km/s to m/s (Fig. 1). A full study of the applicability of the crater scaling laws to lower-speed impacts is currently a gap in the experimental literature. This is because performing impacts at below-m/s speeds is difficult on Earth in terms of data resolution due to high gravitational acceleration. On the other hand, currently available low-speed impact data under low-gravity only provides phenomenological explanations due to these challenges in measurements (Brisset et al., 2018). To overcome these limitations and bridge the aforementioned gap in literature, this study instead makes use of discrete-element method (DEM) granular mechanics simulations in order to test the crater scaling laws quantitatively. The DEM simulations avoid limited low-gravity time and test conditions, as well as vibration-caused noisy data in drop towers and parabolic flights while allowing to perform “experiments” in virtually any small-body environment. The DEM code employed in the study is called pkdgrav, a state-of-the-art parallelized granular mechanics code, which treats particle collisions through a soft-sphere discrete element method (SSDEM). Through SSDEM implementation, pkdgrav handles multi-contact and frictional forces using dissipative and frictional parameters that allow mimicking the behavior of angular and rough particles. The code has been tested extensively and calibrated for a variety of materials to represent the actual granular behaviour realistically throughout different studies.

Impact simulations of a spherical impactor in the study are performed in local vertical at speeds between 1 cm/s and 1 m/s in a regolith bed under asteroid level gravity that is created in the simulation environment. As each particle’s state is recorded during the simulations, the collected data are post-processed to compute not only crater size but also velocity field and ejected mass during the process. This would then yield a complete test of the theory under given conditions which is typically not

©2020. Japan Geoscience Union. All Right Reserved.

available in experimental studies. The tested theory can then be applied to a variety of problems that relevant to current small-body exploration framework, e.g. estimating coefficient of restitution on regolith-covered portions of asteroids, which would subsequently be used in designing landers, sampling spacecraft as well as explaining the reimpact behaviour of ejected materials.

Impact cratering is one of the most important physical processes, then we study crater impact scaling laws in order to elucidate the impact processes on asteroids. It is suggested that the size ratio of the impactor to the surface boulders and the fracture strength of the boulders could affect the crater formation process. In addition, it is suggested that the impact-induced seismic shaking could propagate through an asteroid interior and change the surface topography. Therefore, it is important to understand the impact-induced seismic shaking and to construct crater scaling laws considering the surface boulder strength. Then, in this study, we performed impact cratering experiments by using the target composed of low-strength coarse particles, and studied the effect of the size ratio of the projectile to the target grains, and the fracture strength on the crater scale law, and also investigated the impact-induced seismic shaking.

Cratering experiments were conducted by using a gas gun set at Kobe University and ISAS. Granular targets were prepared by using weathered tuff granules with the size of 1 to 4mm (small particle) and the size of 1 to 4cm (large particle). The crush strength of these tuff particles was measured to be about 60 kPa and 30 kPa. A spherical projectile with the size of 3mm (SUS, zirconia, alumina, glass, and nylon) was lunched at the impact velocity from 40 to 200m/s, and a spherical projectile with the size of 2mm (WC, copper, SUS, zirconia, titan, Al, and nylon) was lunched at the impact velocity from 1.2 to 4.5 km/s, and these two types of the projectile were impacted on the target surface at the normal direction. Impact cratering process was observed by a high-speed camera at 10^3-10^5fps. After the shot, the crater morphology was observed and the diameter and the depth were measured. Impact-induced seismic waves were measured by using 3 accelerometers (specific frequency is 30kHz) set at different positions from the impact point, and a data logger was used to record the seismic data through charge amplifiers (data acquisition rate is 100kHz) connecting to the accelerometer.

The crater size was found to increase with the projectile kinetic energy (E_k) at lower than 0.14J and at higher than 0.63J, so that the crater size was almost constant among them, and more the crater size obtained at very high $E_k$was almost on the extrapolated line from the relationship given by the low $E_k$data. In addition, the crater formation efficiency of the large grain was lower than that of the small grain. The pi-scaling law was used to construct the relationship between normalized radius and the normalized gravity, and all the data was found to be separated into two regions with a large offset according to the impact velocity and the projectile material. This offset might be caused by the disruption energy of several tuff grains. From the above results, it was recognized that the crater formation process of the low-strength coarse grain was different from that of the sand grain target, that is, the crater formation efficiency of the target composed of low-strength grains was lower than that of sand targets composed of high-strength quartz grains.

The propagation velocity of the impact-induced seismic wave was obtained from the accelerometer data. The propagation velocity was 47.0 ±7.6 m/s for the small grain regardless of the impact velocity, and was 42.7 ±4.7 m/s for the large grain regardless of the impact velocity and projectile material. Compared to

©2020. Japan Geoscience Union. All Right Reserved.

previous studies, it was found that the propagation velocity was similar to that of quartz sand. Furthermore, we obtained the relationship between the maximum acceleration and the distance from the impact point. Then, we scaled this relationship with the distance normalized by the crater radius and obtained the following empirical formulas for the attenuation. For small grain target, $g_{max=}10^{1.81}(x/R)^{-1.98}$. For large grain target, $g_{max}=10^{1.77}(x/R)^{-2.21}$.

A projectile accelerated by Hayabusa2 Small Carry-on Impactor succeeded in producing an artificial impact crater with a diameter of >10 m on the surface of the asteroid Ryugu on April 5, 2019. At the time of cratering, Deployable Camera 3 (DCAM3) took clear images of ejecta curtain emerged from the crater. Comparing the ejecta curtain images to a theoretical model of ejecta curtain, we infer the size of the particles composing the ejecta curtain. Since almost of the ejecta particles come from the underground, we can discuss about the particle size distribution of the subsurface layer of Ryugu and the evolution process of Ryugu’ s surface layer. As a result, the typical size range of the ejecta particles is estimated to be ~cm to several 10 cm, although it depends on the assumed size distribution. This typical size is relatviely small compared to the boulder size on the uppermost surface, suggesting some kind of surface process occured in the past.

Space-impact experiment was performed on the surface of the C-type asteroid 162173Ryugu using an instrument called the Small Carry-on Impactor (SCI), carried by JAXA spacecraft Hayabusa2. One advantage of the Hayabusa2 for space-impact experiments was the use of a small satellite separated from the spacecraft, the Deployable CAMera-3 (DCAM3), using which we observed the evolution of the ejecta curtain by the SCI impact in situ. In this presentation, based on the patterns of the ejecta curtain, we evaluated the properties of boulders and particles in the surface and subsurface of Ryugu. We found that the boulders on the surface layer had a strength of ~ a few hundred kPa. Furthermore, the particles in the curtain had a characteristic size of a few cm with the maximum size of several decimeters, mainly originated from the subsurface layer. We propose some processes to realize these features.

The Hayabusa2 spacecraft has completed the rendezvous phase around Cb-type asteroid Ryugu in 2019. From thermal infrared imaging by TIR, global temperature distribution of Ryugu is consistent with the thermal calculation with thermal inertia of 300±100 J m^{-2} K^{-1} $s^{-0.5}$ [1], and thermal inertia values of the floors of craters are in general roughly comparable with the global average [2]. On the other hand, few small craters show anomalously low thermal inertia about 50 J m^{-2} K^{-1} $s^{-0.5}$, which might be contributed from the thermal insulating nature of the fine-grained and unconsolidated materials [3]. However, it is unknown how relaxation process of the crater relates to the thermophysical property and physical condition of the surface materials. On April 2019, Hayabusa2 have carried out an artificial impact (Small Carry-on Impactor or SCI) experiment [4], whereby a ~2 kg mass was fired at 2 km/s against the asteroid surface. As a result of the successful operation, an artificial crater (SCI crater) with diameter larger than 10 m was created on the asteroid. In this study, we investigated thermal property of the SCI crater as the freshest crater on Ryugu.

We had acquired TIR images of the SCI crater in some descending sequences (PPTD-TM1A&B operations on May and June, 2019). All of these images showed higher temperature in the SCI crater than surroundings by ~10 K, especially on the western side of the crater. This high temperature would indicate low thermal inertia materials in the crater, or the high solar incident angle on the crater inner wall would make the temperature higher.

Since the number of images and observation duration were limited for each operation, we could not examine diurnal temperature profile of the crater. In order to estimate the thermal inertia of the SCI crater from single thermal image, we conducted surface temperature simulation using a local digital elevation model (DEM) around the SCI crater. With varying thermal inertia, the simulated images were produced, and thermal inertia was estimated by comparison with the simulation results and observed temperature

©2020. Japan Geoscience Union. All Right Reserved.

images.

As a result, the simulated temperature distribution inside the SCI crater agrees well with the observed image. In this preliminary analysis, we expect that the thermal inertia in the SCI crater is uniformly about 300 J m^{-2} K^{-1} $s^{-0.5}$, consistent with large boulders (Iijima boulder and Okamoto boulder) in the crater, surrounding materials, and the global average. Therefore, the chief determinant of the high temperature in the SCI crater would not be the change of the thermal inertia.

Diurnal thermal skin depth of Ryugu is a few centimeters, assuming the thermal inertia of 300 J m^{-2} K^{-1} $s^{-0.5}$. Although the inside of the SCI crater seems to be filled with finer grains than the surroundings [4], less change in thermal inertia of the SCI crater compared with the surroundings or top-surface large boulders indicates that the typical grain size of the subsurface layer (meter-scale in depth) is larger than a few centimeters. Furthermore, since the centimeter-sized grains have thermal property consistent with the larger boulders and the small grains are considered to be crushed from the large boulders, the thermophysical property of the boulders is expected to be homogeneous in centimeter-scale or larger.

Experimental study on the relaxation of slope terrain due to small-scale impact

*Tomomi Omura[1], Shinta Takizawa[1], Hiroaki Katsuragi[1]

1. Department of Earth and Environmental Sciences, Nagoya University

Observation of planetary surfaces shows some evidence of the relaxation of sloped terrains such as impact craters. The mechanism of the relaxation might be the resurfacing due to impacts and/or the fluidization due to seismicity. Here we focus on relaxation due to small-scale impacts, which occurs on relatively large bodies, e.g., the Moon. Soderblom (1970) modeled the effect of a small-scale impact on the relaxation of the slope terrain by considering asymmetric ejecta deposit. However, the model did not consider the effect of the collapse of cavity and the impact angle. In this study, we study the effect of slope angle and impact conditions on the relaxation efficiency of slope terrain using the result of low-velocity impact experiments on the inclined granular surface obtained by Takizawa & Katsuragi (2020).

We used Toyoura sand in the diameter of 0.1-0.3 mm as a target material. The angle of repose of the sand was 34˚. The spherical impactors in diameter of 6 mm and masses of 0.12, 0.25, and 0.4 g were used. The impact velocity was ranged from 7 to 97 m/s. Experiments were conducted under atmospheric pressure. We analyzed the data with the slope angle of the target θ of $0^\circ \leqq \theta \leqq 34^\circ$ and the impact angle measured from the upper surface ϕ of $50^\circ \leqq \phi \leqq 130^\circ$. The 3D profile before and after the crater formation was measured with a laser profiler.

We measured the displacement of the center of mass caused by the asymmetric ejecta deposit and the collapse of the crater cavity, as an index of relaxation efficiency. We conducted the analysis using the crater profile as follows. First, we made the reference shape using the crater profile obtained by experiment with $\theta=0^\circ$ and $\phi=90^\circ$. The profile was scaled based on the scaling law of the crater minor axis D_{cy} (Takizawa & Katsuragi, 2020) to equalize the D_{cy} of the reference shape and the analyzed profile, and the cavity part was extracted as the reference shape. Next, we subtracted the reference shape from the crater profile. We assumed the part higher/lower than the reference shape has plus/minus mass and calculated the center of mass of the differential part. Finally, we calculated the distance Δx from the impact point to the center of mass of the differential part with defining downward as a positive sense.

When $\theta=0^\circ$, the normalized migration distance of the center of mass $\Delta x/D_{cy}$ was almost 0 owing to the symmetric ejecta deposit around the impact point. However, $\Delta x/D_{cy}$ increased with an increase of slope angle θ because of the collapse of the crater cavity and the asymmetric deposition of the ejecta.

We approximated the dependence of $\Delta x/D_{cy}$ on $\tan\theta$ for data with similar ϕ based on the theoretical model of sediment flux of hillslope (Roering et al., 1999) as follows:

$\Delta x/D_{cy}=a[\tan\theta/\{1-(\tan\theta/b)^2\}]+c$ (1),

where a, b, and c are constants. We will discuss the physical interpretation of each constant on the presentation.

[E] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

[P-PS04] Regolith Science

convener:Koji Wada(Planetary Exploration Research Center, Chiba Institute of Technology), Akiko Nakamura(Graduate School of Science, Kobe University), Patrick Michel(Universite Cote D Azur Observatoire De La Cote D Azur CNRS Laboratoire Lagrange), Kevin John Walsh(Southwest Research Institute Boulder)

Recent planetary explorations have revealed that almost all solid bodies in the solar system are covered with small particles, called regolith. The surface geology, especially regolith behavior on the surfaces of solid bodies, becomes increasingly more important as represented by Hayabusa mission and other on-going and planned sample-return missions such as Hayabusa2, OSIRIS-REx, and MMX.
For fully understanding the regolith science, it is required to know and compare the regolith conditions on various celestial bodies, from asteroids to planets, with various methods.
Therefore, this session welcomes broad topics related to regolith on various celestial bodies, such as asteroids, comets, the Moon, the martian moons, Mars, etc. Papers on the formation, evolution, and alteration processes of regolith particles and regolith systems on the surface of planetary bodies, remote and in-situ observational results and techniques, analyses and results of returned samples, and laboratory, numerical, and theoretical studies on the fundamental physical and chemical processes are all welcome.
Note that what we call regolith is not just fine grains: all kinds of materials (more or less loose) that lie on the surface, from cobbles to finer grains, are our targets.

For sample returns from celestial bodies, there is a demand for more advanced technology for safe long stay from the instantaneous touch-and-go method represented by the Hayabusa series spacecrafts. In the future, landing exploration on the moon and Martian moons is also planned in Japan and understanding the interaction with regolith in the low gravitational environment on the surface of the target celestial body is the key to design spacecraft equipments. Thus, it is considered that the experimental data set for obtaining the parameters to identify behavior of the granular materials under low gravity for long time is still highly valuable. To observe the behavior of granular material such as regolith under low gravity, aircraft experiments and drop test have been conducted in the ground test. However, the range for design verification of spacecraft is not only limited due to the time constraints for maintaining the gravitational environment, but the transition from high gravity to low gravity above 1G affects the initial state of the granular material. It has also been recognized that it is a key issue to accurately understand the interaction between particles and mechanical systems in ground tests. Consequently, the "Hourglass" mission has been performed to investigate the gravitational dependence of basic parameters for reproduction of behavior of granular materials such as regolith and ground sand, and to obtain information that contributes to future spacecraft design. This presents the outline of Hourglass mission and its initial results.

In the Hourglass mission, the behaviors of regolith and ground sand in an arbitrary gravity environment are observed with an artificial gravity generator included in the Cell Biology Experiment Facility (CBEF) in the Kibo module of the International Space Station (ISS). The purpose of this mission is to investigate the effect of low gravity on the properties of granular materials. An hourglass-type container and a measuring-cylinder-type container containing particles such as simulated regolith of planets and ground sand are packed into a sealed metal box mounted on the artificial gravity generator. The behavior of particles is observed with an optical camera while they are periodically reversed under arbitrary low gravity. Eight kinds of specimens are employed for the target samples, and dynamic behavior and sedimentation state (bulk density, angle of repose, etc.) of these granular materials are evaluated. Hourglass mission would have the contribution of understanding of the celestial growth process, provision of basic data for the construction of terramechanics on celestial bodies, optimization of design for future landers, exploration rovers, automatic construction machines on the lunar surface and manned pressurized rover for lunar exploration, and the appeal of the value and ability of “Kibo” artificial gravity environment. The initial experimental results revealed the relation between the artificial gravity and the hourglass hour, and the composition of the forces acting on the granular material during experiments using artificial gravity generators.

Kobe University

Global observations of Ryugu by Hayabusa2 found various geomorphological features, such as high abundance of boulders, depletion in small craters [1], and the presence of a circular circum-equatorial ridge [2]. Furthermore, evidence for mass movement have been found on both sides of the equatorial ridge [1]. Ryugu has a globally uniform spectral distribution, but spectral slope distribution shows regional differences. The equatorial ridge and poles have blue spectra while mid-latitude regions have red spectra [1]. This global spectral variation may be due to surface flows from the equator to mid-latitude regions [1,3]. Ryugu might have the stratigraphic architecture of redder surface materials covering bluer subsurface materials. The spectral variation has been proposed to be caused by surface flow, which removed a reddish top layer and exposed subsurface bluer materials [3]. However, the degree of such surface flows is poorly understood yet. In this study, we search the Ryugu surface for possible surface flow features using spectral slope. Then, we quantitatively investigate both degrees and direction of surface flows.

Wake-like features have been found around large boulders on the equatorial ridge slopes. Although downstream regions of boulders do not have clear and geomorphological flow features, the downstream regions have bluer spectra than their surrounding surface. If a boulder is sitting in the surface flow from the equator, surface redder materials in the downstream region of the boulder would flow away to mid-latitude regions, and the boulder prevents redder materials in the upstream region from flowing into there. Consequently, subsurface bluer materials in downstream regions would be exposed. We measured the length (longitudinal length) and width (latitudinal length) of the flow features. We also measured the lengths of flow features on the equatorial ridge. The color analysis has been conducted based on the calibration obtained with inflight observations of Hayabusa2 [4].

As a result of the survey, we found 20 boulders with wake-like features (i.e., bluer downstream regions associated with boulders). The average width and length of the flow features associated with boulders are 22 ±12 m and 16 ±10 m, respectively. The width and length of the flow features show a good correlation with boulder width. Most of the boulder-associated flows are generally shorter than the flows around the equator. The longitudinal length of the blue band surrounding the equator, suggestive of continuous flows from the equator toward higher latitudes, is 51 ±18 m over different longitudes. However, we found that the length of the boulder-associated flow does not have a correlation with topographical slope or surface potential.

The correlation between the width of boulders and the width and length of flows suggests that the

©2020. Japan Geoscience Union. All Right Reserved.

boulders prevented the surface materials from flowing into higher latitudes, because otherwise the widths of bluer regions are independent of the boulder width. The lack of strongcorrelation between the flow length and topological slope or surface potential suggests that these parameters where a boulder occurs are irrelevant to the flow lengths. On the other hand, the correlation between the width of boulders and the length of flows suggests that the flow lengths associated with boulders may be controlled by boulder size.

The thickness of red surface layer may be from 10 cm to ~1 m if change in spectral slope is resulted in by solar heating [3]. The thickness of fluidized layer is needed to be thicker than that of red surface layer at least. On the other hand, the maximum thickness of fluidized layer may not reach to 10 m because the flow feature areas do not have large depressions.

NASA’s OSIRIS-REx sample return mission has been studying near-Earth Asteroid (101955) Bennu since December 2018 to understand the nature of this body and to support site selection and sample acquisition. This effort has produced a wealth of data with which to constrain its geologic history. Here we report on the global geology of Bennu based on analyses of images combined with shape, mass, and slope measurements. Bennu is a 500-m-diameter object with an oblate spheroidal shape and an equatorial bulge that is similar to other near-Earth asteroids, including Ryugu, as observed by the Hayabusa2 sample return space mission. Candidate impact craters have been observed at a range of diameters, reaching up to 150 m, across the surface of Bennu. An apparent concentration of large craters at low latitudes suggest that the equatorial ridge is stratigraphically old.

The population of boulders is diverse, with many of the largest boulders being darker than the average surface albedo and exhibiting a hummocky texture. A smoother and brighter class of boulders occurs at smaller sizes, and the populations are mixed throughout the surface. Notably there is a distinct lack of very large boulders in the equatorial region (+/− 25 deg.). Only 2 of the 16 boulders larger than 30 m are located in this band. Patterns of apparent mass movement across the surface suggest movement from the mid-latitudes towards the equator. There is evidence of imbrication in the local downslope direction, as well as evidence of mass movement at smaller particle sizes in the form of partial burial of boulders and pileup of boulders at locations downslope of scarps. Many of these signatures are found specifically in regions with high surface slope and in regions where the surface slope would have increased substantially as the asteroid experienced its observed increase in spin rate. The spatial distributions of craters, boulders, observed particle ejection events and signatures of mass movement suggest a dynamic recent history in some regions of Bennu’s surface, and we use these data to divine information about the most mobile elements of its surface and their? relation to the history of Bennu’s equatorial ridge.

Introduction: Asteroid (101955) Bennu's bicone shape is widely ascribed to deformation during periods of critical spin rate [e.g., 1]. Finding geological evidence that can constrain material flow mechanisms and deformation regions is a goal of the OSIRIS-REx mission [e.g., 2]. Two topographic features found near Bennu's equator on high parts of its equatorial ridge - a cone-shaped hill and a deep crater-like cavity - are consistent with formation by fission at critical spin rates. The cavity floor contains evidence of internal flow as thin vertical sheets of rubble.

Bennu Equatorial Features: At ~8° E, centred on the equator, is a unique Bennu landform, a remarkably symmetric ~12 m-tall, ~40 m-diameter cone composed of fine-grained rubble (relative to its immediate surroundings) with some large boulders on its east side. Bennu's equatorial cross section is slightly square in shape [3] with four high points; this cone is located at one of these high points. Although the cone is slightly spectrally distinct from the remainder of the equatorial ridge, and thus may be younger, it has at least 8 small craters 2 to 4 m diameter preserved in its non-boulder-covered area.

At ~4° S, 126° E is a relatively fresh impact crater-like cavity ~10 m-deep and ~45 m-wide formed on the southeast side of a high equatorial hill. Its floor and walls are composed of relatively fine-grained rubble and no large boulders occur within it. Larger crater-like cavities occur both east and west of this feature; the adjacent hills constitute another of the four high spots on Bennu's equatorial ridge. Parts of the floor and walls show a unique banded albedo pattern (of variable distinctness) with rubble bands ~3 to 7 m width. The bands show no obvious topographic expression and a near-vertical dip is indicated by consistent orientation across slope changes. The rubble bands are almost parallel to Bennu's equator (~5° WNW-ESE). A distinct spectral signature suggests that the cavity is relatively young, but the interior has 10 small craters of ~2 to 4 m diameter; this post-formation crater population is comparable to that found on the cone described above.

Possible fission and interior flow scenarios: Equatorial mass loss through fission has been modelled for other NEA's [e.g., 4] to explain equatorial cavities; Bennu's cone and cavity could both be remnants of fission. The described cavity could not have formed by impact or the banded floor structure would not be preserved; the cavity also lacks an ejecta blanket as is found around other young Bennu impact craters. The crater and cone both occur on the highest Bennu equatorial topography, so are logical fission candidates resulting from Bennu's last YORP spin up. The cone may represent an interrupted fission event. For example, Bennu may have been oscillating slightly, allowing the fission flow to start before declining oscillation magnitude lowered the high point always below the loss radius. Modelling of the similarly sized NEA 2008 EV5 equatorial fission required rubble cohesion of <2 Pa [4]. Modelling of Bennu

©2020. Japan Geoscience Union. All Right Reserved.

interior deformation by [1] produces equatorial upwelling with cohesion of 1.25 - 2.5 Pa; given the uncertainties of 2008 EV5 modelling, a common rubble cohesion value may result in both phenomena. The banding would then represent the tops of thin sheets of rising rubble from Bennu’s interior in response to interior deformation and equatorial mass loss.

The Morphological, Elastic, and Electric Properties of Dust Aggregates in Comets: A Close Look at COSIMA/Rosetta's Data on Dust in Comet 67P/Churyumov-Gerasimenko

*Hiroshi Kimura[1], Martin Hilchenbach[2], Sihane Merouane[2], John Paquette[2], Oliver Stenzel[2]

1. Planetary Exploration Research Center (PERC), 2. Max Planck Institute for Solar System Research

The Cometary Secondary Ion Mass Analyzer (COSIMA) onboard ESA's Rosetta orbiter has revealed that dust particles in the coma of Comet 67P/Churyumov-Gerasimenko are aggregates of small grains. We study the morphological, elastic, and electric properties of dust aggregates in the coma of Comet 67P/Churyumov-Gerasimenko using optical microscopic images taken by the COSIMA instrument. Dust aggregates in COSIMA images are well represented as fractals in harmony with morphological data from MIDAS (Micro-Imaging Dust Analysis System) and GIADA (Grain Impact Analyzer and Dust Accumulator) onboard Rosetta. COSIMA's images, together with the data from the other Rosetta's instruments such as MIDAS and GIADA do not contradict the so-called rainout growth of 10 μm-sized particles in the solar nebula. The elastic and electric properties of dust aggregates measured by COSIMA suggest that the surface chemistry of cometary dust is well represented as carbonaceous matter rather than silicates or ices, consistent with the mass spectra, and that organic matter is to some extent carbonized by solar radiation, as inferred from optical and infrared observations of various comets. Electrostatic lofting of cometary dust by intense electric fields at the terminator of its parent comet is unlikely, unless the surface chemistry of the dust changes from a dielectric to a conductor. Our findings are not in conflict with our current understanding of comet formation and evolution, which begin with the accumulation of condensates in the solar nebula and follow with the formation of a dust mantle in the inner solar system.

SEIS, InSight' s seismometer, is monitoring Mars' seismic activity and noise since January 2019 and its installation with a Wind Shield protection has been completed in early February, 2019. We present here results and findings after the first year of monitoring

During the first part of the night, Mars is extremely quiet. Seismic noise is ~500 times lower than Earth' s micro-seismic noise between 4-30 seconds, with ground velocity below 10^{-10} m/s/$Hz^{1/2}$ at 2.5 seconds. The recorded seismic noise increases during the second part of the night and then during the day due to ground deformations induced by convective vortices and ground transferred wind-generated lander noise. During these noisy times, pressure data shows significant coherency with the recorded seismic signals and can therefore be used to perform noise decorrelations.

The subsurface below the landing site has been constrained with seismic signals from dust-devil-like vortices, long period atmospheric signals and from the hammering of the Heat Flow and Physical Properties (HP^3). These analysis reveals a 2-3 meters of very low rigidity materials, possibly associated to eaolian deposition in a eroded crater above more rigid layers. The subsurface is also constrained by shallow site effects, generating ground resonances.

We recorded 389 events until December 31, 2019, with mostly two distinct populations of seismic: mostly small-magnitude events with High or Very high frequencies, and more than 30 Low frequency or Broadband events with signals at and/or below 1 Hz. These have the signature of Marsquakes of magnitude 3-4 located near the crust-mantle interface and with waves propagating at different depths in the mantle. The two larger events are near the Cerberus Fossae system, and preliminary focal inversions have been found to be coherent with the local tectonics, as constrained from remote sensing data.

©2020. Japan Geoscience Union. All Right Reserved.

The three largest quakes detected until September 2019, on sols 128, 173 and 235 have been used for crustal analysis. Receiver function analysis suggested a 8 to 11 km thick superficial layer of highly altered and/or fractured crustal material and multi-scattering analysis constrained the crustal diffusivity and intrinsic attenuation using and find a crustal seismic attenuation ~3 times larger than on the Moon suggesting a crust with small amounts of volatiles.
All data and Activity catalogue of SEIS are available to the community through request on the SEIS data portail (http://seis-insight.eu), IRIS-DMC or NASA PDS.

We re-define time-reversal inversion (back projection) operator that can infer the source location. When we have a good coverage of seismic stations and a robust knowledge on the structure, a classical time-reversal, which cross-correlates observed data and synthetic Green’s functions should work. Due to a poor configuration of one-station seismology in InSight project, however, we need to explicitly include the inverse of the full Hessian matrix in order to detect quakes. We have proven this with synthetic tests using 1D Mars models with/without regolith layers on the top of the planet with an explosion source exerted on the surface. We then applied this method to the real data, especially that of “A” quality, with a set of vertical Green’s functions with an explosion source on the surface in order to roughly estimate the distance, which matches the catalog given by the Marsquake Service. We then extend this method for refining the solution using Green’s functions for all the components.

[P-PS05] Planetary Seismic Exploration-From InSight and Apollo to Future Missions-

convener:Taichi Kawamura(Institut de Physique du Globe de Paris), Takeshi Tsuji(Department of Earth Resources Engineering, Kyushu University), Ralph Lorenz(Johns Hopkins University Applied Physics Laboratory), William Bruce Banerdt(Jet Propulsion Laboratory)

Given that seismic exploration is one of the most successful approach to study the internal structure of planetary bodies, it has been proposed to various planetary missions. Starting from Passive Seismic Experiment on Apollo missions, various seismic experiments were proposed over the next 50 years. Recently, several such proposals have been approved and thus we are entering a new active era of planetary seismology. In early 2019, the NASA InSight Lander successfully deployed the first seismometer on the surface of Mars and detected the first Marsquakes. In addition, recent global interest in lunar exploration has rekindled interest in a new seismic network on the Moon. In-situ resource utilization is being intensively discussed and seismic exploration has been investigated as an approach to search for subsurface water/ice. Finally, the Dragonfly mission was selected as NASA's next New Frontiers mission and a set of short period seismometers is being considered for its payload. With such a diversity of on-going and future missions, the next decade should see significant advances planetary seismology. The aim of this session will be to discuss the latest planetary seismology discoveries and possible future exploration and developments in this field. In terms of recent discoveries, the focus will be on analyses of InSight seismic data from Mars as well as results from other missions. The session will also include discussion on future missions, both selected and proposed. These include the active seismic experiment on the Japanese Lunar Resource Prospector mission and the seismic experiment on NASA's Dragonfly. Though planetary seismology has a long history dating back to the Apollo era, the associated research community is relatively immature due to the nearly 50-years gap in new data. We propose this session to provide opportunity to bring together scientist working on related topics and encourage discussion and collaboration for future development of this theme.

Beginning in 1969, NASA’s Apollo program successfully deployed a long-lived network of seismometers on the Moon. The resulting seismic data revolutionized our understanding of the Moon's interior. In the intervening years, re-examination of Apollo geophysical data and sample analyses combined with a wealth of new data from orbital missions have led to an understanding of a crust, mantle, and core that are likely spatially and compositionally heterogeneous at scales ranging from microscopic to hemispherical, reflecting the Moon’s unique formation history and subsequent evolution.

The structure of the Moon’s interior is elucidated primarily via seismology, with gravity, heat flow, laser ranging, and electromagnetic sounding providing supporting indirect constraints. A passive seismic experiment was deployed on the lunar near side at the Apollo 12, 14, 15, and 16 sites, and operated continuously from 1969 to 1977. Due to the highly scattering nature of the lunar regolith and the overall quality of the instrumentation compared to modern seismometers, lunar seismograms are of limited quality compared to their terrestrial counterparts. Crustal thickness estimates have decreased over the years as newer and more computationally expensive techniques have been applied. Early models based on arrival time inversion alone were supplanted by newer models using maximum likelihood estimates, joint seismic and gravity inversion, and free oscillations. These newer models mostly agree that the only major discernable discontinuity in the lunar interior is the crust-mantle boundary located around 30km deep.

Uncertainties in deep structure estimates afforded from other geophysical measurements are reflected in the seismic structure models. Although many types of naturally occurring seismicity were recorded, no seismic energy originating from the far side penetrated the core, thus it was suggested that the core is likely attenuating. The deepest moonquake sources lie between ~1200-1400km depth, so the core is likely no more than 300-500km in radius.

Previous studies of the Apollo seismic data focused on structure constrained by direct arrivals, meaning they were only able to resolve structure to the depth of the deepest ray connecting a source to a receiver. The geographical extent of the Apollo array, all located around the equator on the nearside, precluded the constraint of any core structure based on direct ray geometry. Two groups have re-analyzed the seismic data looking instead for core reflections, and separately discovered convincing evidence for the presence of a liquid lunar core. One of these also constrained a solid inner core on the basis of the lack of observed SH reflections (horizontally polarized shear waves), and a partially molten layer at the base of the mantle on the basis of observed P reflections (vertically polarized compressional waves). The presence of a fluid-like transition layer between the lunar core and mantle suggests the Moon may still be undergoing cooling. Numerous studies have since emerged offering differing perspectives on the origins of the partial melt layer and whether it is required to satisfy available constraints.

Despite recent advances in lunar seismology, many questions remain regarding the detailed global structure of the Moon’ s deep interior, which has bearing on its thermal, petrological, and rotational history. To build upon the legacy of Apollo, the U.S. National Academies recommends a Lunar Geophysical Network as a prioritized mission in the current planetary decadal survey. A network of four nodes (each with a seismometer, heat flow probe, retroreflector, and magnetometer), operating continuously for up to10 years, would enable progress towards a consistent model of the Moon’ s interior from crust to core.

VBB on the Moon: Expected performances and science return

*Tanguy Nebut[1,2,3], Philippe Lognonne[1,3], Sébastien de Raucourt[1,3], Taichi Kawamura[1,3], Gabriel Pont[4], Taoufik Gabsi[1,2,3], Sylvain Tillier[1,2,3], Olivier Robert[1,2,3], Michel Parise[1,2,3]

1. Institut de Physique du Globe de Paris, 2. CNRS, 3. Université de Paris, 4. CNES

The SEIS VBB, InSight's Very Broad band seismometer, is monitoring Mars' seismic activity and noise since January 2019 and its installation with a Wind Shield protection has been completed in early February, 2019. During the first part of the night ground velocity below 10^{-10} m/s/Hz$^{1/2}$ at 2.5 seconds have been shown, about one order of magnitude below the self-noise of the companion SP instrument, showing the importance of low self-noise and well installed instruments in planetary seismology.

By using the VBB technology, we shows that different configuration of instrument can be proposed. The more simple will be a vertical VBB, which can be used from the spare units of the InSight SEIS experiment, and can be available for very early opportunities prior 2025. Much better will be oblique, 3 axis VBB, designed for the lunar gravity. We detail here the expected performances of these Lunar version of the VBB (3 10^{-11} m/s^2/Hz$^{1/2}$ between 0.02Hz and 1Hz), which can be considered for near future Lunar investigations, either deployed by robotic missions or by human deployed Autonomous surface package.

These performances are about 10 times better than Apollo and will allow addressing several seismic investigations never performed on the Moon. We focus on the detection capabilities of Deep Moon Quakes, Impacts and Shallow Moonquakes, including for surface waves and address what could be observed, including core phases, lunar seismic noise and impacts signals.

We finally conclude by discussing expectations at very long periods, for the detection of free oscillations excited by the largest events and discuss possible improvements made with optical sensing.

Seismic wave propagation on asteroid Ryugu induced by the impact experiment of the Hayabusa2 mission

*Gaku Nishiyama[1], Taichi Kawamura[2], Noriyuki Namiki[3], Benjamin Fernando[4], Kuangdai Leng[4], Takanao Saiki[5], Hiroshi Imamura[5], Yasuhiko Takagi[6], Kei Shirai[5], Masahiko Hayakawa[5], Chisato Okamoto[7], Hirotaka Sawada[5], Yuichi Tsuda[5], Kazunori Ogawa[5], Masahiko Arakawa[7]

Recently, multiple space exploration missions have revealed that asteroids are affected by active surface renewal. Such mass movement has also been observed on 162173 Ryugu, which was explored by the Japanese spacecraft Hayabusa2 from June 2018 to November 2019. While there are several processes that can account for both lateral and vertical mass transport of asteroid regolith, the most plausible hypothesis has been global vibration, that is, impact-induced seismic shaking. The Hayabusa2 was expected to observe such impact-induced seismic shaking through the Small Carry-on Impactor (SCI) operation based on previous numerical simulations and laboratory experiments which suggest that the energy of this impact experiment is high enough to generate boulder movement around a newly formed crater. In April 2019, the SCI operation was successfully conducted and provided surprising images of crater ejecta taken by a Deployable CAMera 3 (DCAM3). Later, the Hayabusa2 Optical Navigation Camera (ONC) took an image of the periphery of the SCI crater in order to compare it with the image taken prior to the SCI impact. The images show that the impactor made a crater of about 13 m in diameter, but boulders located around the edge of the crater appear unmoved by the seismic waves supposedly produced by the SCI impact. Aiming to explain this unexpected observation, we conduct seismic wave propagation modelling with a wide range of elastic parameters of Ryugu.

Using a fast modelling code for 3D seismic wave propagation, AxiSEM3D, we numerically simulate seismic shaking on asteroids, changing rigidities, quality factors and seismic efficiencies (the conversion ratio of impactor’s kinetic energy to seismic wave energy). Following previous studies, an isotropic seismic moment tensor of explosion form is assumed. Through the comparison between simulations and observations, we find that quality factor smaller than 0.5 or seismic efficiency smaller than 10^{-7} are required. However, such an extremely low quality factor seems unrealistic because anelastic heat generation and scattering in anhydrous asteroid regolith are expected to be too small to reduce wave energies rapidly. Thus, we consider very low seismic efficiency more plausible. The reason for such a low seismic efficiency can be resulted from the powdery behavior of regolith. Seismic waves propagate through powdery materials only if the elastic stress is lower than its yield strength. Assuming that the yield strength of regolith is 1 kPa as laboratory experiments, calculated boulder’s lateral movement would be always smaller than 1 m. This hypothesis may account for the absence of regolith lateral movement observed in the SCI operation during the Hayabusa2 mission and indicate that the low yield strength of regolith possibly limits the seismic wave propagation on asteroids, making the apparent seismic efficiency small.

[P-PS06] Science of Venus: Venus Express, Akatsuki, and beyond

convener:Takehiko Satoh(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Kevin McGouldrick(University of Colorado Boulder), Hideo Sagawa(Kyoto Sangyo University), Thomas Widemann(Observatoire De Paris)

In this century, our knowledge about the earth's twin sister, Venus, has greatly been advanced through two latest missions, ESA's Venus Express and JAXA's Akatsuki. The latter, in Venus orbit since December 2015, is providing high-quality data that allow studies of atmospheric dynamics in particular. Successful missions are the trigger of ideas of new missions (Russian Venera-D and Indian Shukrayaan-1 under development, European EnVision, and some US proposals). This session invites papers of the new results from data (spacecraft and ground-based), latest results of theoretical and numerical works, and descriptions of new missions as well.

Akatsuki is the first Japanese Venus orbiter, which was launched in 2010. After the Venus orbit insertion (VOI) in 2015, a lot of images have been taken by the cameras onboard Akatsuki. Lower and middle clouds in the nightside are imaged by 2-μm infrared camera (IR2). Cloud top in the dayside is imaged by the ultra violet imager (UVI). Temperature at the cloud top level is measured by a longwave infrared camera (LIR). UVI and LIR have been working for 4 years after the VOI, but IR2 has ceased its observation about one year after the VOI due to its malfunction of the electronics. Total numbers of the UVI, LIR and IR2 images are different among them; 17,306, 31,444 and 3,201, respectively. Akatsuki observes the Venus atmosphere at different altitudes, local times, and latitudes, then we come close to understanding the Venusian atmospheric dynamics. However, we have to say that the knowledges in the cloud layer are not enough. We need to plan a follow up Venus mission to get more information from the Venusian atmosphere. Now Russia is planning Venera-D mission, and the European scientists are proposing EnVision mission to ESA. Japan should also follow up Akatsuki with a new mission which has the same designed cameras onboard Akatsuki. This leads to the creation of an international Venus observation network.

We are considering that two small probes put at the Lagrange 1 and 2 points of Venus, which is located almost 10^6 km from its dayside and nightside. This idea is inspired by Limaye and Kovalenko [2019][1]. From Lagrange 1(2) point, the dayside (nightside) hemisphere can be always observed. The radius of the Lissajous orbits depends on the delta-V which is required in the insertion. We assumed that the observation phase angle is 25 degrees and estimated total delta-V (for the orbit maneuver to Venus and L1(2) Lissajous orbit insertion) as 720 m s^{-1}.

One idea is to use JAXA’s Epsilon launcher. Epsilon launch vehicle of JAXA is expected to launch 200-250 kg mass to Venus. Then the weight of each probe is about 100 kg, and the required fuel (monopropellant) for the delta-V is estimated to be 36 kg. Assuming 10 kg for the science payload, remaining mass of 54 kg can be used for the bus system including the propulsion, telecommunication, etc. Other possibilities inserting two probes to Lagrange points of Venus, e.g. using H3 launch vehicle or others, should be investigated.

EnVision M5 Venus Orbiter Proposal

*Thomas Widemann[1], Colin Wilson[2], Richard Ghail[3], Dmitri Titov[4]

1. Observatoire de Paris, F, 2. Oxford University, UK, 3. Royal Holloway London, UK, 4. ESTEC, NL

EnVision [1,2] is a Venus orbiter mission that will determine the nature and current state of geological activity on Venus, and its relationship with the atmosphere, to understand how and why Venus and Earth evolved so differently. It is a candidate for ESA' s M5 Space Science mission, with strong NASA participation. It is currently in Phase A study; Wnal mission selection is expected in June 2021. If selected, EnVision will launch by 2032 on an Ariane 6.2 into a six month cruise to Venus, followed by aerobraking, to achieve a near-circular polar orbit for a nominal science phase lasting at least 4 Venus days (2.7 Earth years).

The **Synthetic Aperture Radar, VenSAR,** will:

- Obtain images at a range of spatial resolutions from regional coverage to images of targeted localities
- Measure topography from stereo and InSAR observation;
- Characterize volcanic and tectonic activity, estimate rates of weathering and surface alteration; and
- Characterize surface mechanical properties and weathering through multi-polarisation radar, and emissivity mapping.

The **Subsurface Sounder, SRS,** will:

- Characterize the vertical structure and stratigraphy of geological units including volcanic bows; and
- Determine the depths of weathering and aeolian deposits.

The **Venus Spectrometer suite, VenSpec**, will:

- Obtain global maps of surface emissivity in Wve wavelength bands in the near-infrared, to constrain surface composition and inform evolution scenarios; and
- Measure variations of SO2, SO and linked gases in the mesosphere, in order to link these variations to tropospheric variations and volcanism.

The **Radio Science & Geodesy** investigation will:

- Constrain crustal & lithospheric structure at Wner spatial scale than Magellan; and
- Measure spin rate and spin axis variations to constrain interior structure.

EnVision will produce a huge dataset of geophysical data of a quality similar to that available for Earth and Mars, so will permit investigation across a large range of disciplines. Lab-based and modelling work will also be required to interpret results from the mission. We therefore invite scientists from across planetary, exoplanetary and earth science disciplines to participate in the mission preparation and analysis of the data.

Improving Venus gravity field with the Envision candidate mission

*Pascal Rosenblatt[1], Caroline Dumoulin[1], Jean-Charles Marty[2], Antonio Genova[3]

1. Laboratory of Planetology and Geodynamics, 2. CNES/GRGS, 3. Sapienza Rome University

The gravity field of Venus is merely known from tracking data of two spacecraft: Magellan and Pioneer Venus Orbiter. It shows highly variable resolution preventing the detection of possible lateral variations of the lithospheric and crust thicknesses and the precise knowledge of the size and state of the core. The EnVision mission, which is ongoing selection at ESA, offers the opportunity to improve the current solution of the gravity field of the planet. Precise Doppler tracking data of the spacecraft are indeed foreseen to be performed during telemetry slots of the payload instrument data, providing at least 7 hours of effective tracking per day. This tracking will use the Ka-band carrier frequency, which allows less noisy Doppler data than in X-band (Magellan data). In this study, simulations are performed to assess the expected improvement of the gravity field solution, taking into account a realistic Doppler noise budget and the misleading of the knowledge of the full dynamics of the spacecraft motion. Preliminary results show that a spatial resolution better than 200 km can be reached over the southern hemisphere when the spacecraft altitude is lower than 300-350 km, thus allowing to fill the major gaps in the resolution of the current solution. The precision on the potential tidal Love number k2 allows to better constrain the size and state of the core. The improvement would also allow to investigate more tiny gravity variations due to the mass transfer in the atmosphere related to the thermal tides in the atmosphere.

Crustal recycling and the history of magmatism in Venus

*Masaki Ogawa[1]

1. Division of General Systems Studies, Graduate School of Arts and Sciences, University of Tokyo

Magmatism cannot continue long in a planet where the lithosphere behaves as a stagnant lid and mantle convection occurs only beneath it, because magmatism extracts the heat producing elements (HPEs) that cause the magmatism itself from the mantle to form the crust. In a planet like the Earth and Venus where magmatism is active even today, therefore, there must be some agents that have recycled the crust. On the Earth, the crust recycles by subduction of tectonic plates. In Venus, however, evidence for crustal recycling has not been identified. The two-stage mantle evolution model that I developed for Venus based on a numerical simulation of coupled magmatism-mantle convection system suggests that the crust recycled on the earlier stage owing to mantle bursts: the solid-solid phase boundaries at the top of the lower mantle make the upward convective flow of hot lower mantle materials into the upper mantle episodic, and each episode of convective flow, or mantle burst, causes a vigorous magmatism that forms the tessera terrain and induces crustal recycling. On the later stage, however, mantle bursts cease due to decay of HPEs. Instead, melting in the uppermost mantle continuously generates magma that overlays tessera terrain to form the volcanic plain; there will be no crustal recycling on the later stage. Search for vestiges of past crustal recycling in tessera terrain is important for understanding the history of Venus.

Constraining the Formation of Venus with N-body simulations of Terrestrial Planet Formation

*Patryk Sofia Lykawka[1], Takashi Ito[2]

1. School of Interdisciplinary Social and Human Sciences, Kindai University, 2. National Astronomical Observatory of Japan

One of the most difficult challenges in planet formation theory is to reproduce the orbits and masses of the terrestrial planets Mercury, Venus, Earth, and Mars. Here, we investigated terrestrial planet formation by performing extensive N-body simulations of primordial protoplanetary disks representative of typical models in the literature. Those disks consisted of embryos and planetesimals placed up to ~1-4 au (depending on the disk model).

We used our classification algorithm to identify the systems that formed planet analogs of Venus and Earth (in terms of orbit and mass) plus Mercury or/and Mars in the same system. From the analysis of the terrestrial planets formed in such 3- or 4-planet system analogs, we acquired detailed information about the formation and evolution of our identified Venus analogs. In particular, we obtained a-e-i-mass distributions, feeding zones, delivery of water/volatiles, number of giant impacts, accretion histories, and other properties about Venus analogs.

In this presentation, we also discuss the dependence of the results on the initial conditions, which allowed us to discuss the conditions that a protoplanetary disk must satisfy in order to form simultaneously the four terrestrial planets.

VERITAS: Discovering the Secrets of a Lost Habitable World

*Suzanne E Smrekar[1]

1. Jet Propulsion Laboratory

Magellan almost 30 years ago along with the Venus Express and Akatsuki missions to Venus have done much to elucidate to geologic and atmospheric processes operating at Venus. Yet, basic questions remain informed by these prior investigations about the most Earth-like planet in terms of size, bulk composition, and stellar energy. Answers to these questions for Venus have profound implications beyond Venus to understanding how rocky planets evolve and what makes them habitable.

Geologic processes on Venus are a missing link for rocky planet evolution. Its present condition is a geodynamic analog for early Earth, when the lithosphere was hotter and thinner, plate tectonics began, and life emerged. In turn, plate tectonics led to continent formation. Earth no longer retains a clear record of how these processes began, but Venus may have active subduction—the necessary first step to initiate plate tectonics. Venus is the control case to Earth for determining what conditions give rise to these fundamental processes, thus enabling their prediction for exoplanets.

The proposed VERITAS (Venus Emissivity, Radio science, InSAR, Topography, And Spectroscopy) mission to the NASA Discovery 2019 is structured around 18 science questions designed to understand the processes that led to Venus' current geologic state and determine what processes are geologically active. VERITAS is equipped with an interferometric synthetic aperture radar to acquire high resolution imagery and topography as well as make repeat pass interferometric deformation measurements. It is also equipped with a near IR spectral imager with optimized spectral bands for observing the surface of Venus that supports the determination of igneous rock type and the search for active and recent volcanism. The low Venus orbit of the VERIATS spacecraft supports major improvements in the determination of the Venus gravity field as well as determination of the tidal Love number and phase lag leading to a refined understanding of the Venus interior and assessment of core size and state. This talk provides an overview of its science objectives, measurements and mission profile.

This research was partially conducted at the Jet Propulsion Laboratory, California Institute of Technology, under contract with the National Aeronautics and Space Administration.

Wavelet analysis of gravity wave packets in Venus' atmosphere using radio occultation temperature profiles

Ryota Mori[1], *Takeshi Imamura[1], Hiroki Ando[2], Bernd Hausler[3], Martin Patzold[4], Silvia Tellmann[4]

1. Graduate School of Frontier Sciences, The University of Tokyo, 2. Faculty of Science, Kyoto Sangyo University, 3. Universitat der Bundeswehr Munchen, Germany, 4. Universitat zu Koln, Germany

Atmospheric gravity waves are thought to play crucial roles in transporting momentum and energy in planetary atmospheres. They are frequently observed as localized quasi-monochromatic wave packets in cloud images, while the vertical structures of the wave packets have not been investigated. The wavelengths and the periods of the wave packets should reflect their respective generation processes. Though wave packets are thought to propagate independently, they can be superposed on each other to induce an unstable field. The statistical characteristics of wave packets need to be known to understand the roles of the waves in the development of the atmospheric structure.

We study the characteristics of gravity wave packets in Venus' s atmosphere using high vertical resolution temperature profiles obtained by Venus Express and Akatsuki radio occultation experiments with radio holographic methods. Localized disturbances are extracted by applying wavelet transform to the vertical temperature distributions. The analysis showed that (1) wave packets having different wavelengths are overlapped with each other, (2) each wave packet typically includes 2-3 cycles, (3) waves with vertical wavelengths of ~1 km are dominant,(4) individual wave packets are hardly saturating in isolation, while saturation occurs as a result of superposition of wave packets, and (4) short-vertical wavelength waves are more frequently observed at lower altitudes.

Cross-link Radio Occultation measurements of Venus Atmosphere by using multiple small satellites

*Hiroki Ando[1], Satoshi Ikari[2], Takeshi Imamura[3], Tomotaka Yamamoto[2], Yosuke Kawabata[2], Shoko Sano[2], Norihiko Sugimoto[4], Masahiro Takagi[1], Hideo Sagawa[1], Yukiko Fujisawa[4], Mutsuko Morimoto[4], Mirai Abe[5], Asako Hosono[6], Ryu Funase[2]

By imaging measurements using a spectrometer onboard Venus Express and a camera onboard Akatsuki and ground-based observations using a telescope, the knowledges about the Venusian atmospheric structure in the horizontal direction are steadily being accumulated by imaging measurements using a spectrometer onboard Venus Express, a camera onboard Akatsuki and ground-based observations using a telescope. However, they enable us to observe only the atmosphere at the specific altitude. On the other hand, the progress of modelling studies using GCM is also remarkable, but we cannot confirm the validity of modelling results sufficiently; the optical measurements can only observe the atmospheric structure at the cloud level, and then we cannot compare the modelling results with them globally. In particular, the knowledges about the vertical structure are insufficient.
Radio occultation measurements are usually conducted concurrently with optical measurements. Radio waves are transmitted from the spacecraft, refracted in the planetary atmosphere, and received at a ground station. From the measured atmospheric Doppler shift, we can obtain a vertical temperature profile with a high accuracy (measurement error ~ 0.1 K) and a high vertical resolution (~1 km). Therefore this method is useful for us to investigate the atmospheric structure in the vertical direction. However, the observational region and chance are limited because such a conventional radio occultation measurement highly depends on the configuration of the spatial positions of a spacecraft, a planet and the Earth. In the case of a conventional radio occultation measurement, however, the observational region and chance are limited by the orbit of a spacecraft and the spatial positions of a spacecraft, a planet and the Earth. One of the methods to overcome this weak point is a cross-link radio occultation technique among the multiple spacecraft.
We consider the cross-link radio occultation measurements of the Venus atmosphere by using multiple small satellites, one main satellite and two sub satellites, in terms of both engineering and science. It is assumed that they are conducted by one main satellite and two sub satellites. As a result of the trade-off between the fuel consumption for based on Venus orbit insertion and orbit transfers for the optimal satellite configuration and the number of observation points, it is expected that the number of measurements would be 179 in the rotation period of Venus super-rotation (4 Earth days) and the observation points could distribute globally. This enables us to obtain four-dimensional data of temperature and pressure. If the submillimeter, ultra-violet and infrared imaging measurements were also conducted, we would investigate the cloud physics and the photochemistry as well as the atmospheric structure and dynamics. In addition, we might be able to create a more precise Venusian meteorological model by using a data assimilation technique. In this presentation, we are going to talk about the current status and the future prospect of this conceptual study.

Determination of the homopause altitude on Venus from SOIR/VEx observations

*Arnaud Mahieux[1,2], Hiromu Nakagawa[3], Nao Yoshida[3], Ann Carine Vandaele[1], Roger Yelle[4], Sé verine Robert[1], Shohei Aoki[1,5], Arianna Piccialli[1], Loïc Trompet[1], Yasumasa Kasaba[3]

SOIR was an infrared echelle spectrometer on board the ESA Venus Express mission (2006-2014) (Nevejans et al., 2006). It performed solar occultations of the Venus mesosphere and thermosphere in the 2.2 to 4.4 μm range (Mahieux et al., 2008). It studied both sides of the terminator and the database covers all latitudes. Its very high spectral resolution (~0.2 cm^{-1}) and spectral sampling (~0.04 cm^{-1}) resolved the ro-vibrational lines of the atmospheric gases. Vertical profiles were retrieved from the spectra. SOIR was sensitive to the main species absorbing in the upper atmosphere (Vandaele et al., 2016): CO_2 (Mahieux et al., 2012), CO (Vandaele et al., 2015), H_2O (Chamberlain et al., 2020), HCl, HF (Mahieux et al., 2015c), SO_2 (Mahieux et al., 2015b), and the aerosols (Wilquet et al., 2012). Considering the CO_2 vertical profiles calculated from the SOIR measured spectra and the hydrostatic equilibrium, we could calculate the kinetic temperature profiles (Mahieux et al., 2015a).

The homopause is an altitude region separating the homosphere and the heterosphere. In the homosphere, eddy diffusion exceeds molecular diffusion, such that all the gases are all well mixed. Their vertical distribution all have the same scale height. In the heterosphere, the opposite occurs, and gases are not well mixed anymore. Consequently, each species follows its own scale height, function of the species' molecular weight.

In this work, we present computations of the mean homopause altitude at the terminator based on the CO and CO_2 simultaneously measured number density profiles, and the corresponding temperature profiles. We found out that it is located at a pressure level of 10^{-4} mbar (~120 km). The results are compared to a 1D vertical diffusion code, which accounts for eddy and molecular diffusions.

Long term monitoring of planetary scale temperature variations at the cloud top level of Venus by Akatsuki/LIR observations

*Toru Kouyama[1], Masataka Imai[1], Takeshi Horinouchi[2], Takeshi Imamura[3], Makoto Taguchi[4], Tetsuya Fukuhara[4]

1. National Institute of Advanced Industrial Science and Technology, 2. Hokkaido University, 3. University of Tokyo, 4. Rikkyo University

Since Mariner 10 observation in 1970s, planetary-scale (wavenumber 1) transient waves have been frequently observed at the cloud top level of Venus in both UV albedo and wind speed variations. The typical periods of the wave propagation around Venus are 4-days, which is faster than the super-rotation of Venus at the cloud top, and 5-days, which is slower. Due to the characteristics of their faster or slower propagation speed than the super-rotation, these waves have been considered as Kelvin and Rossby waves. It has been known that the appearances of the Kelvin and Rossby waves are not permanent, and recently it was confirmed that one cycle of increasing and decreasing of a wave amplitude was ~100 days derived from the ultraviolet imager (UVI) onboard Akatsuki (Imai et al., 2019). From these observational evidences, the wave activities are different at different periods, and such variation of wave activity potentially affects the temporal variation of the super-rotation at the cloud level, because these waves can transport atmospheric momentum vertically through their propagation. Therefore, it is worth to confirm typical time scales of the wave life-cycles from observations for assessing temporal variation of atmospheric momentum transportation in Venusian atmosphere.

In this study, we used images obtained by the longwave infrared camera (LIR) onboard Akatsuki from September 2016 to December 2019. The LIR can observe both dayside and night side regions of Venus equally, because the LIR captures thermal emission from the cloud top level of Venus (~70 km). LIR dataset has less observation gaps that is suite for monitoring temporal variations of waves. To extract wave signatures, we performed a periodical analysis with Lomb-Scargle periodgram and used a sliding window method proposed in Imai et al. (2019) in which we set a 40-day window for each analysis. From the result, both 4-day and 5-day wave signatures were confirmed, and their life-times were basically 100 - 200 days. In addition, by averaging the temperature field from the LIR data with a consideration of the 4-day propagation, a horizontal structure of Kelvin-wave like temperature perturbation was also confirmed.

We describe the dayside cloud top structure of Venus as retrieved from 93 images acquired at a wide variety of solar phase angles (0–120 deg) using the 2.02-μm channel of the 2-μm camera (IR2) onboard the Venus orbiter, Akatsuki, from April 4 to May 25, 2016. Since the 2.02-μm channel is located in a CO_2 absorption band, the sunlight reflected from Venus allowed us to determine the cloud top altitude corresponding to a unit aerosol optical depth at 2.02 μm. First, the observed solar phase angle dependence and the center-to-limb variation of the reflected sunlight in the region equatorward of 30 deg were used to construct a spatially averaged cloud top structure characterized by cloud top altitude , Mode 2 modal radius , and cloud scale height , which were 70.4 km, 1.06 μm, and 5.3 km, respectively. Second, cloud top altitudes at individual locations were retrieved on a pixel-by-pixel basis with an assumption that and were uniform for the entire planet. The latitudinal structure of the cloud top altitude was symmetric with respect to the equator. The average cloud top altitude was 70.5 km in the equatorial region and showed a gradual decrease of ~2 km by the 45 deg latitude. It rapidly dropped at latitudes of 50–60 deg and reached 61 km in latitudes of 70–75 deg. The average cloud top altitude in the region equatorward of 30 deg showed negligible local time dependence, with changes up to 1 km at most. Local variations in cloud top altitude, including stationary gravity wave features, occurred within several hundreds of meters. Although long zonal or tilted streaky features poleward of ~45 deg were clearly identifiable, features in the low and middle latitudes were usually subtle. These did not necessarily appear as local variations at the cloud top level, where mottled and patchy UV patterns were observed, suggestive of convection and turbulence at the cloud top level.

Variability of UV albedo and its relation to the wind field revealed by Akatsuki UVI

*Tatsuro Iwanaka[1], Takeshi Imamura[1], Yeon Joo Lee[2], Takeshi Horinouchi[3]

1. The Univesity of Tokyo, 2. Technical University of Berlin, 3. Hokkaido University

Venus is entirely covered by optically thick clouds that play essential roles in the Venus' climate system. The cloud consists of H_2SO_4 aerosols, and H_2SO_4 is produced from SO_2 photochemically. SO_2 is abundant in the lower part of the cloud layer and in the subcloud region (Bertaux, 1996), and is thought to be transported to the cloud top in the sulfur cycle (Mills et al., 2007), although the dynamical processes responsible for the transport are not well understood. The purpose of our study is to confirm that SO_2 is supplied from the lower atmosphere to the cloud top where it is lost via photochemical reactions and to analyze how the stationary planetary-scale circulation and time-varying disturbances contribute to the SO_2 transport. The horizontal divergence calculated from the cloud-tracked wind (Ikegawa & Horinouchi, 2016, Horinouchi et al., 2017 and Horinouchi et al., 2018) is considered as an index of vertical flow. The 283-nm radiance, which is subject to SO_2 absorption, measured by Akatsuki UVI (Yamazaki et al., 2018) was converted to UV albedo following the method of Lee et al. (2015) and Lee et al. (2017), and the albedo is considered to be anti-correlated with the amount of SO_2. By comparing the Lagrangian derivative of UV albedo with the horizontal divergence, the relation between the changes of cloud-top SO_2 and the vertical flow was obtained for independent air parcels and the mean field. The results suggest that the supply of SO_2 by the solar-fixed mean flow is attributed to thermal tides and that the amount of SO_2 also responses to transient, localized ascending flows.

[P-PS06] Science of Venus: Venus Express, Akatsuki, and beyond

convener:Takehiko Satoh(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Kevin McGouldrick(University of Colorado Boulder), Hideo Sagawa(Kyoto Sangyo University), Thomas Widemann(Observatoire De Paris)

In this century, our knowledge about the earth's twin sister, Venus, has greatly been advanced through two latest missions, ESA's Venus Express and JAXA's Akatsuki. The latter, in Venus orbit since December 2015, is providing high-quality data that allow studies of atmospheric dynamics in particular. Successful missions are the trigger of ideas of new missions (Russian Venera-D and Indian Shukrayaan-1 under development, European EnVision, and some US proposals). This session invites papers of the new results from data (spacecraft and ground-based), latest results of theoretical and numerical works, and descriptions of new missions as well.

Akatsuki observations show that large bow-shaped features extending about 10,000 km across the equator from the north polar region to the south polar region, whose zonal wavelength is estimated to be several thousand km at the cloud top level in the Venus atmosphere (Fukuhara et al., 2017). It has been pointed out that these features are gravity waves generated by the surface topography, because they stayed above Aphrodite terra for four Earth days without being advected by the atmospheric super rotation. The bow-shaped features have been also observed over Atla regio and Beta regio located in the equatorial region. Interestingly, the features have not been observed over Ishtar terra located in the north pole region. It has been also pointed out that the bow-shaped features are often identified in the late afternoon (Kouyama et al., 2017)

Young et al. (1987, 1994) investigated the vertical propagation of the gravity waves in the Venus atmosphere. Their results show that vertical winds observed by the VEGA-2 balloon could be explained by the gravity waves excited by Aphrodite. It should be noted, however, that the waves which have long zonal wavelength as seen in Akatsuki observations could not propagate up to the cloud layer. Recently, Lefevre et al. (2019) showed that the bow-shaped features could be formed at the cloud top level by the topographic waves by using a three-dimensional numerical model. Yamada et al. (2019) also showed that the gravity waves could reach the cloud top level and form the bow-shaped feature though the waves were excited thermally in their model. Though the topographic waves strongly depend on the zonal wind and the static stability of the atmosphere through which they propagate, the Venus deep atmosphere remains unclear because of the thick cloud covering the whole planet. Therefore, we investigated how the topographic waves depends on the zonal wind and the static stability in the lower atmosphere by using a regional nonhydrostatic model named Cloud Resolving Storm Simulator (CReSS). We modified CReSS for the Venus atmosphere, in which the radiative transfer process is simplified by Newtonian cooling and the solar heating is neglected. The vertical profiles of the zonal wind and the static stability are based on the previous observations. Numerical experiments are carried out by changing these profiles to take into account of their temporal variations and/or uncertainties. The range of zonal wind near the surface is between 1–5 m/s, and that of the static stability between neutral and weak stable stratification, based on Young et al. (1987). The preliminary results show that the vertical winds excited by Aphrodite have zonal and vertical wavelengths of 200-1200 km and 80-160 km, respectively. Though the horizontal wavelength is roughly consistent with the results of Lefevre et al., (2019), it seems that the vertical wavelength is not consistent. The horizonal resolution of 40 km may not be enough for the topographic waves excited by Aphrodite. It may be also interesting that the temperature deviations associated with the topographic waves have zonal and vertical wavelengths of about 1200 km and 20 km, respectively, which are different from those of the vertical winds. We will investigate how the topographic waves depends on the zonal wind and the static stability near the surface.

Akatsuki IR2 camera data restoration towards revealing Venus’s middle cloud properties

*Choon Wei Vun[1], Takehiko Satoh[2,1], Takao M. Sato[3], Takeshi Horinouchi[4]

1. SOKENDAI, 2. ISAS/JAXA, 3. Hokkaido Information University, 4. Hokakido University

Akatsuki IR2 camera utilises 3 filters (1.735, 2.26, 2.32 um) to observe the Venus nightside that probes down to the lower cloud layer (~48-55 km). The IR2 camera nightside observation has been known to suffer contamination from the intense dayside light spread by the camera’s Point Spread Function (PSF). Two restoration processes were developed: Restoration by Subtraction (RS) and Restoration by Deconvolution (RD). This presentation focuses on the RD method where RS method has helped in further calibrating RD procedures. Two main improvements made in the latest RD are: PSF model to include ‘hole’ in the axisymmetry term resembling perfect internal reflection in the PtSi detector substrate , and optical fogging factor caused by fraction of reflection bouncing back by glass surfaces in the camera. During the process of restoration, we uncover the properties of the cloud layer using Radiative Transfer calculations: CO abundances, variability in cloud number density, and aerosol size distributions. In result, we can observe interesting features such as an enormous cloud few thousands km across propagating faster than the background super-rotation on Venus (2016-08-18 data), where this cloud mass has ~20% attenuation compared to the background cloud. To sum, RD method aims at improving the data quality of nightside observations to enable accurate photometric studies for the first time.

Variations of Venus night clouds as observed by Akatsuki/IR2

*Takehiko Satoh[1,2], Choon Wei Vun[2], Takeshi Horinouchi[3], Takao M. Sato[4]

1. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2. Department of Space and Astronautical Science, The Graduate University for Advanced Studies, SOKENDAI, 3. Faculty of Environmental Earth Science, Hokkaido University, 4. Space Information Center, Hokkaido Information University

The near-IR Venus night-side data were analyzed to study the spatio-temporal variations of clouds. The data were acquired by Akatsuki/IR2 during the Orbits 24 (Aug. 16-20, 2016) and 25 (Aug. 26-30, 2016) at 3 wavelengths (1.735, 2.26, and 2.32 um). From a 2.26-um image, contamination from the day-side is cancelled by subtracting the near-simultaneous 2.32-um image (scaled by an appropriate factor, ~1.10). Then, this "cleaned night (**CLN**)" is subtracted from the original 2.26-um image, leaving only "net contamination (**NTC**)" from the day-side. To restore a 1.735-um image to 1.735**CLN**, the 2.26**NTC** is scaled by another factor (~2.7), and subtracted from the 1.735-um image.

The radiance of night-side emission in 2.26**CLN** and 1.735**CLN** can be converted to a scaling factor to describe the total aerosol content in the clouds. We use the cloud model (vertical profiles and mixing ratios of multi-modal particles) from Haus et al. (2015) and use this "cloud multiplication" factor, MF_{cloud}, to increase or decrease the opacity. The differences of two **MFC** maps actually indicate deviations of aerosol composition from that in the model. We have found interesting features in the (2.26**MFC** –1.735 **MFC**) maps: one example is the mid-latitude bright streaks in Orbit 25. The southern streak is less opaque in 2.26 um than in 1.735 um, indicative of concentration of smaller aerosol particles. This is consistent with the numerical simulation by Kashimura et al. (2019) which attributed these streaks as narrow and strong downwelling regions.

Effect of Insoluble Sulfur on the Microphysics of the Sulfuric Acid Clouds of Venus

*Kevin McGouldrick[1]

1. University of Colorado Boulder

Sulfur allotropes have been suggested (Toon et al. 1982) as a possible identity of the unknown short wavelength absorber that is evident in the region of the upper clouds of Venus. That work had examined the effects on the reflected spectrum of Venus from an absorbing core of sulfur allotropes within sulfuric acid cloud droplets. However, Young (1983) pointed out that elemental sulfur is not miscible in sulfuric acid, thus negating that hypothesis. Nevertheless, the chemical arguments made by Toon et al. (1982) for the existence of sulfur allotropes in the upper clouds of Venus remain valid; these particles are likely to interact with the sulfuric acid droplets also known to be present; and amorphous sulfur allotropes still absorb at wavelengths consistent with that exhibited by this unknown absorber. Young (1983) postulated a "gumdrop" scenario in which sulfur allotropes would accumulate on the surfaces of sulfuric acid droplets, like sugar grains on a gelatinous gumdrop. Such a coating will have implications for the ability of Venus cloud droplets to grow via coalescence proesses, possibly resulting in a difference between the size distribution of droplets that have enocuntered amorphous sulfur particles, and those that have not. Here we investigate with a microphysical model the changes in size distribution that would result from such an inhibition of coalescence efficiency due to a coating of droplets with sulfur; and predict whether the modelled differences would be detectable in measurements of reflected sunlight made by the UVI instrument on Akatsuki.

Status of lightning search in Venus

*Yukihiro Takahashi[1,2], Masataka Imai[3], Mitsuteru Sato[1,2], Ralph Lorenz[4], Tatsuharu Ono[1]

1. Department of Cosmosciences, Graduate School of Science, Hokkaido University, 2. Faculty of Science, Hokkaido University, 3. AIST, 4. Applied Physics Laboratory, Johns Hopkins University

The existence of lightning discharge in Venus has been controversial well over three decades, which might be attributed to the luck of conclusive observational evidence. There had been no satellite payload intentionally designed for the detection of lightning phenomena using radio wave or optical sensor. LAC, lightning and airglow camera, on board Akatsuki spacecraft, is the first sensor optimized for the lightning optical flash measurement in planets other than the Earth. Unique performance of LAC compared to other equipment used in the previous exploration of Venus is the high-speed sampling rate at 20 kHz with 32 pixels of Avalanche Photo Diode (APD) matrix, enabling us to distinguish the natural optical lightning flash from other pulsing noises, including artificial electrical noise and cosmic rays. We selected OI 777 nm line for lightning detection, which is expected to be the most prominent emission in CO2-dominant atmosphere based on the laboratory experiments.

We are conducting lightning search in about 40 passes of AKATSUKI with triggering parameter set optimized for the light curve similar to the normal lightning and also sprite type in the Earth. However, we couldn’ t find any lightning signals up to now. The total coverage of the LAC lightning hunt became 96.9 [million km2-hr], meaning 86 percent detectability of previous results with ground-based telescope by Hansell et al. (1995). Here we report the detailed strategy and the latest status of the LAC observation in 2020, and discuss the future observation strategy including ground observation with a high-speed photometer installed at Pirka telescope, a 1.6-m reflector deployed by Hokkaido University.

Searching minor species on Venus atmosphere using the high-dispersion spectra taken by IRTF/iSHELL

*Hideo Sagawa[1], Takao M. Sato[2], Hajime Kita[3]

1. Faculty of Science, Kyoto Sangyo University, 2. Hokkaido Information University, 3. Japan Aerospace Exploration Agency

Venus atmospheric chemistry can be divided into the following categories: photo-chemistry in the upper atmosphere (including the lightning-induced chemistry, if exists), cloud-related chemistry with heterogeneous reactions on the cloud droplets' surface, and thermal-equilibrium chemistry in the hot lower atmosphere. Precise measurements of the atmospheric composition give the fundamental information to understand these atmospheric chemistries. In addition, some of the minor species in Venus' lower atmosphere are considered to play a significant role as the greenhouse gas. Quantitative understanding of the minor species' distribution becomes important also from such a point of view.

The best remote-sensing approach to search for weak signals emitted/absorbed by the minor species is the high-dispersion spectroscopy at the infrared wavelengths. By using at the near-infrared wavelength, the stellar and solar occultation spectrometer SPICAV/SOIR onboard Venus Express has comprehensively obtained vertical profiles of the minor species in Venus' upper atmosphere (> ~70 km) such as H_2O, HDO, CO, SO_2, HCl, HF, and aerosols. The measurements were mostly limited around the morning and evening local times on Venus. Therefore, one of the still remained problem after the SPICAV/SOIR measurements is to understand any local time variability of these species which should be present if they are sensitive to photochemistry. And, any long-scale temporal variation of the minor species' abundance is also the subject to be studied continuously after the finish of the Venus Express mission in 2014. Motivated by these points, we carried out the high-dispersion spectroscopy (spectral resolving power ~ 75,000) of Venus' dayside hemisphere using a newly developed immersion grating Echelle spectrograph, iSHELL, attached to the IRTF 3-m telescope. The data were taken on August 6 –8, 2018 when Venus apparent diameter was 21.7 arcsec. We used three wavelength bands: L3 (3.20 –3.48 um), Lp2 (3.57 –3.95 um) and Lp3 (3.83 –4.18 um) in order to cover the absorption lines of several interested species like H_2O, HDO, HCl, CO_2, etc. The cross-disperser enabled us to measure the entire wavelength range with different dispersion orders within each of these wavelength bands. The derivation of the abundance of the observed species will be discussed in the presentation.

Technological challenges and achievements in Hayabusa2 mission

*Makoto Yoshikawa[1], Yuichi Tsuda[1], Satoru Nakazawa[1], Fuyuto Terui[1], Takanao Saiki[1]

1. Japan Aerospace Exploration Agency

Hayabusa2 is a Japanese second asteroid sample return mission following Hayabusa. The principal purpose of Hayabua2 is science, especially to study organic maters and water at the time of the birth of the solar system, and to study the birth and the evolution of the solar system. In order to do these studies, the technology or engineering is very important. In this talk, we will summarize the technological challenges and achievements in Hayabusa2 mission.

The Hayabusa2 spacecraft was launched on 3 December 2014 and arrived at its target asteroid Ryugu on 27 June 2018. It stayed there until November 2019 for in situ observation and sample collection. Now Hayabusa2 is on the way back to the earth and will return to the earth in November or December 2020. During the stay around Ryugu, the spacecraft performed many descent operations, such as, deploying rovers and a lander, dropping SCI(Small Carry on Impactor) to create an artificial crater, and two touchdowns. The first touchdown operation was performed successfully on 22 February 2019, and the second touchdown was carried out near the artificial crater on 11 July 2019. By these two touchdowns we think we were able to get both the surface materials and the subsurface materials.

Hayabusa2 achieved the world's first seven engineering accomplishments during its stay around Ryugu. They are as follows:
(1) Hayabusa2 deployed small exploration robots on the surface of the asteroid that moved autonomously and corrected information of the asteroid
(2) Hayabusa2 deployed multiple (three) exploration robots on the surface of the asteroid.
(3) Hayabusa2 touched down to the specified point on the surface of the asteroid with accuracy of 60cm.
(4) Hayabusa2 created an artificial crater by releasing SCI(Small Carry on Impactor) and obtained images representing the process of crater creation
(5) Hayabusa2 touched down two different places on the same asteroid Ryugu
(6) Hayabusa2 sampled subsurface material during the process of 2nd touchdown to the proximity of the created crater
(7) Hayabusa2 released multiple objects which could be artificial satellite of the asteroid

In addition to these world's first accomplishments, we have done a lot of technological challenges and achievements. In this talk, we will summarize the technological challenges and achievements, which are very important to obtain scientific data.

The Hayabusa2 spacecraft touched down on the carbonaceous near-Earth asteroid 162173 Ryugu for the first time on 21 February 2019. In the process of the touchdown operation, Hayabusa2 the optical navigation camera (ONC) had taken extremely high-resolution images of Ryugu’s surface and observed its response to the physical disturbances by the sampling projectile collision and thruster gas jets. Based on the touchdown and global observations, we report the nature of the stratigraphy of the surface materials as expressed in the color observations on Ryugu.
The ONC data show that Ryugu’s surface has almost homogeneous reflectance and color at the macro scale, but there is the regional variation in the spectral slope (b-x slope). The bluer materials are distributed at the equatorial ridge and in the polar regions, while the redder materials are widely spread over the mid-latitude regions (Sugita et al. 2019). The latitudinal variation of spectral slope suggests that exposure of Ryugu’s materials to space has led to their reddening by solar heating and/or space weathering. The ONC images obtained during the touchdown showed that a large amount of debris was produced by the impact of the projectile shot from the sampler system and the reaction control system (RCS) thrust immediately after the touchdown, and the entire field-of-view of ONC-W1 was darkened uniformly. Color changes of boulders observed during the touchdown suggest that the dark fine grains originate from the redder materials that covered the boulder surface. The stratigraphic relationship between the identified craters and the redder materials suggests that surface reddening occurred over a short period of time. These results suggest that Ryugu underwent an orbital excursion near the Sun.

Thermal evolution of Ryugu inffered from spectral characterization of experimentally-heated CI carbonaceous chondrite

*Kana Amano[1], Tomoki Nakamura[1], Fumihiko Usui[2], Satoshi Okumura[1], Michael E. Zolensky[3]

1. Tohoku University, 2. Kobe University, 3. NASA Johnson Space Center

Spectral features of C-asteroid Ryugu, the target of the Hayabusa2 mission, are expected to be similar to experimentally-heated carbonaceous chondrites, however no published spectral data of carbonaceous chondrites completely match with that of Ryugu (Kitazato et al. 2019). There are two problems: (1) no meteorite samples show reflectance at visible wavelengths darker than Ryugu, (2) most of the reported spectra of experimentally-heated carbonaceous chondrite samples cannot be compared with asteroidal spectra, because they are severely affected by adsorbed and rehydrated water. Carbonaceous chondrites exhibit a significant absorption feature at around 2.7 μm owing to the presence of hydrated minerals, however, heated samples can easily be contaminated by atmospheric water, which causes an absorption feature at around 2.9 μm.

The present study shows the results of heating experiments of the Orgueil CI carbonaceous chondrite which has experienced extensive aqueous alteration. Orgueil contains Mg-rich phyllosilicates, which suggests that the parent body of Orgueil might have formed at the farther place from the Sun than other carbonaceous chondrites. We analyzed mineral compositions, water contents, and reflectance spectra of the heated samples to evaluate the systematic changes during heating. Reflectance spectra and water contents of the heated samples were measured without exposure to the air to minimize the effects of adsorbed and rehydrated water. An unheated powdered sample of Orgueil was prepared by preheating at <150 ˚C with the purpose of removal of adsorbed water. Powdered Orgueil samples were then heated at 400, 500, 600, 700, and 900 ˚C under vacuum conditions, to demonstrate asteroidal heating processes.

S-XRD analysis provides precise mineralogical characterization of the fine-grained matrix of the samples. The results indicate that the unheated sample contains saponite, serpentine, and magnetite. The decomposition of serpentine occurs in the 500-˚C heated sample, and saponite and secondary olivine coexist in the 600-˚C sample. The 700-˚C heated sample shows reflections from olivine and Fe-Ni metals, and they become well crystalline in the 900-˚C heated sample.

The total water contents of the samples measured by the Karl Fischer titration are recorded as 7.7, 7.1, 3.9, 1.9, 0.9, and 0.5 wt.% for unheated, 400, 500, 600, 700, and 900 ˚C, respectively. Water contents decrease by heating and retained water in the samples corresponds to the amounts and types of remnant hydrated minerals.

The spectroscopic results showed that (1) moderately-heated samples (400, 500, and 600 ˚C) have darker reflectance in the visible region than unheated samples and the reflectance increases in the samples heated at high temperatures (700 and 900 ˚C), (2) the depth of the 2.7-μm absorption band decreases with increasing heating temperature and it disappears at the temperature at which hydrated minerals in the samples completely dehydrate, (3) the peak position of the 2.7-μm band of the heated Orgueil samples is nearly constant, while that of the heated Murchison samples shifts towards shorter wavelengths with increasing heating temperature according to the decrease of the Fe/Mg ratio of the remnants of hydrated minerals in the heated samples (Mogi et al. 2017, METSOC), and (4) the depth of the 2.7-μm band and the water content of the heated Orgueil and other carbonaceous chondrites form a

©2020. Japan Geoscience Union. All Right Reserved.

positive correlation trend.

In this work, the Orgueil sample heated at 500 ˚C provides the best spectral match to Ryugu: it shows very low reflectance (~2%) at visible wavelengths and small absorption feature (~10%) around 2.72 μm. We suggest that Ryugu might have experienced heating and dehydration at a temperature around 500 ˚C, after aqueous alteration, and presently contains a small quantity of hydrated minerals equivalent to 1-2 wt.% of water at the surface.

Morphological and spectral trends among boulders on asteroid 162173 Ryugu: implication for parent body processes

The Optical Navigation Camera onboard the Hayabusa2 spacecraft revealed the abundance of m-scale boulders on a Cb-type asteroid Ryugu [1,2]. The boulder distribution, morphology, and spectrum should be related to the parent body processes and/or the evolutionary processes as a rubble-pile. Especially, the parent body processes on C-type asteroids are important in understanding the hydrothermal activity in primordial planets and the possible source of terrestrial water/organics. Initial reports have suggested a possible trend in boulder spectra and morphologies [1]. Such variety in boulders should partially be a manifestation of the parent body processes. However, the identification of the process responsible for creating the observed variation is not very straightforward. Our purpose is to determine such parent body processes by conducting a detailed investigation of the trend among boulders. In particular, analysis done by [1] cannot distinguish whether the trends reflect the presence of multiple clusters or one broad continuous cluster. Thus, to distinguish these two possibilities, statistical and quantitative analysis based on a thorough boulder counting is performed. Also, boulder spectra are affected by superficial processes, such as space weathering, solar heating, and grain size sorting [3]. The high-resolution images acquired after the initial reports are used to assess such effects. Also, we report new trends in boulder spectra and intra-boulder spectral variation revealed from high-resolution images.

Approximately 100 largest boulders within the range of 40˚N to 40˚S and 260˚E to 340˚E taken at ~0.2 m/pix were used for our analysis. The rims of boulders were marked manually, and spectra were measured within the outlines. Though the resolution of the shape model used for the photometrical correction was ~10-20 times lower than the image resolution, the error in the normalized spectra was confirmed to be small: the error in b-x slope is <~30% the global variation.

Our result show that the red-to-blue trend among boulders follows the spectral transition by heating experiments of CM chondrites with temperatures between 800 and 900 ˚C [4]. The same trend was seen with different observed phase angles, and thus is unlikely to be a manifestation of the phase reddening effect. The possible presence of multiple clusters in the spectral trend was investigated by conducting the k-means classification. The root-mean-square residual of the classification decreased with increasing number of classes, indicating no clear existence of large spectral clusters. This result is consistent with the existence of boulders which underwent different degrees of thermal metamorphism in the parent body. However, a small spectral class consistent with Type 3 boulders [1] exist, which particularly deviates from the thermal metamorphism trend. Also, the brighter half of the boulder population show a smaller size distribution. Thus, the darker boulders exhibit a volumetric preponderance over brighter boulders, which may also inherit the heterogeneity in the parent body.

We found that the power-law exponent of the 2D Fourier amplitude as a function of the spatial frequency could be an index for surface texture of boulders. The unimodal distribution of the exponent also shows

©2020. Japan Geoscience Union. All Right Reserved.

no clear presence of morphological clusters. Thus, the rugged morphologies are consistent with a genomict-type breccia, which indicates a well-mixed nature of the material at the timing of brecciation (e.g. impact melting, cementation under aqueous environments).

High resolution imaging of the boulders revealed the spectral variation within individual boulders. These variations tend to be associated with different facets. Similar color variation was previously reported for the largest boulder Otohime [1]. By calculating the direction of the bluer facet for each boulder, we found that bluer facets are likely to be directed toward the equator. This is consistent with the preferential vulnerability to space weathering and/or thermal degradation/exfoliation of facets facing a certain direction.

We conclude that majority of boulders on Ryugu exhibit a spectral and morphological trend within a single continuous cluster. The trend may have originated from boulders with different degree of thermal metamorphism together with the genomict-type brecciation processes on the parent body. In addition, observed intra-boulder spectral variation suggests superimposition of space weathering effects.

Time-dependent spectroscopic and mineralogical changes by heating of Murray CM chondrite

*Yuri Fujioka[1], Tomoki Nakamura[1], Kana Amano[1], Shiho Kobayashi[1], Aki Takigawa[2]

1. Department of Earth Science, Graduate School of Science, Tohoku University, 2. Division of Earth and Planetary Science, Kyoto University

Many hydrous carbonaceous chondrites were found to be thermally metamorphosed after aqueous alteration. Spectroscopic observations of C-type asteroid Ryugu suggest that Ryugu is similar to parent bodies of heated hydrous carbonaceous chondrites (e.g. Kitazato et al., 2019). Three possible heat sources are proposed: decay heat of radionuclides, solar radiation, and shock-induced heat and the duration of heating decreases in this order. However, kinetics of thermal alteration of carbonaceous chondrite is poorly understood. In this study, long-duration heating experiments of Murray CM chondrite was performed to evaluate time-dependent changes of reflectance spectra and mineralogy.

A powder ($\phi < 155$ μm) and polished fragments of Murray meteorite (CM2.4–2.5; Rubin, 2007) were heated at 600˚C for the duration of 1, 10, 100, and 500 hours in vacuum at oxygen fugacity of around IW buffer. The heated samples were analyzed by conventional XRD, Synchrotron-XRD, FE-SEM/EDS, micro-Raman spectroscopy, FT-IR, and Karl-Fisher Titration method.

After 1-hour heating, the hydrous minerals (serpentine and tochilinite) were decomposed into amorphous phases and water was completely evaporated from the samples. After 10-hour heating, low crystalline secondary olivine and taenite newly formed. The amounts of these secondary minerals increased with heating duration. The absolute reflectance of the sample at 0.55 μm decreased after 1-hour heating, but continuously increased after 10-hour heating. The D and G bands in the Raman spectra, which reflect structures of amorphous carbon, of several chondrule rims did not change significantly and thus seem to be less sensitive to heating duration at 600˚C. Based on the classification of the heating stage defined by Nakamura (2005), the 1-hour heated sample corresponds to the weakly heated (stage II) chondrites and 10-hour, 100-hour, and 500-hour heated samples correspond to the moderately heated (stage III) chondrites.

We defined and quantified six parameters representing temporal changes of the spectroscopic and mineralogical features such as slope of reflectance spectra in the wavelength range from 0.38 to 0.55 μm, the absolute reflectance at 0.55 μm, the half widths and peak positions of diffractions from secondary olivine and taenite. These parameters will be used to estimate conditions of thermal alteration of naturally-heated carbonaceous chondrites and also returned samples from Ryugu.

The Japanese asteroid explorer Hayabusa2 conducted an impact experiment by using a Small Carry-on Impactor (SCI) on the surface of Ryugu, which constituted the first impact experiment on an asteroid, on April 5th, 2019, and successfully formed an artificial impact crater larger than 10 m in size. The SCI crater has a semicircular shape and an elevated rim around the crater. We found a large boulder named as Iijima-boulder with the size of 5m on the crater floor and it could be moved about 3m northeast during the crater formation. There was another large boulder named as Okamoto-boulder at the south edge of the SCI crater, but we could not detect finite displacement of this boulder after the SCI impact. The Okamoto boulder might have a deep root below the surface and this boulder could stop the ejecta excavation flow toward the south region so that the SCI crater did not grow southward to became a semicircular shape. The size-frequency distribution of the boulders on the SCI crater wall was found to be different from that outside of the SCI crater: the sub-meter sized boulders were deficient on the crater wall. Moreover, a circular depression like a pit was recognized at the center of the SCI crater and it might indicate a cohesive subsurface layer.

The ejecta curtain was observed by a Deployable CAMera3 (DCAM3) from the beginning of the crater formation for more than 10 min. We found that the ejecta curtain continued to grow more than 200 s and the ejecta curtain growth was asymmetric and heterogeneous. We never observed the ejecta curtain growth toward the south, and this feature is consistent with the fact that the crater growth was prohibited by Okamoto-boulder placed at the south region. The observed ejecta curtain growing northward were separated into several rays and this heterogeneity could be due to large boulders covering the surface. The detachment of the ejecta curtain from the ground was never observed during the crater growth and beyond the duration of the crater formation time of 300 s. The ejecta was then confirmed to be deposit on the surface by the gravity of Ryugu.

Our observations of the SCI crater and the ejecta curtain showed that the artificial impact crater was formed in the gravity dominated regime although the surface gravity was as small as 10^{-5}G and the surface was covered with large boulders. Thus, the crater scaling laws in the gravity dominated regime are appropriate for Ryugu and the crater chronology on Ryugu should be revised according to crater size scaling laws that are suitable for the non-cohesive surfaces. This new finding on the suitable scaling laws for a small C-type asteroid could feed collisional evolution models of asteroid populations and their migration within the solar system.

On-going mission of the JAXA Hayabusa2 (the C-type asteroid Ryugu) is a combination of an asteroidal sample return and detailed spectroscopic observations to understand the Solar System evolution from the point of view of organics, and water as hydrous minerals [1]. The Hayabusa2 spacecraft was thought to be successfully obtained the Ryugu samples (an expected total amount of ~ 100 mg) from surface and subsurface on Feb. and Apr. 2019 and will return to the Earth on Dec. 2020. To obtain the fresh subsurface samples of the Ryugu asteroid, Small Carry-on Impactor (SCI) [2] was used to generate an artificial crater on the surface. A driving force of the SCI was made by HMX (High-Melting Explosive; cyclotetramethylenetetranitramine; $C_4H_8N_8O_8$, 296.15) together with HTPB (Hydroxyl Terminated Polybutadiene), IDP (Isodecyl palargonate; $C_{19}H_{38}O_2$) and IPDI (Isophorone diisocyanate; $C_{12}H_{18}N_2O_2$) [2]. Takano and coworkers [3] reported analytical results of SEM-EDS (Scanning Electron Microscopy / Energy Dispersive X-ray Spectroscopy), TD-GC/MS (thermal desorption-gas chromatography/mass spectrometry), SPME (Solid-phase micro extraction)-GC/MS, and isotope mass spectrometry for N and C isotopes. They found volatiles of aliphatic and aromatic carbon structures, and the several functional groups (hydroxyl, aldehyde, nitrile, and carboxyl) [3].

The explosion products generated by their chemical reactions with HMX, HTPB, IDP and IPDI should be investigated prior to analysis of the Ryugu samples because those materials might be possible contaminants in the subsurface samples in the sample container. It is, therefore, necessary to analyze the SCI fragments and its products using the same analysis techniques. These results will provide relevant information to the initial analysis in advance the arrival of the Ryugu samples to the Earth.

In this study, we will report analytical results of the experimental explosion-products of the HMX mixture under Ar condition utilizing an optical microscope for micrometer-scale texture, SEM-EDS for texture and major elements, microFT-IR for functional groups, micro-Raman for structures of carbonaceous materials, STXM (Scanning Transmission X-ray Microscopy) for sub-micrometer-scale functional groups of carbon, nitrogen and oxygen, and NanoSIMS (nano-scale Secondary Ion Mass Spectroscopy) for hydrogen, carbon and nitrogen isotopes.

University of La Laguna, 11. National Institute of Advanced Industrial Science and Technology, 12. Meiji University, 13. Hayabusa2 Project

The Hayabusa2 spacecraft reveals the surface geography of C-type asteroid Ryugu [1, 2, 3, 4]. Ryugu is a 1-km across rubble-pile body formed by the reaccumulation of impact fragments from the parent asteroid. It has ~100 impact craters [2, 3] and many boulders across the surface [2, 4]. Focusing on the relation between craters and their surrounding boulders, we found that the number densities of boulders inside and outside larger craters are almost the same, whereas the number density of boulders inside a smaller crater is lower than that outside the crater. The tendency may reflect the subsurface structure of Ryugu. In order to reconstruct the subsurface structure, we quantitatively investigate the number densities of boulders inside and outside craters having different sizes and depths.

Using the high-resolution images taken by an optical camera ONC-T onboard the Hayabusa2 spacecraft, we measured boulders with mean diameters $s > 0.8$ m aroud selected craters and obtained the cumulative size frequency destributions (CSFDs) of these boulders inside and outside each crater. We used ONC-T images of craters taken from an altitude of 2.7, 1.7, or 0.9 km from the surface of Ryugu. We analized total 21 craters; 2 craters newly found in this work and 19 craters from a list compiled in [3]. From the crater list we included all circular depressions (with and without rims) having depths shallower than 5-6 m based on the data in [5] and located within +/-20 deg from the equator. From regression analyses of boulder CSFDs around each crater, we calculated number densities of boulders ($s > 1$ m) inside $N_{b,in}$ and outside $N_{b,out}$ the crater and the ratio $N_{b,in}/N_{b,out}$. To check the result, we analized the boulder CSFD around the region where an artificial crater was excavated by an impactor SCI onboard the Hayabusa2 spacecraft [6] before and after the SCI impact using the same method.

Owing to the regional variation of boulder density, we found no clear dependence of $N_{b,in}$ on the crater depth d. However, we obtained a remarkable dependence of $N_{b,in}/N_{b,out}$ on d (Fig. 1): (A) $N_{b,in}/N_{b,out}$ ~ 0.5 for craters having $d =< 2.2$ m, which is consistent with boulders around the SCI crater ($d = 2$ m), (B) $N_{b,in}/N_{b,out}$ ~ 1 or larger for craters having $d >= 4$ m, (C) in the intermidiate range of crater depth ($2.2 \text{ m} < d < 4$ m) $N_{b,in}/N_{b,out}$ are scattered and $N_{b,in}/N_{b,out}$ ~ 0.5 in the eastern hemisphere (40-230 degE) vs. $N_{b,in}/N_{b,out}$ ~ 1 in the western hemisphere (230-40 degE), though the number of such craters in each hemisphere is only three or four.

From these results, we reconstructed a three-layered subsurface structure of Ryugu, surface and subsurface boulder-rich layers and a boulder-poor layer sandwiched by the two. The depth of the boundary between the boulder-poor layer (the second layer) and the lower boulder-rich layer (the third layer) is estimated to be ~2.2 m in the western side and ~4 m in other regions. Such a layered structure may have been formed by the so-called Brazil-nut effect [7]. The western side having the thinner boulder-poor layer may be relatively young, which is consistent with a stablity analysis under a past rapid rotation of Ryugu [8].

Highly Porous Asteroid 162173 Ryugu Derived from Lowest Temperatures in a Day

*Tatsuaki Okada[1,2], Tetsuya Fukuhara[3], Satoshi Tanaka[1], Takehiko Arai[4], Naoya Sakatani[1], Yuri Shimaki[1], Hiroki Senshu[5], Hirohide Demura[6], Kentaro Suko[6], Tomohiko Sekiguchi[7], Toru Kouyama[8], Ayumu Ohsugi[1,2]

Introduction: Thermal inertia is the index of thermophysical properties of materials on earth and planetary bodies, which is derived from the temperature profile in a day-night cycle. Lower thermal inertia indicates a granular or porous materials, while higher thermal inertia suggests a dense, consolidated materials. In the Hayabusa2 mission, global, local, and close-up thermal images have been taken using a thermal infrared imager TIR to investigate the distribution of thermal inertia on the C-type asteroid 162173 Ryugu [1]. As a result comparing with the calculations for a given uniform thermal inertia from 50 to 1000 [J m^{-2} K $^{-1}$ $s^{-0.5}$: hereafter, tiu] on the asteroid shape model, and confirming the temperatures of boulders of various size range from < 1 to 100 m scales, it is concluded that the global thermal inertia of Ryugu is about 300 ±100 tiu, which lower than the typical thermal inertia of carbonaceous chondrites, and that Ryugu is a rubble-pile asteroid composed of highly-porous materials, accreted from impact fragments of a "porous" parent body, and the most part of the parent body was in the low degree of consolidation [2].

Thermal Inertia Estimate by TIR: There are several ways to derive the thermal inertia of an asteroid: 1) peak temperature in a day, 2) delay of peak temperature from the local noon, 3) fitting the diurnal temperature curves (hopefully considering the surface roughness), 4) cooling rate after sunset, 5) warming rate after sunrise, 6) lowest temperatures just before sunrise. For the initial analysis, we have taken the methods 1) to 3) to derive thermal inertia, but not considering the surface roughness, which is enough to characterize the thermal inertia much higher than the case of sandy or granular regolith (<100 tiu), and much lower than the typical primitive meteorites (> 600 tiu) or even dense rocks (> 1000 tiu) [2]. Afterwards, we considered the surface roughness at the same time to fit the diurnal temperature profiles much better to derive it thermal inertia of 225 ±45 tiu, with the roughness of 0.41 ±0.08 [3].

In this study, we used the method 6), when we observed the asteroid from a large phase angle of > 40° and at the solar distance of 0.98 to 0.99 au, during Box-B observations on 22 to 24 August 2019. The surface roughness is not considered but it is less effective in the nighttime. Temperatures before sunrise correspond to the apparent thermal inertia of 200 to 300 tiu, which is basically the same as the values derived from the daytime observations.

Acknowledgments: The authors appreciate all the members of the Hayabusa2 Project and supporting staff for their technical assistance and scientific discussions. Thermophysical Properties of Ryugu Estimated from a Box-A Observation

*Yuri Shimaki[1], Hiroki Senshu[2], Naoya Sakatani[1], Tatsuaki Okada[1,3], Tetsuya Fukuhara[4], Satoshi Tanaka[1,5], Makoto Taguchi[4], Takehiko Arai[6], Hirohide Demura[7], Kentaro Suko[7], Tomohiko Sekiguchi[8], Toru Kouyama[9], Jun Takita[10], Sunao Hasegawa[1]

TIR has acquired many one-asteroid rotation thermal images of Ryugu, during the proximity phase in 2018–2019. High-resolved thermal images were obtained during the Mid-Altitude Observation Campaign on August 1, 2018, with the resolution of ~4.5 m/pixel, at the sub-solar latitude of 8°S, the solar phase angle of ~20°, and the heliocentric distance of 1.06 AU. The diurnal temperature profiles of Ryugu showed flat patterns. A thermophysical model using a shape model of rough surface well reproduced the diurnal temperature profiles. By comparing the observation and calculation results, the global thermal inertia of Ryugu was estimated to be 225 ±45 J m^{-2} $s^{-0.5}$ K^{-1}, and the global surface roughness was determined as 0.41 ±0.08 (Shimaki et al., submitted to Icarus). Because of the sub-solar latitude, we cannot determine the thermophysical properties in a part of the northern hemisphere. Here we report the thermophysical properties of Ryugu determined by a Box-A observation on November 14, 2018, with the resolution of ~20 m/pixel, at the sub-solar latitude of 2°S, the solar phase angle of 4.8°, and the heliocentric distance of 1.35 AU. The diurnal temperature profiles showed a peak around the late afternoon. We confirmed that the thermophysical model well reproduces the observed temperature profiles. The global distribution of the thermal inertia is similar to that determined by the previous study, however, we see an offset of the values and the global thermal inertia was estimated to be ~300 J m^{-2} $s^{-0.5}$ K^{-1}. The global surface roughness was estimated to be ~0.3, with the small values around the equatorial ridge.

Acknowledgments: We would like to thank the Hayabusa2 team members for their technical and operational support and helpful scientific discussions. This work is partly supported by the JSPS Grants-in-Aid for Scientific Research (KAKENHI JP17H06459 and JP19H01951) and the JSPS Core-to-Core program “International Network of Planetary Sciences”.

[P-PS07] Solar System Small Bodies: Explorations of Ryugu, Bennu, and the Solar System at Large

convener:Taishi Nakamoto(Tokyo Institute of Technology), Tatsuaki Okada(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Dante S Lauretta(University of Arizona), Masateru Ishiguro(Department of Physics and Astronomy, Seoul National University)

Small Solar System bodies, including asteroids, comets, satellites, and inter-planetary dust particles, are interesting and provide lots of information on the origin and evolution of our Solar System. They can be remotely sensed by telescopes, be visited by spacecraft and studied at high resolution in a variety of wavelengths from IR to visible, UV, X-rays, and gamma rays, and even with neutrons. In addition, recently spacecrafts have been sent to return samples. In this session, all the contributions on the small solar system bodies are welcome. But this year, we especially welcome contributions on recent advances on the study of Ryugu and Bennu whether obtained by rendezvous spacecraft, remote sensing, or other methods.

Spectral heterogeneities at the surface of Ryugu as seen by the NIRS3 spectrometer

*Lucie Riu[1], NIRS3 Team, Hayabusa2 Science Team

1. Institut of Space and Astronautical Science (ISAS/JAXA)

Asteroid Ryugu has been the prime target of the Hayabusa2 spacecraft which performed orbital characterization of the asteroid for a 1.5 yr with on his board the near-infrared spectrometer NIRS3. NIRS3 acquired data throughout the overall proximity phase resulting into a complete dataset of 101 spectral observations of Ryugu. Each observation was performed at various time, spacecraft altitude, observational conditions (incidence/emergence angles), surface temperature, resulting into a very rich dataset for mineralogical characterization. Based on the global mapping observations, that provides a resolution of 20m/px, Ryugu has been identified as a very dark asteroid (average albedo ~1.9%) with very homogeneous surface properties: a slight red slope and a sharp 2.72 um absorption feature attributed to the presence of OH [1]. Morphological and spectral heterogeneities have been highlighted at higher spatial resolution with the ONC camera and the TIR thermal infrared spectro-imager suggesting irregularities at finer scale: bright boulders of possible exogenous origin [2], hot spots inside craters [3], slope difference inside craters [4]. Based on the last two findings, we decided to perform a survey of the 86 craters that were identified at the surface of Ryugu [5] using the global NIRS3 dataset. The methodology applied aimed at evaluating the spectral properties (*e.g.,*spectral slope, absorption features, albedo) inside each crater and compared them to its vicinity. To smooth out potential calibration artifacts or biases based on photometry or thermal corrections, we used all NIRS3 observations to perform this analysis. For each crater, we look for all NIRS3 observations that falls inside the crater with a spot size smaller or equal to the crater. We also extract the spectra of the vicinity of the crater for the same day of NIRS3 observation to perform spectral comparison. For the majority of craters, several NIRS3 spectra are available, the results are thus combined. As an example, we display in Figure 1 the analysis of crater #ID69 [5] that corresponds to a hot spot as detected by TIR [3], that was analyzed based on the high-resolution observation of NIRS3 on October 31st 2018.

We observe that the spectral properties inside and outside the crater are very similar (ratio close to 1 and very flat, Fig.1c). However, the ratio display an increase in the band depth showing that the absorption feature attributed to the presence of hydrated minerals is larger in the crater. For the majority of craters, we observe that the 2.72 um band depth is larger inside compared to the surroundings, but changes in the slope and albedo are often observed. Several possibilities can explain this observation such an increase in the hydration degree, a change in surface properties (grain size for example), fresher material that was less altered by space weathering. The followings steps will be to cluster all craters based on their spectral similarities, morphologies and surface types to outline a story for Ryugu’ s surface formation and evolution and decipher between the different scenario that account for such differences.

Figure 1- (a) Map of the crater based on [5], the blue squares corresponds to the NIRS3 spectra inside the crater, the orange squares corresponds to the spectra outside. (b) Inside spectra (grey = individual, red = average) and outside spectra (black = average), corresponding respectively to the spectra extracted from locations in blue and orange on (a). The vertical blue line corresponds to the position of the 2.72um band. (c) Ratio of the average spectra inside the crater divided by the average spectra outside the crater.

The Hera mission has been approved for development and launch in 2024 in the new ESA Space Safety Programme by the ESA Council at Ministerial Level, Space19+, in November 2019.

Hera will contribute to the first deflection test of an asteroid, in the framework of the international NASA- and ESA supported Asteroid Impact and Deflection Assessment (AIDA) collaboration.

Hera will rendezvous for the first time with a binary asteroid, (65803) Didymos, and in particular its secondary, of only 160 m in diameter. So far, no mission has visited such a small rock in space. Moreover, for the first time, internal and subsurface properties will be directly measured.

As a crucial contribution to planetary defense, Hera will perform the measurements necessary to understand the effect of the NASA DART impact on Didymos' secondary in 2022, in particular its mass, its internal structure, the direct determination of the momentum transfer and the detailed characterization of the crater left by DART. These measurements will also provide unique information on many current issues in asteroid science.

The scientic legacy of the Hera mission will extend far beyond the core aims of planetary defense. Hera is thus the European contribution to the international asteroid exploration era.

DESTINY+ (Demonstration and Experiment of Space Technology for INterplanetary voYage, Phaethon fLyby and dUst Science) was selected in 2017 as a mission for JAXA/ISAS small-class program. It is a joint mission of technology demonstration and scientific observation. It will test high performance electric propelled vehicle technology and high-speed flyby of asteroid (3200) Phaethon and possibly asteroid 2005UD, which a break-up body from Phaethon as an extended mission. Engineering challenges include an up-close encounter at a distance of 500 km from Phaethon with radio-optical hybrid navigation guidance and control, and autonomous imaging based on optical information for target tracking during a high-speed flyby of 33km/sec. The science goal is to understand the nature and origin of cosmic dust brought onto the Earth, in the context of exogenous contribution of carbon and organics for possible prebiotic seeds of the terrestrial life. Phaethon is a parent body of Geminid meteor shower, and thus a known source to periodically provide dust to the Earth, via the dust stream. The science objectives are two folded: (1) in-situ analyses of velocity, arrival direction, mass and chemical composition of interplanetary and interstellar dust particles around 1 au, the dust trail, and nearby Phaethon, and (2) flyby imaging of Phaethon to study its geology, for understanding dust ejection mechanism of active asteroid and the surface compositional variation. Here, we present the latest status of science mission of DESTINY+ with the current understanding of Phaethon on the basis of the recent ground-based and space-based telescopic observation.

DESTINY+mission is a candidate for JAXA’s Epsilon small-class program to be launched in the 2020s. To enable lower cost and higher frequency deep space missions, the spacecraft will demonstrate advanced technologies that include a highly efficient solar electric propulsion system. For the science mission, the spacecraft will perform high-speed flyby observations; exploring the asteroid (3200) Phaethon as the nominal mission and several more asteroids as an extra mission. This paper presents the DESTINY+ mission analysis for multiple asteroid flybys utilizing electric propulsion and Earth gravity-assist techniques. We discuss candidate asteroids that the spacecraft can potentially explore. The target asteroids should be finally selected considering technical constraints, such as remaining propellant, and scientific returns. Multiple asteroid flyby tours are beneficial as precursor missions for future full-scale missions that include asteroid sample return missions.

Twinkle: a visible and near-infrared space-based observatory for exoplanet and solar system spectroscopy

*Billy Nelson Edwards[1,2], Giovanna Tinetti[1,2], Marcell Tessenyi[2,1], Giorgio Savini[1,2], Jonathan Tennyson[1,2], Richard Archer[2], Ian Stotesbury[2], Max Joshua[2], Benjamin Wilcock[2]

1. University College London , 2. Blue Skies Space Ltd.

The Twinkle Space Mission is a space-based observatory that has been conceived to measure the atmospheric composition of exoplanets, study bright stars and brown dwarfs, and reveal the surface mineralogy of Solar System objects. The satellite is based on a high-heritage platform and will carry a 0.45 m telescope with a visible and infrared spectrograph providing simultaneous wavelength coverage from 0.5 - 4.5 μm. The spacecraft will be launched into a Sun-synchronous low-Earth polar orbit and will operate for a baseline lifetime of seven years.

Twinkle’ s rapid pointing and non-sidereal tracking capabilities will enable the observation of a diverse array of Solar System objects, including asteroids and comets. Twinkle aims to provide a visible and near-infrared spectroscopic population study of asteroids and comets to study their surface composition as well as obtaining high-SNR spectra of the outer planets and their moons. Its wavelength coverage, and position above the atmosphere, will make it particularly well-suited for studying hydration features that are obscured by telluric absorption from the ground, as well as searching for other spectral signatures such as organics, silicates and CO_2.

Twinkle is available for researchers around the globe in two ways:

1) joining its collaborative multi-year survey programme, which will observe hundreds of exoplanets and solar system objects; and

2) accessing dedicated telescope time on the spacecraft, which can be freely schedule for any combination of science cases.

I will present an overview of Twinkle’ s capabilities and discuss the broad range of small bodies the mission could observe, demonstrating the huge scientific potential of the spacecraft.

[P-PS07] Solar System Small Bodies: Explorations of Ryugu, Bennu, and the Solar System at Large

convener:Taishi Nakamoto(Tokyo Institute of Technology), Tatsuaki Okada(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Dante S Lauretta(University of Arizona), Masateru Ishiguro(Department of Physics and Astronomy, Seoul National University)

Small Solar System bodies, including asteroids, comets, satellites, and inter-planetary dust particles, are interesting and provide lots of information on the origin and evolution of our Solar System. They can be remotely sensed by telescopes, be visited by spacecraft and studied at high resolution in a variety of wavelengths from IR to visible, UV, X-rays, and gamma rays, and even with neutrons. In addition, recently spacecrafts have been sent to return samples. In this session, all the contributions on the small solar system bodies are welcome. But this year, we especially welcome contributions on recent advances on the study of Ryugu and Bennu whether obtained by rendezvous spacecraft, remote sensing, or other methods.

The primary objective of the OSIRIS-REx mission to asteroid (101955) Bennu is to return pristine carbonaceous regolith that may hold clues to the origins of life. The 500-m near-Earth asteroid Bennu was chosen as a target for sample return based on its orbital characteristics and its spectral properties that suggested an affinity to hydrated, organic-rich carbonaceous chondrites. Primitive chondritic meteorites formed early in solar system history. They provide the opportunity to study the materials, processes, and events that formed our planetary system, including the delivery of pre-biotic organics and volatiles to Earth. The OSIRIS-REx spacecraft arrived at Bennu in December 2018. Proximity operations focused on global mapping using a suite of cameras, spectrometers, and scanning lidar to characterize Bennu’s surface properties, particle size distribution, and composition. With this information, the OSIRIS-REx team performed an extensive site selection process, ultimately designating a primary and a back-up sample site, named Nightingale and Osprey, respectively.

Characterization of Bennu’s surface demonstrates that this asteroid is the ideal target to meet the mission objective of returning hydrated and organic-rich material from the early solar system. Bennu’s near-infrared spectral signature is dominated by a 2.7-μm absorption feature that arises owing to bound hydroxyl molecules and is most consistent with Mg-bearing phyllosilicates. Broadband filter photometry suggests a high abundance of the iron oxide mineral magnetite. Thermal infrared spectra exhibit silicate stretching and bending modes; these modes are also consistent with volumetrically dominant phyllosilicates and the presence of magnetite. These observations indicate that Bennu is compositionally similar to the aqueously altered carbonaceous chondrites and, in particular, the highly altered CI and CM chondrites. Given the enormous (>15 m) boulders on the surface, this aqueous alteration likely occurred on a precursor parent body with a diameter of order 100 km. Catastrophic disruption of this object resulted in the subsequent rubble-pile re-accumulation of Bennu.

Recent observations of Bennu reveal widespread carbonate spectral features. Correlation of these features with imagery shows that, in many cases, they are associated with bright veins that transect exposed boulder surfaces. These veins range in measured thickness from 3 to 14 cm, with lengths of 30 to 60 cm. Further, we observe organics and carbonates occurring together in visible to near-infrared spectra of Bennu. These organic-carbonate spectral mixtures indicate that the abundances, grain sizes, or outcroppings of these materials on Bennu are distinct from those of meteorites and other asteroids. The carbonate detection implies that Bennu’s parent body experienced extensive aqueous alteration, similar

©2020. Japan Geoscience Union. All Right Reserved.

to, or possibly more intense, than indicated in the carbonaceous chondrite meteorite record. If the observed bright veins are carbonates, this would indicate hydrothermal deposition and crystallization at larger scales than previously anticipated or observed for carbonaceous asteroids, where alteration generally has been presumed to occur locally (at the micron scale) in lithified systems resembling meteorites. We investigate the implications for Bennu’ s geologic history and hydrothermal conditions on its parent body.

Overcoming the Challenges of Sample Collection at Nightingale

*Michael C Moreau[1], Dante Lauretta[2]

1. NASA Goddard Space Flight Center, 2. University of Arizona

The OSIRIS-REx mission will collect a sample of near-Earth asteroid (101955) Bennu and return it to Earth. The returned sample will provide valuable constraints on the earliest stage of rocky planet formation and the origin of life. The data collected at the asteroid, combined with the analysis of the returned sample, will also improve our understanding of hazardous asteroids. In preparation for retrieving a sample, the OSIRIS-REx spacecraft has been flying in close proximity to Bennu since December of 2018, conducting a campaign of challenging maneuvers and scientific observations.

The sample will be acquired using a technique called Touch and Go, or TAG. The spacecraft will contact the surface of Bennu with with its Touch-and-Go Sample Acquisition Mechanism (TAGSAM), mounted on the end of a 3-m-long robotic arm. Contact with the surface is for a few seconds before the spacecraft backs away. When contact is detected, pressurized gas will mobilize fine-grained material, some of which will be captured with TAGSAM. TAG begins from a safe home orbit with the spacecraft approximately 1 km from the surface. The spacecraft will depart from this orbit and descend over the sunward side of Bennu towards the location of the TAG site. During a four-hour transit, the spacecraft will take images of Bennu’ s surface with a navigation camera and process these images to update navigation information onboard. As OSIRIS-REx nears the surface, the spacecraft will perform two maneuvers to precisely target the TAG location.

Earth based observations of Bennu, combined with the experience of the Hayabusa mission at (25143) Itokawa, suggested that Bennu would have large flat areas containing fine-grained regolith, ideal for our collection technique. However, the earliest global observations of Bennu revealed a dramatic, rocky world with no obvious hazard-free regions. Subsequent high-resolution imaging of candidate TAG sites revealed that even the best candidates have very few areas containing clearly resolvable particle sizes of 2 cm or smaller, as required for collection. In response to these challenges, the Site Selection and Sample Acquisition campaigns changed. The project switched the TAG autonomous guideance technique from an originally planned lidar-based navigation update to an image-based navigation method called Natural Feature Tracking (NFT). A new observation campaign, Reconnaissance A, was added during October 2019 that collected high-resolution imagery of the top four candidate TAG sites to search for sampleable material and provide data needed to build onboard feature maps. Finally, an onboard hazard avoidance capability was developed to keep the spacecraft safe from large hazards in close proximity to the targeted TAG location. The highest-resolution (8 cm/pixel) images collected of the primary sample site, Nightingale, provide direct evidence of abundant sampleable material.

This talk will describe the challenges of asteroid Bennu, the factors that went into selection of the Nightingale site for TAG, and the preparations for the TAG event planned for summer 2020. The latest images of Nightingale and the backup TAG site, Osprey, will be shown.

Introduction: Current estimates of asteroid (101955) Bennu’ s gravity have been determined, based on a series of independent solutions from different teams involved on the OSIRIS-REx mission. In addition to classical radio science techniques for estimating a body's gravity field coefficients, the discovery of particles ejected from Bennu that persist in orbit for multiple revolutions provides a unique opportunity to probe the gravity field to higher degree and order than possible by using conventional spacecraft tracking [1]. However, the non-gravitational forces acting on these particles must also be characterized, and their impact on solution accuracy must be assessed, requiring the different gravity field estimates to be compared and reconciled.

Given the measured gravity field of Bennu, rigorous constraints on its internal density heterogeneity can be found by comparing the measured field with the constant density field computed from the asteroid shape. These results in turn provide unique insight into the global geophysical processes that drive the external and internal morphology of small rubble-pile asteroids such as Bennu.

Finally, definitive results on the surface and close-proximity force environment of Bennu can be derived and updated from the initial analysis based on the total mass and constant density shape. Several aspects of the environment are highly sensitive to the gravity field and are expected to change from earlier results [2, 3, 4].

We assess the current gravity field solutions and uncertainties, update the surface and proximity environment models, and provide the geophysical implications and interpretations of these measurements.

Geophysical Models: Using the determined density inhomogeneity patterns, we investigate specific geophysical aspects of Bennu. Current estimates show the measured *J2* and *J4* gravity coefficients to be larger than the constant density values. If these trends stay consistent with the final gravity field estimates, it points to a combination of an over-dense equator and under-dense center. The evaluation of the other gravity field coefficients will constrain the degree to which the interior density is inhomogeneous, applying the simple theory outlined in [5].

An over-dense equator could be consistent with transport of material to the equator which is subsequently compacted. This would match with the lower slope region within the rotational Roche lobe. If this is paired with a lower-density interior, then it could be consistent with a long-ago period of rapid spin and failure of the interior of the body along with preferential transport of material to the equator.

©2020. Japan Geoscience Union. All Right Reserved.

An alternate hypothesis holds that the asteroid took on its shape when it was initially formed and has not shifted since [6]. This theory is consistent with a stronger rubble pile that has not changed its shape or rearranged material over many YORP cycles. Tests of this hypothesis require additional simulations of how rubble-pile asteroids coalesce after the catastrophic disruption of their parent body.

The OSIRIS-REx mission is exploring asteroid (101955) Bennu, carbonaceous near-Earth asteroid whose surface is covered with boulders of various sizes larger than 50 m [1]. Bennu is a top-shaped, rubble-pile asteroid with diameter of about 500 m [2]. Because of its small size, the collisional lifetime of Bennu is much shorter than the age of the solar system [3]. It is probably a fragment of a larger “parent-body” asteroid with diameter of approximately 100 km [4]. The OSIRIS-REx Camera Suite (OCAMS) [5] provided high-resolution images (<2 cm/pix) of the surface of Bennu. Some boulders appear to have layering in multiple, distinct units demarcated by different textures [6]. The layer-like texture might have formed by parent-body processing [1, 7]. In this work, layered boulders on the asteroid surface were identified and categorized by texture and average normal albedo. We offer two hypotheses about how the apparent layering could have originated in the parent body.

We used OSIRIS-REx Laser Altimeter (OLA) altimetry data and PolyCam images with a scale of ~1.5 cm/pix in the Small Body Mapping Tool (SBMT) [8]. The images typically had phase angles between 30 and 50°, and our search was up to 80° north or south latitudes. The total search explored ~80% of the entire surface of the asteroid under similar illumination and pixel scale.

Identifying layered boulders with multiple textures: SBMT [8] was used to examine the surface by projecting images onto a shape model. Fourteen boulders were identified as apparently layered boulders with multiple textures. We selected three large boulders (Figure 1) that show clear variations in texture for detailed photogeological analysis.

Categorizing the textures: Textural differences can be caused by variation in composition and the size of the constituent particles. Both these aspects can result in variation of the normal albedo. A global normal albedo map was utilized with SAOImageDS9 [9] to calculate the average albedo of each texture in the three analyzed boulders. In SAOImageDS9, a region was selected for each texture, and the average within the region was calculated. To obtain normal albedo values with higher precision, local shape models were created for some boulders with OLA data, and boulder images were registered onto a corresponding shape model using USGS’ s Integrated Software for Imagers and Spectrometers 3 (ISIS3, [10]). Albedo ranges are (from darkest to brightest): bin 1, 3.0 to 3.4%; bin 2, 3.5 to 3%; bin 3, 4.0 to 4.2%; bin 4, 4.3 to 4.5%; and bin 5, 6.0 to 6.5%.

©2020. Japan Geoscience Union. All Right Reserved.

Hypotheses of the formation of layered boulders with multiple textures: This work is designed to test two hypotheses of multi-texture layered boulder formation. One is brecciation in the parent body. Boulders could be fractured by thermal fatigue [6], impact, or internal pressure, and fragments with various textures could be melded together by melting or internal pressure. Second, Bland and Travis [11] modeled mud convection in a 100-km asteroid parent body and showed that particle size sorting could occur. Catastrophic disruption of a parent body with a size-sorted interior could produce some rock fragments that include a boundary between two textures.

The Phenomenon of Particle Ejections from Asteroid Bennu

*Coralie Dominique Adam[1], Dante S Loretta[2], Carl W Hergenrother[2], Steven R Chesley[3]

1. KinetX Inc., Space Navigation and Flight Dynamics Practice, Simi Valley, CA, USA, 2. Lunar and Planetary Laboratory, University of Arizona, Tucson, AZ, USA, 3. Jet Propulsion Laboratory, Pasadena, CA, USA

The OSIRIS-REx spacecraft has been operating in proximity to near-Earth asteroid (101955) Bennu since December 2018. Particle ejections off the surface of the asteroid were first discovered[i] in images from 6 January 2019, 1 week after the spacecraft entered orbit and 4 days before Bennu perihelion. This phenomenon was serendipitously captured in the NavCam 1[ii] optical navigation images, intended to image background stars while maintaining Bennu in the field of view. Prior to arrival at Bennu, an extensive natural satellite imaging campaign conducted to search for orbiting objects greater than 10 cm yielded null results.

The first optically observed particle ejection event on 6 January 2019 shows more than 200 star- like point-source objects and trailed (higher-velocity) objects located off the limb of Bennu. A second image minutes later shows objects in common with the earlier image that have moved away from Bennu, implying the movement of discrete particles. The included figure[i] shows (A) a composite image of two exposures taken by the NavCam on 6 January 2019 in immediate succession: a short-exposure image (1.4 ms), showing the asteroid, and a long-exposure image (5 s), showing the particles; and (B) two long-exposure images (5 s, spaced 7.27 min apart) registered on the center of Bennu and differenced to highlight any moving particles. Particles moving at high velocity appear as streaks in a single image (red), and paths of particles moving more slowly (yellow) are identified from individual particles detected in the earlier image that also are present in the later image, farther from Bennu’ s limb.

This first observation triggered an immediate mission risk assessment, which concluded that the size and velocity of these particles (0.07–3.3 m/s, <1 to ~10 cm)[i] did not pose risks to keeping the spacecraft in its 1.6 x 2.0 km frozen orbit. The operations teams quickly worked to build new observation campaigns to improve the frequency and data quality in observing the active asteroid activity. In the subsequent year of operations, the team has detected multiple large ejection events, more than a dozen small events (<20 observed particles), as well as a persistent background level of particles in the Bennu environment. A pipeline was established which automates the detection of potential particles, identifies object pairs between images, reconstructs the event location and timing, and solves for various dynamical and physical properties of each particle.

A forthcoming special collection in the *Journal of Geophysical Research: Planets* will characterize this phenomenon, from reconstruction of the event dynamics to proposed mechanisms for particle release.

This work is supported by NASA under Contracts NNM10AA11C, NNG12FD66C, and NNG13FC02C. OSIRIS-REx is the third mission in NASA’ s New Frontiers Program. Dante Lauretta of the University of Arizona, Tucson, is the principal investigator, and the University of Arizona also leads the science team and the science observation planning and data processing. Lockheed Martin Space Systems in Denver built the spacecraft and is providing flight operations. Goddard Space Flight Center and KinetX Aerospace are responsible for navigating the OSIRIS-REx spacecraft.

[P-PS07] Solar System Small Bodies: Explorations of Ryugu, Bennu, and the Solar System at Large

convener:Taishi Nakamoto(Tokyo Institute of Technology), Tatsuaki Okada(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Dante S Lauretta(University of Arizona), Masateru Ishiguro(Department of Physics and Astronomy, Seoul National University)

Small Solar System bodies, including asteroids, comets, satellites, and inter-planetary dust particles, are interesting and provide lots of information on the origin and evolution of our Solar System. They can be remotely sensed by telescopes, be visited by spacecraft and studied at high resolution in a variety of wavelengths from IR to visible, UV, X-rays, and gamma rays, and even with neutrons. In addition, recently spacecrafts have been sent to return samples. In this session, all the contributions on the small solar system bodies are welcome. But this year, we especially welcome contributions on recent advances on the study of Ryugu and Bennu whether obtained by rendezvous spacecraft, remote sensing, or other methods.

Some C-complex asteroids are thermally metamorphosed as indicated by their reflectance spectra (e.g., Hiroi et al., 1993). However, the thermal history of these asteroids is poorly understood. CM chondrites are aqueously altered in their parent body, and some of them apparently underwent post-alteration thermal metamorphism (e.g., Nakamura, 2005). In this work, we study Jbilet Winselwan (JW), a thermally metamorphosed CM chondrite, to constrain the heat source for thermal metamorphism and to investigate the evolution of thermally metamorphosed C-complex asteroids.

Sulfide minerals in JW are pyrrhotite with abundant pentlandite blebs, suggesting mild heating (Kimura et al., 2011). Mass losses in thermogravimetric analysis are 0.98 and 4.1 wt% for temperature ranges of 200-400 and 400-770 ˚C, which correspond to OH^-/water release from tochilinite and phyllosilicate, respectively (Garenne et al., 2014). These values are much lower than the corresponding values of Murchison (3.1 wt% for 200-400 ˚C and 6.8 wt% for 400-770 ˚C). Large clumps of tochilinite/cronstedtite intergrowth (TCI), which are commonly found in CMs, are rare. TCIs in JW have lower S/SiO_2 and higher FeO/SiO_2 ratios (~0.16 and ~3.2, respectively) than expected from typical CMs (Rubin et al., 2007). These observations suggest that tochilinite, unstable at high temperatures of >170 ˚C (Zolensky, 1984), is decomposed by heating. The decomposition of TCIs has also been confirmed for other thermally metamorphosed CMs and an experimentally heated Murchison sample (Nakato et al., 2008).

Ca-sulfate grains are commonly surrounding calcite grains, indicating that Ca-sulfate precipitated subsequently after calcite. The Ca-sulfate is identified as anhydrite ($CaSO_4$) using Raman spectroscopy. Gypsum ($CaSO_4 \cdot 2H_2O$), stable at <110 ˚C (Prieto-Taboada et al., 2015), is absent. The absence of gypsum also indicates that JW underwent heating. Because we found substantial amounts of Ca-sulfate, Ca-sulfate is one of the main carriers of sulfur. We propose that sulfur in Ca-sulfate was supplied from TCIs decomposed by heating.

The ^{53}Mn-^{53}Cr age (half-life: 3.7 Myr) of JW calcites measured by SIMS is 4564.8 (+1.2/-1.5) Ma, significantly older than the ages of typical CMs (~4563 Ma) (Fujiya et al., 2012). The older age of JW calcites indicates an earlier onset of aqueous alteration. Therefore, JW contained a larger amount of radioactive ^{26}Al (half-life: 0.7 Myr) than typical CMs when aqueous alteration took place, which is consistent with a higher peak temperature experienced by JW. Thus, the energy for the heating was most likely provided by ^{26}Al decay.

In summary, the aqueous alteration and calcite formation in JW initiated ~4564.8 Ma. Then, the temperature kept increasing, which led to thermal metamorphism associated with the TCI decomposition and subsequent anhydrite precipitation. These processes were likely driven by ^{26}Al decay. It is currently unclear whether JW was located at the inner part of the CM parent asteroid, or it is derived from a different parent asteroid than typical CMs. We will conduct Cr- and Ti-isotope analyses to investigate a genetic relationship between JW and typical CMs.

Aggregate structure of comet 67P/Churyumov-Gerasimenko

*Sota ARAKAWA[1,2], Kazumasa Ohno[3,2]

1. NAOJ, 2. Tokyo Tech, 3. UCSC

The Rosetta mission to comet 67P/Churyumov-Gerasimenko has provided plenty of data to understand what comets are made of. The thermal and mechanical properties of dust aggregates encapsulate information on their internal structure. In this study, we investigate whether the comet is made of homogeneous or hierarchical aggregates using theoretical models of the thermal inertia and tensile strength of dust aggregates (Arakawa et al. 2019, Tatsuuma et al. 2019). We found that it is difficult to explain the tensile strength of the comet if the comet is a homogeneous aggregate constituted by micron-sized dust grains. Then we also calculated the thermal inertia and tensile strength of hierarchical aggregates. We analytically derived the physical properties of hierarchical dust aggregates and compared our theoretical model with experimental data of the tensile strength of hierarchical aggregates (Blum et al. 2014, Brisset et al. 2016). We found that the thermal inertia and tensile strength of the comet are consistent with the hierarchical aggregate constituted by cm- or dm-sized aggregates, which is basically consistent with the result of Blum et al. (2017). These findings indicate that the icy planetesimals may form via accretion of cm- or dm-sized compressed dust aggregates in the solar nebula.

Numerical Simulations of Spinup of Asteroids and the Formation of Top-Shaped Asteroids

*Keisuke Sugiura[1], Hiroshi Kobayashi[2], Sei-ichiro WATANABE[3], Hidenori Genda[1], Ryuki Hyodo[4], Shu-ichiro Inutsuka[2]

The asteroids Ryugu and Bennu visisted by the spacecraft Hayabusa2 and OSIRIS-REx, respectively, have so-called “spinning top” shapes. The characteristics of the top shapes are as follows: pronounced equatorial ridges, cone-like surfaces from low latitudes to mid latitudes, and mostly axisymmetric shapes. Many top-shaped asteroids such as the asteroid 1999 KW4 have rapid rotations with rotation periods of about 3 hours. The axisymmetric shapes and the rapid rotations of the top-shaped asteroids suggest that top shapes are formed through the deformation due to spinup and rapid rotations of asteroids. However, how rapid-rotating asteroids deform and how top shapes form are not well understood.

Ryugu, Bennu, and many other asteroids are rubble-pile bodies, and thus friction of granular materials plays an important role for the deformation of rapid-rotating asteroids. Thus investigation of friction angles required for the formation of top shapes may lead to constrain properties of top-shaped asteroids. Although the major spinup mechanism is considered to be the Yarkovsky-O’Keefe-Radzievskii-Paddack (YORP) effect, spinup can also be caused by reaccumulation of fragments after collisional catastrophic disruption. Spinup rate caused by the YOPR effect is much smaller than that caused by gravitational reaccumulation. Thus investigation of spinup rates required for the formation of top shapes may even constrain formation mechanisms.

In this study, we investigate the deformation of rubble pile bodies due to spinup using a Smoothed Particle Hydrodynamics (SPH) code. The code includes friction model for granular material and can treat dynamics of granular bodies. We simulate spinup of a uniform spherical body with the radius of 500 m and the density of 1.19 g/cm^3. The spinup rate is set to beta x 8.954 x 10^{-10}[rad/s^2], where beta is a parameter and beta = 1 gives acceleration from the period of 3.5 h to 3.0 h in about 10 rotations. We mainly change the friction angle phi_d and the spinup rate beta.

All the simulations with beta = 1 result in axisymmetric deformation. The spinup with phi_d < 40 degrees results in quasi-static and internal deformation, that with 50 degrees < phi_d < 60 degrees results in dynamical and internal deformation, and that with phi_d > 70 degrees results in dynamical and surface landslides. Especially, the simulation with phi_d = 80 degrees produces an axisymmetric top shape.

The simulation with phi_d = 80 degrees but with slower spinup rate beta = 0.05 results in non-axisymmetric landslide and the formation of a non-axisymmetric shape. Thus Our simulations show that fast spinup with beta ~ 1 of spherical body with phi_d > 70 degrees produces axisymmetric top shapes.

The friction angle phi_d > 70 degrees is much larger than that of cohesionless granular materials. This suggests that the other strength of granular materials such as cohesion is also important for the formation of top shapes. The YORP spinup gives beta << 1, while gravitational accumulation of fragments gives beta > 1. Thus our results suggest that top shapes are possibly formed through fast spinup due to reaccumulation of fragments or coalescence of remnants after collisional catastrophic disruption. Another

possibility is multiple non-axisymmetric landslides. The timescale for the YORP spinup is mainly shorter than collisional lifetime for 1-km sized asteroids, and they probably experience multiple cycles of YORP acceleration and non-axisymmetric landslides. Multiple non-axisymmetric landslides at different places may lead to the formation of axisymmetric top shapes.

YORP Effect on Asteroid Ryugu

*Masanori Kanamaru[1], Sho Sasaki[1], Tomokatsu Morota[2], Yuichiro Cho[2], Naru Hirata[3], Naoyuki Hirata[4], Hiroki Senshu[5], Yuri Shimaki[6], Satoshi Tanaka[6], Tatsuaki Okada[6], Tomohiro Usui[6], Seiji Sugita[2], Sei-ichiro WATANABE[7]

The Yarkovsky and YORP effects are recoil force induced by thermal radiation from a surface of an asteroid, which secularly alter the orbit and the spin state of the body, respectively. The combined effect of Yarkovsky and YORP is a key to shed light on the dynamical evolution of asteroid 162173 Ryugu such as the orbital migration from the main belt to a near-Earth orbit and the formation mechanism of the spinning top shape. In this presentation, we aim to investigate the spin-down process of Ryugu from the fast rotation in the past to the current mild spin and compare its time scale with the surface age of the asteroid estimated from the crater statistics.

We conducted a numerical simulation of the YORP effect on asteroid Ryugu based on the orbit, the spin state and the 3-dimensional shape as revealed by Hayabusa2. Given a polyhedral shape model of 49,152 surface facets constructed by the stereo-photoclinometry (SPC), we computed the net torque on Ryugu to change the rotation period and the spin pole direction. As a result, Ryugu is currently decreasing the spin rate (spinning down) in the so-called YORP time scale of 1.2 million years. On the other hand, the obliquity of Ryugu, that is, the tilt angle of the spin pole is increasing toward the obliquity of 180 degrees. The attached figure shows the obliquity dependence of the YORP effect on Ryugu. The solid and dashed curves represent the rate of change of the obliquity and the spin rate of Ryugu. Note that the obliquity curve has the asymptotic nodes where the spin pole becomes stabilized at 0, 90 and 180 degrees. For Ryugu, there are thresholds around the obliquity of 36 and 144 degrees which determine the subsequent evolution of the spin state. The vertical dotted line at the obliquity of 172 degrees denotes the current value of Ryugu, where the spin rate is decreasing and the spin pole approaches an obliquity perpendicular to the orbital plane.

Moreover, we surveyed various initial spin states and confirmed that only limited combinations of the initial period and obliquity could reach the current spin state of Ryugu. The time scale of the spin evolution was at most 2.3 million years, which is shorter than the surface age of approximately 9 million years (Sugita et al., 2019). This study indicates that Ryugu experienced a disturbance of the spin state such as impact cratering or an Earth flyby at least in this few million years.

Each asteroid collision and/or disruption event in the Main Belt produces an asteroid family consisting of a vast number of remnant objects. These families contain a distribution of sizes with many km-sized objects and fewer larger objects. All of these remnants themselves are subject to the collisional environment in the Main Belt, and many will be disrupted and destroyed, with some of the larger remnants being broken into smaller families of their own. Over time, the original family and all the subsequent generations of families drift around the Main Belt, and some small fraction of them find the dynamical pathways leading to orbits as near-Earth asteroids (NEAs). The smaller bodies, which drift faster and further, preferentially find the escape routes out of the Main Belt, which is reflected in the size of the population of NEAs. To best interpret the geology of km-sized NEAs currently being visited by space missions, we aim to determine how likely NEAs are to be 1st generation remnants from a disruption event in the Main Belt.

We created a model that tracked the survival of asteroid disruption remnants to understand the likelihood that they are direct rubble-pile products of a large asteroid family (1st generation) or the product of a slightly larger rubble pile that itself is the product of a larger asteroid family (2nd generation...up to Nth generation). The competition is between the very large numbers of the 1st generation km-sized family members racing against time to reach an escape route before being destroyed in a collision—versus 5- to 10-km rubble piles, moving much more slowly but more resistant to immediate destruction, being broken up eventually and having some of their remnants escape. We find that for scenarios in the inner Main Belt, the total number of escaping bodies is dominated by 1st generation rubble piles. For older families, those whose age is two or three times the collisional lifetime of the NEA of interest, the bodies reaching escape routes can be equal contributions of 1st and Nth generation rubble piles. Thus, the answer to whether a specific NEA is more likely a 1st or Nth generation rubble pile depends on knowledge of its parent family and that family's age.

[P-PS08] Mars and Mars system: results from a broad spectrum of Mars studies and aspects for future missions

convener:Hideaki Miyamoto(University of Tokyo), Tomohiro Usui(Japan Aerospace Exploration Agency), Yuki Harada(Kyoto University), Sushil K Atreya(University of Michigan Ann Arbor)

NASA's Magnetospheric Multiscale (MMS) formation flying satellites have been making unprecedentedly high time resolution measurements of collisionless plasmas in and around Earth's magnetosphere since it was launched in 2015. After completing its nominal mission in 2018, MMS has continued its observations including targeting the magnetic reconnection in the Earth's magnetotail.
The major purpose of this session is to summarize the new world of electron physics that MMS has so far revealed and also to consider a future observation plan recently submitted by the mission team for the extended mission of MMS especially during the coming several years.
The collaboration with multiple missions including Geotail, Cluster II, THEMIS, Arase and other solar terrestrial probes while MMS focuses into electron scale is the key to understanding multiscale phenomena in the Earth's magnetosphere.
We solicit contributions from satellite observations, numerical simulations, laboratory observations, and theories that relate MMS observations. Contributions to the possible future observation plans are especially welcome.
This is a joint session with American Geophysical Union (AGU).
We hope this session will promote further international collaboration among Japan, United States and space physicists all over the world.

MAVEN observations revealed existence of a new type of aurora, diffuse aurora, which illuminates an extended region of Martian upper atmosphere in terms of longitude and latitude and does not related to the crustal magnetic fields [Schneider et al., 2015; 2018]. The diffuse aurora is considered to be caused by the SEP (solar energetic particle) electrons [Gerard et al., 2017]. Since Mars has no global intrinsic magnetic field, direct interaction between the solar wind and Martian upper atmosphere results in the draping of the interplanetary magnetic field (IMF) around Mars and forms the induced magnetosphere. The diffuse aurora observation in the northern hemisphere, where the crustal field is absent, indicates penetration of the high-energy electrons of ~100 keV down to the altitudes around 70 km most likely along the draped IMF around the planet. However, to what extent the draped magnetic field configuration around Mars controls the SEP electron penetration to the atmosphere is far from understood.
In this study, we investigated three SEP events observed by MAVEN in December 2014, March 2015, and September 2017. The pitch angle (PA) distributions of the high-energy (30-210 keV) electrons observed in the Martian ionosphere are analyzed in details. In order to achieve a good coverage in the 2-D (PA-energy) phase space, data obtained during a SEP event is accumulated and binned. Using the elevation angle of the local magnetic field, we also sorted the data so as to investigate the SEP electron loss below the MAVEN periapsis (~150 km altitude). The obtained PA distributions in the ionosphere are compared with the distributions of the source electrons in the magnetosheath. The results show that the field-aligned component is pronounced for the penetrating electrons and it does not significantly depend on the initial PA distributions in the magnetosheath. The observation also indicates that the highest energy of the SEP electrons lost into the Martian atmosphere depends on the magnetic field configuration draped around the planet. The SEP electron loss into the atmosphere is larger in higher SZA, suggesting the deeper penetration of draped magnetic fields in the nightside than dayside. These results support the scenario that the solar energetic electrons penetrate into the ionosphere along the draped magnetic field and the altitude to which they can penetrate depends on the magnetic field configuration. In other words, global diffuse aurora observations can give a new tool to visualize Martian space environment for understanding interaction between the solar wind and Martian upper atmosphere, especially the dynamics of the nightside ionosphere.

The ionospheric electron temperature is important for determining the neutral/photochemical escape rate from the Martian atmosphere via the dissociative recombination of O_2^+. The Langmuir Probe and Waves instrument onboard MAVEN (Mars Atmosphere and Volatile EvolutioN) measures electron temperatures in the ionosphere. The current paper studies electron temperatures in the dayside for two regions where: (1) crustal magnetic fields are dominant and (2) draped magnetic fields are dominant. Overall, the electron temperature is lower in the crustal-field regions, namely, the strong magnetic field region, which is due to a transport of cold electrons along magnetic field lines from the lower to upper atmosphere. The electron temperature is also greater for high solar extreme ultraviolet (EUV) conditions, which is associated with the local EUV energy deposition. The current models underestimate the electron temperature above 250 km altitude in the crustal-field region. Electron heat conduction associated with a photoelectron transport in the crustal-field regions is altered due to kinetic effects, such the magnetic mirror and/or ambipolar electric field because the electron mean free path exceeds the relevant length scale for electron temperature. The mirror force can affect the electron and heat transport between low altitudes, where the neutral density and related electron cooling rates are the greatest, and high altitudes, while the ambipolar electric field decelerates the electron's upward motion. These effects have not been included in current models of the electron energetics, and consideration of such effects on the electron temperature in the crustal-field region should be considered for future numerical simulations.

We report a new set of stellar occultation measurements for nightside temperature profiles made by the MAVEN/IUVS that provide evidence for a recurring layer of warm air between 70 - 90 km altitudes in the nightside mesosphere of Mars during Ls = 0º - 180º in Martian Year 33-34. The nightside profiles reveal a recurring peak of atmospheric temperature around 80 km over the equator to the middle latitudes in the northern hemisphere. The predictions of the Mars Climate Database have a warm layer with much smaller amplitudes. The observed peak amplitudes are larger than those predicted by the model by up to 90 K. Wavenumber-3 structures are seen in the warm layer that are potentially signatures of thermal tides or stationary planetary waves, with amplitudes two-times larger than predicted.

Studying martian dust storms, clouds, and associated meteorology using observations from Indian and foreign satellite missions

*JAGABANDHU PANDA [1], Bijay Kumar Guha[1]

1. National Institute of Technology Rourkela

Dust and water ice are the two major constituents in the Martian atmosphere, which significantly affect its climatic system. The dust activities over Mars could be ranging from dust devils, i.e., a few meters across, to dust storms, i.e., thousands of kilometers or more. The occurrence of dust storm events can modulate the global weather and climate by influencing the radiation budget and interacting with the primary circulation. The impact also strongly depends upon its vertical structure. Therefore, in the present study, we analyzed the aerosol profiles and associated atmospheric features during a dust storm event in early Martian southern summer based on the observations from Mars Colour Camera (MCC) onboard the Indian Mars Orbiter Mission (MOM) during October 11 and October 20, 2014 (Figure 1a). The dust storm is found to be a local-scale in nature (area calculated ~ 4.68×10^5 km^2), happened within the north-eastern portion of the Lunae Planum region on October 11, 2014, which is observed to be relatively larger during October 20. Analysis of dust and water ice extinction and temperature profile derived from the observations of Mars Climate Sounder (MCS) onboard Mars Reconnaissance Orbiter (MRO) is carried out before, during and after the dust storm period. Dustiness is found to have increased drastically at the HATDM (High Altitude Tropical Dust Maximum) layer but with a temporal delay of ~2°L_S after the dust storm disappearance (here L_S is the areocentric solar longitude). The delayed variation consequently explained the convective boundary layer growth during the dust storm scenario and is also exclusively reflected in the increased heating rate at different levels of the atmosphere. The vertical mixing time scale of dust is also found to be effective in a global dust storm scenario, which indicated a similar mechanism irrespective of the spatial extension (regional or global) of a dust storm. On the other hand, the clouds play an important role in controlling the water vapor profile; consequently, they influence transport and exchange of water with ground reservoirs and could be used to track the water vapor transport over a synoptic-scale. Again, the clouds are mostly present in the middle atmosphere, where they can interact with the dustiness. The dust and water ice are linked mechanistically by the ability of dust particles to nucleate water ice clouds, or it may modulate the air temperature by heating/cooling of itself, which consequently impacts the clouds present in the atmosphere. Therefore, we aimed to investigate the clouds over the entire tropical and subtropical latitudes over Mars. The thick clouds appear as a belt over the tropical latitude and are popularly known as Aphelion Cloud Belt (ACB), due to its appearance in the aphelion season (L_S = 0 –180°). Analysis of water ice column opacity suggests its spatial extension of nearly -20 –40°N during L_S ~ 45 –135°, wherein the three phases of ACB are identified. The cloud belt shows a northerly movement within the three phases of it, where an influence of upper-tropospheric dustiness is evident. Further, the tropical clouds are primarily dominated by the orographic clouds over the highly elevated terrains or volcanos, e.g., Olympus Mons and Arsia Mons (Figure 1b). The cloud appearance over these volcanos are found to be strongly controlled by the air temperature during the aphelion period and is more influenced by the elevated dustiness and by the circulation pattern during the perihelion period.

Greeley et al. (2006) revisited: the size distribution and frequency of dust devils at the Gale crater

*Kazunori Ogohara[1]

1. School of Engineering, University of Shiga Prefecture

Many dust devils have been observed by the Pathfinder, the Spirit rover, and the Phoenix lander. The most useful statistical summary of dust devils is found in the two papers by R. Greeley and co-authors (Greeley et al., 2006; 2010). They detected visually dust devils, counted the number of the dust devils, and measured their size, lifetime, and speed. The distributions of the diameter, speed and local time, and the seasonal variation of the dust devil frequency they reported are quality statistical information describing properties of Martian dust devils near the Spirit site because of the large number of dust devils visually detected. They showed that dust devils tended to occur in the early afternoon in the southern summer season and peaked the frequency around the southern summer solstice. This can be explained by the diurnal and seasonal variations in the thickness of the boundary layer (Rennó et al., 1998)

On the other hand, there may be atmospheric phenomena that change the thickness of the boundary layer and the stability. Stationary and traveling waves in low latitudes may modify the atmospheric conditions regarding dust devil occurrences although amplitudes of the diurnal and seasonal variations are larger than those of such waves. If the atmospheric waves can modify the conditions of dust devil occurrences significantly, we can find the correlation between the phase of the waves around the Spirit rover and dust devils frequency observed by the Spirit/Navcam. However, Greeley et al. (2006; 2010) neither reported the number of dust devils observed on each sol nor listed time stamps of each observed dust devil. The correlation between the atmospheric waves and dust devil frequency cannot be investigated only based on information they showed in their paper. Therefore, we again detect dust devils from images the Spirit took, estimate the diameter of the dust devils and record the time of the occurrences.

The NOMAD (“Nadir and Occultation for MArs Discovery”) spectrometer suite on board the ExoMars Trace Gas Orbiter has been designed to investigate the composition of Mars' atmosphere, with a particular focus on trace gases, clouds and dust probing the ultraviolet and infrared regions covering large parts of the 0.2-4.3 μm spectral range [1,2].

Since its arrival at Mars in April 2018, NOMAD performed solar occultation, nadir and limb observations dedicated to the determination of the composition and structure of the atmosphere. Here we report on the different discoveries highlighted by the instrument: investigation of the 2018 Global dust storm and its impact on the water uplifting and escape, its impact on temperature increases within the atmosphere as inferred by GCM modeling and observations, the dust and ice clouds distribution during the event, ozone measurements, dayglow observations and in general advances in the analysis of the spectra recorded by the three channels of NOMAD.

[P-PS08] Mars and Mars system: results from a broad spectrum of Mars studies and aspects for future missions

convener:Hideaki Miyamoto(University of Tokyo), Tomohiro Usui(Japan Aerospace Exploration Agency), Yuki Harada(Kyoto University), Sushil K Atreya(University of Michigan Ann Arbor)

A wealth of new data from the US, European, Russian, and the Asian exploration missions are contributing to improved understanding of geologic and climate evolution and the habitability of Mars. Eight spacecraft are currently operating at Mars, with six in orbit (Odyssey, MRO, MAVEN, Mars Express, Mangalyaan and TGO) and two on the surface (MSL-Curiosity and InSight), the largest number ever at any given time. In addition, Mars 2020, ExoMars and the Emirates Mars Mission are all scheduled to be launched in 2020. JAXA's MMX mission to explore Phobos, Deimos, and Mars is scheduled for a 2024 launch. This shows that the scientific community, international space agencies and the general public are committed to the exploration of the fascinating world of Mars. Synergistic investigations of ongoing or already completed missions together with modeling studies and earth-based observations are gradually revealing the nature of Earth's most closely resembling planet, which took a different evolutionary track than the other terrestrial planets. Seasonally, temporally and episodically variable phenomena seen on the surface and the atmosphere indicate that Mars is presently active. Thus, this session is planned to discuss recent results from a broad spectrum of Mars studies encompassing the interior, surface, atmosphere, plasma environment, and the Mars system including its two satellites. Abstracts on instrumentation and future mission plans are also encouraged for this session, as both the presenters and the audience would greatly benefit from ensuing discussions and feedbacks.

We present the first complete dataset of retrievals of water D/H vertical profiles derived from the Nadir and Occultation for Mars Discovery (NOMAD) instrument, onboard ExoMars Trace Gas Orbiter (TGO). NOMAD is a spectrometer operating in the spectral ranges between 0.2 and 4.3 μm onboard ExoMars TGO. NOMAD has 3 spectral channels: a solar occultation channel (SO –Solar Occultation; 2.3-4.3 μm), a second infrared channel capable of nadir, solar occultation, and limb sounding (LNO –Limb Nadir and solar Occultation; 2.3-3.8 μm), and an ultraviolet/visible channel (UVIS –UV visible, 200- 650 nm). The infrared channels (SO and LNO) have high spectral resolution ($\lambda/d\lambda$ ~10,000-20,000) provided by echelle grating in combination with an Acousto Optic Tunable Filter (AOTF) which selects diffraction orders.

Deuterated water (HDO) is primarily quantified by probing the v1 band at 3.7 μm, corresponding to the orders 118-122 of the NOMAD/SO channel. We used information from all of these orders to quantify HDO. Water is measured with NOMAD at different diffraction orders across the whole SO wavelength range. Some strong bands, such as the v1 and v3 of water at 3.7 μm (orders 166-170), allow to probe high altitudes where the atmosphere is thin, yet these bands become too optically thick at lower altitudes (<30 km). We therefore complement the water measurements by also probing weaker bands, such as the 2v2 at 3.3 μm (orders 133-136) and lines in the 3 μm region (orders 147-149). At altitudes when different orders provide similar sensitivities, we verified that the retrievals of water were consistent between the orders. This multi-order quantification strategy ensures maximum altitude coverage and self-consistency across the database.

Measurements of water vapor vertical profiles are a key diagnostic to the escape processes acting on water on Mars. Since its first scientific operation started on 21/April 2018, the ExoMars/NOMAD instrument suite has regularly conducted solar occultation measurements that are able to provide water vapor vertical profiles with unprecedented vertical resolution (< 1 km). The occultations sample the dawn and dusk terminators, allowing us to investigate diurnal changes, while the broad range of dates (April/2018 –September/2019) spans almost a full Mars year, and permits the investigations of the seasonal cycle on the D/H. For the retrieval analysis, we employed the Planetary Spectrum Generator (PSG).

Our initial analysis of two D/H profiles measured with NOMAD reveal strong variability before and after the dust storm of 2018, indicative of a strong effect of the climatology on the water cycle and isotopic signatures. In this paper, we advance these pioneering measurements to the whole planet and a broad range of seasons. Our latest results show dramatic variability of the D/H across seasons and over short time scales. The D/H is expected to vary due to the Vapor Pressure Isotope Effect (VPIE), which produces

©2020. Japan Geoscience Union. All Right Reserved.

an isotopic fractionation at condensation (e.g., cloud formation and frost/ground fog formation), yet the observed localized (in time and space) anisotropies are certainly higher than was predicted by current atmospheric models. In this presentation, we will discuss different possible scenarios that may explain this variability and will discuss how these short-term processes impact our ability to estimate water loss from atmospheric D/H measurements.

Istituto di Astrofisica e Planetologia Spaziali (IAPS/INAF), Via del Fosso del Cavaliere, 00133 Rome, Italy, 4. Instituto de Astrofisica de Andalucia (IAA/CSIC), Granada, Spain

The NOMAD (“Nadir and Occultation for MArs Discovery”) spectrometer suite on board the ExoMars Trace Gas Orbiter (TGO) has been designed to investigate the composition of Mars' atmosphere using a suite of three spectrometers operating in the UV-visible and infrared. NOMAD is a spectrometer operating in ultraviolet (UV), visible and infrared (IR) wavelengths covering large parts of the 0.2-4.3 μm spectral range [1].

The UV-visible “UVIS” instrument covers the spectral range from 200 to 650 nm and can perform solar occultation, nadir and limb observations [2]. The main purpose of UVIS is dedicated to the analysis and monitoring of ozone and aerosols such as dust and ice clouds. In the present work we will present preliminary results of UV retrievals recorded in nadir geometry: spatial and seasonal distribution of ice clouds, dust and ozone.

Evolution of hydrological and glaciological activities on early Mars before late Tharsis formation

*Arihiro Kamada[1], Takeshi Kuroda[1], Yasumasa Kasaba[1], Naoki Terada[1], Hiromu Nakagawa[1], Katsushige Toriumi[1]

1. Graduate School of Science, Tohoku University

The present Mars is cold and arid environment with little stable water on surface. However, the planetary environment on early Mars would have been quite different from that on the current Mars. Many observations have shown geological evidences for the past Martian environment, which should have been moderate enough to allow both the large-scale surface runoff and ice-sheet activities. These well-known geological evidences are called as “valley networks (VNs)”.The orientation of VNs in the boundary between the Late Noachian and Early Hesperian (3.85-3.6 Ga) should have been influenced by the Tharsis bulge, which is the largest volcanic plateau centered near the equator in the western hemisphere of Mars, but the formation epoch of the Tharsis bulge is still under debate [e.g. Phillips et al. 2001; Anderson et al. 2001].Recent work such as Bouley et al. [2016] suggested that the Tharsis rise might have been largely emplaced after the formation of the valley networks during the Noachian and Hesperian boundary. The location of the pole of Mars has shifted due to the great mass of volcanic material in the load of Tharsis. This phenomenon is called as “True Polar Wander”.

We have developed a paleo-Mars global climate model (PMGCM) assuming a $CO_2/H_2O/H_2$ atmosphere under the ‘Faint Young Sun’ condition (with a solar luminosity of ~75% of the current value) for surface pressures of between 0.5 and 2 bar, and obliquity between 20 and 60 degrees. The PMGCM has a hydrologic cycle module, which includes ocean thermodynamics and processes of water vapor advection, convection, condensation and precipitation, as well as the calculations of surface fluvial activities assuming the rainfall infiltration (base or direct runoff) and surface erosion and transportation associated with river channel activities [Kamada et al., 2020]. Also, here we implemented the pre-True Polar Wander topography [Bouley et al., 2016] to investigate the global water cycle of early Mars before late Tharsis formation. In addition, we newly developed a surface glaciological scheme and implemented into the PMGCM, which estimates the surface erosion and transportation associated with glacier activities from the accumulation, ablation, spatial velocity and temperature fields of the surface ice.

When we assumed an H_2-rich ancient Martian atmosphere and dense surface pressures (more than 1.5 bar), the PMGCM showed that the global mean annual temperature of early Mars would exceed the melting point of water in all obliquity cases, as shown in Kamada et al. [2020] which assumed the current Martian topography. However, with lower obliquities, precipitation was rather restricted in both polar regions, with less precipitation in the regions of observed VNs. In contrast, with higher obliquities, there were enough snow precipitation in southern low to middle latitudes, because larger obliquities brought larger seasonal variations in the middle to high latitudes and mixed atmosphere more complicatedly. Additionally, apparent ice sheets were formed alongside the VNs regions, which should help surface or basal glacial dynamical movements on early Mars.

©2020. Japan Geoscience Union. All Right Reserved.

Our fluvial diagnosis model in the PMGCM showed that there would have been almost no apparent precipitation-fed surface runoffs and accompanied sediment transport in southern low to middle latitudes, and fluvial activities would have been limited to seashore or lakeshore regions. Instead, in higher obliquity cases, glaciers with basal temperatures above the melting point of water would make basal sliding and bring lots of melt-water, which would feed surface runoff in Martian southern low to middle latitudes when we assumed the terrestrial-like geothermal heat flux (30 mW m^{-2}). Moreover, such surface runoff activities would erode soft deformable bed-rock, and form U-shaped and V-shaped valleys over the long time. Our simulation results would suggest that observed VNs would have formed by glacial activities rather than riverine activities.

Permittivity of subsurface on Mars and its importance for electromagnetic wave reflection method such as radar sounder and ground penetrating radar

*Makito Kobayashi[1], Takafumi Niihara[1], Hideaki Miyamoto[1], Atsushi Kumamoto[2], Toshiyuki Nishibori[3]

1. University of Tokyo, 2. Tohoku University, 3. Japan Aerospace eXploration Agency

Recent planetary explorations have successfully acquired a large amount of high- resolution remote-sensing data of extraterrestrial bodies, especially the moon and Mars. However, the surfaces of solid bodies not having the condense atmosphere are generally covered by regolith, which is an essential problem for previous remote-sensing techniques such as cameras and spectroscopies to obtain critical information to understand the evolution of solid bodies. Hence, subsurface explorations schemes, such as using seismic waves and electromagnetic waves, have been applied or being discussed. Especially, the ‘electromagnetic wave reflection method’ such as radar sounder (MARSIS and SHARAD) and ground penetrating radar (RIFMAX and WISDOM) is capable of obtaining information of subsurface within a short time and visualizing the subsurface structures without contacting the surface, and then the method would be widely used in the future landing/rover missions.

The electromagnetic wave reflection method uses the electrical property of EM waves that reflects from the boundary of the materials having the different permittivity and has the potential to visualize the subsurface structures based on the travel time of the reflected wave. The estimation of subsurface structures needs the velocity of EM waves in a medium, and the velocity is decided by the relative permittivity of medium such as rocks. However, the value of permittivity is controlled by many parameters such as frequency, temperature, water content, bulk density, chemical composition, and so on, and it is required to use the permittivity under the condition according to its state. Especially, on the Martian surface, the temperature is lower than the terrestrial condition and the water content in the soils or rocks is basically zero. So, it is required to measure the permittivity under low temperature and dry condition. We developed the measurement system which is capable of measuring the real part of permittivity of regolith simulant with 5 % measurement error under the low temperature and dry condition using the coaxial probe method. We found that the permittivity values become about 7-20 % lower at -60 ˚C, which is the average temperature on the Martian surface, compared with the room temperature. Using the measured permittivity, we calculated the permittivity structure on the subsurface on Mars. As a result, the calculated permittivity is higher about 60 % than assumed before at 1.5 km depth, which is the estimated depth to exist a water-filled lake on the Martian south polar by Orosei et al. (2018). Our results suggest that it is important to measure the permittivity of rocks under the proper condition and use it for the interpretations of the electromagnetic wave reflection method such as radar sounder and ground penetrating radar on Mars.

TIMINGS OF MARTIAN WRINKLE RIDES, A GLOBAL INVESTIGATION

*Trishit Ruj[1], KENJI KAWAI[1]

1. Department of Earth and Planetary Science, School of Science, The University of Tokyo

Wrinkle ridges are common compressional structure found on the surface of Mars. These structures are observed on the surface with volcanic floors that have suffered crustal shortening with an indefinite depth of extent of the associated low angle thrust fault and have the potential to comment on the thermal evolution of the planet. However, wrinkle ridges are also frequent on the large crater floors and the region surrounding the volcanic patera. Here, in this research work, we updated the existing global map of Martian wrinkle ridge structures (Knapmeyer et al., 2006; 2008) and thereafter, used the Buffer Crater Counting (BCC) technique to extract the age of the wrinkle ridges. We have categorized and divided the wrinkle ridges into several groups, depending on their morphological and orientational pattern. We restricted our observation on 70° on each hemisphere. We carried our mapping and crater counting (in ArcGIS) using high-resolution Context (CTX) camera images (6 m/pixel; Malin et al., 2007), Thermal Emission Imaging System (THEMIS) (Christensen et al., 2004) global mosaic and High-Resolution Stereo Camera (HRSC)-MOLA blended Digital Elevation Models (DEM) (200 m/pixel; Fergason et al., 2018).

Our result suggests that most of the Martian wrinkle ridges are formed around the mid-phase of early Hesperian i.e., ~3.50 to ~3.60 Ga old. It includes Tempe Terra (~3.59 Ga), Lunae planum (~3.58), Solis Planum (~3.52), Thaumasia Planum (~3.59 Ga) as a part of Tharsis region. However, we have found that the age of the Tharsis surrounding wrinkle ridges are older than those of their counterparts in the Tharsis bulge (Chryse Planitia ~3.63 Ga; the eastern part of the Coprates rise ~3.65 Ga). Their orientation nature of the Tharsis-circumferential implies the influence of the origin of the compressional stress from the Tharsis volcano-tectonic province. The ages of the wrinkle ridges within Tharsis bulge also corresponds to the ages of the Noachis Terra/Terra Sabaea region of the southern highlands (~3.60 Ga), wrinkle ridges on the eastern part of the Hellas basin (~3.50 and ~3.52 Ga), wrinkle ridges associated with the southern part of the Circum Hellas Volcanic Province (i.e., ~3.48 to ~3.64 Ga), wrinkle ridges on the Hesperia Planum (trending ENE ~3.54 Ga and trending ~3.46 Ga), and wrinkle ridges on the west of Arcadia Planitia (~3.56 Ga). However, wrinkle ridges on the Syrtis Major Planum (radial ~3.40 Ga and concentric ~3.39 Ga). There are two sets of wrinkle ridges on the Amenthes Planum region. Dichotomy parallel wrinkle ridges are ~3.49 Ga old. However, dichotomy perpendicular ridges are younger and in this preliminary investigation, we are getting age of ~2.68 Ga. This age indicates a much younger age than the surroundings and possibly needs fresh reinvestigation.

Displacement-Length Ratios and Contractional Strains of Wrinkle Ridges in Thaumasia Minor and Solis Planum, Mars

DIPAYAN DASGUPTA[1], *ABHIK KUNDU[1]

1. Asutosh College, Kolkata, India

Statistical analyses of the planetary tectonic structures such as faults, joints and dikes are established means to comprehend stress-strain conditions throughout the history of planetary bodies. The geometric properties of the tectonic structures have been used by earlier workers to infer the rudimentary mechanical controls that helped in their origin and evolution [1]. Studies confirm that within the fault on terrestrial and planetary surfaces the maximum displacement (D_{max}) is proportional to its length (L). The D_{max}-L ratios are therefore utilized to delineate an average long-term equilibrium stress field [2, 3]. Wrinkle ridges, formed above to blind thrust faults, are compressional structures found abundantly on Mars [4]. Wrinkle Ridges in Thaumasia Minor and Solis Planum were studied using MOLA/HRSC Blended DEMs. Topographic profiles, across trends, were extracted for each wrinkle ridge near their midpoints [cf. 2] to evaluate their height and maximum displacement (D_{max}). Displacement and length values of the wrinkle ridges were plotted on a graph. The D_{max}-L ratios (γ) for wrinkle ridges of both the regions are calculated by a linear fit method [cf. 2, 5]. The γ value of ridges in Thaumasia Minor was found to be (2×10^{-3}) while that in Solis Planum is found to be (1.2×10^{-3}). The contractional strains (ε) in Thaumasia Minor and Solis Planum are estimated to be ~0.14% and ~0.1% respectively (fault plane dip θ is assumed to be 25°). These estimated values indicate that the Thaumasia Minor is more affected by compressional tectonics than the adjacent Solis planum.

[P-PS08] Mars and Mars system: results from a broad spectrum of Mars studies and aspects for future missions

convener:Hideaki Miyamoto(University of Tokyo), Tomohiro Usui(Japan Aerospace Exploration Agency), Yuki Harada(Kyoto University), Sushil K Atreya(University of Michigan Ann Arbor)

A wealth of new data from the US, European, Russian, and the Asian exploration missions are contributing to improved understanding of geologic and climate evolution and the habitability of Mars. Eight spacecraft are currently operating at Mars, with six in orbit (Odyssey, MRO, MAVEN, Mars Express, Mangalyaan and TGO) and two on the surface (MSL-Curiosity and InSight), the largest number ever at any given time. In addition, Mars 2020, ExoMars and the Emirates Mars Mission are all scheduled to be launched in 2020. JAXA's MMX mission to explore Phobos, Deimos, and Mars is scheduled for a 2024 launch. This shows that the scientific community, international space agencies and the general public are committed to the exploration of the fascinating world of Mars. Synergistic investigations of ongoing or already completed missions together with modeling studies and earth-based observations are gradually revealing the nature of Earth's most closely resembling planet, which took a different evolutionary track than the other terrestrial planets. Seasonally, temporally and episodically variable phenomena seen on the surface and the atmosphere indicate that Mars is presently active. Thus, this session is planned to discuss recent results from a broad spectrum of Mars studies encompassing the interior, surface, atmosphere, plasma environment, and the Mars system including its two satellites. Abstracts on instrumentation and future mission plans are also encouraged for this session, as both the presenters and the audience would greatly benefit from ensuing discussions and feedbacks.

The Giant Sinkholes of Mars: Furthering our Understanding of the Red Planet's Hydrosphere

*Alexis Palmero Rodriguez[1], Hideaki Miyamoto[2], Victor Baker[3]

1. Planetary Science Institute, 2. University of Tokyo, 3. University of Arizona

One of the greatest puzzles in the exploration of our Solar System is the history of water on Mars. There is mounting evidence gathered over 50 years of research indicating that early in its history, oceans repeatedly formed on Mars, first in the presence of a globally interconnected hydrosphere and hundreds of millions of years later in connection to the massive disruption of vast aquifers.

Evidence of the aquifers includes the presence of chaotic terrains (zones of collapse) that are associated with catastrophic flood channels. The nature of the aquifers remains a mystery. Some researchers suggest that they might form part of a global hydrosphere confined beneath kilometers of permafrost. This hypothesis suggests that southern circum-Chryse may have had a crust exceeding abundant in volatiles. However, there is another view- that the terrain disruptions that we observe are zones where subterranean rivers transported groundwater from distal regions. The location of the aquifers that fed into the proposed underground rivers remains uncertain, though some workers have suggested the subsurface of the Tharsis volcanic rise as a likely source location. If this hypothesis is correct, subterranean river flow was a key component of Mars hydrology, which we are just beginning to understand.

The former presence of subterranean rivers has been inferred from the mapping of subsidence patterns in highland regions that adjoin large outflow channel systems. These studies suggest that the rivers flowed through immense conduits with diameters of ~10 km and perhaps larger. These features have no terrestrial analogs and hence might reflect some unique conditions that developed on Mars.

Here, we further test this hypothesis and refine its implications towards our understanding of the planet's early geologic history. We present the first identification of potential sinkholes that occur within and near the proposed region of subsidence. We used the sinkholes diameters, and their floor depths are proxies to the conduit dimensions and their distribution within the Martian upper crust. Our preliminary results confirm the gigantic nature of the conduits and appear to position their distribution at discrete elevation ranges that connect tectonic trends and unconformities that we are tracing throughout the study areas. The results outline and constrain the locations of the potential aquifers to a few areas of the Martian western hemisphere at sufficient elevations to generate the hydraulic head required to produce the subsurface flows. In this respect, we identified an unconformity in the highlands that might trace an area of collapse created when the source aquifers were drained. The area, we find, was subsequently buried by lavas.

Our results depict Mars' early hydrosphere as an extremely dynamic planetary feature and highlight the role of subterranean river flow as a substitute to surface water drainage as an essential modifier to the planet's ancient landscapes.

Constraining the Formation of Mars with N-body simulations of Terrestrial Planet Formation

*Patryk Sofia Lykawka[1], Takashi Ito[2]

1. School of Interdisciplinary Social and Human Sciences, Kindai University, 2. National Astronomical Observatory of Japan

Reproducing the orbits and masses of the terrestrial planets Mercury, Venus, Earth, and Mars remains elusive. To address that question, we investigated terrestrial planet formation by performing extensive N-body simulations of primordial protoplanetary disks representative of typical models in the literature. Those disks consisted of embryos and planetesimals placed up to ~1-4 au (depending on the disk model).

First, we employed our classification algorithm to identify the systems that formed planet analogs of the Venus-Earth pair (in terms of orbit and mass) plus Mercury or/and Mars in the same system. From the analysis of the terrestrial planets formed in such 3- or 4-planet system analogs, we obtained detailed properties regarding the formation and evolution of a vast number of identified Mars analogs. These properties include a-e-i-mass distributions, delivery of water/volatiles, number of giant impacts, accretion histories, and many others.

In this presentation, we also discuss the dependence of the results on the initial conditions (models considered), which allowed us to discuss the conditions that a protoplanetary disk must satisfy in order to satisfy the main properties of Mars and to form simultaneously the four terrestrial planets.

Extensive delivery of Martian ejecta to its moons: The gateway to a time-resolved history of Mars

*Hidenori Genda[1], Ryuki Hyodo[2], Kosuke Kurosawa[3], Tomohiro Usui[2], Kazuhisa Fujita[2]

1. Earth-Life Science Institute, Tokyo Institute of Technology, 2. JAXA ISAS, 3. Planetary Exploration Research Center, Chiba Institute of Technology

Mars has experienced continuous asteroidal impacts throughout its history. These have produced impact-generated Mars ejecta, and a fraction of this debris is delivered to the moons of Mars: Phobos and Deimos. We studied the amount and condition of recent delivery of impact ejecta from Mars to its moons. Using state-of-the-art numerical approaches, we report that the amount of delivered materials is 10-100 times more than previously estimated, and the delivered materials are physically and chemically different from the Martian meteorites, which are all igneous rocks with a limited range of ages. We show that Mars ejecta mixed in the regolith of its moons potentially covers all its geological eras and consists of all types of rocks, from sedimentary to igneous.

Phobos and Deimos, the two small moons of Mars, are the target bodies of the Japan Aerospace eXploration Agency (JAXA) sample return mission Martian Moons eXploration (MMX). The plan for MMX is to collect samples of more than 10 g of Phobos regolith. Assuming a typical and expected grain size, at least 30 Martian grains would exist in the returned sample. These grains will provide a wealth of time-resolved geochemical information about the evolution of Martian surface environments.

Morphological characteristics of small craters of Phobos

*Ryodo Hemmi[1], Hideaki Miyamoto[1]

1. The University of Tokyo

The surface of Phobos is covered by plenty of small (up to meter-sized) craters. Although most of them show a bowl-shaped morphology, some of them represent concentric, flat-floored, or central-mound geometries [1], which is considered to be related to the existence of a surface layer with a thickness comparable to their crater depth [2]. Also, the blue unit of the sub-Mars side of Phobos was interpreted as a massive landslide deposit extended from the W-NW inner wall of Stickney crater [3], which remains enigmatic. If these layered deposits having a certain thickness covered small craters, they could have been partially modified or obliterated. We have recently investigated the topographic profiles of sub-kilometer craters of Phobos by creating 20 m/pixel MRO/HiRISE stereo-derived digital terrain model (DTM), and found that their crater depth/diameter ratios (d/D) are comparable between the red and blue units in a diameter range of 100 to 1,000 m, and the inner wall of a crater inside the blue unit is affected by a post-crater depositional event [Hemmi and Miyamoto, in revision]. Thus, in this study, we aim to quantitatively characterize the morphology of craters smaller than 100 m in diameter by using a highest resolution DTM.
Here we performed noise reduction and bundle adjustment of HiRISE stereo-pair images of Phobos [4] by means of the U.S. Geological Survey's ISIS3, and then created a highest-resolution (~6.5-m/pixel) DTM by using our stereo-derived DTM and the multi-view shape-from-shading technique [5]. Consequently, the resulted DTM enables us to measure precise measurements of the small craters' depths and to study unique crater floor geometries in detail. We will discuss the results of morphometric measurements of these craters in comparison with those of craters larger than 100 m at the meeting.

The MMX Rover: objectives, science goals, and contributions to the MMX mission

*Hideaki Miyamoto[1], Patrick Mitchel[2], Stephan Ulamec[3], Ute Böttger[3], Matthias Grott[3], Naomi Murdoch[4], Pierre Vernazza[5], MMX Rover team

1. University of Tokyo, 2. Université Côte d’ Azur, Observatoire de la Côte d'Azur, CNRS, 3. Deutsches Zentrum für Luft- und Raumfahrt e.V. , 4. Institut Supérieur de l'Aéronautique et de l'Espace, 5. Laboratoire d’ Astrophysique de Marseille

The Martian Moons eXploration (MMX) will carry the small (~25kg) rover, which is mainly contributed by the Centre National d’ Etudes Spatiales (CNES) and the German Aerospace Center (DLR). The rover is designed as a scout, a demonstrator, and an in-situ science investigator, and will survive >100 days on the surface of Phobos. The primary objective of the rover is increasing the landing safety of the MMX mothership, which is planned to obtain >10 g of samples including at depth >2cm from each of two sampling sites. Scientific objectives of the rover include 1) understanding the physical properties and mechanical behaviors of Phobos regolith, 2) in-situ geological and geochemical survey of the roving area; 3) mineralogical study of the surface material at the landing/roving area; 4) understanding the thermal properties of the surface; and 5) studying the heterogeneity of the surface at various scales. The scientific payload of the rover consists of four instruments, such as the IR radiometer; miniRad, which is designed mainly to characterize the thermal properties of the regolith; NavCams, which is composed of two cameras in stereo and will observe the soil and landscape in front of the rover in color; RAX, which is a Raman spectrometer for characterizing the composition of the ground just below the rover; and WheelCams, which consists of two cameras looking at the interface between the wheel of the rover and the surface to characterize the behavior of regolith. The rover is in a significantly important position in multi-scale observations between the global observations of the MMX mothership and the very localized precise information obtained from the returned sample. The rover team is now composed of 39 Co-Is and 23 collaborators and is working together with all science sub teams (SST) of the MMX mission, especially the Surface Science and Geology SST (Science Sub Team).

The first four orbits of Parker Solar Probe (PSP) consists of many observations of stream interaction regions (SIRs), which form when fast solar wind streams overtake slower solar wind. While it is known that SIRs accelerate ions in the heliosphere and can trigger geomagnetic storms, the temporal and radial evolution of SIRs is still an active topic of research. During the first four orbits of PSP, SIRs were observed by PSP at small heliospheric distances, as well as at 1 au by the Advanced Composition Explorer (ACE), Wind, and Solar Terrestrial Relations Observatory (STEREO) missions. These SIRs are observed not only at different heliospheric distances, but also at different points in the temporal development of the stream interface. Through analyzing the various SIRs together, insight can be gained in regards to the spatial and temporal evolution of SIR characteristics, as well as to the mechanisms of particle acceleration and transport along the SIR interface. The general characteristics of SIRs observed by PSP during the first four orbits are presented, and an in-depth comparison of a few of the SIR events is conducted to further analyze the evolution of SIR streams in the inner heliosphere. These observations show examples of a fast solar wind stream steepening into an SIR, with evidence of locally accelerated particles via compressive mechanisms at the interface distinguishable from observations of particles likely accelerated at shocks formed at larger heliospheric distances.

Hinode Observation of Sun’s Polar Regions over a solar cycle

*Daikou Shiota[1], Masumi Shimojo[2]

1. National Institute of Information and Communications Technology (NICT), 2. National Astronomical Observatory of Japan

Observations of the magnetic fields in the Sun’s polar regions are of crucial importance to understand the long-term variation of solar magnetism. As a consequence of the magnetic variation the three-dimensional structure of global solar corona and solar wind also show a drastic long-term variation and, as a result, fast solar wind emanates from the polar regions around solar minima. The first Hinode observation of the polar region reveals the fine structure of photospheric vector magnetic fields of the polar areas: the existence of many patchy magnetic concentrations with intrinsic field strengths of over 1 kG distributed across the entire polar region (Tsuneta et al. 2008) around the solar minimum. Following the first polar observation, the monitoring of the polar regions has been continued for 12 years. Since 2012, which was before the solar maximum of this cycle, the time variations in the distribution of the whole polar regions during the polarity reversal period have been monitored with periodic SP observations during a month at the proper timing (March for the south pole and September for the north pole). The monitoring revealed that the distributions of large magnetic patches show yearly variations associated with the solar activity cycle while small magnetic patches does not change. The polarity reversal of the northern polar region progressed prior to that of the south in the early stage of the this cycle: The decrease of large negative patched in the north polar region is earlier than the decrease of large positive patches in the southern polar region as similar to shown in the previous work (Shiota et al. 2012). As most of the negative magnetic patches in the north polar region had disappeared by 2013, the average magnetic field of the north polar region became nearly zero and had remained so until 2015. we can see significant increase in the large positive patches after 2016. On the other hand, the reversal process progressed so quickly. Now, the Sun comes the solar minimum state, the polarity reverse seems to complete in this cycle.

Coronal radio sounding using Akatuski spacecraft: variation in the solar cycle

*Shota Chiba[1], Takeshi Imamura[1], Munetoshi Tokumaru[2], Ayumi Asai[3], Hiroaki Isobe[4], Daikou Shiota[5], Takuma Matsumoto[6], Hiroki Ando[7]

1. Graduate School of Frontier Sciences, The University of Tokyo, 2. Institute for Space-Earth Environmental Research, Nagoya University, 3. Astronomical Observatory, Kyoto University, 4. Faculty of Fine Arts, Kyoto City University of Arts, 5. National Institute of Information and Communications Technology (NICT), 6. Nagoya University, Ta Lab, 7. Kyoto Sangyo University

Radio occultation observation is one of the limited means to approach the dark and hot coronal region. Quasi-periodic density fluctuations that are considered to be acoustic waves were detected by radio occultation observations in 2011 using radio waves transmitted from the Japanese Venus explorer Akatsuki and received at the ground station during the superior conjunction period. The acoustic waves were considered to have been generated from the nonlinearity of Alfven waves that originate from the photosphere. However, since the observation was limited to a certain period of the 11-year solar activity cycle, to what extent the suggested features are typical and the variability in the solar cycle are uncertain. In this research, we analyze radio occultation observations carried out during the superior conjunction periods from 30 May 2016 to 15 June 2016 and from 29 December 2017 to 20 January 2018 as well as the observations in 2011. Solar offset distances of about 2 to 10 solar radii were probed intermittently 11 times in the former period and 10 times in the latter period. The time series data of frequency and intensity of radio waves received at the ground station are analyzed. Radial velocities of the solar wind are estimated from intensity spectra, and wavelet analysis is applied to the frequency time series to detect quasi-periodic density fluctuations that are thought to be manifestations of acoustic waves. The solar wind velocities near the Sun obtained by the radio occultation observations and those at far distances measured by IPS (Interplanetary Scintillation) observations are compared. We also aim to clarify the dependence on the solar activity by analyzing all observational data from 2011 to 2018.

Global distribution of the solar wind speed during Cycle 22-24

*Munetoshi Tokumaru[1], Ken'ichi Fujiki[1], Kazumasa Iwai[1], Nobuhiko Nishimura[1], Ryuya Maeda[1]

1. Institute for Space-Earth Environmental Research, Nagoya University

Observations of interplanetary scintillation (IPS) at 327 MHz have been conducted since 1980s at ISEE of Nagoya University using multi-station system. The IPS observations enable reliable determination of global distribution of the solar wind (SW) speed via the computer assisted tomography analysis. We investigated long-term variation of the solar wind speed distribution for the period between 1985 and 2020, which covers solar cycles (SCs) 22-24. The solar activity dropped significantly during this period, and peculiar aspects of the solar wind structure have been reported from several studies for SC24. Derived SW data clearly demonstrate that global distribution of SW speed changes systematically with the solar cycle. At solar minima, the fast SW develops over the polar region, and the slow SW is located at equatorial region. At solar maxima, the fast SW diminishes in size, and the slow SW dominates at all latitudes. This solar cycle variation of SW show good correlation with polar field strength. One of prominent features found for SC24 data is an increase in fast wind area at low latitudes. Another features of SC24 data is enhanced North-South asymmetry of slow wind distribution, particularly for the period between 2011 and 2015; i.e. at solar maximum of SC24. These are considered as heliospheric responses to the peculiar solar activity in SC24.

Next generation interplanetary scintillation observation telescope using 2D phased array system

*Kazumasa Iwai[1], Munetoshi Tokumaru[1], Ken'ichi Fujiki[1]

1. Institute for Space–Earth Environmental Research (ISEE), Nagoya University

There are still many important issues in the heliospheric physics, such as the acceleration and propagation of the solar wind, propagation of coronal mass emissions (CMEs) in the inner heliosphere, the global structure of the heliosphere, and its variations associated with the solar activity. These issues are also important for the space weather forecasting. Interplanetary scintillation (IPS) is a radio scattering phenomenon caused by the disturbances in the solar wind. The IPS observation using ground-based radio telescopes has been an important technique to investigate the global structure of the heliosphere. We, Nagoya University, have observed the solar wind velocity and density irregularities for several decades using our own large radio telescopes at 327 MHz. Recently, the unusual solar actively makes complex solar wind distributions, which requires more detailed IPS observations. Detecting CME structures is also required to forecast the arrival of CMEs. In this study, we investigated the design of next generation IPS observation instruments, and developed their pathfinders.
Multi-point IPS observations throughout the year are required for more detailed reconstructions of the solar wind velocity distributions. In order to realize the IPS observation even in the snowfall season, we considered a flat two-dimensional phased array with a wide field of view. This structure is also resistant to natural disasters such as typhoons by eliminating the drive unit. The real time digital signal processing of the receiver system is required for the digital multi beam forming that observes multiple directions simultaneously. This system will enable us to take several all-sky IPS maps within a day to track fast CMEs. This system is also able to detect the passage of CMEs and derive their structures by tracking a specific radio source. One of the important development parts in this project will be the digital signal processing part that requires about 1000 units of digital boards. We designed and developed a low-cost digital board dedicated to the IPS observation using ADCs and FPGAs, and found that the digital board has enough performance. The developed prototype is able to process 8 signals simultaneously and has a size of 37cm x 27cm, which is a reasonable size for the mass-production.

convener:Kazumasa Iwai(Institute for Space–Earth Environmental Research (ISEE), Nagoya University), Yasuhiro Nariyuki(Faculty of Education, University of Toyama), Ken Tsubouchi(University of Electro-Communications), Masaki N(Japan Aerospace Exploration Agency, Institute of Space and Astronautical Science)

This session aims to secure comprehensive insights into physical processes of plasmas and fields in the heliosphere. Presentations of the recent studies from any approaches (integrated observation/theoretical modeling/massive numerical simulation) are welcomed. Topics are not restricted to any specific issues: phenomenological studies on solar flares/CME/solar wind, and related fundamental physics problems such as shocks/waves/turbulence/particle transport and acceleration can be the main target, including heliospheric high-energy phenomena and their impact on the Earth's environment.

Discussion

Ion scale waves and kinetic instabilities in the inner heliosphere

*Jungjoon Seough[1], Yasuhiro Nariyuki[2], Peter Yoon[1,3,4], Kyung-Suk Cho[1]

1. KASI, 2. UT, 3. UMD, 4. KHU

The coherent electromagnetic waves at ion scales have been frequently observed in the inner heliosphere during the first perihelion of Parker Solar Probe. It is expected that ion- scale waves, propagating preferentially quasi-parallel to the mean magnetic field, are locally driven by the ion velocity-space micro-instabilities that are closely associated with turbulent heating and thermodynamic processes in the expanding solar wind. In the present study, we discuss the underlying physical processes of how the ion-scale waves are generated in the inner heliosphere, where Parker Solar Probe has explored. Here we present a recently developed expanding box model based upon the velocity moment-based quasilinear kinetic analysis. This model incorporates the kinetic physics, such as plasma heating driven by Alfven-wave turbulence and micro-instabilities calculated by a self-consistent manner, into the large-scale fluid description. The theoretical results may help us understand the observational features, not only the presence of abundant ion-scale waves but also the solar wind thermodynamics, such as the evolution of temperature and its anisotropy.The coherent electromagnetic waves at ion scales have been frequently observed in the inner heliosphere during the first perihelion of Parker Solar Probe. Effects of initial density fluctuations on linear and nonlinear evolution of parametric decay instabilities of circularly polarized Alfven waves

*Yasuhiro Nariyuki[1]

1. Faculty of Education, University of Toyama

The parametric decay instability [Goldstein, ApJ, 1978; Derby, ApJ, 1978] is regarded as an important process of damping of large amplitude, low-frequency Alfven waves in the solar wind. Since Alfvenic fluctuations and anisotropic spectra are widely observed in the solar wind, nonlinear evolution of decay instabilities can be related to the formation of the anisotropic spectra of magnetohydrodynamic turbulence in the solar wind. Recently, Shoda and Yokoyama[ApJL, 2018] discussed the relationship between the multi-dimensional decay instability and nonlinear processes such as the phase mixing and the perpendicular cascade.

In this presentation, we discuss roles of initial density fluctuations on the decay instabilities of Alfven waves. Since not only parallel propagating waves but also obliquely propagating waves are unstable to the decay instability [Vinas+Goldstein, JPP, 1991], oblique initial density fluctuations with finite amplitude can preferentially be excited, even if their linear growth rates are not large. In such a case, the growth of the parallel propagating mode is usually suppressed. Numerical results of three-dimensional MHD simulation also show an opposite case, in which the linear growth of the parallel propagating modes is promoted by the effects of the multi-dimensionality. Dependence of linear and nonlinear evolution on wave number spectra of initial waves will be demonstrated.

Search of energy source of 1-16Hz Whistler Mode Waves Detected by Kaguya in the Lunar Polar Orbit

*Tomoko Nakagawa[1], Futoshi Takahashi[2], Hisayoshi Shimizu[3], Yoshifumi Saito[4]

1. Information and Communication Engineering, Tohoku Institute of Technology, 2. Department of Earth and Planetary Sciences, Faculty of Science, Kyushu University, 3. The moon is exposed to the solar wind or magnetospheric plasmas due to the lack of global magnetic field or the dense atmosphere like those of the Earth. Most of the incident plasmas are absorbed by the lunar surface, but a small fraction of protons are scattered back into the solar wind in the form of ions, or neutral atoms to be re-ionized through charge exchange. The solar wind particles that came across intense local crustal magnetic field so called as the magnetic anomalies are more strongly reflected back due to the Lorentz force. Electrons that came into the region near intense magnetic anomalies are mirror reflected and/or accelerated by local electric field generated by difference of penetration depth of ions and electrons.

These plasmas have energy that can generate various wave activities (Harada and Halekas, 2016). Protons reflected by the magnetic anomalies are responsible for generation of monochromatic ULF waves or ELF waves through cyclotron resonance with MHD waves or whistler mode waves. Mirror-reflected electron beams along the magnetic field connected to the magnetic anomaly are thought to be the source of non-monochromatic whistler mode waves in the frequency range from 0.1 to 10 Hz. Detection of the non-monochromatic whistler waves depends on magnetic connection between the spacecraft and the magnetic anomalies.

Another type of ELF whistler waves were found by Kaguya. The frequency range was broad (1-16 Hz) like the non-monochromatic whistlers generated by field-aligned electrons, while their detection was less sensitive to the magnetic connection as well as the waves generated by reflected protons. They were preferentially observed above the polar region of the moon. The detection site was off the magnetic anomaly. They were found when the incident solar wind density was high.

The generation mechanism of such diffuse whistler mode waves is not yet understood. Dense solar wind flux incident to lunar surface unshielded by the crustal magnetic field is likely to cause scattering of solar wind protons in the form of ions or neutral atoms to be re-ionized. Scattered protons with less collimated velocities might account for the broad frequency range and the occurrence property less sensitive to the magnetic connection to the lunar surface.

Relationship between the inner heliosheath thickness and the pickup ion density

*Ken Tsubouchi[1]

1. University of Electro-Communications

The interaction of the supersonic solar wind with the interstellar medium results in the formation of the shock wave (termination shock; TS) inside the heliosphere, as well as the discontinuous interface between them (heliopause; HP). The location of the TS and HP characterizes the size and shape of the heliosphere, which suggests a feature of the pressure equilibrium with interstellar space. Therefore, it is important to quantitatively associate the thickness of the inner heliosheath (IHS), the region between the TS and HP, with the energy composition there. Recently, both Voyager 1 and 2 (V1, V2) crossed the TS at the heliocentric radial distance of 94 (V1) and 84 (V2) au, and the HP at 122 (V1) and 119 (V2) au, estimating the IHS thickness along the V1 and V2 trajectories 28 (V1) and 35 (V2) au, respectively. This difference is mainly caused by that of solar wind conditions, because each crossing was in a different phase of the solar activity. However, it is insufficient to evaluate the pressure in the IHS by solar wind parameters only. The striking feature of the IHS plasmas is the dominant contribution of pickup ions (PUIs) to the energy density. It is well known that the presence of PUIs greatly modifies the TS property and the consequent energy composition in the downstream. In this talk, we aim to study the dependence of the PUI density on the size of the IHS by simultaneously generating the TS and HP via large-scale hybrid simulations. A simple analytical assessment is also presented. We expect that the results will be useful to deduce the PUI density itself from the observed IHS thickness.

Inter-hemispheric Coupling During Sudden Stratospheric Warming Events

Kristina Shizuka Yamase Skarvang[2], *Patrick J Espy[1], Robert E. Hibbins[1], Willem E. van Caspel[1]

1. Norwegian Univ. of Science and Technology, Birkeland Centre for Space Science, 2. Norwegian Univ. of Science and Technology

Long-term data sets of mesospheric winds and temperatures from the Antarctic station at Rothera (68 S, 68 W) and the Northern Hemisphere radar at Trondheim (64 N, 10.5 E) have be used to examine the Southern Hemisphere (SH) response to sudden stratospheric warmings (SSW) in the Northern Hemisphere (NH). Temperatures and winds in the upper mesosphere (80-100 km) in the SH from a Skiymet meteor radar system are compared to those from a similar system in the NH to examine whether the SSW perturb the global circulation or whether the effects are confined to the NH only. The winds and temperatures from both systems are also be compared with re-analysis and satellite data to examine the role of equatorial ozone in the coupling. The analysis first characterized and removed seasonal cycles, and then performed a super-posed epoch centred on SSW events. The results of this comparison, as well as possible mechanisms for the SH signature, will be presented and discussed.

Dynamical characteristics of the middle atmosphere associated with the Antarctic sudden stratospheric warming in 2019.

*Kaoru Sato[1], Yoshihiro Tomikawa[2], Dai Koshin[1]

1. Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 2. National Institute of Polar Research

In September 2019, a strong sudden stratospheric warming (SSW) occurred in the Antarctic. The size of the ozone hole, which is greatly affected by the temperature in the lower stratosphere, was as small as in the 1980s, and its maximum area was smaller than that of Antarctica for the first time in 30 years. We report the dynamical characteristics of this SSW.

First, planetary waves with strong heat fluxes entered into the stratosphere after around August 20. This heat flux intrusion was followed by a sudden increase in the zonal mean temperature averaged over 60 S-90 S at 10 hPa (corresponding to an altitude of about 30 km) around August 22. The temperature was maximized around September 16. Simultaneously, the zonal mean zonal wind at 60 S was significantly weakened to 15 m/s at 10 hPa. The zonal mean zonal wind did not become negative, and hence did not meet the criteria for the major SSW. However, as the zonal mean zonal wind averaged over the past 40 years is about 74 m/s there, the decrease in the zonal wind amounts to nearly 60 m/s. If the same zonal wind weakening occurred around October 1, the criteria for the major SSW would have been met.

What is interesting about this event is that barotropic instability had frequently occurred around 10 hPa since mid-September. Barotropic instability is a phenomenon that is sometimes seen in the upper stratosphere and mesosphere, but rarely occurs at 10 hPa. The characteristics are described by using Ertel’ s potential vorticity (PV). The maximum of the zonal mean |PV| (absolute value of PV) was frequently observed in the range of 70 S to 80 S in the middle stratosphere, and often extended down to the 850 K isentropic surface corresponding to 10 hPa. Time evolution of the horizontal structure of the PV in the polar stereo maps was examined. It is seen that the high |PV| of the polar vortex was strongly deformed by the planetary waves and stretched like a string surrounding the polar vortex and toward low latitudes. Then, the string-like high |PV| was split into many vortices which subsequently developed. These features are a typical barotropic instability.

Next we examined the EP flux in the meridional cross section. The upward EP flux from the troposphere did not converge around 60 S, which is the central latitude of the polar night jet, but went toward low latitudes and converged in a pressure level of 30 hPa (~23 km) to 5 hPa (~35 km). It is considered that the EP flux toward low latitudes is accompanied by the barotropic instability. At 10 hPa, 30 S, which is the center of the EP flux convergence area, a strong westward jet exceeding 20 m/s was formed.

As such, this Antarctic SSW event exhibits an interesting time evolution: Due to the barotropic instability that frequently occurred during the SSW event, the planetary waves did not efficiently decelerate the polar night jet and then the stratospheric condition did not reach the major SSW. Instead, a strong westward jet was formed in the mid-latitudes of the middle stratosphere.

WACCMX Simulations of the 2002 and 2019 Southern Hemisphere Sudden Stratospheric Warmings

*Nicholas M Pedatella[1]

1. National Center for Atmospheric Research

Sudden stratospheric warmings (SSWs) are characterized by large-scale, rapid, changes in the polar winter middle atmosphere, and also lead to large variability throughout the whole atmosphere, including changes in the mesosphere, thermosphere, and ionosphere. SSWs occur in roughly six out of ten Northern Hemisphere winters, and, due to hemispheric differences in planetary wave activity, are significantly less frequent in the Southern Hemisphere. Though rare, Southern Hemisphere SSWs have occurred recently in 2002 as well as 2019. With these two events, it is possible to investigate similarities and differences between SSW events in the Northern and Southern Hemispheres. Simulations of the 2002 and 2019 Southern Hemisphere SSWs are performed using in the Specified Dynamics version of the Whole Atmosphere Community Climate Model with thermosphere-ionosphere eXtension (SD-WACCMX). The simulations are used to compare and contrast variability in mesospheric tides and the equatorial ionosphere during Southern and Northern Hemisphere SSW events.

Characteristics of small-scale gravity waves in the Arctic winter mesosphere

*JING LI[1], TAO LI[2,3], QIAN WU[4], YIHUAN TANG[2], ZHAOPENG WU[1,3], JUN CUI[1]

1. Planetary Environmental and Astrobiological Research Laboratory (PEARL), School of Atmospheric Sciences, Sun Yat-sen University, Zhuhai, Guangdong, China, 2. CAS Key Laboratory of Geospace Environment, School of Earth and Space Sciences, University of Science and Technology of China, Hefei, Anhui, China, 3. CAS Center for Excellence in Comparative Planetology, Hefei, Anhui, China, 4. High Altitude Observatory, National Center for Atmospheric Research, Boulder, CO, USA

Using the long-term datasets observed with an OH all-sky imager, a Fabry-Perot Interferometer at Resolute Bay observatory, Canada (74.7˚N, 94.9˚W), Microwave Limb Sounder and reanalysis data, we study the characteristics of small-scale gravity waves (GWs) with the horizontal wavelength less than 20 km in the Arctic winter mesosphere during 2014-2016. The observed small-scale GWs may be excited in the mesopause region, such as secondary wave generated by primary wave breaking, or a result of baroclinic instability processed in the stratosphere, and the interaction of planetary waves with the background winds. In addition, almost all of the small-scale GWs occurred in 2015/2016 anomalous winter, when both the strong El Nino-Southern Oscillation (ENSO) and anomalous Quasi-biennial Oscillation (QBO) happened. Further studies are needed to explore the mechanism of GW excitation and propagation.

Studying atmospheric and ionospheric variabilities in the mesopause and ionospheric F2-region during winter sudden stratospheric warmings of various types

*Irina Medvedeva[1,2], Konstantin Ratovsky[1], Alla Suvorova[3]

1. Institute of Solar-Terrestrial Physics SB RAS, Irkutsk, Russia , 2. Obukhov Institute of Atmospheric Physics RAS, Moscow, Russia , 3. GPSARC National Central University, Taoyuan, Taiwan

We present the results of studying the activity of atmospheric waves at the heights of the mesopause (80-100 km) and ionospheric F2-region during the periods of winter sudden stratospheric warmings (SSW) of various types. The analysis is based on the experimental data on the rotational temperature of the hydroxyl molecule (OH band (6-2) 834.0 nm) obtained from spectrometric measurements at the Geophysical Observatory of the ISTP SB RAS (51.8˚ N, 103.1˚ E, Tory), and on the peak electron density NmF2, from the Irkutsk ionosonde DPS-4 (52.3˚ N, 104.3˚ E) data. The rotational temperature of the hydroxyl molecule corresponds to the temperature of the atmosphere at the mesopause heights. In this study, we used the method for estimating the atmospheric and ionospheric variabilities described in (Medvedeva and Ratovsky, 2015), which allows one to analyze the manifestation of wave activity in a wide range of altitudes of the upper atmosphere. As a characteristic of atmospheric variability, we used standard deviations of the mesopause temperature in the annual and nightly variations, by which one can analyze the manifestation of the various timescale wave process activity in the upper atmosphere (Perminov et al., 2014, Medvedeva and Ratovsky, 2015). As a characteristic of ionospheric variability, we used the variability of the F2 peak electron density (NmF2). The values of atmospheric and ionospheric variability obtained using this technique during the SSWs, are compared with seasonally average values. We revealed significant differences in the manifestation of wave activity at the heights of the mesopause and ionospheric F2-region during the SSWs of various types. Thus, the major SSW in February 2018 led to an increase in the day-to-day atmospheric and ionospheric variability, which can be caused by the intensification of planetary wave activity in the upper atmosphere. The largest effects of the major January 2019 SSW in the upper atmosphere were observed in the behavior of diurnal atmospheric variability due to the effects of tides and internal gravity waves.

Acknowledgments

The reported study was funded by RFBR, Russian-Taiwanese joint research project number 18-55-52006 MHT_a. Experimental data recorded by the equipment of Center for Common Use «Angara» (http://ckp-rf.ru/ckp/3056/) obtained with budgetary funding of Basic Research program II.16 were used.

Influences of migrating semidiurnal tide variabilities on the low latitude ionosphere

*Jia-Ting Lin[1], Charles Lin[1], Loren Chang[2,3], Hanli Liu[4], Nicholas M Pedatella[4,5]

1. Department of Earth Sciences, National Cheng Kung University, Taiwan, 2. Center for Astronautical Physics and Engineering, National Central University, Taoyuan, Taiwan, 3. COSMIC Program Office, University Corporation for Atmospheric Research, Boulder, CO, USA

In this study, we investigate the variability of ionosphere and its electrodynamic responses to the changes in amplitude and phase of migrating semidiurnal tide (SW2) associated with sudden stratospheric warming (SSW) using numerical experiments under boreal winter and solar minimum condition. A sensitivity assessment of the Thermosphere-Ionosphere-Electrodynamics General Circulation Model (TIE-GCM) simulations shows that ionospheric variabilities greatly depend on the SW2 condition in the lower boundary. Our results show that the earlier phase shift of SW2 causes the morning-enhanced and afternoon-reduced TECs by modulating equatorial vertical E ×B drift, which agrees with the observation qualitatively but with insufficient magnitude. Instead, the increase in amplitude of SW2 only drives temporally upward E ×B enhancement at local noon; nevertheless, it is suppressed soon by the rise of SW2 tidal dispassion from the westward acceleration of F-region zonal winds. The long sustained and stronger earlier local time of upward drift arises from a combination of the amplitude and phase changes of the SW2, demonstrating the combination of amplified and earlier phase SW2 are required to reproduce ionospheric SSW effects. Additionally, the equilibrium duration in response to the amplitude and phase change of SW2, and the importance of perturbed zonal and meridional tidal wind in generated equatorial vertical E ×B drift are determined.

This paper presents a detailed model-data comparative study of the 17 March 2015 geomagnetic storm using the high-resolution version of the Thermosphere-Ionosphere-Electrodynamic General Circulation Model (TIEGCM) and the total electron content (TEC) observations from a dense GNSS network. Driven by time-dependent high-latitude ionospheric convection and auroral precipitation inputs, together with an empirically defined subauroral plasma stream (SAPS) field, our simulation reproduce many observed storm-related ionospheric phenomena, including large-scale traveling ionospheric disturbances (TIDs) over Europe, the effects of prompt penetration electric field (PPEF) over South and Central America, and the formation of a storm enhanced density (SED) plume across the continental United States. Our simulation results reaffirm a number of important characteristics concerning the SED plume: (1) enhanced background ionospheric density is a necessary but not sufficient condition, and enhanced ion drift is required to form the SED plume; (2) the SAPS flow channel does not directly transport the plasma from midnight to postnoon via dusk to form the SED plume; instead, the SED plume is formed at the equatorward and westward edge of the SAPS channel; and (3) the SED plume appears to subcorotate with respect to the Earth.

Evolution of mid-latitude density irregularities and scintillation during storms

*Toshi Nishimura[1], Sebastijan Mrak[1], Josh Semeter[1]

1. Boston University

While high-latitude and equatorial density irregularities and radio signal scintillations have been explored in detail, studies on mid-latitude density irregularities and scintillation are scarce and their properties are less understood. Mid-latitude scintillation is not frequent, but because much more human activities are present at mid-latitudes than at high and equatorial latitudes, radio signal disturbances at mid-latitudes despite their lower occurrences have a large impact on technology such as aircraft navigation using GNSS. Due to the small number of scintillation observations, past ground-based studies of mid-latitude density irregularities and scintillations are limited to case studies in small regions, statistical studies using limited satellite coverage or a small number of receivers, or inference from TEC variations (e.g., ROTI which does not necessarily indicate scintillation). Thus it has been difficult to determine event-specific spatial distribution of scintillation over a continental scale and changes shorter than satellite orbital periods. In the present study, we determine the event-specific 2-d distributions of mid-latitude GNSS signal scintillation and fluctuation, and their relation to large-scale density structures using a network of GNSS receivers in North America. In the 7-8 September 2017 storm event, we found that GNSS signal scintillation is closely associated with the mid-latitude trough equatorward boundaries. As the trough moved equatorward and the plumes and troughs developed, the phase scintillation increased further in the density gradient, while amplitude scintillation increased in the trough and plume. Other regions are covered by the receivers but did not show GNSS signal scintillation/fluctuation, indicating that our technique can specify occurrence regions of scintillation/fluctuation, and scintillation/fluctuation in this event was confined along the steep TEC gradients and trough. Our study indicates that scintillation structures and evolution can be detected can be precisely determined in this technique.

Growin: Modeling Ionospheric Instability Growth Rates and Giving Away the Code

*Jonathon Smith[1,2]

1. Catholic University of America, 2. NASA Goddard Space Flight Center

The first seasonal and zonal climatology of Rayleigh-Taylor growth rates during solar minimum and solar moderate conditions as a function of local time and altitude has been developed using open source data and software.
The *growin* python module utilizes other Heliophysics python modules to collate and process vertical plasma drift to drive the SAMI2 model and subsequently calculate the flux tube integrated Rayleigh-Taylor growth rate.
The process is repeated for two different types of drift inputs: the Fejer-Scherliess model and measured drifts from C/NOFS.
These growth rates are compared to bubble occurrence frequencies obtained from a dataset of bubbles detected by the C/NOFS satellite.
There is agreement between periods of strong positive instability growth and high frequencies of bubble occurrence in both low and moderate solar activity conditions when using C/NOFS drifts.
Fejer drifts are only in agreement with bubble occurrence frequencies during moderate solar activity conditions.
Bubble occurrence frequencies are often above 25% even when growth rates in the bottomside F region are negative.
The climatological nature of the growth rates discussed here begs further study into the diurnal variability of the growth rate and its drivers.

Spatial and temporal relation among magnetic ripples, wavy structure of electron density fluctuation and GPS TEC variations

*Toshihiko Iyemori[1], Tadashi Aoyama[1], Yoshihiro Yokoyama[1], Akiyasu Yamada[1]

1. Kyoto University

Wavy structures of electron density (Ne) and magnetic ripples observed along the orbit of Swarm satellites in low-latitude on the dayside, and GPS-TEC variation under the orbit are analyzed to see their correlation. Their apparent periods are typically 20-30 seconds, 10-20 seconds and a few minutes, respectively. Near the equatorial region, the APEX latitudes of the region where wavy Ne structure appears and the region traced down from magnetic ripples to 120km altitude, i.e., ionospheric current layer, often coincide suggesting acoustic mode waves as a common source of their generation. Assuming the GPS-TEC variation with a period around a few minutes is temporal variation, we try to check the correlation in the location among the three quantities to check the validity of our idea that the acoustic mode waves are the common source of the variations.

Temporal and spatial variations of the total electron content enhancement from the mid-latitude to the equator associated with a geomagnetic storm

*Atsuki Shinbori[1], Yuichi Otsuka[1], Sori Takuya[1], Takuya Tsugawa[2], Michi Nishioka[2]

1. Institute for Space-Earth Environment Research (ISEE), Nagoya University, 2. National Institute of Information and Communications Technology

A spatial distribution of the electron density in the ionosphere shows a strong dependence on geographical latitude, longitude, and local time. The structure changes severely from the high-latitude to the equatorial regions during geomagnetic storms. The storm-time prominent ionospheric phenomena are tongue of ionization (TOI), mid-latitude broad storm-enhanced density (SED), SED plume, and intensification of equatorial ionization anomaly (EIA). These phenomena are very dynamic because ionospheric electric fields and particle precipitation from the magnetosphere vary significantly during the development and decay of the geomagnetic storms. The generation mechanism of SED has been thought as local upward electric field drifts [e.g., Liu et al., 2016], westward plasma transportation from the nightside to the dayside by sub-auroral polarization stream (SAPS) [Foster et al., 2007], equatorward neutral winds [Anderson, 1976], and latitudinal expansion of EIA [e.g., Kelley et al., 2004]. However, since such different mechanisms of the formation of SED have been proposed by many researchers, a comprehensive understanding of the cause of SED formation has not yet been done. In this study, we investigate the temporal and spatial variation of the total electron content enhancement related to SED during the geomagnetic storms using Global Navigation Satellite System (GNSS) Total Electron Content (TEC) data with high time and spatial resolutions together with solar wind, interplanetary magnetic field, geomagnetic indices, ionosonde, geomagnetic field, Jicamarca IS radar and SuperDARN radar data to identify the main mechanism responsible for SED. In this analysis, we first calculate the average TEC of 10 geomagnetically quiet days every month, referring to the list of quiet and disturbed days provided by GFZ. Next, we subtract the storm-time TEC from the average TEC and create global maps of the ratio of the TEC difference (rTEC) in geographical and geomagnetic coordinates. As a result, a clear rTEC enhancement related to the mid-latitude broad SED first occurred from noon to afternoon at high latitudes within 1 hour after sudden increase and expansion of the high-latitude convection and prompt penetration of the electric field to the equator associated with the southward excursion of the IMF. Approximately 1-2 hours after the onset of the hmF2 increase in the mid-latitude and low-latitude regions associated with the high-latitude convection enhancement, the rTEC and foF2 values began to increase and the enhanced rTEC region expanded to the low latitudes within 1-2 hours. This signature suggests that the ionospheric plasmas in the F2-region move at a higher altitude due to local electric field drift, where the recombination rate is smaller, and that the electron density increases due to additional production at the lower altitude in the sunlit region. The average upward electric field drift velocity of the ionosphere was a little faster at the mid-latitude than that at the low latitude. This result implies that the electric field intensity tended to increase with an increasing latitude, and that the source of the electric field is located at high latitudes. After the appearance of the mid-latitude broad SED, the SED plume with a latitudinally narrow structure is separated from the mid-latitude broad SED and is formed along the dusk convection cell. The SED plume can extend up to the pre-noon sector (10:00-11:00 MLT) due to the clockwise rotation of the high-latitude convection pattern. The SED plume moves toward the high latitudes from the throat region between the dawn and dusk convection cells and entries the polar cap region as a TOI phenomenon. Later, another rTEC enhancement related to EIA appeared in the equatorial region

©2020. Japan Geoscience Union. All Right Reserved.

approximately 1 hour after the prompt penetration of the electric field to the equator and extended to higher latitudes within 3-4 hours. The EIA structure merged with the mid-latitude broad SED structure at the low latitude.

Atmospheric influence on relationship between solar and ionospheric 27-day variations

*Konstantin Ratovsky[1], Maxim Klimenko [2], Vladimir Klimenko[2], Alexei Dmitriev[3], Loren Chang[3]

1. Institute of Solar-Terrestrial Physics SB RAS, 2. West Department of Pushkov IZMIRAN, RAS, 3. National Central University

We believe that the atmospheric influence on relationship between solar and ionospheric variations includes two effects: (1) the delay in the response of thermospheric characteristics relative to the response of the ionization rate to a change in the solar flux, and (2) the presence of a 27-day component in the ionospheric response to atmospheric variations not related to a change in the solar flux. The first effect leads to a delay in the ionospheric 27-day variations relative to the 27-day variations in the solar flux and to different ratios between the amplitudes of the solar and ionospheric components. The second effect reduces the correlation coefficient between the solar and ionospheric components, and also has a significant effect on the delay and amplitude of the ionospheric component. Both effects are studied both theoretically and with measurements. The basis of the theoretical study is the first principles Global Self-consistent Model of the Thermosphere, Ionosphere, and Protonosphere (GSM TIP) developed in West Department of IZMIRAN. The model gives time-dependent global three-dimensional distributions of (1) the neutral upper atmosphere parameters (temperature, composition, and wind velocity vectors) from 80 to 526 km, (2) the ionosphere parameters (density, temperature, and velocity vectors of atomic and molecular ions and electrons) from 80 km up to 15 Earth radii. For all considered periods the GSM TIP was utilized for model runs with taking into account solar activity variations and without taking into account geomagnetic activity variation. Note that our approach ignores possible changes in the lower atmosphere due to an increase in solar activity. The basis of the observational study is a statistical analysis of 27-day variations in the peak electron density, total electron content, global electron content and solar index F10.7. We assume that atmospheric variations unrelated to changes in solar flux have a strong effect on the peak electron density and a much smaller effect on the global electron content. For this reason, the response in global electron content is expected to better agree with the model calculations compared to the response in the peak electron density. A statistical analysis of both characteristics allows us to verify this assumption.

Acknowledgments
The reported study was funded by RFBR, Russian-Taiwanese joint research project number 18-55-52006 MHT_a. Experimental data recorded by the equipment of Center for Common Use «Angara» (http://ckp-rf.ru/ckp/3056/) obtained with budgetary funding of Basic Research program II.12 were used.

[P-EM12] Coupling Processes in the Atmosphere-Ionosphere System

convener:Huixin Liu(Earth and Planetary Science Division, Kyushu University SERC, Kyushu University), Yuichi Otsuka(Institute for Space-Earth Environmental Research, Nagoya University), Yue Deng(University of Texas at Arlington), Loren Chang(Institute of Space Science, National Central University)

The Atmosphere-Ionosphere (A-I) system forms the so-called near-Earth space. Recent rapidly expanding use of satellite constellations in Low-Earth Orbit (LEO) drives a high demand for better understanding and accurate forecast of the global A-I system for scientific and operational purposes. This session aims to provide a forum for research advances and frontiers related to these aspects, and we invite presentations on global A-I coupling at all temporal and spatial scales. This includes but is not limited to: A-I coupling via atmospheric waves (tides, gravity waves, planetary waves) and trace gases (CO2, O3, H2O), A-I response to Space Weather events (solar flares, CMEs, CIRs), polar-equatorial or inter-hemispheric coupling via TADs/TIDs/disturbance dynamo/penetration electric field, ionospheric plasma irregularities, ionospheric currents, etc. Observations, theoretical studies, model simulations, data assimilation, instruments development are all highly welcome.

Observations of Atmospheric Waves in the Thermosphere from New Earth-Orbiting Spacecraft

*Scott England[1]

1. Virginia Tech

Atmospheric waves play an important role in coupling different regions of the atmosphere. Clear evidence of wave coupling from the troposphere to the thermosphere and from the thermosphere to the ionosphere have been seen. Prior observations had revealed significant perturbations to the ionosphere that result from atmosphere waves in the lower thermosphere region, where coupling to the ionosphere via the E-region dynamo can play a significant role. However, observations of atmospheric waves at altitudes above the lower thermosphere are comparatively rare and much about the nature of waves and their impacts at these higher altitudes is not known. Not only the dynamo coupling between the neutral thermosphere and ionosphere is expected to change between the lower and middle thermosphere, but also the nature of the waves themselves as diffusive separation and ion drag become increasingly important. New results of atmospheric waves at altitudes above the lower thermosphere from observations with ICON and GOLD will be presented.

Observations of the Thermosphere-Ionosphere System by the Global-scale Observations of the Limb and Disk (GOLD) Mission

*Richard Eastes[1]

1. Laboratory for Atmospheric and Space Physics/University of Colorado

Observations by the Global-scale Observations of the Limb and Disk (GOLD) mission provide fundamental information for understanding the Thermosphere-Ionosphere system. Data from GOLD’s two-channel, ultraviolet spectrograph include images taken from geostationary orbit at a 30-minute cadence. The dayside images cover the full disk of Earth. For the first time these data provide simultaneous, synoptic imaging of the composition and temperature near 160 km. The images, and GOLD’s limb observations, quantify the global-scale response of the thermosphere to external and internal forcing as it evolves spatially and temporally. Intriguing observations, some of which are indicate the presence of coupling of the thermosphere-ionosphere system to the mesosphere, have now been conducted during geomagnetically quiet and storm times as well as during a solar eclipse. These observations are providing significant tests of current models, an essential step to advances in global-scale modeling of the thermosphere and ionosphere system. Examples of these observations, as well as their potential for advancing models of the thermosphere-ionosphere system, will be presented.

Initial result on aurora and airglow observations with the all sky 630nm imager on Shirase

*Takeshi Sakanoi[1], Naoshi Yagi[1], Yuta Hozumi[2], Takuo T. Tsuda[2], Takeshi Aoki[2], Akinori Saito[3], Takahiro Naoi[5], Takanori Nishiyama[4], Mitsumu K. Ejiri[4]

1. Planetary Plasma and Atmospheric Research Center, Graduate School of Science, Tohoku University, 2. Graduate School of Informatics and Engineering, The University of Electro-Communications, 3. Graduate School of Science, Kyoto University, 4. National Institute of Polar Research, 5. National Institute of Information and Communications Technology

To cover the auroral and airglow observation gap in the Southern Ocean, we developed an all-sky imager (Shirase ASI) with a 3-axis attitude stabilized gimbal installed on the icebreaker Shirase. The route of Shirase from February to March is preferable to observe aurora in the aurora region at the south of Australia. This region is also important to understand the height and zonal variations of mesospheric dynamics. All-sky image data taken in the observation gap provide us unique opportunity to examine the auroral and airglow phenomena, and contribute to network observation in collaboration with ground-based imagers. The advantage of Shirase ASI is to observe faint auroral and airglow emissions with a long exposure time more than 10s under the conditions where the ship is swaying. In addition to auroral observation, Shirase ASi can observe airglow variations caused by plasma bubbles and MSTID when Shirase is located at the mid- and low-latitudes.
On the development of Shirase ASI, we selected the low-noise cooled CMOS (ZWO ASI183MM Pro) as a detector. We developed compact and small optical system which consists of a bandpass filter (Andover interference filter, center wavelength 630 nm, FWHM 4.4 nm), and objective fisheye lens (Fujinon FE185C086HA, focal length 2.7 mm, F value 1.8). Optical system was mounted on a 3-axis attitude stabilized gimbal (DJI Ronin-S). The optical system with the gimbal was installed in the water-proof observation box on the 06 deck of Shirase. During observation time, the data is temporarily recorded in the mini-PC (LIVA Q2) in the observation box, and data is transferred to NAS via the laptop PC in the observation room of Shirase during the next day. The laptop PC obtains the current location from GPS signal, and calculates the appropriate start and end timings of observation every day. The exposure time and interval are 19 s and 20 s, respectively, and the data is integrated in later analysis for up to 120 s depending on the intensity of target. All of observation data will be collected in April when Shirase returns to Japan, but in order to confirm the status of instruments and observation data, about 10 thumbnail images and housekeeping data, such as the temperatures and humidity in the observation box, are sent to Japan via e-mail. The observation box on the deck is temperature controlled using an automatic oil heater, and circulation of cooled air from the air cooler in the observation room connecting with insulated hoses.
We got sensitivity calibration data of Shirase ASI using the integrated sphere in NIPR on June 26 and 27, 2019. We confirmed that ASI has the dynamic range of intensity from 34 R to 3000 R with a resolution of 0.73 R/bit when the camera operates with a gain of 400 and an exposure time of 120 s. We obtained 630 nm airglow images with ASI at the Zao observatory of Tohoku University (geographic latitude and longitude: 38.1 deg. N, 140.5 deg. E) on June 13, 2019. From the test observation data integrated for 120 s, we obtained the variation of 630.0 nm airglow with an amplitude of 43 R caused by MSTID travelling from north-east to south-west. On September 3, 2019, the whole system of Shirase ASI was installed on the Shirase 06 deck and in the observation room 1. From the data obtained during the test cruise on October 11, 2019, we examined the performance of gimbal that attenuate the sway of ship. We estimated that typical sway range of Shirase to be 8 deg, and that of field-of-view of ASI to be 0.5 deg. 0.5 deg of the sway corresponds to 2km of horizonal distance in the 630nm emission layer at a 250 km altitude, which

©2020. Japan Geoscience Union. All Right Reserved.

satisfies the scientific requirement of spatial resolution of airglow variations in the F-region.
We confirmed that Shirase ASI has been operated correctly from the departure of Japan on November 12, 2019. We will perform detailed data analysis after returning of Shirase to Japan in April 2020. In this talk, I will report the initial results of data analysis.

Comparison between migrating atmospheric tides in TIMED/SABER observations and free running WACCM-X simulations

*Yi Chung Chiu[1], Loren Chang[1], Cornelius Csar Jude Salinas[1], Qian Liying [2]

1. Graduate Institute of Space Science and Engineering, National Central University, Taiwan, 2. High Altitude Observatory, National Center for Atmospheric Research, Boulder, Colorado, USA

The Whole Atmosphere Community Climate model –eXtended (WACCM-X) is a comprehensive numerical model with a range from the Earth’ s surface to the upper thermosphere (~ 500 km) and also includes the ionosphere. Excited in the troposphere and stratosphere, atmospheric tides are the dominant dynamical feature in the mesosphere and lower thermosphere and play an important role in vertical coupling. In this study, we used the least squares method to extract diurnal and semidiurnal migrating tides from free running WACCM-X temperatures in the mesosphere and lower thermosphere region (MLT). The results are compared to observations from TIMED/SABER. Differences in tidal structure and variation during solar maximum and minimum in March and June are examined, to better understand the variation of migrating tides resolved in free running WACCM-X, and its implications for future studies utilizing this model.

Interannual Variation of Diurnal Tide Components in Tropical Lower Thermospheric Temperatures

*Cornelius Csar Jude Salinas[1], Huixin Liu[2], Loren Chang[1], Jia Yue[3], James Russell[4], Martin G Mlynczak[5]

1. National Central University, 2. Kyushu University, 3. NASA Goddard Space Flight Center, 4. Hampton University, 5. NASA Langley Research Center

This work takes advantage of almost 16 years of temperature observations by the SABER instrument onboard the TIMED satellite to analyze the interannual variation of the migrating diurnal tide and two non-migrating diurnal tidal components in tropical lower thermospheric temperatures. The two non-migrating diurnal tides are the DE2 and DE3 tides. These are analyzed because they are known to significantly affect the upper atmosphere. A wavelet analysis on the de-seasonalized time-series of the amplitudes of these tides between latitudes 20S and 20N and located at around 105 km show that they have very clear 2 to 4 year oscillations that are consistent with the the Quasi-biennial Oscillation (QBO) as well as the El Nino Southern Oscillation (ENSO). An 11-year oscillation is also found although this oscillation is beyond the cone-of-influence in the spectra. A closer look at the spectra though reveals that the presence of these 2 year oscillations aren’ t consistent throughout the data coverage. Specifically, the 2 year oscillations in DW1 disappears after 2012 while the 2 year oscillations in DE3 weakens between 2012 and 2014. Thus, this work pushes further our understanding of tidal interannual variability by explaining these specific details in the wavelet spectra of these tides through numerical experiments conducted using the Ground-to-topside model of the Atmosphere and Ionosphere for Aeronomy (GAIA). GAIA will be run with and without the QBO, ENSO and 11-year solar cycle to determine how much of these interannual phenomena contribute to these diurnal tide interannual variations.

Dynamical response in the upper atmosphere: GAIA simulation with doubled CO2

*Huixin Liu[1], Chihiro Tao[2], H. Jin[2]

1. Earth and Planetary Science Division, Kyushu University SERC, Kyushu University, 2. NICT

It is known that increasing CO2 in the atmosphere will produce global cooling in the thermosphere, in contrast to global warming in the troposphere. However, how will thermosphere dynamics and wave activity change remain unclear. In this study, we explore these aspects via a doubled-CO_2 numerical experiment using the whole atmosphere model GAIA. Model simulations were done for solar minimum under geomagnetic quiet conditions, with the CO2 mixing ratio set at 345 ppm and 690 ppm, respectively. The results reveal three major features in the doubled-CO_2 impacts. 1. The thermosphere cools about 10K more around solstices than equinoxes, more at the summer pole than the winter pole. 2. The meridional circulation strongly accelerates by 5--15 m/s. 3. The tidal activity experiences dramatic changes, with a 40--60% reduction in the semi-diurnal tides (SW2) throughout the thermosphere, but an 30-50% enhancement in diurnal tides (DW1) below 200 km altitude. The non-migrating tide DE3 changes only about 3K. These changes in meridional circulation and tides are robust features in all seasons, and can profoundly affect the spatial and local time distribution of the ionospheric responses via composition and electrodynamics.

Energy Flux and Conductance from Meso-Scale Auroral Features

*Christine Gabrielse[1], Toshi Nishimura[2], Margaret Chen[1], James Hecht[1], Larry Lyons[3], Yue Deng[4]

1. The Aerospace Corporation, 2. Boston University, 3. UCLA, 4. University of Texas, Arlington

Earth’s Atmosphere-Ionosphere system is inseparably coupled, with both regions driven from above and below by various terrestrial and space weather phenomena. Global models have done well at capturing large-scale effects, but currently do not capture the meso-scale (~10s-500 km) phenomena which often are locally more intense. As computing power improves, and modeling meso-scales now becomes possible, it is vital to provide data-informed inputs of the relevant drivers. In this presentation, we focus on the energy flux deposited into the ionosphere from the magnetosphere by precipitating particles that result in the aurora, specifically at meso-scales, and the resulting conductance. Thanks to NASA’s THEMIS mission, an array of all-sky-imagers (ASIs) across Canada monitors the majority of the nightside auroral oval at a 3 second cadence, providing a global view at temporal & spatial resolutions required to study the aurora on meso-scales. Thus, we present 2-D maps over time of the energy flux, energy, and conductance that result from the aurora during solar storms and substorms, including those features at meso-scales. Our results can be utilized by the broad community, for example, as inputs to atmospheric models or as the resulting conductance from precipitation inferred by magnetospheric models or missions like THEMIS, Van Allen Probes, or Arase.

Study of latitudinal and longitudinal differences of mesospheric and ionospheric waves based on 3-dimentional FFT analysis of long-term multi-point airglow images

*Kazuo Shiokawa[1], Yuichi Otsuka[1], Takuji Nakamura[2]

1. Institute for Space-Earth Environmental Research, Nagoya University, 2. National Institute of Polar Research

In this presentation, we review recent results obtained by the 3-dimentional Fast Fourier Transform (FFT) analysis of multi-point airglow images reported by Takeo et al. (2017) and Tsuchiya et al. (2018; 2019; 2020). We used the airglow images taken by the Optical Mesosphere Thermosphere Imagers (OMTIs) at Shigaraki (SGK) (35°N, 136°E, 1999-2017) and Rikubetsu (RIK) (44°N, 144°E, 1999-2017), Japan, Athabasca (ATH), Canada, (55°N, 247°E, 2005-2017), and Magadan (MGD), Russia (60°N, 151°E, 2008-2017). First we estimated phase-velocity spectra of mesospheric gravity waves in 557.7-nm airglow images and medium-scale traveling ionospheric disturbances (MSTIDs) in 630.0-nm airglow images. For all the stations, mesospheric gravity waves in 557.7-nm airglow images tend to propagate poleward in summer and equatorward in winter (except for MGD). The summer-time poleward waves may be caused by duct propagation of gravity waves from tropospheric convection source. Wind filtering effect by mesospheric jet is clearly seen over Japan (SGK and RIK), while it becomes less evident at high latitudes in ATH and MGD. For MSTIDs in 630.0-nm airglow images, southwestward-propagating waves are dominant at SGK, RIK, and ATH (except for summer), while they are not evident at MGD. Clear anti-correlation of MSTID power (amplitudes) and 11-year solar activity can be found at SGK, RIK, and ATH. We also show wavenumber spectra of gravity waves and MSTIDs at these stations. Weak positive correlations were obtained between the daily wave power of gravity waves in 557.7-nm images and MSTIDs in 630.0-nm images, suggesting that the MSTIDs in the thermosphere may be partially generated by the gravity waves from the mesopause region.

Global distribution of the mesoscale disturbances at 95km altitude detected by a space-borne airglow observation

*Akinori Saito[1], Ryota Okada[1], Takeshi Sakanoi[2], Yuta Hozumi[3]

1. Department of Geophysics, Graduate School of Science, Kyoto University, 2. Planetary Plasma and Atmospheric Research Center, Graduate School of Science, Tohoku University, 3. University of Electro-Communications

Global distribution of the mesoscale disturbances at 95 km altitude was investigated with the 762nm airglow observed by International Space Station-Ionosphere, Mesosphere, upper Atmosphere and Plasmasphere mapping (ISS-IMAP) mission. The horizontal structures of the mesospheric disturbances have been widely investigated with ground-based all-sky imagers. It is reported that the horizontal wavelength of the mesospheric structures has maximum between 10 km and 30km. The structures whose wavelength is longer than 100 km are, however, difficult to be detected by the ground-based imagers because of their narrow field-of-view. The mesoscale structures on the topside of the mesosphere with a few hundred kilometers of horizontal scale are yet to be investigated. Visible and near Infrared Spectral Imager (VISI) of ISS-IMAP mission observed the mesospheric airglow structures with the airglow from the molecular oxygen in 762nm wavelength. The size of VISI’s field-of-view is 600km in the direction perpendicular to the ISS trajectory, and longer than 10,000km along the trajectory. The mesoscale structures at 95km altitude was investigated with the 762nm airglow data of VISI. By the comparison between the plasma bubble activities measured by the ground-based GNSS receivers, and the mesoscale structure activities in the mesosphere measured by ISS-IMAP/VISI, the relation between the plasma bubble and mesospheric disturbance is discussed. The classical “seeding” theory of the plasma bubble by the atmospheric gravity waves that vertically propagate from the lower atmosphere to the upper atmosphere was evaluated with the space-borne global observation.

Recurrent high-speed solar wind co-rotating interaction region imprint on the ionosphere and atmosphere: GPS TEC variations and atmospheric gravity waves

*Paul Prikryl[1,2], James M. Weygand[3], Reza Ghoddousi-Fard[4], Lidia Nikitina[2], Bharat S. R. Kunduri[5]

1. Physics Department University of New Brunswick, Canada , 2. Geomagnetic Laboratory Natural Resources Canada, 3. Earth Planetary and Space Sciences, University of California, USA, 4. Canadian Geodetic Survey Natural Resources Canada , 5. Bradley Dept. of Electrical and Computer Engineering, Virginia Tech, USA

High-speed streams (HSS) from coronal holes dominate solar wind structure in the absence of coronal mass ejections during solar minimum and the descending branch of solar cycle. Prominent and long-lasting coronal holes produce intense co-rotating interaction regions (CIR) on the leading edge of high-speed plasma streams that cause recurrent ionospheric disturbances and geomagnetic storms. Through solar wind coupling to the magnetosphere-ionosphere-atmosphere (MIA) system they affect the ionosphere and neutral atmosphere at high latitudes, and, at mid to low latitudes, by the transmission of the electric fields [1] and propagation of atmospheric gravity waves from the high-latitude lower thermosphere [2].

The high-latitude ionospheric structure, caused by precipitation of energetic particles, strong ionospheric currents and convection, results in changes of the GPS total electron content (TEC) and rapid variations of GPS signal amplitude and phase, called scintillation [3]. The GPS phase scintillation is observed in the ionospheric cusp, polar cap and auroral zone, and is particularly intense during geomagnetic storms, substorms and auroral breakups. Phase scintillation index is computed for a sampling rate of 50 Hz by specialized GPS scintillation receivers from the Canadian High Arctic Ionospheric Network (CHAIN). A proxy index of phase variation is obtained from dual frequency measurements of geodetic-quality GPS receivers sampling at 1 Hz, which include globally distributed receivers of the RT-IGS network that are monitored by the Canadian Geodetic Survey in near-real-time [4]. Temporal and spatial changes of TEC and phase variations following the arrivals of HSS/CIRs [5] are investigated in the context of ionospheric convection and equivalent ionospheric currents derived from the ground magnetometer network using the spherical elementary current system method [6,7].

The Joule heating and Lorentz forcing in the high-latitude lower thermosphere have long been recognized as sources of internal atmospheric gravity waves (AGWs) [2] that propagate both upward and downward, thus providing vertical coupling between atmospheric layers. In the ionosphere, they are observed as traveling ionospheric disturbances (TIDs) using various techniques, e.g., de-trended GPS TEC maps [8].

In this paper we examine the influence on the Earth’s ionosphere and atmosphere of a long-lasting HSS/CIRs from recurrent coronal holes at the end of solar cycles 23 and 24. The solar wind MIA coupling, as represented by the coupling function [9], was strongly increased during the arrivals of these HSS/CIRs.

Observation of secondary gravity waves over the Southern Andes during an intense mountain wave event.

*Masaru Kogure[1], Jia Yue[2,3], Takuji Nakamura[1,4], Lars Hoffmann[5], Sharon Vadas[6], Yoshihiro Tomikawa[1,4], Mitsumu K. Ejiri[1,4], Diego Janches[2,3]

Gravity waves (GWs) are an important atmospheric phenomenon with horizontal scales ranging from several kilometers to several thousand kilometers. GWs propagate vertically from their sources in the troposphere to upper altitudes, and they deposit their momentum into the background flow when they break. This deposition of momentum influences the global atmospheric circulation and temperature structure of the atmosphere [Lindzen, 1981; Holton, 1983].

The Southern Andes are well known as one of the mountain wave hot spots [e.g., Ern et al., 2004; Alexander et al., 2008; Hoffmann et al., 2013]. Recently, Vadas and Becker [2019] demonstrated with numerical modeling that the breaking of mountain waves over the Andes can create secondary GWs at about 50-80 km of altitude, yielding concentric ring structures. Vadas and Becker [2019] also pointed out that secondary (and higher-order) GWs could create medium- and large-scale ionospheric disturbances. Some observational studies support this hypothesis [Vargas et al., 2016; de Wit et al., 2017; Liu et al., 2019], but the observational evidence is still limited and indirect, and the characteristics of the secondary GWs (e.g., occurrence rate, horizontal distribution, and wave parameters) are not well understood. The purpose of this study is to look for signatures of secondary GW generation in observations from a space-based instrument (VIIRS/Suomi-NPP) and compare their characteristics in the real atmosphere with model simulations.

This study focuses on a mountain wave event with significant amplitudes (>3 K) and ~500 km horizontal wavelengths over the Southern Andes, observed on 24 and 25 July 2017 with AIRS/Aqua satellite data [Hoffman et al., 2017]. The AIRS/Aqua satellite instrument can measure GWs with >30 km horizontal wavelengths in a range of ~20-50 km of altitude. In the MERRA-2 reanalysis wind data, a mesoscale vortex-like pattern appeared to the west of the Andes, and the wind flowed over the Andes. Thus, the GWs observed by AIRS/Aqua were probably mountain waves. VIIRS/Suomi-NPP (can resolve GWs with > several km horizontal wavelengths at ~85 km) did not detect mountain waves but instead observed concentric ring-like GWs with a few hundred km wavelengths at 4.5 UT on the same night (25 July 2017) over the Southern Andes and its east side (leeward).

In this presentation, we will show the observational results and discuss the relationship between the mountain waves observed by the AIRS/Aqua satellite and the concentric GWs observed by VIIRS/Suomi-NPP. In particular, we will focus on what altitude the observed mountain waves broke and why the observed concentric ring-like GWs extended leeward.

[P-EM12] Coupling Processes in the Atmosphere-Ionosphere System

convener:Huixin Liu(Earth and Planetary Science Division, Kyushu University SERC, Kyushu University), Yuichi Otsuka(Institute for Space-Earth Environmental Research, Nagoya University), Yue Deng(University of Texas at Arlington), Loren Chang(Institute of Space Science, National Central University)

The Atmosphere-Ionosphere (A-I) system forms the so-called near-Earth space. Recent rapidly expanding use of satellite constellations in Low-Earth Orbit (LEO) drives a high demand for better understanding and accurate forecast of the global A-I system for scientific and operational purposes. This session aims to provide a forum for research advances and frontiers related to these aspects, and we invite presentations on global A-I coupling at all temporal and spatial scales. This includes but is not limited to: A-I coupling via atmospheric waves (tides, gravity waves, planetary waves) and trace gases (CO2, O3, H2O), A-I response to Space Weather events (solar flares, CMEs, CIRs), polar-equatorial or inter-hemispheric coupling via TADs/TIDs/disturbance dynamo/penetration electric field, ionospheric plasma irregularities, ionospheric currents, etc. Observations, theoretical studies, model simulations, data assimilation, instruments development are all highly welcome.

Dramatic Neutral Temperature enhancement and an Inversion Layer (NTIL) have been detected by the Fe Boltzmann lidar at McMurdo, Antarctica during a geomagnetic storm. None of empirical or default configurations of physical models capture these features. We use the Thermosphere-Ionosphere-Electrodynamics General Circulation Model (TIEGCM) with high-latitude drivers constrained by data to examine the mechanisms of NTIL. The auroral precipitation maps from DMSP/SSUSI are incorporated in the TIEGCM, which increase Pedersen conductivity significantly in the auroral region. Sub-grid electric field variabilities are implemented with regard to the spatial distribution of auroral activities. Thereby, the observed large temperature enhancement and NTIL are reproduced. The default model runs underestimate the neutral densities by 40% compared with GRACE measurements, which are resolved by incorporating observed auroral maps and sub-grid electric field variabilities. The mechanism to generate temperature inversion in the lower thermosphere is : strong local Joule heating due to the enhanced auroral precipitation and sub-grid electric field variability induces large upward vertical wind which leads to strong cooling around 200 km. Strong heating around 150 km, while cooling dominating above it, generates the inversion layer. The two different model resolutions are run for this event, and the contributions from the fine-scale auroral precipitation and electric field to the storm-time neutral atmosphere are examined.

The neutral density of the thermosphere directly impacts satellites that reside within or traverse Low-Earth Orbit (LEO) over a wide range of timescales. At shorter time scales—minutes to days—variations in density impede the operational imperative to track satellites and objects and to avoid collisions. At longer time scales—a solar cycle and beyond—variations in density control the size and distribution of the LEO population of objects. As the number of SmallSat missions and the resulting debris objects population increase at unprecedented rates, monitoring and modeling the LEO environment become ever more important. The challenges of this are compounded by the relatively few direct data sources currently available with which to monitor the thermosphere over these pertinent timescales. In this talk, we will discuss efforts to use precision orbit determination (POD) from GNSS-equipped SmallSats to fill in the sparsely observed thermosphere. We will also provide an update on efforts to create a civilian thermosphere monitoring system, blending available data sources with a physical model of the coupled thermosphere-ionosphere system in the context of a data assimilative framework.

In this study, we presented the variability of equatorial electrojet (EEJ) current examined using data measured by ground stations and satellite magnetometers during quiet days in different solar activity levels. Two main focus here are the EEJ’ s longitudinal profile and its peak time. We have evaluated both ground and satellite data using linear regression method before categorized them into different solar activity levels: low, moderate and high. A good agreement of EEJ longitudinal profile between both measurements appear during low solar activity with a high correlation coefficient is observed in the Southeast Asian sector. Apart from that, our analysis demonstrated that the seasonal dependence of EEJ’ s peak time reported by previous studies were only reflected at certain longitude sectors.

Ionospheric trough is a low plasma-density area occasionally appeared at subauroral latitudes, typically seen for period of geomagnetic disturbances. On 20 February 2018, a zonally elongated ionospheric trough was developed from Fennoscandia to North America. Of notable interest was the geomagnetic activity, which was considerably quiet level as represented by Kp index of 0+ for the time interval interested in this study. The ionospheric trough was located at 70-71 deg N and the main auroral oval stayed at 74-76 deg N in the Fennoscandia sector. A minor but obvious auroral enhancement occurred at about 18:30 UT (~21 MLT) near Svalbard archipelago. We call this “pseudo-breakup” in this study. Coinciding with the pseudo-breakup, westward turning of the ionospheric ion velocity from +200 m/s to -200 m/s was detected with the dynasonde at Tromsø, Norway (69.6 deg N), that is, in the ionospheric trough or slightly its equatorward side. At the same time, a collocated Fabry-Perot interferometer (FPI) also detected westward acceleration of the wind starting from +100 m/s (positive eastward) but without change its direction. While some previous publications mentioned the westward acceleration in the vicinity of the substorm growth-phase arc, there are few reports to clearly present the experimental evidence in the ionospheric trough. Causality to produce the westward acceleration of the FPI wind was probably ion drag despite of moderately low plasma density in the ionospheric trough. The relative speed between ions and neutral particles would result in frictional heating, which might lift denser or molecular neutral particles to the upper ionosphere and induce decrease in the ionospheric density through dissociative recombination of the molecular ions.

Day-to-day variation of pre-reversal enhancement in the equatorial ionosphere based on GAIA model

Priyanka Ghosh[1], *Yuichi Otsuka[1], Sivakandan Mani[1], Hiroyuki Shinagawa[2]

1. Institute for Space-Earth Environmental Research, Nagoya University, 2. National Institute of Information and Communications Technology

Plasma bubble is a localized plasma density depletion occurring at magnetic equator through the Rayleigh-Taylor instability. Eastward electric field plays an important role for the Rayleigh-Taylor instability, so that the plasma bubbles tend to occur more frequently when Pre-Reversal Enhancement (PRE) of the eastward electric field is intense. However, mechanisms for day-to-day variation of the PRE is not still unknown. Using Ground-to-Topside Model of Atmosphere and Ionosphere for Aeronomy (GAIA), we have aimed to find parameters which control day-to-day variation of PRE. With respect to the day-to-day variation, cross-correlation coefficients of PRE with zonal electric current density, electron density, and neutral winds between the E and F regions are investigated. We have found that the cross-correlation coefficient between PRE and eastward current density in the E and F regions are approximately 0.5 and 0.8, respectively. We have also found that the cross-correlation coefficient between PRE and eastward electric current density is largest at 17 LT (pre-sunset) than at other local time. This result suggests that the equatorial electro-jet at pre-sunsent is closely related to development of PRE. This result is consistent with previous observation of equatorial electro-jet by Uemoto et al. (2010).

Enhanced Electric Field Before Large Earthquakes

*Koichiro Oyama[1,2,3], Yoshihiro Kakinami[4], Chia-Hung Chen[5], Teiji Uozumi[2]

1. ISAPS,National Cheng Kung Univ., 2. ICSWE, Kyushu University, 3. ASERC Coltd, 4. Hokkaido Information Univ., 5. Depart. of Earth Science, National Cheng Kung Univ.

Electric field seems to be a main driver which disturbs ionosphere prior to large earthquake. The problem is where and how the electric field is generated. We have proposed that electric field is originally dynamo field which appears ionosphere E and F region. It enhances around the epicenter region. That is, during daytime the eastward electric field is enhanced, while during nigh time, westward electric field is enhanced. This idea explains all ionosphere anomalies which we have found from the past studies (Oyama et al., 2008; Oyama et al., 2011 ;Oyama et al., 2019). Next question is the mechanism of enhanced dynamo E field. Most probably, Pedersen conductivity of E/F region reduced. The electric potential which exists between dawn and dusk is divided by the conductivity of the earthquake-disturbed region, resulting in the stronger E field in the disturbed region. Further question is the mechanism of reduced conductivity. The conductivity is reduced by irregularity of neutral particle density and by increase of neutral density. These two are generated by the breaking of gravity and/or acoustic waves.

Chemical releases from the sounding rockets for observing dynamics and properties of lower thermosphere and ionosphere have been conducted since 1950’s. Vapors of sodium (Na), lithium (Li), barium (Ba), and strontium (Sr), and tri-methyl aluminum (TMA) are released as a tracer of neutral wind and ion drift velocity. Ionized Ba (Ba^+) is used as a tracer of ion drift because Ba is immediately ionized by solar EUV after the release while the others are used as tracers of neutral wind. The chemical release experiments using Na, Li, Ba, and Sr require solar or lunar illumination to visualize the chemical clouds while TMA does not require them because of chemiluminescence. The chemical release experiments had contributed to understand dynamics of thermosphere and ionosphere but the number of experiments decreased due to limitation of optical observation etc. However, since the performance of CCD has been improved in the past decade and one can detect dark resonance scattered light, the chemical release experiment has been draw renewed attention from scientists again. Lithium ejection system was newly developed in Japan and the chemical release experiment of Li was conducted in Uchinoura, Japan in 2007 after a long interval. The experiment achieved success to release Li and vertical profile of neutral wind velocity together with diffusion velocity were obtained in the dusk. Similar experiments were successfully conducted in the dawn in Uchinoura, Japan in 2011, in the dusk in Marshall Islands in 2013, and in the daytime in Wallops, US in 2013. The results showed strong wind shears exist around 100 km altitude. We estimated altitude profile of neutral density from the diffusion velocity. The Li cloud was detected under the condition of moonlit in Uchinoura, Japan in 2013. These experiments show that the wind profile is observable in all local time. The ejection systems of Barium and Strontium were newly developed in US. The chemical release of Ba and Sr was conducted in Andoya, Norway in 2014 and neutral and ion drift velocities were simultaneously observed. Further, another experiment using Ba, Sr, and TMA was executed in 2019 and Ba and Sr experiment was also executed in Norway in 2019. In this paper, we summarize the results of chemical release experiments in recent decade and present new experiment planed in Japan.

The Ionospheric Dynamics Exploration and Attitude Subsystem Satellite (IDEASSat / INSPIRESat-2) is a three-unit (U) CubeSat developed with the objective of providing in-situ measurements of the Earth's ionosphere in order to quantify both global scale ionospheric variability and small scale irregularities. The science payload is the Compact Ionospheric Probe (CIP) - an all in one in-situ plasma sensor developed at Taiwan National Central University (NCU), which is the miniaturized version of the larger Advanced Ionospheric Probe (AIP) that is carried and operational aboard the 450 kg FORMOSAT-5 spacecraft. The spacecraft has been developed by NCU in partnership with the International Satellite Program in Research and Education (INSPIRE) consortium, and is funded by the Taiwan National Space Organization (NSPO), Ministry of Science and Technology, and Ministry of Education as part of the first national effort to encourage small satellite development at Taiwan universities. IDEASSat will work in conjunction with FORMOSAT-5, as well as the INSPIRESat-1 and ARCADE/INSPIRESat-4 small satellites to provide ionospheric observations spanning different altitudes and local times. IDEASSat will be launched in late 2020. In this report, we describe the IDEASSat mission and spacecraft design, the potential for combined multi-satellite observations, as well as unique lessons learned as part of the development process.

Development of new receiver for HF Doppler sounding utilized by Software-Defined Radio device

*Hiroyuki Nakata[1], Yuhei Oki[2], Kenro Nozaki[3], Keisuke Hosokawa[3], Ichiro Tomizawa[3], Ryo Matsushima[3], Kumiko K. Hashimoto[4], Toshiaki Takano[1], Hiroyo Ohya[1]

To examine the dynamics of the ionosphere, the observation of both steady and disturbed states of the ionosphere is important. Various observation systems have been utilized to observe the behaviors of the ionosphere itself and the ionospheric disturbances. One of the useful observation systems is HF Doppler sounding. When the reflection point of the radio wave moves vertically, the frequency of the radio wave shifts due to the Doppler effect. From this Doppler frequency, we are able to estimate the vertical motions of the ionospheric plasma. To develop and maintain the transmitter and the receiver of Doppler sounding system, the knowledge of the analog circuit has been inevitable. Recently, on the other hand, Software-Defined Radio (SDR) device, which equips digital electronics for signal processing, is developed and make it possible to develop the equipments for HF Doppler sounding system easily by utilizing the software processing. This means that the receivers for HF Doppler sounding system are developed without the knowledge of the analog circuits. Therefore, we have developed the new HF receiver using SDR device instead of the traditional receiver. In this study, we adopted USRP N210 as a new SDR device. In HFD sounding system, the transmitter for 5.006 MHz and 8.006 MHz is located at Chofu Campus of the University of Electro-Communications and that for 6.055 MHz and 9.595 MHz (now off the air) is Radio NIKKEI transmitter located at Nagara. The previous receiver can observe radio waves at four different frequencies with 100 Hz sampling. New SDR receiver is also enable to observe the four different radio waves with 160 Hz sampling. Test observation of the new SDR receiver were performed in Awaji with the previous receiver. We compared the observational results of Doppler frequencies between both receivers.

The Doppler frequencies of the sky wave observed by SDR receiver and the previous analog receiver are coincided each other. Therefore, it is found that the new receiver can be utilized for the actual observation. New SDR receivers will be installed at Onna, Sarobetsu, and existing stations.

GPS radio occultation measurement for SMILES-2

*Makoto Suzuki[1], Philippe Baron[2], Satoshi Ochiai[2], Naohiro Manago[3], Josaphat Tetuko Sri Sumantyo[3], JANN-YENQ Liu[4], Akinori Saito[5], Huixin Liu[6], Masato Shiotani[7]

Center for Environmental Remote Sensing, Chiba University, 4. Center for Astronautical Space and Engineering, National Central University , 5. Kyoto University, 6. Dept. of Earth and Planetary Science Faculty of Science Kyushu University, 7. RISH, Kyoto University

SMILES-2 (Shiotani et al IGARSS 2019, Ochiai et al IGARSS 2019) is a proposal submitted to JAXA/ISAS small satellite program (Feb. 2020), which is now under selection to go to Pre-Phase A1b and, if selected, it launch will be latter half of 2020s. SMILES-2 will have 3 instruments; (1) submm and THz limb sounder, (2) GPS Radio Occultation (RO) for temperature and density, and (3) Langmuir probe for in situ Electron density and temperature. This paper discuss the combined measurement of submm-THz and GPS RO.

Two submm bands are (i) 619.1-627.1, 649.05-657.05 GHz double side bands (DSB) with 638.075 GHz Local oscillator (LO), and (ii) 750.0-756.0, 771.0-777.0 GHz DSB with 763.5 GHz LO, both with 1.0 MHz sampling interval. The 638 GHz band is a band width extended one from ISS/JEM/SMILES frequency coverage, and the 763.5 GHz band is designated to measure O2 and H2O well suited for temperature and wind speed retrieval. Terahertz (THz) band is aiming to measure O-atom (O-atom density, temperature, and wind speed), and OH. Suzuki et al have shown sensitivity for chemical species (Suzuki et al IGARSS 2019), and Baron et al have shown sensitivity for temperature and wind speed (Baron et al, AMT 2020).

GPS RO is established measurement technique of temperature-density-altitude profile (0-40 km) and electron density profile (upper atmosphere; 90 km - Satellite altitude). If SMILES-2 spacecraft has two RO antenna forward and backward, we can expect 5-6 times/day coincidence (i.e. <100 km in azimuth direction at tangent points) of submm-THz and GPS-RO measurements. The THz observation of SMILES-2 (2.0 THz for O-atom) can provide dataset of temperature, O-atom density, wind speed of neutral atmosphere (<150 km), so we can investigate the interaction from electron density at the coincident condition.

GPS RO meteorological dataset (0-40 km) is also crucial for improving spectroscopic parameters (gamma-air and n-air), since those spectroscopic parameter will have 5%-20% uncertainty without careful laboratory measurements . It will affect to all retrieval of chemical species with same magnitude (5%-20%). So, we propose to make spectroscopic studies based upon SMILES-2 dataset (submm-THz L1B data with GPS RO temperature profile). The GPS RO dataset is the only dataset which has comparable temperature precision of SMILES-2, and the accuracy (systematic difference from true value) is much better than the SMILES-2 dataset.
GPS RO instrument can be developed easily based upon JAXA GPSR system standard for most JAXA earth orbiting satellites, and it was a plan in the 2018 SMILES-2 proposal. We have chosen the one from Taiwan Central University because of its strong scientific ad engineering heritage from COSMIC-1/2 programs.

SCIntillation and IONosphere –eXtended (SCION-X) –A Small Satellite for Ionospheric and Atmospheric Science

*Pin-An Lin[1], Kai-Lun Cheng[1], Tsai-Ju Yu[1], Ruo-Yu Wang[1], Yueh-Chun Hsieh[1], Glenn Franco Gacal[1], Hsin-I Tu[1], Sittinat Denduonghatai[1], Guan-Po Ciou[1], Loren C. Chang[1], Jann-Yenq Liu[1], Cheng-Ling Kuo[1], Tang-Huang Lin[2], Amal Chandran[3]

1. Graduate Institute of Space Science and Engineering, National Central University, Taoyuan City, Taiwan, 2. Center for Space and Remote Sensing Research, National Central University, Taoyuan City, Taiwan, 3. Satellite Research Centre, Nanyang Technological University, Nanyang Avenue, Singapore

With the advent of the new era of space science and technology and the effects of climate change, SCION-X, a small satellite under development by National Central University in Taiwan has the ability to provide more accurate observations for atmospheric measurements and air quality from the lower atmosphere, as well as ionospheric plasma density for space weather monitoring and forecasts. SCION-X will carry three science payloads. One of the payloads for SCION-X mission is a GNSS Radio Occultation Receiver (GROR), which uses measurements of GPS L1 and L2 pseudorange, phase, and carrier to noise ratio (Cb/No) to derive the vertical profiles of ionospheric electron density and S4 amplitude scintillation index. These observations will be further complemented by the Compact Ionospheric Probe (CIP), which is an in-situ plasma sensor with high Technological Readiness Level (TRL) and high sampling rates to measure ionospheric parameters and irregularity structure at sub-kilometer scales. These observations will help to correct and predict the positioning errors and satellite communications disruptions caused by ionospheric anomalies such as the generation and propagation of plasma bubbles. In addition to ionospheric studies, GROR can also provide observations of the water vapor and temperature distribution in the troposphere. Assimilation of the tropospheric observations into weather forecast models will be beneficial for global climate research and improve the accuracy of tropical cyclone forecasts. The third payload is Hyper-SCAN, which is a newly developed hyperspectral imager. By analyzing the spectrum between 380 - 1020 nm and comparing with in-situ PM2.5 aerosol measurements on the ground, a first calibration test of Hyper-SCAN will be performed to serve as a reference for the study of PM2.5 pollution distribution and its sources.

The development and validation of a photochemical model for atomic oxygen ion retrieval from ground-based airglow observations

*YI DUANN[1,2], Loren C. Chang[1,2], Yi-Chung Chiu[1,2], Cornelius Csar Jude H. Salinas[1,2], Alexei V. Dmitriev[1], Konstantin G. Ratovsky[3], Irina V. Medvedeva[3], Roman Vasilyev[3], Alexander V. Mikhalev[3], Jann-Yenq Liu[1,2], Charles Lin[4]

Institute of Solar-Terrestrial Physics, Siberian Branch, Russian Academy of Sciences, Irkutsk, Russia, 4. Department of Earth Science, National Cheng Kung University, Tainan, Taiwan

Three photochemical inversion models are derived to retrieve atomic oxygen ion density ($[O^+]$) from 630.0 nm intensity emitted by $O(^1D)$ excited state, to understand the relation between 630.0 nm airglow emission and $[O^+]$. Three experiments are performed in this study. The first experiment validated our inversion models with Thermosphere-Ionosphere-Electrodynamics General Circulation Model (TIE-GCM) results, with the derived $[O^+]$ showing high correlation with the TIE-GCM model truth. Sensitivity testing results show that molecular oxygen density ($[O_2]$) used in the inversion process is most effective in determining the trends of calculated $[O^+]$. The second and third experiments are applied with ground-based spectrometer 630.0 nm data from Geophysical Observatory of the Russian Academy of Sciences Siberian Branch near Irkutsk, Russia (51.8˚N, 103.1˚E) in 2016, but with unobserved background inputs from TIE-GCM and empirical models, respectively. A new height profile based on emission layer thickness and *hmF2* derived 630 nm airglow intensity peak altitude for Gaussian distribution (GD) is applied for converting Rayleighs into Volume Emission Rate (VER) (*Adachi et al.,* 2009), and is consistent with the TIE-GCM calculated airglow peak altitude. Future work will replace GD with Chapman distribution which should be closer to reality. With the new inversion models and preliminary height profile, estimations of $[O^+]$ using empirical models and airglow observation are possible and may be extended to estimate $[O_2]$ if combined with electron density measurements.

[P-EM13] Dynamics of Magnetosphere and Ionosphere

convener:Aoi Nakamizo(Applied Electromagnetic Research Institute, National Institute of Information and Communications Technology), Mitsunori Ozaki(Faculty of Electrical and Computer Engineering, Institute of Science and Engineering, Kanazawa University), Akiko Fujimoto(Kyushu Institute of Technology), Yuka Sato(Nippon Institute of Technology)

This session provides an opportunity to present recent results from satellite and ground-based observations and theoretical and simulation studies on the magnetosphere, ionosphere, and their coupling processes. We invite talks and posters discussing various phenomena related to the magnetosphere-ionosphere system: solar wind-magnetosphere interaction, magnetosphere-ionosphere convection, field-aligned current, magnetic storms/substorms, neutral-plasma interaction, ionospheric ion inflow and outflow, aurora phenomena, and so forth. Discussions on planetary and satellite ionospheres and magnetospheres, future missions and instrument developments are also welcome.

The Sun and the solar wind are sources of space weather disturbances in the geospace environment. During the declining phases of solar cycles, the solar wind high-speed streams (HSSs) are a dominant phenomenon, even though they appear at all phases of the solar cycle. HSSs originate from the coronal holes on the Sun and during their travel in the interplanetary space, HSSs interact with the slow solar wind, generating co-rotating interaction regions (CIRs). The effect of HSS/CIRs on the terrestrial ionosphere is a complicated and poorly understood process, which involves flow of mass and energy from the Sun, interaction with the Earth’ s magnetosphere, and final entry of energy into the ionosphere in different forms including particle precipitation and Poynting flux producing Joule heating.

In this talk, we will focus on the effects of HSS/CIRs on the high-latitude ionosphere. We will give a brief overview of the observed features and modeling effects in earlier studies and then we will focus on one specific event taking place in March 2016, for which we have an extensive set of measurements. The event was caused by two interacting HSS/CIR structures, which produced a moderate geomagnetic storm, which lasted for eight days. In specific, we have EISCAT Tromso and Svalbard (ESR) incoherent scatter radar measurements for this event, giving information of development of plasma parameters during several days of the storm. The radars were performing CP3 antenna scan patterns covering latitudes from the north of the radar site to the south. TomoScand ionospheric tomography provided electron densities from latitudes extending to the south of EISCAT Tromso radar field-of-view. IMAGE magnetometer network gave information of the substorms taking place locally; globally the AE index repeatedly exceeded 1000 nT. In specific, we are interested in the effects of this storm on the high-latitude F-region electron density behavior (long-duration decreases and increases in different MLT sectors) and the physical processes producing the observed changes, including ionosphere-thermosphere coupling.

The 2nd Antarctic station of Korea, Jang Bogo Station (JBS, AACGM latitude: 79.87˚S) has been operating ‘Vertical Incidence Pulsed Ionospheric Radar (VIPIR)’ to monitor the variations of the ionosphere since 2015. During the main phase of the 11 May 2019 geomagnetic storm, we confirmed the absence of F-region for ~12 hours from ~10:00 UT to ~22:00 UT in night time from the VIPIR observations. During the interval of the F-region disappearance, Geo-KOMPSAT-2A (GK-2A), located west of JBS with ~2-hr local time separation, observed strong westward geomagnetic field perturbations at geosynchronous orbit. These field perturbations at GK-2A can be attributed to the field-aligned currents (FAC) flowing out of the ionosphere in the Southern Hemisphere below the satellite in the pre-midnight sector and into the ionosphere in the Northern Hemisphere above the satellite in the post-midnight sector. We examined the relationship between NmF2 at JBS and the amplitude of westward perturbation at GK-2A and found that NmF2 decreases as the amplitude of westward perturbation increases (i.e., as the intensity of FAC increases). This indicates that the F-region plasma density decrease at the polar cap region is associated with FAC during the main phase of the geomagnetic storm. Since the plasma density decrease is related to the O/N2 decrease, we suggest that the heating of the polar atmosphere is driven by FAC, causing the Joule heating in the auroral zone.

High ion temperature events at F region altitudes in the cusp: Spatial relations to the moving electron precipitation regions

*Satoshi Taguchi[1], Yunosuke Nagafusa[1], Yasunobu Ogawa[2], Keisuke Hosokawa[3], Tomokazu Oigawa[1], Morio Tanaka[1], Hiroyuki Shinagawa[4]

1. Department of Geophysics, Graduate School of Science, Kyoto University, 2. National Institute of Polar Research, 3. Department of Communication Engineering and Informatics, University of Electro-Commnunications, 4. National Institute of Information and Communication Technology

High ion temperatures at F region altitudes reflect how fast the ions convect through the slower moving neutral gas. Previous studies have shown that the high ion temperature regions exist in the vicinity of the mesoscale moving cusp aurora. For the large-scale motion of the electron precipitation region in the cusp, it is understood that fast ion flow often occurs nearly simultaneously with the intensification of the electron precipitation, but the detailed spatial relations between the fast ion flow and the large-scale motion of the electron precipitation region require clarification. In this study, we examined auroral image data obtained by an all-sky imager at Longyearbyen, Svalbard and data from field-aligned fixed EISCAT Svalbard Radar (ESR). From data obtained during six winter seasons (December 2012 to January 2018) we first identified approximately 84 hours as the period of the simultaneous observation in the daytime sector. Examination of the ESR ion temperature at F region altitudes during those periods of time has shown that the ion temperatures up to 2000 K are often observed, whereas the ion temperatures exceeding 2000 K are very limited. We present two cases from those high ion temperature events. Aurora image data show that one event is the repetitive poleward motions of the cusp auroras which were observed in the large-area of the imager's field-of-view, while another is the equatorward shift of the large-scale cusp aurora belt responding to the southward turning of the IMF. Although the maximum ion temperatures for both cases are similar, their rise and decay features during approximately 10 min are different. We show the detailed features of the ion temperature variations and their spatial relations to the motion of the electron precipitation regions, and discuss the ion-neutral interaction for the cases in which the large-scale electron precipitation regions move in the cusp.

Japan Atomic Energy Agency, 9. Osaka University

We report two mesospheric ionization events, both occurred during a substorm growth phase. The ionization reached at 68 km altitude at 2305 UT on 25 May 2017, and at 0000 UT on 25 July 2018, as identified by the PANSY radar at Syowa Station. Theoretically, the deep ionization events can be caused by the thinning of the magnetotail because of the small curvature radius of magnetic field lines at equator, which is comparable to the gyro radius of energetic electrons. Fortunately, the footprints of the Arase satellite passed nearby the Syowa Station during these two events, and we cannot find associated plasma waves to scatter energetic electrons, as expected from the curvature theory. In this study, we quantitatively evaluate the mesospheric ionization profiles by comparing the intensity of cosmic noise absorption as observed by the imaging riometer at Syowa Station, and the simulated one using the PHITS code with the input data of energetic electron flux as observed by the Arase satellite.

Molecular ions ($O_2^+/NO^+/N_2^+$) in the magnetosphere have been observed during the magnetic storms [e.g., Klecker et al., 1986]. Recent Arase observations in the ring current revealed that the existence of the molecular ions is a common phenomenon during geomagnetically disturbed period under Dst < -30 nT [Seki et al., 2019]. These molecular ions are considered to originate from the low-altitude ionosphere (altitude < 300 km). In order to escape to the magnetosphere, they thus need to have been transported upward from low-altitude ionosphere below 300 km altitude by some heating processes such as ion frictional heating, electron turbulent heating and small-scale plasma instability. However, what mechanism causes such an ion upflow from the low-altitude ionosphere is not known, because it is difficult to transport molecular ions against dissociative recombination [Peterson et al., 1994]. In this study, we aim at observational investigation of the ion upflow mechanisms based on simultaneous observations by the EISCAT radar and the Arase (ERG) satellite.

Three ion upflow events from the low-altitude ionosphere during geomagnetically disturbed periods (Dst < -30 nT) are analyzed in detail using the EISCAT uhf radar data. These ion upflows have similar features: the upward velocity along the field aligned direction with ion temperature enhancement at 200-400 km altitudes and electron temperature enhancement at 100-120 km altitudes. It indicates that the ion frictional heating caused by strong electric field formed these ion upflows from the low-altitude ionosphere. On the other hand, we found ion upflow events from the low-altitude ionosphere which showed different features from the above three events. Geomagnetic conditions are less active (Dst ~ 0 nT, AE ~ 200 nT) in these latter events. The ion upflows occurred with no significant ion heating but with electron density and temperature enhancement. It suggests that electron heating caused by soft electron precipitation created the second type of the ion upflows from the low-altitude ionosphere.

The Formation of Substorm Aurora in the Solar Wind-Magnetosphere-Ionosphere Coupling System

*Yan Song[1], Robert L Lysak[1]

1. University of Minnesota

Magnetospheric substorms have often been referred to as auroral substorms. Understanding the formation of substorm auroras, the evolution of their morphological structures, and the explosive nature of the aurora displays during the expansion phase is a key unsolved question in substorm study.

A necessary condition for the development of substorms is the accumulation of free magnetic energy in the magnetotail. Thus the question how this energy can be released and converted into accelerated particle energy causing the explosive enhancement of the aurora needs to be answered. We pointed out that a decrease in momentum transfer from the solar wind into the magnetosphere due to, for example, an IMF northward turning, will start a preconditioning stage, and cause force imbalance, producing a net earthward body force acting on the magnetotail. This huge earthward force can cause a large scale movement of the tail towards a more dipole-like configuration, producing disturbances in the tail, such as bursty bulk flows and dipolarization fronts.

We suggest that electrostatic fields are the most efficient and powerful means for auroral particle acceleration during substorm. We will elucidate the generation of parallel electrostatic fields by Alfvenic interaction in the inhomogenous Solar Wind-Magnetosphere-Ionosphere coupling system. The generation of parallel electrostatic fields in the auroral acceleration region and the resulting formation of low-density cavities is a positive feedback process. The continuous large energy supply from Poynting flux during the expansion phase can support long-lasting strong parallel electrostatic fields and create explosive auroral displays.

The Known and Unknown of Equatorial Plasma Bubbles

*Shasha Zou[1], Ercha Aa[1,2]

1. University of Michigan Ann Arbor, 2. MIT Haystack Observatory

In the equatorial and low latitude ionosphere, the equatorial ionization anomaly (EIA) is the most striking large-scale phenomenon. Embedded within EIA are smaller-scale low-density structures, i.e., the equatorial plasma bubbles (EPBs). EPBs are known to host ionospheric irregularities that can cause severe satellite signal scintillations and even signal loss of lock, thereby affecting communication and navigation. However, our understanding of the day-to-day and longitudinal variability of EIA and EPBs is still illusive. During geomagnetic disturbances, energy and momentum from the solar wind and the magnetosphere largely deposit in the high-latitude region, while their impact can propagate to the mid-latitude to equatorial regions in multiple ways to affect EPB dynamics, including prompt penetrating electric field (PPEF), disturbance winds and the associated dynamo electric field (DDEF), and traveling atmosphere disturbances and their ionosphere manifestations (TADs/TIDs). In recent years, the rapidly developing ground-based GNSS receiver network has enabled regional to continental scale measurements of the ionosphere and has revealed rich dynamic structures in those regions during storm time, such as much widened or asymmetric EIA crest and super equatorial plasma bubbles reaching relatively high latitudes. In this talk, we will discuss our recent findings about the knowns and unknowns of EPB dynamics, such as the dynamic evolution of the super bubble event during the Sep. 7, 2017 storm.

Causality for formation of electromagnetic channel from Polar to Equatorial Ionosphere

*Akimasa Yoshikawa[1], Aoi Nakamizo[2], Shinichi Ohtani[3]

1. Department of Earth and Planetary Sciences, Kyushu University, 2. National Institute of Information and Commiunications Technology , 3. APL/JHU

Formation of global ionospheric current system and it’ s associated plasma dynamics are frequently discussed under the electrostatic approximation of plasma electrodynamics. Since the Poynting flux never across the equipotential line, it is impossible to provide electromagnetic energy from source region to loading region across the magnetic field line. And hence, to discuss causality for evolution of ionospheric current system, we need to take into account an electromagnetic process of coupled system. To resolve this problem, we propose electromagnetic coupling model from polar to equatorial ionosphere. In this model, ionospheric current produces Ampere force and generates motion of plasma. The motion of plasma and associated mechanical process excite electromotive force and resultant electric field. Curl of electric field causes magnetic field disturbances and evolution of ionospheric current. Therefore, causality for evolution of electromagnetic energy and plasmas acceleration for expanding of ionospheric current system has occurred at the wave front region and/or conductivity gradient region. In this talk, we will discuss about what type of plasma motion induces electric field in the ionosphere, and how and whrere they produce magnetic field disturbances (hence the Ampere force) for acceleration of plasma as wave propagation process. Furthermore, we also discuss what kind of mechanical and electromagnetic process have occurred at the conductivity gradient region, which become very important for establishment of geometrical structure of ionospheric current system.

Automatic scaling of echo traces on ionogram for elucidation of a global current system

*Moe Hayashi[1], Akimasa Yoshikawa[4], Akiko Fujimoto[3], Shinichi Ohtani[2]

1. Kyushu University, 2. The Johns Hopkins University Applied Physics Laboratory, 3. Kyushu Institute of Technology, 4. Department of Earth and Planetary Sciencse, Kyushu University

Space weather occurs in a magnetosphere-ionosphere-atmosphere and solar-wind coupled system. In ionosphere, ionospheric current produces Ampere force and generates plasma motions. The motions of plasma and associated mechanical process excite electromotive force and resultant electric field. Curl of electric field causes magnetic field disturbances and evolution of ionospheric current. Therefore, it is very important to investigate an electoromagnetic and dynamic process of ionospheric plasma for comprehensive understanding (i.e., causality and global aspects) of space weather phenomena.

Ionogram, observing data of ionosphere, gives important information of plasma behavior in the ionosphere such as ionospheric electron density and of which altitude variation. So ionogram is very useful for analyzing motion of plasma in variety of space weather phenomena. Ionospheric observations start 1920s, but the technique for automatic scaling of echo traces on ionogram hasn't been established yet because of the complexly of data and considerable variations.

For the above reasons, in this study, we develop a new algorithm for automatically scaling ionospheric echoes applying image analysis. Our method has five steps: 1. Data extraction in proportion to intensity of reflection. 2. Sampling echo traces density of data. 3. Removing scattered noise. 4. Acquisition of fo (frequency of each layers) and h (height of each layers). Using this method, we successfully get echo traces, fo (frequency of each layers) and h (hight of each layers). It enables speedy and objective process for a large amount of ionogram data, and it helps to clarify a variety of space weather phenomena.

Applying above new technique, we try to understand how polar to equatorial (P-E) coupled channel is formed during substorm processes. As for the onset process of substorm, Imajo et al., (2015) suggest formation of global Cowling channel [Yoshikawa et al.,,2012] from polar to middle and low latitude dayside ionosphere. On the other hand, detail of P-E coupled process during expansion phase to recovery phase of substorm and connection between dayside and nightside ionosphere have not been become clear.

In this talk, we will introduce our new technique of automatic scaling of echo traces on ionogram and will show preliminary results of combining analysis for substrom process by using ionospheric data (ionogram) and magnetospheric data (SuperMAG, MAGDAS).

Ion-neutral collision frequencies for calculating ionospheric conductivity

*Akimasa Ieda[1]

1. Institute for Space-Earth Environmental Research, Nagoya University

Molecular oxygen collides with its first positive ion in the earth’ s ionosphere. The collision frequency of this particle pair is used to calculate the electric conductivity of the ionosphere. However, for this parental pair there are two collision types, resonant and nonresonant, and the selection of the collision type has differed among previous studies in calculation of conductivity.

In the present study, we clarify that the nonresonant collision is physically essential for this pair because the relevant temperatures are low. That is, the peak of the ionospheric conductivity occurs at altitudes between 100 and 130 km, where the temperatures of ions and neutral particles are usually lower than 600 K, and for these temperatures nonresonant collisions are dominant. The collision frequency would be underestimated by 30% if the resonant collision was assumed at an altitude of 110 km (where the temperature is 240 K).

The impact of this difference on the conductivity is estimated to be small (3%), primarily because molecular nitrogen is much more abundant than molecular oxygen. Although we have confirmed that the nonresonant collision is essential, we also include the resonant type, primarily in case of possible elevated temperature events.

A set of ion-neutral collision frequency coefficients for calculating the conductivity is summarized, including other particle pairs, in the Appendices. Small corrections to the traditional coefficients are made.

Properties of Auroral Electron Backscatter

*John P Dombeck[1], Joshua Magnus[1], Robert Lysak[1], Cynthia Cattell[1]

1. University of Minnesota

Electron precipitation is an important and significant magnetosphere-ionosphere (M-I) coupling component. Understanding the net, rather than just downward, energy and number flux contribution and where that energy is deposited for different precipitation types and conditions is an important part of the SW-M-I-T system. We present the results of a number of related studies on backscatter properties that reduce the energy and number flux input to the ionosphere from electron precipitation and provide electron outflow. These include a straight-forward empirical backscatter model for primary and secondary backscatter based on ~13 years of FAST 2d distribution data that is accurate to within a few percent, a quasi-static acceleration net precipitation model including trapping of backscatter, and the results of an empirical study of backscatter reprecipitation effects in the conjugate hemisphere.

Profound mysteries exist about how the Earth’ s magnetosphere and ionosphere (M-I) interact and generate the dynamic and structured auroras. Scattered throughout the auroras are recurrent auroral forms (tens to hundreds of km) but their role in the M-I system remains unknown. Such features are likely manifestations of energy and momentum transport within the M-I system. Shortcomings in our understanding of these recurrent forms are largely due to observational challenges arising from their complex structure and dynamic variability. These characteristics present a difficult observational challenge which require multipoint, multivariate measurements with appropriate spacing in time and space.

In the magnetosphere-ionosphere coupling, three-dimensional (3D) current system on the ionosphere is essential to understand how electromagnetic energy and momentum are transported between the magnetosphere and ionosphere. However, it is generally difficult to derive the 3D current system of the auroral phenomena from the observation. One of the methods to obtain the 3D current system on the ionosphere is so-called Kamide-Richmond-Matsushita (KRM) method. This method calculates the 3D current system from the ionospheric equivalent current and the ionospheric conductivity; the former is derived from the ground-based magnetometer network data and the latter is often given by the empirical model.
In this study, we estimate the 3D current system of auroral vortices in the discrete arc, which were observed with the multiple imagers with a wavelength of 427.8 nm in Northern Europe at 22:15-22:20 UT on March 14, 2015, by using the local KRM method (Vanhamaki et al., 2006). The advantage of this study is to obtain the ionospheric conductivity from the imager network observation. We applied the auroral computed tomography method to the multiple monochromatic images and obtained 3D distribution of the volume emission rate of 427.8 nm every 10 second during 22:15-22:20 UT. By using the theoretical model and the empirical atmosphere model, we converted the volume emission rate to the electron density in the ionosphere. As a result, we obtained the height-integrated conductivity in the horizontal area of 150 km x 300 km. The ionospheric equivalent current was derived every 10 second from the IMAGE chain magnetometer data. Finally, we estimated 3D current system around the discrete arcs by using the local KRM method. The results showed that pairs of upward and downward field-aligned current (FAC) drifted eastward along the arc together with the auroral vortices. It was found that the distribution of the upward and downward FACs was distorted, which was caused by the divergent ionospheric Hall current due to the non-uniform ionospheric conductivity.

Simulation on 3D structure of auroral electrojet

*Yuto Yano[1], Yusuke Ebihara[1]

1. Research Institute for Sustainable Humanosphere, Kyoto University

We developed a simplified Hall-MHD simulation to understand the magnetosphere-ionosphere coupling in the polar region during the auroral substorm. The governing equations were derived from the law of conservation of momentum of ions and electrons, the equation of continuity of plasma, the law of Ohm, the law of Ampere, and the law of Faraday. The Hall effect is included because it retains the Hall term in the governing equations. The advection in the governing equations were solved by using the Lax-Wendroff scheme and the Superbee limiter function. We imposed a flow shear on the topside boundary to excite Alfven wave. First, we ran the simulation under the condition that the ionospheric plasma density is uniform in the horizontal space. The Alfven wave propagates downward, and reflected at altitude being lower than the peak of the Pedersen conductivity. It was confirmed that the FACs were closed by the Pedersen current in the lower ionosphere. Secondary, we introduced a high-density channel. The secondary electric field is confirmed to appear due to blockage of the Hall current (polarization), which intensifies the ionospheric current. The direction of ionospheric current depends on altitude. The current is intensified at specified altitudes. This is similar to the auroral electrojet.

Statistical characteristics of the duskside mesoscale field-aligned currents without accompanying the large-scale Region 1 current

*Yoshihiro Yokoyama[1], Satoshi Taguchi[1], Toshihiko Iyemori[2], Keisuke Hosokawa[3]

1. Department of Geophysics, Graduate School of Science, Kyoto University, 2. Kyoto University, 3. Department of Communication Engineering and Informatics, University of Electro-Communications

During prolonged quiet times the large-scale Region 1 current nearly diminishes except for its near-noon part, and irregular magnetic perturbations exist at latitudes where the Region 1 current disappeared. Our recent event study has shown that the irregular magnetic perturbations on the duskside are a result of highly structured quasi-static field-aligned currents whose typical latitudinal size is 20–30 km, and that those mesoscale currents in the duskside auroral oval are the phenomena that are pertinent to the magnetosphere for a northward IMF condition, not a simple remnant of the typical Region 1. In the present study, in order to clarify detailed characteristics of the mesoscale field-aligned currents without accompanying the large-scale Region 1 we examined large amounts of data obtained by Swarm satellites during three years, i.e., from January 2014 to December 2016. How the occurrence of those mesoscale field-aligned currents is controlled by solar illumination of the ionosphere and upstream solar wind parameters other than the northward component of IMF is presented.

Ionospheric plasma sheet isolation during northward interplanetary magnetic field periods reproduced by numerical magnetohydrodynamic modeling

*Masakazu Watanabe[1,2], Takashi Tanaka[2], Shigeru Fujita[3]

1. Graduate School of Science, Kyushu University, 2. International Center for Space Weather Science and Education, Kyushu University, 3. Meteorological College

During periods of northward interplanetary magnetic field (IMF), for the case of IMF $B_y<0$, the dawnside plasma sheet expands poleward in the northern ionosphere, while in the southern ionosphere the duskside plasma sheet expands poleward. At the same time, auroral arcs aligned to the auroral oval are often observed at dawnside high latitudes in the northern hemisphere and at duskside high latitudes in the southern hemisphere. The above-mentioned dawn-dusk relation reverses for the case of IMF $B_y>0$. Although the oval-aligned arcs at high latitudes may simply be an intensification of the poleward boundary of the plasma sheet, an alternative explanation is the plasma sheet “fragments” that have been detached from the main body of the plasma sheet. For the latter case, an open magnetic flux is intruding into the closed flux region on the flankside in the ionosphere, implying an unknown topological structure in the magnetosphere that differs from the basic 2-null, 2-separator topology. We call this ionospheric configuration “plasma sheet isolation.” The purpose of this study is to investigate such plasma sheet isolation by numerical magnetohydrodynamic modeling. Using the REPPU (Reproduce Plasma Universe) code, we unintentionally found a plasma sheet isolation event for the following solar wind and IMF conditions. We first made a steady state magnetosphere with a total IMF intensity of B=6 nT and a clock angle of $\theta=45^\circ$ ($B_y<0$). The solar wind parameters were N=10/cc (density), V=370 km/s (speed), and T=100,000 K (temperature). We then changed the IMF abruptly to B=13 nT and $\theta=70^\circ$ without changing the B_y sign. The figure below shows the polar caps about 70 min after the IMF change. The gray area represents the open magnetic flux region, while the white area shows the closed magnetic flux region. The thin solid lines indicate the contours of electric potentials every 1 kV. Plasma sheet isolation is seen on the dawnside in the northern hemisphere and on the duskside in the southern hemisphere. The plasma sheet isolation started about 50 min after the IMF change and lasted about 40 min. The plasma sheet fragments on the two hemispheres are magnetically conjugate. In the magnetotail, the closed lines threading these fragments are stuck by IMF lines, exhibiting a tangling of field lines. We discuss the origin of such a topological structure in terms of magnetic reconnection. The plasma sheet isolation is a consequence of Dungey-type “crossover reconnection” in the tail plasma sheet that is prohibited in the basic 2-null, 2-separator structure.

Impact of foreshock transients on the Earth’s nightside magnetosphere and ionosphere

*Chih-Ping Wang[1], Xueyi Wang[2], Terry Z. Liu[3], Yu Lin[2], Sixue Xu[1]

1. University of California Los Angeles, 2. Auburn University, 3. University of Alaska, Fairbanks

The density and flow perturbations associated foreshock transients can result in dynamic pressure changes in the magnetosheath, thus distorting the magnetopause and driving disturbances within the magnetosphere and ionosphere. In this paper, we present three events from multiple spacecraft observations to show that transient foreshock perturbations associated with an IMF directional discontinuity can persist as they propagate to the mid-tail magnetosheath ($X < -40\ R_E$) together with the discontinuity and disturb the nightside magnetopause. We show observations that these transients can enhance compressional magnetic field waves within the nightside magnetosphere, drive Pc-5 magnetic field perturbations on the ground traveling from the dayside toward nightside, and generate localized ionospheric flow vortex on the nightside. We also present results from a 3D global hybrid simulation of an rotational IMF discontinuity using the ANGIE3D (AuburN Global hybrId codE in 3-D) code. The simulation shows that transient plasma and field perturbations are formed in front of the foreshock with characteristics consistent with a foreshock bubble (FB). The FB subsequently propagates into the magnetosheath, and as it propagates tailward to the mid-tail together with the discontinuity it continuously causes localized and transient distortion of the flank magnetopause, as well as field-aligned currents into the ionosphere. Therefore, our observations and simulations demonstrate that foreshock transients can have a global impact on the nightside magnetosphere and ionosphere.

The main observational properties of throat aurora and their implicaitons on dayside S-M-I coupling

*Han Desheng[1]

1. School of Ocean and Earth Science, Tongji University

Throat aurora is a particular auroral form observed around the dayside ionospheric convection throat region and was defined during an extensive study on dayside diffuse aurora. Throat auroras typically exhibit as north-south aligned discrete auroral forms extending from the equatorward edge of the east-west-aligned auroral oval toward low latitude. The main observational properties of throat aurora have been revealed as follows. 1) The occurrence rate of throat aurora is rather high. 2) Throat auroras are caused by precipitation of particles from the magnetosheath and have been suggested to be the ionospheric signature of magnetopause indentations. 3) The occurrence rate of throat aurora is dependent on both magnetospheric internal factors, such as diffuse aurora and magnetospheric convection, and external factor, i.e., the IMF cone angle. 4) Throat aurora are associated with clear magnetopause reconnection signatures. Based on these observational results, a conceptual model for throat aurora is proposed, which suggests that a polarization electric field in the ionosphere may play the key role for producing throat aurora by affecting the magnetopause reconnection.

A Possible Formation Scenario of the Transpolar Arcs with the Nightside End Distortions: Role of Field-Aligned Currents

*Motoharu Nowada[1], Qiu-Gang Zong[2], Benoît Hubert[3], Quan-Qi Shi[1], Yong-Fu Wang[2], Jun Yang[1], Adrian Grocott[4], Alexander William Degeling[1], An-Min Tian[1], Xu-Zhi Zhou[2], Chao Yue[2]

Space science, Technologies and Astrophysics Research (STAR) Institute, Université de Liège, Belgium, 4. Space and Planetary Physics Group, Department of Physics, Lancaster University, Lancaster, United Kingdom

Since we discovered the newly morphological transpolar arc (TPA), whose nightside end got distorted toward pre- or post-midnight, identified as “nightside distorted TPAs”, their fundamental characteristics have been revealed based on investigations of the space-borne auroral imager data and corresponding solar wind conditions. Nightside distorted TPAs had two types; “J”- and “L”-shaped TPAs, and their locations of appearance (dawn or duskside of the polar cap) were governed by the polarity of the B_y component of the Interplanetary Magnetic Field (IMF). Furthermore, we found that the nightside distorted TPAs have antisymmetric morphologies in the Northern and Southern hemispheres, also depending on the IMF-B_y orientation.
In this presentation, we show that that the electric currents flowing aligned to the magnetic field lines which connect between the magnetotail and the ionosphere, that is, Field-aligned currents (FACs) play an essential role in the formations of the “J”- and “L”-shaped TPAs. They are induced by significant plasma flow velocity difference (plasma flow shear) between the fast plasma flows associated with nightside magnetic reconnection and slower background plasma flows in the magnetotail. The current vortex structures with the counterclockwise rotation are also clearly seen in the ionospheric current vectors derived from fluctuations of the geomagnetic field measured at the ground observatories beneath and in close proximity of the growth regions of the nightside distorted TPA. This result suggests that the FACs were flowing out of the ionosphere toward the magnetotail (upward FACs) near the TPA.
Furthermore, based on the geomagnetic field variations and the SuperDARN HF radar data, we obtained evidence in which the locations of magnetotail magnetic reconnection, which persisted even during northward IMF-B_z intervals, that is, the TPA durations, retreated further down tail as the TPA grew to the dayside. Taking into account these observational results, we finally show a model to illustrate the nightside distorted TPA (particularly, “L”-shaped TPA) formation.

Fade of transpolar arc and its relation to the intensification of the nightside oval

*Takahiro Obara[1]

1. Planetary Plasma and Atmospheric Research Center,Tohoku University

We have identified that night side oval intensification took place when the transpolar arc was fading. This is due to the switch of IMF Bz polarity from north to south. We have confirmed in the past that theta aurora appears in the polar cap region, corresponding to the IMF By polarity change (Type I) or long lasting strong IMF By (Type II) during northward IMF conditions. In the Type I case, the transpolar arc was detached from the morning (evening) side oval and moves dusk ward (dawn ward), corresponding to the IMF By polarity change from negative to positive (positive to negative). Movement of the transpolar arc is caused by the large supply of newly formed open field lines to the polar cap region, due to the change of the null point location. For the change of IMF By from negative to positive (positive to negative), accumulation of the magnetic flux occurs within the newly formed polar cap region in the dawn side (dusk side). When the IMF switched to the south, accumulation continues in the same side of the polar cap. Enhanced convention stores the energy and the stored energy at last releases, resulting in the intensification of the night side auroral oval. Location of the intensification with respect to the transpolar arc seems to depend on the IMF By polarity; i.e. dusk side for negative IMF By and dawn side for positive IMF By in the northern polar cap. For the Type II case, accumulation of open flux in the polar cap would enhance due to the switch of IMF Bz to the south, resulting in the intensification of the night side oval.

Feedback instability theory extended to the magnetosphere-ionosphere coupling with field-aligned inhomogeneity

*Tomo-Hiko Watanabe[1], Junya Hiwatari[1], Shinya Maeyama[1]

1. Graduate School of Science, Nagoya University

The feedback instability theory for Alfvenic coupling of the magnetosphere and the ionosphere has been extended by introducing inhomogeneous profiles of the ionospheric collision frequency and the magnetospheric Alfven speed. The eigenvalue analysis clarifies the stabilizing mechanism of high frequency components of the ionospheric Alfven resonator (IAR) mode for the strongly inhomogeneous collision frequency profile in the ionosphere. The stabilization is brought by an effective internal resistivity due to the ionospheric inhomogeneity, not by a shear of the ionospheric current. Low frequency components of the field line resonance (FLR) mode remain unstable even when the high frequency components are stabilized. The theoretical results demonstrate a robustness of the feedback instability mechanism providing spontaneous growth of the auroral arc structure in the magnetosphere-ionosphere coupling.

Antarctic large area network observation of auroral phenomena using unmanned system: Current status of project as of early 2020

*Akira Kadokura[1], Yasunobu Ogawa[1], Yoshimasa Tanaka[1], Hisao Yamagishi[1], Masaki Okada[1], Ryuho Kataoka[1], Herbert Akihito Uchida[2], Yuichi Otsuka[3], Motoba Tetsuo[4], Natsuo Sato[1]

1. National Institute of Polar Research, 2. SOKENDAI, 3. Nagoya University, 4. Johns Hopkins University, Applied Physics Laboratory

Space and upper atmospheric sciences group in the National Institute of Polar Research (NIPR) is now planning to construct an observation network for auroral phenomena along the coast of the Dronning Maud Land in the Antarctica including Japanese Syowa Station, and has developed a Unmanned Auroral Observation system (UAO), which is equipped with a 3-axis fluxgate magnetometer, all-sky auroral imager, GNSS/TEC receiver, and a data communication system using the Inmarsat satellite data link with a low power consumption. The first UAO (UAO-1) had been installed at Amundsen Bay area, which is located about 500 km eastward from Syowa Station, in February, 2017 in the summer operation of the 58th Japanese Antarctic Research Expedition (JARE-58). The second UAO (UAO-2) had been installed at Belgium Princess Elisabeth Antarctica (PEA) Station in January, 2020. Electric power of the UAO-1 is supplied by a hybrid natural energy electric generation system which consists of three sets of 192W wind generators and 8 sets of 62W solar panels, while that of the UAO-2 is supplied from the AC power source of the PEA Station which is generated by a power generation system of the station using nine big wind generators and solar panels. For the UAO, observed magnetometer data (1 sec resolution), GNSS BINEX data (30 sec resolution), daily Keogram and sample image data of the auroral imager, and House Keeping data (temperatures and power voltages) (1 min resolution) are transmitted at every 1 hour via the satellite link system to a server in Japan by FTP, and auroral image data of 1 sec resolution are stored in a memory card of the video encoder in the system. Sample interval and pixel resolution of the transmitted auroral image data are 1 hour (5 minutes) and 640x480 (160x120) for the UAO-1 (UAO-2), respectively. UAO-2 has the other USB memory in the system which can store auroral still image of 1 sec resolution with 640x480 pixel resolution and GNSS BINEX data of 1 sec resolution. PEA Station is maintained during summer season, and becomes an unmanned station during winter season, while the electric power to all the instruments at the station is supplied continuously all through the season. In January, 2020, we had also installed an auroral imager system at Indian Maitri Station, which consists of four sets of all-sky imager using Watec cameras: 1) Panchromatic (color) ; 2) Panchromatic (black&white); 3) filtered at 560nm (FWHM:10nm); 4) filtered at 632nm (FWHM:10nm), respectively. Maitri is a year-round station. The auroral imager system is run autonomously. We ask expedition members at Maitri to send daily summary files via E-mail to us. In our presentation, we will talk about current status of the project including the installation both at PEA and Maitri stations in this January, and preliminary results of the observations at both stations.

Pulsating aurora (PsA) is one of the major types of aurora often seen in the lower latitude part of the auroral region in the morning side. PsA is known to have two distinct periodicities. One is the main pulsation whose period ranges from a few to a few tens of seconds. The other is so-called internal modulation which is ~3 Hz luminosity modulation during the ON phase of main pulsation. Previous studies indicated that ~50% of PsA are accompanied by the internal modulation (i.e., internal modulation is often seen, but not always observed during PsA). Recent coordinated ground/satellite observations of PsA suggested that these two periodicities are closely associated with the intensity modulation of whistler mode chorus waves in the morning side magnetosphere. In particular, the association between the main pulsation and bursts of chorus was confirmed for example by Nishimura et al. (2010) and more recently by Kasahara et al. (2018). However, it has still been under debate which characteristics of chorus waves control the existence/absence of internal modulation. This review talk will be focused on several results from recent coordinated ground/satellite observations of PsA (e.g., Ozaki et al., 2019; Hosokawa et al., 2020) since the launch of the Arase satellite. Especially, we will introduce conjugate high-time resolution measurements of fine-scale temporal variations of chorus waves in space and PsA seen from the ground.In addition, we will talk about recent ground-based radar observations of PsA showing the simultaneous precipitation of sub-relativistic electrons during PsA, which will be one of the primary scientific objectives of EISCAT_3D currently being prepared in Scandinavia.

[P-EM13] Dynamics of Magnetosphere and Ionosphere

convener:Aoi Nakamizo(Applied Electromagnetic Research Institute, National Institute of Information and Communications Technology), Mitsunori Ozaki(Faculty of Electrical and Computer Engineering, Institute of Science and Engineering, Kanazawa University), Akiko Fujimoto(Kyushu Institute of Technology), Yuka Sato(Nippon Institute of Technology)

This session provides an opportunity to present recent results from satellite and ground-based observations and theoretical and simulation studies on the magnetosphere, ionosphere, and their coupling processes. We invite talks and posters discussing various phenomena related to the magnetosphere-ionosphere system: solar wind-magnetosphere interaction, magnetosphere-ionosphere convection, field-aligned current, magnetic storms/substorms, neutral-plasma interaction, ionospheric ion inflow and outflow, aurora phenomena, and so forth. Discussions on planetary and satellite ionospheres and magnetospheres, future missions and instrument developments are also welcome.

The injection region's formation, scale size, and propagation direction have been debated throughout the years, with new questions arising with increased plasma sheet observations. How do temporally and spatially small-scale injections relate to the larger injections historically observed at geosynchronous orbit? How to account for opposing propagation directions--earthward, tailward, and azimuthal--observed by different studies? To address these questions, we used a combination of multisatellite and ground-based observations to knit together a cohesive story explaining injection formation, propagation, and differing spatial scales and timescales. We used a case study to put statistics into context. First, fast earthward flows with embedded small-scale dipolarizing flux bundles transport both magnetic flux and energetic particles earthward, resulting in minutes-long injection signatures. Next, a large-scale injection propagates azimuthally and poleward/tailward, observed in situ as enhanced flux and on the ground in the riometer signal. The large-scale dipolarization propagates in a similar direction and speed as the large-scale electron injection. We suggest small-scale injections result from earthward-propagating, small-scale dipolarizing flux bundles, which rapidly contribute to the large-scale dipolarization. We suggest the large-scale dipolarization is the source of the large-sale electron injection region, such that as dipolarization expands, so does the injection. The >90 keV ion flux increased and decreased with the plasma flow, which died at the satellites as global dipolarization engulfed them. We suggest the ion injection region at these energies in the plasma sheet is better organized by the plasma flow.

Flux decrease of outer radiation belt electrons associated with solar wind pressure pulse: A Code coupling simulation of GEMSIS-RB and GEMSIS-GM

*Ito Hiroki[1], Yoshizumi Miyoshi[1], Shinji Saito[2], Yosuke Matsumoto[3], Takanobu Amano[4]

1. Institute for Space-Earth Environmental Research, Nagoya University, 2. National Institute of Information and Communications Technology, 3. Gradual School of Science, Chiba University, 4. Department of Earth and Planetary Science, University of Tokyo

Relativistic electron flux of the outer radiation belt dynamically changes in response to solar wind variations. Enhancement of dynamic pressure causes the flux drop-out of the outer belt electrons, and magnetopause shadowing (MPS) has been proposed to cause rapid loss of relativistic electrons (e.g.,Kim et al.,2008). In general, it has been expected that MPS is a cross-field transportation due to convection and/or the dayside compression of the magnetosphere. However, the gyro-radius of relativistic electrons of the outer belt seems to be too small compared with the spatial scale of gradient of the dayside magnetopause, so that it is difficult for electrons to escape across the magnetopause(e.g., Kim and Lee, 2014). In this study, we investigate another escaping process of relativistic electrons into the interplanetary space. We conduct a code-coupling simulation of a test-particle simulation code (GEMSIS-RB: Saito et al., 2010) and a global MHD magnetosphere simulation code (GEMSIS-GM: Matsumoto et al., 2010). We calculate trajectories of a number of electrons of guiding-center of electrons in electromagnetic fields calculated from GEMSIS-GM. In the simulation, electrons are initially distributed from Re = 6 to 11 with initial energies from 1 MeV to 10 MeV. Initial pitch angles of electrons are distributed from 50 degrees and 90 degrees. In this simulation, the solar wind dynamic pressure and the magnetopause stand-off distance change in the different phase of variation ; [i] The stand-off distance of the magnetopause is 12 RE with the initial dynamic pressure of 1.0 nPa, By_IMF of 0.005 nT, Bz_IMF = 3.0 nT. [ii] The solar wind dynamic pressure increases to 2.5 nPa, and the magnetopause moves to 9 RE. In this period, the pitch angle scattering of electrons with L value larger than 9.0 occurs by Drift Shell Bifurcation (DSB). [iii] The dynamic pressure decreases, and the inflation of the magnetopause takes place. The stand-off distance of the magnetopause moves back to 10 RE. In this period, the pitch angle of electrons with L value larger than 9.25 are scattered by DSB. During phase [ii], the high-latitude magnetic reconnections occur at dawn-side. Several electrons scattered by DSB change their mirror points to the high latitude where electrons can escape into the interplanetary magnetic field along the field line. During the periods, the high-latitude reconnections occur at the high-latitude in the dusk side. As a result, some of trapped electrons escape into the interplanetary space along open magnetic field, which cause the loss of trapped electrons in the lower L-shells at least L = 8.75. In our study, it is also found that outward transport tends to occur at high energy, because electrons with fast drift velocity observes dawn to dusk electric field for relatively long period, and resultant outward movement takes place. Moreover, the higher the dynamic pressure, the lower the L value closer to the earth. The study reveals a part of erectrons of the outer radiation belt escape into the interplanetary space along the field line, which are different process from the MPS.

Seasonal Variation in Mass and Electron Densities of the Plasmasphere in the New Zealand Meridian

*Yuki Obana[1], Akiko Fujimoto[2], Satoko Saita[3], János Lichtenberger[4,5], Tanja Petersen[6]

1. Department of Engineering Science, Faculty of Engineering, Osaka Electro-Communication University, 2. Graduate School of Computer Science and Systems Engineering, Kyushu Institute of Technology, 3. National Institute of Technology, Kitakyushu College, 4. Eötvös Loránd University, 5. Research Center for Astronomy and Earth Sciences, 6. GNS Science

The equatorial mass and electron densities of the plasmasphere are respectively obtained from field line resonance (FLR) frequency and dispersion of whistler wave frequency. They have been effective tools for monitoring the plasmasphere from ground-based measurements.

At the two geomagnetic stations Middlemarch (L=2.8, belonging to CRUX magnetometer array http://www1.osakac.ac.jp/crux/) and Eyrewell (EYR, L=2.5, belonging to INTERMAGNET http://www.intermagnet.org/) in New Zealand, 1 sec observation of geomagnetic field started in 2011, and data have been accumulated for over 9 years. These observation points are approximately 300 km (dL=0.3) apart in the north-south direction, and this is an ideal location to detect field line resonances from cross-phase and power ratio.

In order to detect FLR frequencies, we applied an automatic algorithm, well-known 't-statistic method' introduced by Berube et al., 2003, to this data set and derive equatorial plasma mass densities. As a result, the plasma density in quiet time (maximum of Kp index in the previous 4 days < 4) showed the seasonal variation with minima in December, and its amplitude is larger in the solar maximum. According to the previous studies (e.g., Park et al., 1978), the electron density in the West American meridian showed opposite seasonal variation with minima in June) and similar dependence of solar activity (amplitude of the seasonal variation is larger in the solar maximum).

The Automated Whistler Detectorand Analyser (AWDA) system automatically detects whistler traces from VLF signals recorded at Dunedin (L=2.8) in New Zealand and provides equatorial electron densities.

By combining the electron and plasma mass densities, the corresponding average ion mass can be estimated by the reasonable assumptions that the plasma is quasi-neutral and the electron mass is negligible compared to the ion mass.

In the presentation, we will introduce the first results of comparison of these densities obtained from New Zealand stations during 2011-2019 which includes both solar maximum and minimum.

Differences in Near-Earth Magnetotail Evolution Between Pseudosubstorms and Substorms

*Yukinaga Miyashita[1], Kento Fukui[2], Shinobu Machida[2], Yoshizumi Miyoshi[2], Akimasa Ieda[2], Toshi Nishimura[3], Vassilis Angelopoulos[4]

Pseudosubstorms (pseudobreakups) are similar to substorms during the early stage of auroral development but differ in the later stage. That is, pseudosubstorms are not accompanied by poleward expansion, while substorms are. To understand what causes this difference, we statistically studied temporal and spatial development of the near-Earth magnetotail at X=-7 to -11 Re around pseudosubstorm and substorm onsets, based on THEMIS data. We find that near-Earth reconnection occurs before onset for both pseudosubstorms and substorms, but the earthward flow generated by reconnection is slower for pseudosubstorms than for substorms. Dipolarization, together with magnetic field fluctuations, occurs at X=-8 Re for both cases, but it is weaker at other distances for pseudosubstorms than for substorms. This result suggests that the current disruption related to dipolarization does not expand tailward and hence auroral poleward expansion does not occur for pseudosubstorms. Furthermore, the total pressure is larger at X=-8 to -11 Re for several minutes before onset for substorms than for pseudosubstorms. The total pressure gradient increases more largely after onset for substorms than for pseudosubstorms. We suggest that these differences are important factors for determining whether ballooning instability causing current disruption grows in a wide area, that is, whether the initial action develops into a substorm or subsides as a pseudosubstorm.

Geomagnetic field and energetic particle oscillations observed at geosynchronous orbit during the growth and expansion phases of a substorm

*Khan-Hyuk Kim[1], Hyuck-Jin Kwon[1], Jongho Seon[1], Uli Auster[2], Werner Magnes[3], Stefan Kraft[4]

1. School of Space Research, Kyung Hee University, Korea, 2. IGeP, TUBS, Mendelssohnstrasse, Braunschweig, Germany, 3. Space Research Institute, OeAW, Graz, Austria, 4. ESOC-ESA, Robert-Bosch-Strasse, Darmstadt, Germany

Magnetic field and energetic electron data (E > 175 keV) acquired by GEO-KOMPSAT-2A (GK-2A) geosynchronous spacecraft in the pre-midnight sector have been used to study quasi-periodic magnetic field and particle oscillations during the substorm growth and expansion phases on 6 March 2019. Three types of oscillations are found in the magnetic field and electron flux: (1) ~300-s and (2) ~120-s oscillations during the decrease of the energetic particle flux prior to the expansion phase (i.e., during the substorm growth) and (3) ~60-s oscillations during the substorm expansion. The ~300-s electron flux oscillations have a quadrature relationship with the magnetic field oscillations in the azimuthal component at geosynchronous orbit, indicating the properties of a standing Alfven wave, and are nearly identical to the waveform of the geomagnetic field measured at low latitude (L = ~1.3) ground station. The ~120-s electron flux oscillations were observed just before the substorm onset. They are out of phase with the magnetic field perturbation in the radial component, which is dominant in the pre-midnight sector. There are no ground perturbations corresponding to the ~120-s electron flux oscillations. At the substorm onset, the ~60-s electron flux oscillations were excited, and the first four cycle of the flux oscillations show an in-phase signature of Pi2 oscillations identified at low-latitude ground station. In this study, we discuss how and where the electron flux oscillations are generated during the substorm growth and expansion phases.

Longitudinal propagation of thin auroral arcs

Fei Zhang[1], *Jian Yang[1], Wenrui Wang[1,2]

1. Southern University of Science and Technology, 2. Sun Yat-sen University

Substorm onset is initiated along an east-west aligned thin arc. The formation and dynamics of these thin arcs are important for understanding substorms. However, the arcs can be complicated and their associated process in the magnetosphere is still unclear. Our previous Rice Convection Model simulation has showed that when it is traveling through the middle plasma sheet, a flux tube bubble is elongated along the Sun-Earth direction, causing an auroral streamer; while when it arrives at the magnetic transition region and expands azimuthally, it will give rise to an east-west thin arc . In order to verify our prediction, we analyzed a number of events using THEMIS All-Sky-Imager data,.We find that the longitudinal propagation speed of the leading edge of the arcs is between 0.5 and 3.5 km/s, which is consistent with our simulation results.

[E] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

[P-EM14] Frontiers in solar physics

convener:Shinsuke Imada(Institute for Space-Earth Environmental Research, Nagoya University), Alphonse Sterling(NASA/MSFC), Takaaki Yokoyama(School of Science, University of Tokyo), Toshifumi Shimizu(Institute of Space and Astronautical Science, JAXA)

Over recent decades, Sun-observing satellite missions have told us much about the dynamic solar atmosphere. These satellites can observe magnetic activity in the solar corona at wavelengths inaccessible from ground-based telescopes, such as X-rays and EUV. Additionally, the seeing-free conditions of space allow for consistent, high-spatial resolution at visible wavelengths; e.g. the HInode satellite can observe solar surface magnetic field elements down to ~0.2 arcsec. From observations such as these, we have identified three important points regarding what is required form future space-based solar missions to solve fundamental solar problems, such as how the corona is heated and what drives solar eruptions: (1) seamless observation over all temperature regimes of the solar atmosphere, from the chromosphere to the corona, at the same time; (2) high spatial and temporal resolution to resolve elemental structures of the solar atmosphere, and to track their evolution; and (3) plasma diagnostic capability to quantify the dynamics of elementary process taking place in the solar atmosphere. To meet these requirements, recently the solar physics community in Japan proposed the Solar-C_EUVST mission, which will be launched in the mid-2020s. Furthermore, additional top-rate solar observatories, such as the Parker Solar Probe (PSP), Solar Orbiter, and the Daniel K. Inouye Solar Telescope (DKIST), will be operating in the years leading up to Solar-C_EUVST. In this session we will discuss what solar physics observational and numerical-simulation studies are required prior to the mid-2020s, to prepare most efficiently for the new observational era. We welcome contributions dealing with remote-sensing space-based observations (e.g. from Hinode and SDO), in-situ observations from near- and deep-space (e.g., PSP, Pioneer), ground-based observations, and numerical studies.

Alfvenic fluctuations in the near-Sun solar wind: Measurements from Parker Solar Probe

*Stuart D Bale[1]

1. University of California Berkeley

The PSP/FIELDS instrument has measured a rich variety of phenomena over PSP Encounters 1-3, including Alfvenic fluctuations and turbulence, dust, plasma instabilities and solar and Jovian radio emissions. The PSP spacecraft had its 4th solar encounter at < 28 Rs in late January, 2020. Here we report a summary of first results from the PSP/FIELDS instrument focusing on new results beyond those observed in Encounter 1-3 and describing measurements of Alfvenic 'switchbacks'.

BepiColombo is the ESA-JAXA joint mission to explore Mercury with two spacecraft: "Mio" (Mercury Magnetospheric Orbiter: MMO) and "Bepi" (Mercury Planetary Orbiter: MPO). The two spacecraft were successfully launched by Ariane-5 launch vehicle from Kourou in French Guiana on 20 October 2018. Mio is fully dedicated to investigating Mercury’s environment with a complete package of plasma instruments (particles, electric fields, and magnetic fields), a spectral imager of sodium exosphere, and a dust monitor. The trajectory of the BepiColombo spacecraft ranges from 1.2 AU to 0.3 AU including Earth, Venus, and Mercury flybys. During the cruise to Mercury, in addition to two spacecraft MMO Sunshield and Interface Structure (MOSIF) and Mercury Transfer Module (MTM) are all integrated together. Though the observation capabilities of some instruments onboard Mio and MPO are constrained due to the stacked configuration during the interplanetary cruise phase, BepiColombo can still contribute to inner-heliospheric science. For example, continuous monitoring of interplanetary magnetic fields and solar energetic particles can be achieved during the cruise phase. In the solar conjunction periods, the radio science instrument will perform the solar corona measurements by a radio occultation method. In addition to BepiColombo, NASA’s Parker Solar Probe and ESA’s Solar Orbiter are exploring the inner heliosphere at the same time. JAXA’s Venus orbiter Akatsuki also has capabilities of radio occultations. These multi spacecraft explorations collaborated with ground-based observations and numerical simulations will play a key role to investigate the inner heliospher. Here we present the overview and observation plans of BepiColombo for the interplanetary cruise phase and the proposals for collaborated studies with other spacecraft, ground-based observations, and simulations.

The Solar-C_EUVST: the EUV High-Throughput Spectroscopic Telescope, is a revolutionary spectrometer that is designed to provide high-quality and high cadence spectroscopic data covering a wide temperature range of the chromosphere to flaring corona. To achieve high spatial and temporal resolution than ever, the optics of Solar-C_EUVST is designed to have only two imaging systems; a 28-cm aperture off-axis parabolic primary mirror and a two-split toroidal grating both which have high reflective coatings in EUV-UV range (17-21 nm, 47-125 nm), without a blocking filter for visible light before the primary mirror. For this reason, about 53 W of sunlight is absorbed by the multilayer coating of a solar absorbance 0.6 put on the primary mirror. The primary mirror has bipod pads support using an adhesive, and movable mechanisms such as tip-tilt and image scanning and refocusing are placed just under the primary mirror, in which a high temperature needs to be avoided. We successfully designed the thermal model of EUVST telescope in which the temperature of the primary mirror bonding part and the mechanisms is well lower than 60 degC and the thermal deformation of the primary mirror is small. The instrumental design of EUVST telescope to achieve high spatial resolution is presented.

Analysis of Small-scale Flares using Genetic Algorithm

*Toshiki Kawai[1], Shinsuke Imada[1]

1. Institute for Space-Earth Environmental Research, Nagoya University

Coronal heating is one of the long-standing problems in solar physics. So far, two primary mechanisms have been proposed to explain how the corona is heated, namely small-scale magnetic reconnection and wave dissipation. To estimate the contribution of small-scale magnetic reconnections, so called nano-flares, to heat the corona is crucial to solve the coronal heating problem. To reach this goal, we develop a new method to analyse small-scale flares based on the combination of a numerical simulation and a machine learning technique. firstly, we obtain the light curves of the coronal loops from SDO/AIA multi-wavelength observation. Secondly, we carry out thousands of one-dimensional hydrodynamic simulations which calculate the time evolutions of coronal loops heated by flares which have various heating rates, durations, and occurrence times. Thirdly, we observe the simulated coronal loops by some SDO/AIA channels in a pseudo-manner. Then, we randomly make some “genes” which have the information of the combination of some pseudo-observed light curves. Comparing observed and linear superposition of pseudo-observed light curves, the genes are optimized based on the genetic algorithm which is one of the machine learning techniques. Repeating the optimization, finally, we estimate the occurrence frequency distribution of flares as a function of energy. As a result, we reveal that the coronal loops are heated by smaller flares dominantly in a specific energy range.

Magnetic Flux Cancellation and Associated Plasma Heating in the Upper Solar Atmosphere

*Sung-Hong Park[1], KD Leka[1,2], Kanya Kusano[1]

1. Institute for Space-Earth Environmental Research of Nagoya University, 2. NorthWest Research Associates

Magnetic flux cancellation in the solar photosphere has been studied to understand a detailed, complicated process of magnetic reconnection, in particular with respect to various types of reconnection signatures in the upper solar atmosphere such as current sheet-like structures, jet-like features and nonthermal particle acceleration. Recently, a theoretical model of magnetic reconnection has been proposed, in which the reconnection process is driven by converging magnetic patches of opposite polarities on the photospheric surface and their flux cancellation. This model allows us to analytically estimate the amount of magnetic energy released as heat at a reconnecting current sheet. Here we present a small-scale flux cancellation event observed by Hinode, IRIS and SDO. During flux cancellation, two opposite-polarity magnetic patches are identified and traced by an automated feature tracking technique. Determining their flux, converging speed and overlying field strength as a function of time, we first estimate the temporal variation of the total rate of energy release as heat through reconnection. This estimated heating rate is then compared with the multi-wavelength IRIS and SDO/AIA observations to quantitatively examine how valid the proposed reconnection model is in the context of the release of magnetic energy.

Nonlinear force-free modeling of the flare-productive magnetic fields observed in the solar active region 12673

*Daiki Yamasaki[1], Satoshi Inoue[2], Shin'ichi Nagata[3], Kiyoshi Ichimoto[3]

1. Department of Astronomy, Kyoto University, 2. Institute for Space-Earth Environmental Research, Nagoya University, 3. Astronomical Observatory, Kyoto University

The solar active region (AR) 12673 was one of the most flare-productive AR through the solar cycle 24. This AR produced not only multiple M-class flares but also several X-class flares. Among them, the X9.3 flare observed on September 6th 2017 was the largest solar flare in the solar cycle 24. The purpose of this study is to comprehensively understand the flare-productive magnetic fields and flare activities observed in the AR12673. In this study, based on the nonlinear force-free field (NLFFF) extrapolation, we investigated a temporal evolution of the three-dimensional (3D) magnetic field producing the several M-class flares, which occurred around 2 days prior to the X9.3 flare. Furthermore, we analyzed 3D magnetic field structure few minutes before the M5.5 flare, which was accompanied with coronal mass ejection (CME), and discussed the flare onset mechanism. The NLFFFs were extrapolated from the time series data of the photospheric vector magnetic field, which cover before and after the M5.5 flare, from Helioseismic and Magnetic Imager (HMI) on board the Solar Dynamics Observatory (SDO). As a result, we found the followings; (1) Three magnetic flux ropes (MFRs) evolved from September 4th, one of which produced the X9.3 flare on September 6th. One of the MFRs had a positive helicity which had a different sign from other two MFRs. Since, the temporal evolution of the magnetic flux occupied by the positive helicity captures one of the GOES X-ray flux well, we suggest that the positive helicity injection is related to the occurrence of the M-class flares including the M5.5 flare. (2) We investigated the 3D magnetic field structure before the M5.5 flare. We found a null point in the magnetic field surrounding the MFRs. By comparing to the AIA 1600 angstrom images, the footpoints of the overlying field lines are well anchored to the area where the initial brightening of the AIA 1600 angstrom was strongly enhanced, and the flare ribbons were observed at the footpoints of the MFR with positive twist. Therefore, we suggest that a reconnection occurred at the null point possibly drives the M5.5 flare. (3) Most of the M-class flares were far from the PIL where the X9.3 flare was observed. Therefore, we suggest that the MFR concerned with the X9.3 flare would be stable before September 6th.

[P-EM14] Frontiers in solar physics

convener:Shinsuke Imada(Institute for Space-Earth Environmental Research, Nagoya University), Alphonse Sterling(NASA/MSFC), Takaaki Yokoyama(School of Science, University of Tokyo), Toshifumi Shimizu(Institute of Space and Astronautical Science, JAXA)

Over recent decades, Sun-observing satellite missions have told us much about the dynamic solar atmosphere. These satellites can observe magnetic activity in the solar corona at wavelengths inaccessible from ground-based telescopes, such as X-rays and EUV. Additionally, the seeing-free conditions of space allow for consistent, high-spatial resolution at visible wavelengths; e.g. the HInode satellite can observe solar surface magnetic field elements down to ~0.2 arcsec. From observations such as these, we have identified three important points regarding what is required form future space-based solar missions to solve fundamental solar problems, such as how the corona is heated and what drives solar eruptions: (1) seamless observation over all temperature regimes of the solar atmosphere, from the chromosphere to the corona, at the same time; (2) high spatial and temporal resolution to resolve elemental structures of the solar atmosphere, and to track their evolution; and (3) plasma diagnostic capability to quantify the dynamics of elementary process taking place in the solar atmosphere. To meet these requirements, recently the solar physics community in Japan proposed the Solar-C_EUVST mission, which will be launched in the mid-2020s. Furthermore, additional top-rate solar observatories, such as the Parker Solar Probe (PSP), Solar Orbiter, and the Daniel K. Inouye Solar Telescope (DKIST), will be operating in the years leading up to Solar-C_EUVST. In this session we will discuss what solar physics observational and numerical-simulation studies are required prior to the mid-2020s, to prepare most efficiently for the new observational era. We welcome contributions dealing with remote-sensing space-based observations (e.g. from Hinode and SDO), in-situ observations from near- and deep-space (e.g., PSP, Pioneer), ground-based observations, and numerical studies.

The Chromospheric Layer SpectroPolarimeter (CLASP2) Mission: Introduction

*David E. McKenzie[1], Ryohko Ishikawa[2], Ryouhei Kano[2], Joten Okamoto[2], Laurel Rachmeler[1], Javier Trujillo Bueno[3], Frederic Auchere[4], Ken Kobayashi[1], Donguk Song[2], Masaki Yoshida[2]

A major challenge for solar physics is to decipher the magnetic structure of the chromosphere, because of its vital role in the transport of energy into the corona and solar wind. Routine satellite measurements of the chromospheric magnetic field will dramatically improve our understanding of the chromosphere and its connection to the rest of the solar atmosphere. Before such a satellite can be considered for flight, we must refine the measurement techniques by exploring emission lines with a range of magnetic sensitivities. In 2015, the CLASP mission achieved the first measurement of linear polarization produced by scattering processes in a far UV resonance line (hydrogen Lyman-alpha), and the first exploration of the magnetic field (via the Hanle effect) and geometrical complexity in quiet regions of the chromosphere-corona transition region. These measurements are a first step towards routine quantitative characterization of the local thermal and magnetic conditions in this key layer of the solar atmosphere.

Nonetheless, Lyman-alpha is only one of the magnetically sensitive spectral lines in the UV spectrum. The CLASP2 mission extended the capability of UV spectropolarimetry by acquiring groundbreaking measurements in the Mg II h and k spectral lines near 280 nm, whose cores form about 100 km below the Lyman-alpha core. These lines are sensitive to a larger range of field strengths than Lyman-alpha, through both the Hanle and Zeeman effects. CLASP2, launched from White Sands Missile Range in April 2019, captured measurements of linear and circular polarization to enable the first determination of all 4 Stokes parameters in chromospheric UV radiation. Coupled with numerical modeling of the observed spectral line polarization (anisotropic radiation pumping with Hanle, Zeeman, and magneto-optical effects), CLASP and CLASP2 are pathfinders for determination of the magnetic field's strength and direction, as well as of the geometry of the plasma in the upper solar chromosphere.

In this presentation we will introduce the CLASP and CLASP2 missions. We will summarize the results of the 2015 flight of CLASP; and we will describe the modifications, performance characteristics, and observing plan for the CLASP2 flight in 2019. Initial results from the 2019 flight will be shown in the partner presentation by Okamoto.

The magnetic field in the chromosphere is one of the most important parameters needed to understand the dynamics of the solar atmosphere and to solve the coronal heating problem. To verify a new technique proposed to determine the magnetic field in the upper solar chromosphere, we developed a new instrument, CLASP2 (Chromospheric LAyer SpectroPolarimeter), which allows to measure the four Stokes profiles across the Mg II k and h lines around 280 nm. The launch operation was performed on 2019 April 11 at the White Sands Missile Range in New Mexico, USA. During its suborbital flight, CLASP-2 observed for 6 minutes three targets, including the center of the solar disk for 18 s to calibrate the instrument, a strong plage for 155 s to measure magnetic fields via the Hanle and Zeeman effects, and a quiet limb region for 136 s to measure scattering polarization and its modification through the Hanle and magneto-optical effects.
The spectropolarimetric observations were successfully done and we detected clear polarization signals in the plage and in the quiet limb region. Here we show some preliminary results. First, we confirm the theoretically-predicted scattering polarization pattern across the Mg II k and h lines. The spatial variation of the observed polarization signals encodes information on the magnetic field via the Hanle, Zeeman, and magneto-optical effects. Second, we show clear circular polarization signals in several spectral lines induced by the Zeeman effect, from which we derive the spatio-temporal variations of the line-of-sight field strength in the upper chromosphere. Third, with the slit-jaw instrument, we could observe the predicted broad-band scattering polarization of the hydrogen Lyman-alpha line, including its center-to-limb variation. During the CLASP2 flight, we also carried out coordinated observations with the IRIS and Hinode satellites.

Mathematical modelling of effect of flows in magnetic flux tubes

*Samuel Joseph Skirvin[1], Viktor fedun[1], Gary Verth[1]

1. University of Sheffield

Magnetohydrodynamic (MHD) waves are thought to play a crucial role in the energy budget of the solar atmosphere. It is well thought that these waves contribute to the heating of the solar chromosphere and corona. As a result, understanding the physics and behaviour of these waves within the context of a realistic solar atmospheric environment is of great importance. The solar atmosphere is dynamic and contains structures which may support the propagation of these waves. Many, if not all, of these structures will have plasma flow present, however the exact velocity profile of these flows are as yet unobservable.

We derive a new governing equation describing the generalised case for a spatially arbitrary flow in a 2-dimensional magnetic slab. This equation reduces to the familiar known forms if the flow is constant or removed entirely. This second order differential equation with varying coefficients has no known analytic solution, as such the dispersion diagram cannot be derived analytically and a numerical method must be used instead.

We therefore also introduce the idea for a new method of retrieving the dispersion diagram describing the types of waves which can exist in the system. This method is based on the shooting method and requires that the total pressure perturbation and total horizontal velocity (displacement) is matched at the boundaries of the slab.

This theoretical study of waves propagating in a spatially dependant flow in a magnetic slab will be verified via 2-3D numerical modelling to visualise the effect of the flow.

Numerical study of fast and slow wave heating of the magnetic chromosphere

*WANG YIKANG[1], Takaaki Yokoyama[1], Haruhisa Iijima[2]

1. The University of Tokyo, 2. Nagoya University

The problem how to heat the solar chromosphere is still under debate especially in the magnetic chromosphere. MHD waves are considered as important energy transporter and make contribution to chromospheric heating. Previous researches usually discuss propagation of MHD waves in the chromosphere with great detail but the setting of flux tube and wave generation is artificial. There are also studies by realistic simulations but they are used for comparison with observations without discussing detail physical processes. In our study. by using the result of a two-dimensional realistic MHD simulation, we identify shock waves and separate fast and slow mode waves. We further estimate the heating rate by them. We find that fast wave heating rate is larger than slow wave heating rate in the chromosphere. In addition, the wave heating rate is consistent with radiative cooling rate in classic atmospheric empirical model.

Solar photospheric jet-like structures formed by slow shock

*Yuji Kotani[1], Kazunari Shibata[2]

1. Department of Astronomy, Kyoto University, 2. Kwasan and Hida Observatories, Kyoto University

Jet phenomena with a bright loop in their footpoint have been observed in the solar corona and chromosphere, and these are called anemone jets. These jets are formed by magnetic reconnection, and from the scale universality of magnetohydrodynamics (MHD), it can be expected that anemone jets exist even in the solar photosphere. However, it is not obvious whether jets can be generated by magnetic reconnection even in the solar photosphere where magnetic energy is not dominant. To verify whether anemone jets exist in the solar photosphere, we perform 3D MHD simulation including gravity with the solar photospheric parameter. As a result of the simulation, jet-like structures are formed by magnetic reconnection even in the solar photosphere. We find this jet-like strucutures are caused by slow shock formed by reconnection and propagating roughly in the direction of the background field. In this talk, we will introduce the formation mechanism of this jet-like structure.

Chromospheric magnetic field: A comparison of He I 10830 Å observation with nonlinear force-free field extrapolation

*Yusuke Kawabata[1], Andrés Asensio Ramos[2], Satoshi Inoue[3], Toshifumi Shimizu[4]

1. National Astronomical Observatory of Japan, 2. Instituto de Astrofísica de Canarias, 3. Institute for Space-Earth Environmental Research, Nagoya University, 4. Institute of Space and Astronautical Science, JAXA

Magnetic field structures in the solar corona are essential to understand the dynamical nature of the plasmas responsible for occurrence of flares and coronal mass ejections. The coronal magnetic field, however, is difficult to be directly observed because of the weak polarization signal in thermally broadened spectral lines. To overcome the difficulty, the nonlinear force-free field (NLFFF) modeling has been extensively used to infer the three-dimensional (3D) magnetic field in the solar corona. The assumption in the NLFFF extrapolation is that the plasma beta is low, but this condition is considered to be incorrect in the photosphere.

We attempt to reveal the non-potential magnetic field distribution in the chromosphere through spectropolarimetric observations and how significantly the magnetic field at the chromospheric height derived by the current NLFFF modeling with photospheric magnetic field is deviated from the measured chromospheric magnetic field. We examine the direct measurements of the chromospheric magnetic field in the whole active regions through the spectropolarimetric observations at He I 10830 Å. In addition, the photospheric magnetic field is measured with Hinode and Solar Dynamics Observatory. The results of NLFFF extrapolation from the photosphere are compared with the direct measurements. Our analysis shows that chromospheric magnetic field may have larger non-potentiality compared to the photospheric magnetic field at some locations. Moreover, the large non-potentiality in the chromospheric height may not be reproduced by the NLFFF extrapolation from the photospheric magnetic field. The magnitude of the underestimation of the non-potentiality at the chromospheric height may reach 30-40 degree in signed shear angle. We conclude that the magnetic field in the upper atmosphere may have higher non-potentiality than previously thought based on the NLFFF.

An adaptive load balancing method for particle-in-cell simulations

*Yosuke Matsumoto[1]

1. Graduate School of Science, Chiba University

Particle-in-cell (PIC) simulations have been used for understanding particle accelerations, particle transport and magnetic field generation in space and astrophysical phenomena. The PIC simulation bases on the Vlasov equation in which the distribution function of each particle species evolves in the phase space in response to the electric and magnetic field time evolution. While the evolution of the distribution function is represented by motions of finite numbers of macro particles, the electric and magnetic field evolution are represented by a disretized form of the Maxwell equations; the PIC simulation is composed of Eulerian and Lagrangian methods.

Using massively parallel supercomputer systems with a parallelized PIC code is a powerful way to elucidate such nonlinear phenomena. When using very large numbers of processor cores (say, greater than 1000 cores), the code needs to adopt a domain decomposition method, in which each MPI process is associated with a portion of the whole region, for an efficient parallelization. Although this parallelism introduces somewhat cumbersome implementations to the code for exchanging arbitrary numbers of particles among MPI processes every time step, resulting high scalability allows us to examine with unprecedentedly large-scale simulations. Indeed, we have elucidated important acceleration mechanisms in collision-less shocks by using the Japanese flagship supercomputer system with a hundred of thousands of processor cores (e.g., Matsumoto et al., 2017).

In this presentation, we report an upgrade with an implementation of an adaptive load balancing method to our PIC code. The load imbalance among MPI processes in PIC simulations arises if particles were in-homogeneously distributed in the simulation domain as a result of time evolution. This imbalance becomes problematic when using very large numbers of MPI processes (say greater than millions of cores), and we expect to meet this situation with the next generation Japanese flagship system called FUGAKU. A few approaches have been proposed and implemented in PIC codes. For example, in PSC and SUMILEI codes (Germaschewski et al., 2016; Derouillat et al., 2018), each domain of a MPI process is further divided into sub-domains, and these "patches" are exchanged among the processes so that the total number of particles in each MPI domain is equally distributed. The exchange of patches are determined according to the Hilbert curve passing through them. The resulting shape of each domain is rather irregular, which complicates inter-process communications. Alternatively, we adopt the recursive multi-section algorithm which have been successfully implemented into the cosmological N-body simulations (Makino, 2004; Ishiyama et al., 2009). This method requires rather simple inter-process communications because each MPI domain is a rectangular shape. We successfully implemented this method to the PIC code for the first time with benchmark tests of the Weibel instability and collision-less shock simulations.

Relation between Alfven-ion-cyclotron and Weibel instabilities in the collisionless perpendicular shock transition region: Upstream plasma parameter dependence

*Takuro Nishigai[1], Takanobu Amano[1]

1. Department of Earth and Planetary Science, University of Tokyo

One of the most important problems in space physics is the mechanism by which charged particles accelerated to non-thermal energies. The collisionless shocks in plasmas have been studied extensively observationally, numerically, and theoretically, since they are believed to be the major sources of non-thermal high energy particles through the first-order Fermi acceleration. In this study, we investigate plasma instabilities in the collisionless shock transition region. In a collisionless shock wave having a sufficiently large Alfven Mach number, some of the upstream ions are reflected by a potential barrier in the shock. A variety of instabilities excitedby the velocity difference between the reflected ions and the upstream ions play a crucial role in the dissipation at the shocks.

Low-frequency and long-wavelength instabilities generated in the transition region may have large saturation levels, and can affect the entire shock stricture. In particular, we focus on Alfven Ion Cyclotron (AIC) instability and Weibel instability, both of which are excited by an effective temperature anisotropy generated by the reflected ions. It is well known that the AIC instability generates a rippled shock surface (Winske & Quest, 1988). On the other hand, the Weibel instability dominates at very high Mach number shocks as seen in supernova remnants. Large-scale Particle-in-Cell simulations have found electron acceleration in spontaneous magnetic reconnection generated in the amplified magnetic field and dense current filaments (Matsumoto et al., 2015). This electron acceleration may play an important role in pre-acceleration required for the Fermi acceleration. Qualitatively, the Weibel instability will be the dominant mode at very high Mach numbers (or weak magnetic field), and otherwise, the AIC instability should be dominant. However, the relation between the two instabilities has not been understood.

In this study, we adopt an idealized model for describing the dynamics in the shock transition layer. We consider a homogeneous plasma in the upstream rest frame, which consists of three particle species: the upstream ions, upstream electrons, and reflected ions. The initial velocity distributions are assumed to be Maxwellian distributions for the upstream ions and electrons while the reflected ions form a ring distribution in the direction perpendicular to the ambient magnetic field. Under these conditions, we performed linear analysis for a wavenumber parallel to the ambient magnetic field using the cold plasma approximation. We found that the AIC and Weibel instabilities both appear from single dispersion relation in different limiting cases. In other words, the AIC instability changed to Weibel instability in the limit of no magnetic field (or infinite Mach numbers). Two-dimensional Particle-in-Cell (PIC) simulation also shows that, as the Alfven Mach number increased, the generated mode structure changes from AIC-like to Weibel-like. In this presentation, we will report simulation results on the transition between the two different regimes and how it depends on upstream physical parameters such as the Alfven Mach number and ion-to-electron mass ratio.

Full PIC simulations of the surface charging on the night side of Phobos

*Masaki Tanabe[1], Naoki Terada[1], Yohei Miyake[2], Hideyuki Usui[2]

1. Graduate school of science, Tohoku University, 2. Graduate school of system informatics Kobe University

We calculated the surface charging on the night side of Phobos caused by the solar wind interaction and analyzed the charging process.
It is known that the surface soils of airless bodies exposed to the solar wind are altered by space weathering. This process at Phobos is important for determining its origin using surface remote sensing and sample analysis by the Martian Moons Exploration (MMX) mission. Meanwhile, the solar wind, a supersonic plasma flow, makes complicated plasma structure around these bodies. Among these structures, surface charging has a close relation with space weathering processes.
Previous studies suggested that there are many types of current systems associated with the surface charging: Solar wind current, photoelectron current and secondary electron current. In order to keep a current balance on the surface, the surface charges up in a steady state. The charging process is different between the dayside and nightside of bodies. While the dayside surface potential is determined by the balance of the solar wind and photoelectron currents, the nightside charging process is complicated. When solar wind plasmas flow into small airless bodies, most of them are absorbed by the dayside of the surface. This removal of plasma at the dayside results in a wake region in the downstream. Then, solar wind ions are accelerated and go into the wake region by ambipolar electric field. While a previous theoretical analysis suggested that the nightside surface potential charged up to several hundred volts, details of electromagnetic field and density distribution around bodies have not been clarified.
In order to understand the process of surface charging, we calculated the plasma environment around a small body by self-consistent 2-D particle-in-cell simulations.
In this study, we calculated a quasi-steady state solution of the electric potential around Phobos in the solar wind by self-consistent PIC simulations. Though Phobos' mean radius is about 11 km, we changed it to 1 km in the simulations to save computational resources. To reveal charging mechanism of Phobos, we adjusted the ratios of the solar wind bulk velocities to thermal velocities and Phobos radius to gyro radii to real ones. 2-D electrostatic PIC simulations were performed under a southward interplanetary magnetic field condition. Compared with theoretical analysis, we found that the surface potential nearly corresponds to theoretical results at the shallow wake region. However, at the deep wake region, the result of simulation shows different potential. This result suggests that the surface potential is affected by not only ambipolar diffusion but also plasma void and non-neutral regions around the wake.
To evaluate the dependence of the surface potential on the solar wind condition, we calculated two types of conditions: Nominal and strong solar wind conditions. While previous studies showed that the surface is charged strongly in the strong solar wind condition, our calculation showed an opposite result at the deep wake region.

An Analysis of Slow-Shock and Slow Shock-Like Structures Observed in the 2D Hybrid Magnetic Reconnection Simulations

*Nehpreet Kaur Walia[1], Kanako Seki[1], Takanobu Amano[1]

1. Department of Earth & Planetary Science, Graduate School of Science, University of Tokyo

Slow-shocks are present in the Petschek's reconnection model to achieve fast magnetic reconnection. The presence of slow-shocks has been established in the MHD and Hall-MHD regime by various simulations[e.g., 1, 2], however in the kinetic regime, slow-shocks are not always observed. Some hybrid and PIC studies have found slow-shocks in their reconnection simulations [e.g., 3], while in some no slow-shocks or slow shock-like-structure [e.g., 4,5] is seen. As for satellite observations, [6] and [7] reported the detection percentage of slow-shocks as 20% and 10% in the dayside magnetopause and the magnetotail, respectively. The possible reasons behind the low detection probability of slow-shocks can be the proximity of the crossings studied to the X-point, presence of flux-ropes, or high turbulence. The error in the determination of shock normal and the shock frame of reference can also lead to non-detection of slow-shocks. In order to study the structure of magnetic reconnection as we transition from ion inertial scale to MHD scale and to check the influence of the above mentioned parameters on the boundary structure, we performed 2D hybrid simulations.

The simulations were performed with two different beta values, and were checked for the presence of slow-shocks using Rankine-Hugoniot conditions, and the specific conditions for Mach number, normal angles etc. [6]. It was found that for high beta case, slow-shocks can be seen as close as ~10 λ_i (i = ion inertial length) from the X-point. For low plasma beta, a transition region exits, in which a slow shock-like structure is seen until ~70 λ_i. From ~70 λ_i slow-shock structure is present at all points. The slow-shock detection percentage in our simulations are found to be highly dependent on the determination of shock normal and on the angle at which the artificial spacecraft crosses the reconnection boundary. The ion distribution functions obtained show clear difference between the regions where slow-shocks are found and where they aren't. The downstream of slow-shocks is not thermalized and has two-component population, crescent-shaped hot beam population and cold population. These structures of ion distribution functions are similar to the ones observed by Geotail spacecraft slow-shock observations [8]. We will also report the trajectories and the energization mechanisms of particles of both the populations.

Outstanding issues in plasma Riemann problem

*Tohru Hada[1]

1. Interdisciplinary Graduate School of Engineering Sciences, Kyushu University

The Riemann problem is an initial value problem for a given physical system (such as the hydrodyanmcis (HD), magnetohydrodynamics (MHD), or plasma in general) in which the initial conditions consist of two constant states forming a discontinuity. Obviously, it has numerous applications in space plasma, e.g., the formation of planetary bow shocks, magnetopause, interplanetary shocks, heliopause, and termination shocks. Despite the importance of the problem, there remain several issues remain unsolved. In particular, the solution of the MHD Riemann problem is not always uniquely determined due to the presence of intermediate shocks (Wu, 1987; Takahashi and Yamada, 2014). In this presentation, first we will briefly review our current understanding of the MHD Riemann problem and then will propose a method to determine the solution. For practical applications to space plasma, we will also comment on how plasma kinetic effects may modify the solution qualitatively.

A simple stochastic model of electron diffusion by whistler waves in a non-uniform magnetic field

*Yasuhiro Nariyuki[1]

1. Faculty of Education, University of Toyama

Scattering/acceleration of electrons by electromagnetic waves is a fundamental process to generate relativistic electrons in the inner magnetosphere. Although quasi-linear theories have widely been used to discuss the electron diffusion, the significance of nonlinear wave-particle interactions is also commonly recognized. Recently, we proposed a simple model of the charged particle diffusion including both stochastic and coherent processes [Nariyuki, POP, 2019]. In this presentation, we apply the model to electron diffusion in a simplified dipole magnetic field. Dependence of pitch-angle diffusion on parameters is discussed in detail.

[P-EM15] Plasma Theory and Simulation

convener:Seiji Zenitani(Kobe University), Fan Guo(Los Alamos National Laboratory), Takayuki Umeda(Institute for Space-Earth Environmental Research, Nagoya University), Takanobu Amano(Department of Earth and Planetary Science, University of Tokyo), Yasuhiro Nariyuki(Faculty of Education, University of Toyama)

This session invites contributions in plasma theories and simulations. Theoretical and/or numerical results on plasma processes (magnetic reconnection, collisionless shocks, wave-particle interactions, and boundary problems) and their applications in space, solar, astrophysical, and laboratory environments are welcome. Results in computational techniques for simulations and for data analysis are also welcome, including applications of Machine Learning. The session will be held in English.

Nonlinear Interaction of Radiation Belt Electrons with Obliquely Propagating Whistler-mode Chorus Emissions

*Yoshiharu Omura[1], Yi-Kai Hsieh[1]

1. Reserach Institute for Sustainable Humanosphere, Kyoto University

Whistler-mode chorus emissions are generated at the equator in the parallel direction to the magnetic field, and propagate toward higher latitudes changing the wave normal angle gradually to oblique directions. Interaction between the wave and energetic electrons through Landau resonance becomes effective in the oblique propagation. As observed from the guiding center of a Landau resonant electron moving with the parallel phase velocity, the wave phase becomes stationary. With the perpendicular wave number and the deviation of the gyrating particle position from the guiding center, the electron sees a wave phase of a right-handed circularly polarized wave, which causes efficient acceleration by the perpendicular component of the wave electric field [1]. The interaction time between the resonant electron and the wave packet is maximized with the frequency close to half the cyclotron frequency, because the parallel phase velocity becomes nearly equal to the parallel group velocity. The efficient acceleration of resonant electrons causes damping of the wave at half the cyclotron frequency. Although our previous model assumed that the nonlinear wave damping was due to the parallel wave electric field in the presence of the gradient of magnetic field [2], we have confirmed that the nonlinear trapping due to the perpendicular components of the wave fields plays the major role in the electron acceleration and resultant wave damping in the nonuniform magnetic field [3]. In addition to the nonlinear damping, propagation characteristics of upper and and lower band chorus wave packets are much different. The Gendrin angle, at which the group velocity takes the parallel direction, exists only for the lower band chorus, while the group velocity of the upper band chorus takes highly oblique directions [4], and this difference enhances separation of the two bands in space. A single chorus element can be generated at the equator forming a long-lasting rising tone emission covering half the cyclotron frequency. As the wave packet propagates away from the equator, it splits into lower band and upper band wave packets because of the nonlinear damping through Landau resonance at half the cyclotron frequency, and the wave packets propagate in different directions.

Energy-consistent finite difference method for compressible magnetohydrodynamic simulations

*Haruhisa Iijima[1]

1. Institute for Space-Earth Environmental Research, Nagoya University

We propose a finite difference scheme for solving the fully compressible magnetohydrodynamic equations with the energy consistency in the discrete sense. One notable advantage of this scheme is that the conservation properties of the internal, kinetic, and magnetic energy equations can be satisfied in the discrete level without solving the total energy equation. This characteristic of the proposed scheme is achieved by carefully chosing the differentiated variables of the basic equations. The predicted conservation properties are demonstrated with linear and nonlinear numerical tests. We found that the proposed method can handle the extremely stringent problems, such as the propagation of shock wave in the ambient plasma beta of 10^{-6} or less.

Implementing neural network's inference into the magnetohydrodynamic simulation code

*Yuki Sawamura[1], Yosuke Matsumoto[1]

1. Chiba University

For understanding astrophysical phenomena, magnetohydrodynamic (MHD) simulations have been powerful research tools with increasing computational capability. CANS+ is a public MHD simulation code (Matsumoto et al., 2019) and provides a suite of solvers of nonlinear MHD equations. As other modern MHD simulation codes, CANS+ employs the HLLD approximate Riemann solver and the hyperbolic divergence cleaning method, but with the fifth-order accurate reconstruction technique (MP5 scheme) for providing numerical solutions with high accuracy and stability. Because the total computational cost of CANS+ is mostly due to the reconstruction and the numerical flux calculation, improving these numerical operations remains as a task in terms of computation speeds.
Recently, the machine learning has attracted much attention in different research fields. Especially, the deep learning (or neural network, DNN) has been applied to big data analysis in our daily life and become an important computational technology. In addition, the DNN is compatible with GPUs, and it is also a research subject of high-performance computing.

We introduce this algorithm as a new alternative to the most computationally expensive parts in CANS+. These expensive operations can be replaced by the DNN inference, which is further accelerated by use of GPUs. In this study, we deal with the 1D shock tube problem and generated training data by CANS+ simulations which are initialized by randomly selected conditions. The training data size is up to 300,000 sets.
The input data for the DNN are the primitive variables in six computatinal cells, and the true label data are the numerical flux. The dataset was standardized before training. We examined three network models to achieve high accuracy, and compared each accuracy and calculation time to find the best performance model.
Model 1 predicts the flux associated with all the primitive variables by one network. Model 2 and Model 3 predicts different pairs of the numerical flux according to the transverse and longitudinal components of the MHD equations. As a result, we found the three models can predict the numerical flux with 99.99% accuracy for the validation data which was not used in the training of the networks.

In this presentation, we detail the network structure and their prediction performance for the validation data as result of hyper parameter tunings. We also show performance of the CANS+ code implemented with these networks by examining 1D simulations.

Visualizing Magnetospheric Topology in Global 3D MHD Simulations

*DongSheng CAI[1]

1. University of Tsukuba

This report focuses on visualizing a global three-dimensional magnetospheric field topology. A global magnetospheric field topology can be determined by the combinations of types of nulls in the magnetic field, where all the nulls are saddle points due to the solenoidal condition, and we obtain the eigenvalues of nulls and determine the so-called saddle connections (for examples, Arnold and Silverman, 1978). We apply the visualization algorithm by Krauskopf and Osinga (1999) to visualize the global earth magnetic field topology in a northward interplanetary magnetic field (IMF) from a 3D global MHD (Magneto-Hydro-Dynamic) simulation. In so doing, we determine the two-dimensional and one-dimensional stable or unstable manifolds, respectively, are computed from the nulls found in a 3-D global MHD simulation to visualize 3D magnetospheric topology. Present results show that (i) first time, the theoretical magnetic field topology by Lau and Fin (1990) are recovered, (ii) the magnetospheric manifold spanned by the null near the north pole is very complicate than that near the south pole, (iii) the neutral line can be determined as the saddle connecting lines, and (iv) the global magnetospheric topology may lead to understanding the magnetospheric dynamics better.

Plasma State inside of the Super Massive Kerr Black Hole and Problem of the Gravitational Wave Source

*Hiroshi Oya[1]

1. Department of Geophysics Graduate School for Science Tohoku University

1.Introduction
The motivation of the present studies has been raised by results of the related studies on Sgr A,at the center of our Galaxy, which is concluded to consist of super massive binary system whose member Kerr black holes (BH) have masses of 2.27 million and 1.94 million solar mass, orbiting with a period of 2200 sec. To accept the existence of this binary system we are required to consider a possible model, for the inside of the Kerr black hole, which prevent the propagation of the gravitational waves.
2.Relation between the Event Horizon(EH) and Distribution Limit of the Material(ML)
Though there is basic difference between EH and ML, no clear separation could be discussed in current theory of the gravitational waves from BH. We propose, however in the present study, the significance of the quasi vacuum space ,existing between EH and ML inside of Kerr black hole, that is formed by condensation of the distribution of high energy plasma inside EH by keeping the same rotation parameter a(=J/Mc for angular momentum J, Mass M, and the light velocity c) for the state EH>ML, as if EH=ML.
3.Condensation Mechanism and a Model of Plasma Distribution within ML
Condensation of plasma inside of EH is caused basically by the gravity for which we can find equilibrium state by centrifugal force and pressure gradient of high energy plasma. To keep the rotation parameter to be a constant value in the process of diminishing ML, the role of Lorentz factor that appears in angular momentum of the moving particles in plasma with velocity close to the light velocity has essential significance. We evaluate the equilibrium in a frame of local Minkowsky space time which can be found inside of the moving plasma which consists of two components; the first component has number density Nb (N:total number density, b: fractional coefficient) where element plasma particles rotate around a common axis with velocity c((1-e)^(1/2)) (e: fractional coefficient with condition e <<1) and the second component has number density N(1-b) with spherical shell like velocity distribution centered around cz (z: fractional coefficient 1>z).
4.Example of the Calculated Plasma Distribution Based on the Model within ML
For the case, of 2 million solar mass Kerr black hole, that is interested in the present study, we have calculated ML that shows 1/6 of EH as an example. For this case where EH is 2.97x10^11 cm, plasma density ,Lo; plasma number density, and mean distance d becomes Lo=3.66x10^4 g/cc, N=2.29x10^28 /cc, and d=3.52x10^(-10) cm, respectively, when we assume EH=ML. When we consider ML=(1/6)EH, however, it follows that the inside plasmas are confined within a spherical shell zone close to ML with thickness of 0.15ML; the most dense case of parameters, in this case, show that Lo=8.16x10^9 g/cc; N=5.10x10^33 /cc . The mean separation distance of ions becomes to be 5.81x10(-12) cm, for this case, which approaches to the quantum physical radius of proton, 10^(-13) cm.
5.Propagation of the Gravitational Waves and Their EH Encounter
The gravitational waves generated by accelerated motions of material region inside ML propagate in space time range between ML and EH which has 6 times wider than source range. It has been confirmed by our previous work (1) that the velocity of gravitational waves that approach the event horizon becomes zero.
6.Discussion
Observation evidences which oppose to the results of present study are reports of LIGO that show many cases of merger of the black hole binary. There are however possibilities of discussion because their

©2020. Japan Geoscience Union. All Right Reserved.

conclusion of sources for observed gravitational waves as merger of star mass black hole binaries is based on the theories, of the generation of the gravitational waves, which have not considered effect of the event horizon on the propagating gravitational waves.

[P-EM16] Magnetospheric Multi Scale (MMS) mission: Accomplishments and Future Plans

convener:Yoshifumi Saito(Solar System Science Division, Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), James L Burch(Southwest Research Institute), Barbara L Giles(NASA Goddard Space Flight Center), Hiroshi Hasegawa(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

NASA's Magnetospheric Multiscale (MMS) formation flying satellites have been making unprecedentedly high time resolution measurements of collisionless plasmas in and around Earth's magnetosphere since it was launched in 2015. After completing its nominal mission in 2018, MMS has continued its observations including targeting the magnetic reconnection in the Earth's magnetotail.
The major purpose of this session is to summarize the new world of electron physics that MMS has so far revealed and also to consider a future observation plan recently submitted by the mission team for the extended mission of MMS especially during the coming several years.
The collaboration with multiple missions including Geotail, Cluster II, THEMIS, Arase and other solar terrestrial probes while MMS focuses into electron scale is the key to understanding multiscale phenomena in the Earth's magnetosphere.
We solicit contributions from satellite observations, numerical simulations, laboratory observations, and theories that relate MMS observations. Contributions to the possible future observation plans are especially welcome.
This is a joint session with American Geophysical Union (AGU).
We hope this session will promote further international collaboration among Japan, United States and space physicists all over the world.

Advances in Reconnection, Acceleration and Turbulence with MMS

*James L Burch[1]

1. Southwest Research Inst.

The NASA Magnetospheric Multiscale (MMS) mission was launched in March 2015 to investigate electron-scale phenomena (magnetic reconnection, particle acceleration and turbulence) in the boundary regions of the Earth's magnetosphere. Four spacecraft in tetrahedral configuration with scale sizes of 7 - 160 km perform high time resolution plasma measurements (30 ms for electrons, 150 ms for ions), accurate 3D electric and magnetic field measurements, and energetic particles and ion composition measurements to investigate conversion of magnetic energy to charged particle energy in the electron diffusion region (EDR) of reconnection. These capabilities also allow investigation of ion diffusion regions, flux transfer events, hot flow anomalies, bow shocks, Kelvin-Helmholtz instabilities, and many other phenomena in the geospace boundary regions. A rather complete picture of asymmetric reconnection at the dayside magnetopause and the magnetosheath has been obtained. Predictions about the source of the reconnection electric field, the location of the electron stagnation region Earthward of the X-line, and the existence of electron crescent distributions in the electron diffusion region (EDR) have been confirmed and described in greater detail. New discoveries include similar crescent distributions in electron outflow jets, generation of high-frequency waves by the crescent distributions, and energy conversion occurring near the X-line only for significant guide fields while otherwise confined to the stagnation region. Observations of reconnection in the magnetotail reveal multiple electron crescent distributions as suggested by simulations, generation of high-frequency waves by the multiple crescents, electron acceleration to several hundred keV by turbulent electric fields, and reconnection rates of 0.1 - 0.2 as predicted by simulations. The tetrahedron formation will be maintained until 2022 after which different configurations (string of pearls, leader with following three-spacecraft cluster, etc.) may be used for targeted investigations. The current orbit with perigee of ~1.3 R_E, apogee of 29 R_E, and inclination of 28 deg., will be maintained.

Observations of multi-scale wave coupling and plasma mixing in the magnetotail separatrix

*Justin C. Holmes[1], Rumi Nakamura[1], Daniel Schmid[1], Owen Wyn Roberts[1], Takuma Nakamura[1], Zoltan Vörös[1]

1. Space Research Institute

One of the notable features of the Magnetospheric MultiScale (MMS) mission is the four spacecraft formation that enables direct measurement of electron scale features using various reconstruction and curlometer methods. We present an example of these techniques in the separatrix region associated with an electron diffusion region encounter by MMS on July 11th 2017, where spacecraft separation was less than 20 km. The overall structure of the inflow-outflow boundary is shown with gradient reconstruction to be on ion-gyro scales with evidence for time-dependent compression of the magnetic field. Possible $\mathbf{J}\cdot\mathbf{E}$ dissipation and coupling between lower-hybrid, Buneman, and electron beam-mode waves near the magnetic peak can be inferred from curlometer measurements of current and local structure of the electric field. As in previous observations and simulations of reconnection separatrices, lower-hybrid waves appear to enable parallel, electrostatic mixing between inflow and outflow plasmas, enhanced by larger scale, time-dependent behavior of the reconnection outflow. To continue investigating these multi-scale phenomena, it is important to utilize MMS’ s unique capabilities for simultaneous observations of ion and electron scale physics in future extended mission phases.

We report the temporal variation of energy transfer from hot anisotropic protons to electromagnetic ion cyclotron (EMIC) waves during a compressional ULF wave event using the data obtained by the four MMS (Magnetospheric Multiscale) spacecraft traversing the duskside outer magnetosphere. For the ULF wave, the period was about 2-5 minutes (Pc5 frequency range), and the magnetic and ion pressures were in antiphase, such that the total pressure remained almost constant. To derive the propagation velocity of the ULF wave, we applied timing method to the filtered (0.001-0.05 Hz) magnetic field data from the four spacecraft. The derived phase velocity was ~40 km/s that was comparable to $\mathbf{E} \times \mathbf{B}$ drift velocities. Thus, they were mirror mode type structures that have zero frequency in the plasma rest flame and we can therefore investigate the spatial size of the structure from the period and the velocity. The burst ion data from Fast Plasma Investigation Dual Ion Spectrometer (FPI-DIS) with a time resolution of 150 ms are available for two of the EMIC wave events during the ULF wave. To directly detect energy transfer from hot protons to EMIC waves, we apply the Wave-Particle Interaction Analyzer (WPIA) method to the data. The energy transfer rate by cyclotron resonance was calculated as the dot product of the wave component of the perpendicular electric fields and ion current perpendicular to the magnetic field around the resonance velocity which is called the resonant current. The energy transfer rate peaked at the local minima of magnetic field intensity, which corresponds to the maxima of the ion pressure in the compressional ULF wave. This result indicates that the spontaneous EMIC wave generation is affected by ULF waves, and preferential locations for the cyclotron resonant energy transfer are magnetic field intensity troughs with the spatial size of only ~3 times of hot proton gyro-radius. In these troughs, the relatively low resonance velocity owing to small magnetic field intensities and the enhanced hot proton flux can contribute to the enhanced energy transfer from hot protons to EMIC waves by cyclotron resonance.

Electron Scattering and Acceleration by Whistler Waves at Collisionless Shocks

*Mitsuo Oka[1], Fumiko Otsuka[2], Shuichi Matsukiyo[2], Tai Phan[1], The MMS team

1. University of California Berkeley, 2. Kyushu University

Electrons are accelerated to non-thermal energies at shocks in space and astrophysical environments. While Shock Drift Acceleration (SDA) has been considered a key process of electron acceleration at collision-less shocks, it has also been recognized that SDA needs to be combined with an additional stochastic process to explain the observed power-law energy spectra. Here, we report observations of Earth’ s bow shock by the Magnetospheric Multiscale (MMS) mission and present in-situ evidence of pitch-angle scattering of non-thermal electrons by whistler waves. As the solar activity picks up in the coming years, we anticipate conjunctive, simultaneous observations of interplanetary shocks by, for example, MMS and Geotail, enabling us to further advance our understanding of electron acceleration at shocks.

The relation between high-frequency whistler waves and energetic electrons in the quasi-perpendicular bow shock

Chika Umegaki[1], *Takanobu Amano[1], Naritoshi Kitamura[1], Olivier Le Contel[2], Narges Ahmadi[3], Barbara L Giles[4]

1. Department of Earth and Planetary Science, University of Tokyo, 2. Laboratoire de Physique des Plasmas, CNRS/Ecole Polytechnique/Sorbonne Université/Univ. Paris-Sud/Obs. de Paris, 3. Laboratory for Atmospheric and Space Physics, University of Colorado, Boulder, 4. NASA Goddard Space Flight Center

The dissipation at the collisionless shock must be provided by nonlinear wave-particle interactions. Therefore, the generation of waves and associated heating have been the central topic of collisionless shock research. A fraction of ions that are reflected back at the shock (the reflected ions) and the strong current associated with the steep magnetic field gradient provide the primary sources of free energy that drive various kinds of instabilities. Indeed, waves at all the spatial and temporal scales (i.e., from the electron scale to MHD scale) have been observed at the Earth's bow shock. However, the relative roles played by the waves for the heating and acceleration of particles are still largely unknown.

Meanwhile, Oka et al. (2006) discovered that the so-called whistler critical Mach number regulates the non-thermal electron acceleration efficiency as quantified by the spectral index. The whistler wave is essentially a high-frequency counterpart of low-frequency Alfven waves that may have higher phase and group velocities. This thus defines the critical Mach number beyond which whistler waves of any frequency/wavenumber are no longer able to propagate upstream against the flow. The definition, therefore, considers the wave property alone and has nothing to do with particle energization. Nonetheless, Oka et al. (2006) clearly demonstrated that harder spectra were observed primarily at the super-critical regime, whereas large scatters in spectral indices, perhaps intrinsic to the solar wind, were seen at the sub-critical shocks. The observations can, in principle, be explained by considering a self-generation mechanism of high-frequency whistlers by accelerated electrons (Amano & Hoshino, 2010). The self-generated waves may then trigger the stochastic shock drift acceleration (SSDA) that leads to the formation of a power-law spectrum (Katou & Amano 2019).

In this study, we use Magnetospheric Multiscale (MMS) measurements of the bow shock to investigate the relation between the properties of high-frequency whistler waves and energetic electron production. We compare the wave properties between bow shock crossing events with efficient and inefficient energetic electron production. We found that the whistler waves observed in the efficient events were more intense and had bi-directional propagation characteristics with respect to the background magnetic field. In contrast, at least one of these properties was not satisfied with waves seen in the inefficient events. The efficient events were highly super-critical with respect to the whistler critical Mach number, whereas the inefficient events were either marginal or sub-critical. This observation implies the presence of a wave generation mechanism that becomes active only in the super-critical regime. Theoretical interpretation of the measured wave properties will be discussed.

Future Plans of the Magnetospheric Multiscale Mission

*Steven M Petrinec[1], James L Burch[2], Stephen A Fuselier[2,3], Michael Hesse[4], Roy Torbert[2,5], Tai D Phan[6], Barbara L Giles[7]

1. Lockheed Martin Advanced Technology Center, Palo Alto, CA USA, 2. Southwest Research Institute, San Antonio, TX, USA, 3. University of Texas at San Antonio, TX, USA, 4. University of Bergen, Bergen, Norway, 5. University of New Hampshire, Durham, NH, USA, 6. University of California, Berkeley, CA, USA, 7. NASA Goddard Space Flight Center, Greenbelt, MD, USA

The Magnetospheric Multiscale (MMS) mission has been extremely successful at sampling the microphysics of collisionless magnetic reconnection with unprecedented temporal and spatial multipoint resolution. As this exciting mission moves forward, changes in the MMS spacecraft configuration and evolution of the orbit provide new science opportunities. While MMS continues its prime science objective of observing the physical processes of magnetic reconnection *in situ*, additional outstanding science questions will be addressed by taking advantage of the changed orbit and spacecraft configurations, and via planned conjunctions with other active science missions. The future plans of the MMS mission are presented.

Recently, the GNSS (Global Navigation Satellite System) including GPS has been used in various situations in economy and society. It becomes an indispensable social infrastructure. As one of the GNSS, Japan operates QZSS (Quasi-Zenith Satellite System, nickname is Michibiki). Because its radio waves can reach Thailand, it is expected that Thailand can utilize various applications using Japanese QZSS. GNSS is considered as a key technology for self-driving vehicles in the future.

On the other hand, it is not generally known for the public that the "plasma bubbles", one of the phenomena of space weather, have a significant effect on the accuracy of GNSS. Plasma bubbles occur around the magnetic equator, for example in Thailand, and generally travel eastward, for example to Japan, after their generation. It is a serious problem not only in Thailand and Japan but also all over the world.

NICT and KMITL have been conducting collaborative research in the space weather field, including establishment and operation of Southeast Asia Low-latitude Ionospheric Network (SEALION) for 17 years. Based on this strong relationship, NICT and KMITL have jointly installed the VHF radar in KMITL Chumphon campus, and started its operation to observe plasma bubbles from January 2020. Chumphon is close to the magnetic equator where plasma bubbles are expected to be generated. Therefore it is one of the best places to observe plasma bubbles from their initial generation stage. The VHF radar station will augment existing SEALION stations and sensors to give more complete understanding of ionosphere and coupling to upper and lower atmosphere. The operation of the VHF radar together with the SEALION will lead to a significant progress in the use of advanced satellite-based navigation in Southeast Asia and Japan, and contribute to the further development of both Southeast Asia and Japan.

COSPAR/URSI International Reference Ionosphere 2020

*Dieter Bilitza[1,2]

1. George Mason University Fairfax, 2. SPDF NASA GSFC Greenbelt

This presentation will give an overview of the current status of the International Reference Ionosphere (IRI) project and model. Shortcomings and improvements of the model were discussed during several IRI-related meetings in 2018 and 2019. We will report the outcome of these meetings and the decisions made regarding the 2020 release of IRI. IRI-2020 will include several important improvements and additions in particular a more accurate description of the electron density in the lower ionosphere, in the F-region and in the topside, and a better representation of the variability of ion temperature. We will highlight some of the ongoing activities that are geared towards future improvements of IRI. Great advances have been made in progressing IRI from the standard climate model to a model that can represent the real-time space weather changes. This is achieved by assimilating real-time ground and space data into the background IRI model. An important upcoming milestone in 2020 is the re-certification as the ISO standard for the ionosphere. The International Standardization Organization (ISO) requires this re-evaluation of a standard every five years.

We will present the latest usage statistics of the model that show the continued increase of IRI usage across many disciplines and for many applications. A good metric are the acknowledgements of IRI usage in scientific journals and the wide range of these journals.

Astronauts have been taking a large number of photographs of the Earth from the International Space Station (ISS) using digital single lens reflex (DSLR) cameras. Images obtained from this observation often contain upper atmospheric phenomena such as airglow and aurora. We have introduced a method for projecting the photographs of aurora from ISS onto the geographic coordinate system using night city lights in the images as markers [Nanjo et al., 2020, submitted]. The temporal resolution of the ISS photography is less than 1 sec with a wide field-of-view (FOV) coverage (as wide as the FOVs of multiple ground-based all-sky imagers). Besides, the FOV of the ISS photography sweeps for a long distance (4-5 hours in local time) in a short time interval (~10 min). Since the typical pulsating period of pulsating aurora (PsA) is 2-40 sec and their spatial scale ranges from a few tens to a few hundreds of km, we are able to employ the ISS photographs for investigating large-scale characteristics of spatio-temporal variations of PsA. First, we analyzed the MLT dependence of pulsating period. However, it was difficult to claim that there is a clear dependence of period on MLT for all the intervals of interest. Next, we focused on the color of aurora in the ISS image. The DSLR camera has three color channels (i.e., R, G and B). Typical greenish aurora (557.7 nm) could correspond to the G channel and the bluish band emission of nitrogen molecule (e.g., 427.8 nm) could correspond to the B channel. The electrons, responsible for the band emission of nitrogen, are known to have relatively higher energy than those causing greenish aurora. Therefore, the intensity ratio of B and G channels (B/G ratio) can be used as a proxy for the characteristics energy of precipitating electrons. We analyzed the B/G values from the ISS images for multiple events and found that the B/G value is higher 1) in the morning sector, 2) within PsA rather than within discrete aurora, 3) during ON-time of PsA than during OFF-time. These characteristics are consistent with previous findings regarding the energy of PsA electrons, which implies the feasibility of using the B/G ratio as a proxy for the energy of precipitating electrons.

The longterm trend of temperature in mesopause region between 1990 and 2020

*Tao Yuan[1]

1. Utah State University

The mesopause in the upper atmosphere is a boundary between mesosphere and thermosphere with the coldest atmospheric temperature. It is formed mainly by the combining effects of radiative cooling of CO2 and the vertical adiabatic circulation in the upper atmosphere. A continuous multidecade nocturnal temperature data base of an advanced Na lidar between 1990 and 2020, obtained in USA at middle latitudes, provides an unprecedented opportunity to study the longterm variations of this important atmospheric boundary. In this paper, in addition to the temperature longterm trend in mesosphere and lower thermosphere, we focus on the longterm trend of radiative mesopause mostly during winter and dynamic mesopause during summer, including mesopause height and temperature longterm variations. A longterm study by Whole Atmosphere Community Climate Model with thermosphere and ionosphere extension also indicated the similar mesopause changes, mostly caused by stratosphere and lower mesosphere cooling and contraction.

Statistical analysis of ionospheric total electron content (TEC): Estimation of extreme values in a hundred years in Japan

*Michi Nishioka[1], Susumu Saito[2], Chihiro Tao[1], Daikou Shiota[1], Takuya Tsugawa[1]

1. National Institute of Information and Communications Technology, 2. Electronic Navigation Research Institute

The ionospheric condition is one of the most important space weather features for users of radio-based systems, such as the Global Navigation Satellite Systems (GNSS), high frequency (HF) communication systems, and space-based remote sensing systems. Radio wave which propagates in the ionosphere experiences a delay due to the electrons in the ionosphere. Total delay is proportional to the ionospheric total electron content (TEC) through the propagation path. Therefore, ionospheric TEC is a key parameter for users of radio-based systems. The purpose of this study is to understand the extreme values of TEC in some periods, especially with a probability of once per one, ten, and a hundred years in Japan. In order to estimate the extreme values of TEC, cumulative distribution of daily TEC is derived using 22-year TEC data from 1997 to 2018. The result shows the extreme value with probabilities with once per one year and ten years are 85TECU and 110TECU, respectively at Tokyo. On the other hand, 22-year TEC data would not be enough to estimate the extreme TEC value with a probability of once per a hundred years. Therefore, we also used long-term data of ionosonde observation in addition to 22-year TEC data. Ionosonde observation has been conducted in Tokyo since 1950s. Manually scaled parameters are available from 1957 to present. We analyzed manually scaled F2 layer critical frequency (foF2) for 62 years from 1957 to 2018. First, we study the relationship between TEC and foF2 for 22 years. Then the relationship is applied for the statistical distribution of foF2 for 62 years. The extreme value of TEC with a probability once per a hundred years is estimated as about 170TECU at Tokyo.

National Institute of Information and Communications Technology

Geomagnetically induced currents (GICs) flow in power grid in response to geomagnetic field variations. Because of the potential threat of power outage, GIC is regarded as one of the important aspects of space weather. We calculated the transfer function in frequency domain that describes a linear relationship between the GICs measured at 3 substations in Japan and the geomagnetic field measured at the Kakioka observatory. The transfer function is found to show a drastical time variation. For the periods at 2-10 minutes, the amplitude of the transfer function in night time is about 1 order of magnitudes larger than in day time. The day-night difference reduces for the periods >100 minutes. In addition, the amplitude of the transfer function tends to increase with local rainfall amount. These regular and irregular variations associated with local weather can be explained in terms of resistivity of earthing resistivity. The resistivity of the non-frozen soil decreases by about 40% when the temperature increases from 15˚C to 35˚C, resulting in the reduction of the earthing resistivity. Rainwater permeating into the soil also results in reduction of the earthing resistivity. Reduction of the earthing conductivity gives rise to magnification of the GICs. These results imply that a weather condition strongly affects the magnitude of GIC in Japan and challenge the conventional wisdom that the transfer function is almost steady in this time scale.

The Heliophysics Space Weather Science Application Program

*James F Spann[1], Nicola J Fox[1], James E Favors[1]

1. NASA Headquarters

NASA is a mission driven agency whose science mission is focused on discovering the secrets of the universe, looking for life elsewhere, and safeguarding and improving life on Earth. Heliophysics plays a key role in every aspect of the NASA science mission, including understanding the drivers of and enabling the prediction of space weather. Heliophysics has an established research program that motivates and funds solar and space physics, which is the essence and foundation of space weather research. The Heliophysics Division has established a Space Weather Science Application Program, SWxSA. The objective of this program is to enable the transition of the knowledge and understanding of space weather to operation environments and to conduct missions that directly impact the advancement of understanding and directly enable better forecasting. We do this by partnering with sister national and international agencies, the commercial sector, and academia. SWxSA leverages relevant NASA capabilities to reach this objective, specifically the Community Coordinated Modelling Center. This talk provides an overview of SWxSA and new initiatives relevant to space weather in the NASA Heliophysics Division, and will highlight SWxSA involvement in the NASA Artemis effort to move forward to the Moon and beyond.

Toward cycle 25: Future perspective on space radiation environment in the inner heliopshere

*Yoshizumi Miyoshi[1], Shinsuke Imada[1], Ryuho Kataoka[2], Kanako Seki[3], Hiroko Miyahara[4], Aiko Nagamatsu[5], Daikou Shiota[6], Tatsuhiko Sato[7]

1. Institute for Space-Earth Environmental Research, Nagoya University, 2. National Institute for Polar Research, 3. The University of Tokyo, 4. Musashino Art University, 5. JAXA, 6. NICT, 7. JAEA

During solar cycle 25, Japan and international community plan to proceed toward lunar and Marian exploration. The space radiation environment from GCR, the solar energetic particle (SEP) and the trapped particles cause serious damage of the spacecraft, the international gateway and human activity. For example, the intermittent enhancement of SEP associated with the solar flare prevent human activity on the lunar surface and causes serious damage on astronauts during the cruising phase to Mars. Therefore, understanding on the physical process of these space radiations and prediction their variability will be one of the important subjects of the space weather for upcoming cycle 25. We would like to review possible future perspective for studies on space radiation environment for solar cycle 25 by showing several examples of new observations and modeling.

Development of real-time prediction system of CME arrival and magnetic field with ensemble SUSANOO-CME simulation

*Daikou Shiota[1,4], Seiji Yashiro[2], Ryuho Kataoka[3], Kazumasa Iwai[4], Yusuke Ebihara[5]

1. National Institute of Information and Communications Technology (NICT), 2. Catholic University of America, 3. National Institute of Polar Research, 4. Institute for Space-Earth Environmental Research, Nagoya University, 5. Research Institute for Sustainable Humanosphere, Kyoto University

The predictions of CME arrival to the Earth and the southward magnetic field brought by the CME flux ropes are one of crucial tasks for space weather forecast.
We have developed an MHD simulation of the interplanetary propagation of multiple CMEs with their internal magnetic flux ropes, called as SUSANOO-CME (Shiota & Kataoka 2016). The simulation solves propagation of solar wind and CMEs in the inner heliosphere from 25 solar radii where all the balk flow exceeds fast mode speed. The information of solar wind and CME is specified at the inner boundary with empirical and analytical models using real-time observations of the Sun and the corona.
Recently, we have been constructing a prediction system of CME impacts (CME arrival and magnetic field) utilizing SUSANOO-CME with the real-time solar observations for the purpose of use in space weather forecast in NICT. The system is capable of performing ensemble simulation with different sets of multiple CME input parameters, which is controlled from web-browser interfaces. We developed a methods to visualize results of each ensemble case and summarize time profiles of the ensemble simulations, which are also accessible through a web-browser. In this presentation, we will report the current status of the development and discuss the remaining issues and the future development.

A dynamical model of the heliosphere with adaptive mesh refinement

*Tomoaki Matsumoto[1], Daikou Shiota[2], Ryuho Kataoka[3], Hiroko Miyahara[4], Shoko Miyake[5]

1. Hosei University, 2. NICT, 3. National Institute of Polar Research, 4. Musashino Art University, 5. National Institute of Technology, Ibaraki College

A change in the heliospheric environment plays an important role in the modulation of the galactic cosmic rays (GCRs). The magnetic field structure and the speed of the solar wind affect the GCRs transport in the heliosphere. In the previous studies, the simple Parker spiral models have been utilized for calculating the modulation of GCRs.

We have here developed a dynamical model of the heliosphere based on MHD simulations. This model is a framework for simulating the heliospheric environment that the planets are inhabiting. The model was constructed as a part of Project Gm7. We utilized the adaptive mesh refinement (AMR) code, SFUMATO, to obtain local high-resolution around the heliospheric current sheet (HCS) because the GCRs are transported efficiently in the HCS.

Recently we modified the heliospheric model several points. First, we extended the computational domain of a distance of 14 au from the Sun up to a distance of 100 au. The extension of the computational domain allows us to reproduce highly tightly winding spirals of the HCS. The AMR captures the tightly winding spirals with a relatively low numerical diffusion. Second, we improved the robustness of the numerical method. We modified the numerical scheme by solving the advection of the internal energy besides the total energy in the conservation forms of MHD equations. This modification ensures the positivity of the internal energy even for very high speed and low beta plasmas.

Validation and operation of a coronal mass ejection arrival time forecasting system using interplanetary scintillation observations

*Kazumasa Iwai[1], Daikou Shiota[2], Munetoshi Tokumaru[1], Ken'ichi Fujiki[1], Mitsue Den[2], Yuki Kubo[2]

1. Institute for Space–Earth Environmental Research (ISEE), Nagoya University, 2. National Institute of Information and Communications Technology

Coronal mass ejections (CMEs) cause disturbances in the environment of the Earth when they arrive at the Earth. However, the prediction of the arrival of CMEs still remains a challenge. We have developed an interplanetary scintillation (IPS) estimation system based on a global magnetohydrodynamic (MHD) simulation of the inner heliosphere to predict the arrival time of CMEs. In this system, the initial speed of a CME is roughly derived from white-light coronagraph observations. Then, the propagation of the CME is calculated by a global MHD simulation. The IPS response is estimated by the three-dimensional density distribution of the inner heliosphere derived from the MHD simulation. The simulated IPS response is compared with the actual IPS observations made by the Institute for Space-Earth Environmental Research, Nagoya University, and shows good agreement with that observed.
We demonstrated how the simulation system works using a halo CME event generated by a X9.3 flare observed on September 5, 2017. We find that the CME simulation that best estimates the IPS observation can more accurately predict the time of arrival of the CME at the Earth. We have validated this system using more than 10 halo CMEs and found that the error of the arrival time is reduced to less than 5 hours by using the IPS based forecasting system. These results suggest that the accuracy of the CME arrival time can be improved if our current MHD simulations include IPS data. A part of this system has been installed in a space weather forecasting of NICT, the space weather forecasting center of Japan, and operated for the daily forecasting.

Annual rings record the intensity of cosmic rays that had entered into the Earth’ s atmosphere. Several rapid ^{14}C increases in the past, such as the 775 CE and 994CE ^{14}C spikes, have been reported to originate from extreme solar proton events (SPEs). Another rapid ^{14}C increase, also known as the ca. 660 BCE event in German oak tree rings as well as increases of ^{10}Be and ^{36}Cl in ice cores, was presumed similar to the 775 CE event; however, as the ^{14}C increase of approximately 10‰ in 660 BCE had taken a rather longer rise time of 3–4 years as compared to that of the 775 CE event, the occurrence could not be simply associated to an extreme SPE. In this study, to elucidate the rapid increase in ^{14}C concentrations in tree rings around 660 BCE, we have precisely measured the ^{14}C concentrations of earlywoods and latewoods inside the annual rings of Japanese cedar for the period 669–633 BCE. Based on the feature of ^{14}C production rate calculated from the fine measured profile of the ^{14}C concentrations using an 11-Box model of carbon cycle, we found that the ^{14}C rapid increase occurred within 665–663.5 BCE, and that duration of ^{14}C production describing the event is distributed from one month to 3.4 years. The possibility of occurrence of consecutive SPEs over up to three years is offered.

It is thought that the longer-term variations of the solar activity may affect the Earth’s climate. Therefore, predicting the next solar cycle is crucial for the forecast of the “solar-terrestrial environment”. To build prediction schemes for the next solar cycle is a key for the long-term space weather study. Recently, the relationship between polar magnetic field at the solar minimum and next solar activity is intensively discussed. Because we can determine the polar magnetic field at the solar minimum roughly 3 years before the next solar maximum, we may discuss the next solar cycle 3 years before. Further, the longer term (~5 years) prediction might be achieved by estimating the polar magnetic field with the Surface Flux Transport (SFT) model. So far, we success to predict next solar cycle by using SFT model (see Iijima et al., 2017, for detail). Further, Flare/Coronal Mass Ejection (CME), solar wind prediction study has been also largely progressed (Kusano et al., 2012, Shiota et al. 2014, Iwai et al., 2019). We believe that it is good time to try to extend our models to predict future Flare/Coronal Mass Ejection (CME) and/or Solar Energetic Particles (SEP). In this talk we will introduce what we have achieved and what we will do in the future to understand the variability of high energy particle environment associated with solar activities.

A reliable prediction of the space weather conditions on the radiation exposure caused by galactic cosmic rays (GCRs) is one of challenges topics in the field of space weather forecast. In order to understand heliospheric environments during extremely weak solar cycle such as past grand minima and the current solar cycle, we have developed a hybrid simulation model for the cosmic-ray modulation, which solves the stochastic differential equations (SDEs) describing a propagation of the GCRs in a dynamical MHD model of the heliosphere. We have calculated the dynamical model of the heliosphere with an adaptive mesh refinement technique. Space weather forecast system, SUSANOO, is imposed on the inner boundary of the dynamical model. By considering the solar wind velocity and the heliospheric magnetic field obtained from the dynamical model of the heliosphere, we have calculated the trajectories and the momentum histories of the GCRs that have a charge-sign dependence caused by the drift motion in the heliospheric magnetic field. In this presentation, we will show preliminary results of our MHD-SDE hybrid simulation for the cosmic-ray modulation during recent solar cycle.

Geosynchronous Energetic Particle Variations based on FY-2 Series Satellites Observations

*chunqin wang[1], guohong shen[1], shenyi zhang[1], huanxin zhang[1]

1. national space sciend center,CAS

FY2 series satellites are the principal observational platforms for covering dynamic weather events and the near-earth space environment in China.High energy particle detectors carried on the satellites have provided continuous and simultaneous monitoring of the geosynchronous energetic particle environment.The energetic particle detector flown on FY2G and FY2H satellite consists of two instruments.The high energy electron instrument senses electron flux from 200keV to greater than 4MeV with eleven channels.The high energy proton instrument senses protons with seven channels from 4MeV to 300 MeV.We present several observations performed from 2015 to 2019 based on FY2G and FY2H. A precise description and preliminary analysis of particle dynamic during disturbances such as magnetic storm,sub storm and solar eruption suggests that the detector can reach an accurate response to various disturbances and can provide refined particles data. Further comparisons of particles dynamic observations with different instruments on other satellites demonstrate that the energetic particle fluxes can enter into a coherent level, yet intensive disturbances can cause great difference between observations of satellites, which can be helpful for data assimilation of multi-satellite as well as further research in more complicated magnetosphere energy particle dynamic.

10 years observation of charged pariticle flux with MAXI/RBM on the International Space Station

*Satoshi NAKAHIRA[1], Ryuho Kataoka[2], Haruka Ueno[1]

1. Japan Aerospace Exploration Agency, 2. National Institute of Polar Research

High energy charged particles in lower earth orbit are considered to relate to the plasma waves of the geospace. Recently, they are attracting more attention from Arase's observations. In this research, we focused on the observatories in the exposed facility of International Space Station (ISS), which is flying the altitude around 400 km and an inclination angle of 51.6 degrees. Here we employed Radiation Belt Monitor (RBM) consists of Si PiN diode equipped on Monitor of All-sky X-ray Image (MAXI) in operation from 2009 August to now. The RBM is sensitive to electrons above 0.3 MeV and the particle trigger counts are accumulated on a one-second basis. Since it has a two field-of-view towards horizontal and zenithal directions, the RBM has a capability to measure the anisotropy. Additionally, we utilized the SEDA-AP of the same platform, operated from 2009 August to 2018 March. Standard Dose Monitor (SDOM) can measure the energy spectra for electrons of 0.28—20.01 MeV with 7-channels at every 10-second interval.

We first searched for highly variable time intervals from MAXI/RBM time series data with 1-s time cadence, obtained from 2009 August to 2019 December. We applied peak-finding method to detect local maxima. When three peaks which has prominence higher than 7-sigma within 180 seconds we identified the time intervals to be "variable".As a result we obtain about 4400 events. Showing various patterns of time variation, it sometimes changes more than 3 orders of magnitude within a few seconds. Those time variations can be produced by both intrinsic time variation of its flux and spatial structure scanned by ISS flying at a velocity of 7.7 km/s.

Then, we tried to classify them by the time variation patterns. We calculated distance (similarity) for all combinations of extracted time series by the "Dynamic Time Warping" method, and then they are grouped by the "Ward" method. Consequently, they are roughly classified into five types; (1) several ~1s width spikes over a few minutes, (2) dense ~1s width shots over a few minutes, (3) a broad peak usually with small short-time variations, (4) doubleed peak and (5) quasi-periodic fluctuations of baseline with a time scale of ~10 seconds. We will discuss the origin of these variation patterns by employing MeV electron information of SEDA-AP/SDOM. Finally, we statistically discuss the solar wind parameter dependence or geomagnetic activitiy dependence of those variable events found in 10 years.

Statistical Analysis of the Relation between Coronal Mass Ejections and Solar Energetic Particles

*Kosuke Kihara[1], Yuwei Huang[2], Nobuhiko Nishimura[3], Nariaki Nitta[4], Seiji Yashiro[5], Kiyoshi Ichimoto[2], Ayumi Asai[2]

1. Department of Astronomy, Kyoto University, 2. Astronomical Observatory, Kyoto University, 3. Institute for Space Earth Environmental Research, 4. Lockheed Martin Advanced Technology Center, 5. The Catholic University of America

Solar energetic particles (SEPs), which originate in powerful eruptions in the solar corona, give rise to critical radiation hazards for astronauts and airline passengers, causing damages to satellites, which result in serious societal impacts. Although past studies show some relations between coronal mass ejections (CMEs) and SEP events, they have considerable scatters and it suggests that there are some unknown factors between them. In order to advance our understandings of how the properties of CMEs affect that of SEPs, we have conducted a statistical study of the relation between CMEs and SEP events. Instead of correlating SEP properties with CMEs as conduced in a majority of past studies, we started from all the 257 fast ($v > 900$ km/s) and wide (Angular width $> 60^\circ$) CMEs that occurred between December 2006 and October 2017. We detected their associated SEP events in >10 MeV protons from the three directions, GOES, STEREO-A, and STEREO-B. For the detected CME-SEP pairs, we computed three timescales of SEP events, onset time (TO), rise time (TR), and duration (TD), and correlated them with the CME speed and the longitude of the CME source location relative to the Parker spiral footpoint ($\Delta\Phi$). It is found that near the Parker spiral footpoint ($|\Delta\Phi| < 60^\circ$), TO tends to be short and negatively correlates with CME speed. The correlation between TO, TR and $\Delta\Phi$is weaker than TO, but TD and CME speeds have a positive correlation.

Solar flares and coronal mass ejections (CMEs) are eruptive phenomena caused by the coronal magnetic fields. In particular, large eruptive events originate in active regions (AR) with strong surface magnetic fields. However, it is still unclear what determines the capability of an AR to specifically produce eruptive flares and CMEs, and this hinders our knowledge of the initiation mechanism for the eruptive component of these phenomena. In this study, we propose a new parameter r_m to measure the possibility that a flare which occurs in an AR can be eruptive and produce a CME. The parameter r_m is defined by the ratio of the magnetic flux of twist higher than a threshold Tc to the surrounding –and specifically the overlying –magnetic flux. The value of r_m for each AR can be estimated using the nonlinear force-free field (NLFFF) extrapolation models of the coronal magnetic field. Based on the data obtained by the Solar Dynamics Observatory (SDO)/Helioseismic and Magnetic Imager (HMI), we calculated the values of r_m for 29 ARs at 51 times prior to flares larger than M5.0 class. We find that the foot-point of field lines with twist larger than 0.2 can well represent the flare ribbons, and field lines overlying and “fencing in” the highly twisted region will work to confine the eruption, generating confined flares. Discriminant function analysis shows that r_m is moderately able to discriminate those ARs which have the capability to produce eruptive flares. Regarding the events that cannot be classified according to r_m correctly, we find that there are external overlying field lines that are not captured by NLFFF extrapolation in those confined events with large r_m. This is probably one of the reasons to cause the failed classification. The other events that cannot be well classified based on r_m are also discussed in this study

Realistic MHD Modeling of delta-sunspots: How to Generate Most Violent Active Regions of the Sun

*Shin Toriumi[1], Hideyuki Hotta[2]

1. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2. Graduate School of Science, Chiba University

Observations revealed that the delta-shaped sunspots, in which opposite polarities are closely neighboring that they share a common penumbra, produce the strongest solar flares in history. In this study, for the first time, we succeed in simulating the entire process where a subsurface magnetic flux tube is elevated by the turbulent background convection and spontaneously forms delta-shaped sunspots in the photosphere, by utilizing the novel radiative MHD code R2D2, which simultaneously solves the thermal convection from the deepest convection zone to the surface layer of the Sun. We find that within the delta-spots, strongly sheared polarity inversion lines, spot rotations, and flux rope structures are built, all of which are consistent with the observations of flare-prolific active regions. In the presentation, we discuss the key roles of turbulent convection in producing the delta-spots, the most eruptive category of active regions.

Deep Flare Net Extended to 4-Class Solar Flare Prediction

*Naoto Nishizuka[1], Komei Sugiura[1], Yuki Kubo[1], Mitsue Den[1], Mamoru Ishii[1]

1. National Institute of Information and Communications Technology

We developed a 4-class solar flare prediction model by extending Deep Flare Net (DeFN), which is an operational model to predict flares using a deep neural network. The solar flares are classified by GOES classes (X, M, C, etc.), and, the larger amount of flare X-rays increases the ionization of ionospheric D-layer, results in greater absorption of the radio signals. The model can forecast the flare occurrence probabilities of 4 classes of flares and predict the maximum classes of flares that occur in the following 24 h after observation images. From $4x10^5$ observation images taken during 2010-2017 by Solar Dynamic Observatory, we automatically detected sunspots and calculated 79 features for each region, to which flare occurrence labels of X-, M-, and C-class were attached. We adopted the features used in Nishizuka et al. (2017) and (2018), where we added ones from database in 2016-2017: for example, line-of sight/vector magnetogram in the photosphere, coronal hot brightening at 131 A (T~10^5 K) and the X-ray and 131 A intensity data 1 and 2 h before an image. For operational evaluation, we divided the database into two for training and testing: the dataset in 2010-2015 for training and the one in 2016-2017 for testing. The DeFN model consists of deep multilayer neural networks, formed by adapting skip connections, batch normalizations and weighted cross entropy. To statistically predict flares, the DeFN model was trained to optimize the skill score, i.e., the Gandin Murphy-Gerrity score (GMGS). As a result, we succeeded in predicting flares with GMGS=0.63 for 4-class flares including X, M, C and non-flares. Furthermore, we also developed a system to visualize the impact on the HF radio communication, based on our flare prediction results.

Investigation of statistical relationships between loop structures in X-ray coronal image and CME using automatic recognition of coronal loops

*Yusuke Iida[1], Yusuke Kawabata[2], Toshifumi Shimizu[3]

1. Niigata University, 2. NAOJ, 3. JAXA/ISAS

We investigate the statistical relationships between the various parameters of loop structures in X-ray images taken by Hinode/XRT and coronal mass ejection using automatic recognition of loop structures.

It is known that the presence of the S-shaped loop structures (Sigmoid) in the X-ray image correlates with the occurrence of coronal mass ejection (CME). Kawabata et al. (2018) investigated 211 flare events observed by the Hinode satellites to reveal the statistical relationships between Sigmoid, flare and CME. They found that and the absence of Sigmoid has good correlation with no occurrence of CME, which mean that loop structures, especially Sigmoid, in X-ray images are probably useful for the CME prediction. However, the loop structures were automatically extracted and the Sigmoids were visually determined and it is difficult to explore the further statistical investigation. To this end, we develop the automatic recognition code of loop structures including the Sigmoid detection.

The method is developed based on the OCCULT-2 algorithm (Aschanwden+, 2010; 2013) and we change several limitations of the loop tracing algorithm for the recognition of Sigmoidal structures. The developed code is applied to the X-ray data of 211 flare events (~50,000 X-ray images) analyzed in Kawabata et al. (2018). We found the significant correlations between the absence of the Sigmoid and no occurrence of CMEs, which is confirmed by Kawabata et al. in the visual analysis. Further, it is newly found that the maximum, average and mean intensity of loop structures are DARKER in the CME occurring active regions than those in the non-CME active regions. We will show our interpretation of the result and discuss the further application for CME prediction.

Determination of 3D velocity fields of disappearing and erupting solar filaments using SMART/SDDI at Hida observatory

*Nami Kimura[1], Kenichi Otsuji[1], Ayumi Asai[1], Yosuke Alexandre Yamashiki[1]

1. Kyoto University

Solar flares, explosions on the solar surface, and associated eruptive phenomena affect the interplanetary environment, space weather, and these sometimes cause various damages on our infrastructures. Therefore, it is becoming more and more important to forecast space weather. Filament eruptions, eruptions of cool and plasmas floating in the solar corona into the interplanetary space, highly related to coronal mass ejections, and therefore, they are thought to be one of the sources of magnetic storms. However, the relation among filament eruptions, coronal mass ejections, and magnetic storms has not yet been clarified well. One of the reasons for this is the lack of accurate measurements of the velocity field of filaments and the temporal evolution. We have not been able to determine precisely whether the plasma is actually ejected into the interplanetary space. It is impossible to obtain the line of the sight velocity field of the filament plasma only by the H-alpha line center (6562.808 Angstrom) image.

The SDDI (Solar Dynamics Doppler Imager) installed in SMART (Solar Magnetic Activity Research Telescope) in Hida observatory can take the solar chromospheric full-disk dataset with 0.25 Angstrom step between -9 to +9 Angstrom centered at H-alpha line. This means that we can get a spectrum of the H-alpha line for the entire region of the filament. In this study, by applying the Beckers's “cloud model” to the filament observation at 73 wavelengths, we can detect the line of sight velocity up to 400km/s. We calculated the line of sight velocities of the filament eruption which started at 23:30UT on 2016 August 9. The filament is located at the north east limb of the sun, and ejected to become a CME. We tracked the three-dimensional morphological changes of the filament structure entirely from the pre-ejection stage to the disappearance by checking the dense part in H-alpha and AIA images by eyes. We also confirmed the magnetic structure of the erupted filament by using a magnetogram taken with Solar Dynamic Observatory (SDO) /Helioseismic and Magnetic Imager (HMI). We also compared the activities of filament eruption and CME from the aspect of the time variation of the speed and direction to obtain the detailed evolution of the filament eruption which is useful for the space weather forecast.

[P-EM18] Study of coupling processes in solar-terrestrial system

convener:Mamoru Yamamoto(Research Institute for Sustainable Humanosphere, Kyoto University), Yasunobu Ogawa(National Institute of Polar Research), Satonori Nozawa(Institute for Space-Earth Environmental Research, Nagoya University), Akimasa Yoshikawa(Department of Earth and Planetary Sciences, Kyushu University)

The Earth accepts vast input of energy and material from the Sun. The Earth's environment is maintained by the balance between their inputs and outputs. It is therefore important to study energy and mass transport on the Earth. This is an international session that discusses studies of the coupling processes in the Sun-Earth system based on the project "Study of coupling processes in solar-terrestrial system" that was approved by the Master Plan 2014/2017 of Science Council of Japan. We continue proposing the project to the Master Plan 2020. The facilities and networks included are Equatorial MU Radar (EMU) in Indonesia to study the whole equatorial atmosphere, the EISCAT_3D radar system in northern Scandinavia to study detailed structures and elementary processes of the magnetosphere-ionosphere coupling in the polar region, and global networks of various ground-based instruments and observation data. We will show the current status of the project and discuss sciences by soliciting variety papers. This session is open to the world, and we strongly encourage submission of papers related to other facilities and projects, i.e., atmospheric or incoherent scatter radars, observation networks, satellites, and simulation or theoretical studies, etc.

Energy from the sun is divided into radiation and solar wind (high-speed particles), which are maximum at the equatorial and polar regions, respectively. We study the flow of the energy and materials in the whole atmosphere by establishing following two large atmospheric radars at these singular points, and global observation network.

(1) Equatorial fountain
The energy and material flows that occur in all height regions of the equatorial atmosphere are named as "Equatorial Fountain." These processes from the bottom also cause various effects in the upper atmosphere. We establish Equatorial MU Rdar (EMU radar) in Indonesia as main instrument for the studies.
(2) Energy inputs into polar upper atmosphere and its response
The energy/particle inflow results in auroral Joule heating and ion drag of the atmosphere. The ion outflow from the polar ionosphere controls ambient plasma constituents in the magnetosphere. We will contribute the international EISCAT_3D radar project that has started in northern Scandinavia since 2017.
(3) Global network of observation and data
We develop a global observation network of compact radio and optical remote sensing equipment from the equator to polar region. Data from the observations will be archived and utilized by the data exchange framework of IUGONET.

This project was selected as one of important projects in both Masterplan 2014, 2017, and 2020. It was also selected as a new project in the roadmap 2014 by the Japanese Ministry of Education, Culture, Sports, Science and Technology (MEXT). We now apply this plan to MEXT Roadmap 2020.

Status of Equatorial MU Radar project in 2020

*Mamoru Yamamoto[1], Hiroyuki Hashiguchi[1], Tatsuhiro Yokoyama[1], Toshitaka Tsuda[1]

1. Research Institute for Sustainable Humanosphere, Kyoto University

Research Institute for Sustainable Humanosphere, Kyoto University (RISH) has been studying the atmosphere and ionosphere by using radars. The first big facility was the MU (Middle and Upper atmosphere) radar installed in Shiga, Japan in 1984. This is one of the most powerful and multi-functional radar, and is successful of revealing importance of atmospheric waves for the dynamical vertical coupling processes. The next big radar was the Equatorial Atmosphere Radar (EAR) installed at Kototabang, West Sumatra, Indonesia in 2001. The EAR was operated under close collaboration with LAPAN (Indonesia National Institute for Aeronautics and Space), and conducted the long-term continuous observations of the equatorial atmosphere/ionosphere. The EAR, however, had a limited sensitivity to the MU radar as the total output power is just 1/10 to the MU radar. Our new project is to establish "Equatorial MU (EMU) Radar" just next to the EAR site in Indonesia. The EMU will have an active phased array antenna with the 163 m diameter and 1055 cross-element Yagis. Total output power of the EMU will be more than 500 kW. The EMU is the "MU radar class" facility, and can detect turbulent echoes from the mesosphere (60-80 km). In the ionosphere incoherent-scatter observations of plasma density, drift, and temperature would be possible. Multi-channel receivers will realizes radar-imaging observations. Preparation for the EMU progress in many aspect including site survey for the construction, discussion with local government, etc. In March 2019, RISH and LAPAN have 1st Internal School on Equatorial Atmosphere (ISQUAR) 2019 with more than 100 participants at Bandung, Indonesia. ISQUAR aims to promote interesting studies of the equatorial atmosphere and use of the atmospheric radar including the EMU. The EMU is one of the key element in the project "Study of coupling processes in the solar-terrestrial system" that is one of the important project in the Master Plan 2014 and 2017 of the Science Council of Japan (SCJ). The project kept the same status at the SCJ Masterplan 2020.

Current Status of the EISCAT_3D project and the Japan’s contribution

*Hiroshi Miyaoka[1], Yasunobu Ogawa[1], Satonori Nozawa[2], Koji Nishimura[1], Taishi Hashimoto[1], Shin-ichiro Oyama[2], Takuji Nakamura[1], Ryoichi Fujii[2], Craig James Heinselman[3]

1. National Institute of Polar Research, 2. Institute for Space-Earth Environmental Research, Nagoya University, 3. European Incoherent Scatter Scientific Association

The European Incoherent Scatter(EISCAT) Scientific Association with associate members from Sweden, Norway, Finland, UK, China and Japan, has officially started the construction of the 1st stage of EISCAT_3D in September 2017 toward its completion by the end of 2021, including the commissioning of the radar system. EISCAT_3D is the major upgrade of the existing EISCAT mainland radars, with a multi-static phased array system composed of one core (transmit-receive) site and 4 receive-only remote sites to provide us 50-100 times higher temporal resolution than the present system. The construction of EISCAT_3D is planned to implement by 4-staged approach, starting from the core site with half transmitting power about 5MW and 2 receiving-remote sites in Sweden and Finland as the 1st stage. At Skibotn, the core site in northern Norway, geoengineering surveys and groundworks have been almost completed with the extension of power lines and optical fiber cables. The site buildings are scheduled to be built in 2020 summer to start the installation of the radar systems.

The National Institute of Polar Research (NIPR) has been contributing in-kind to the construction of EISCAT_3D by supplying radar transmitter units in collaboration with the EISCAT scientific association and ISEE/Nagoya University. The EISCAT_3D program in Japan was successfully granted by the Science Council of Japan as one of the high-priority programs of the Master Plan 2014/2017/2020 and the Roadmap 2014 program by MEXT (Ministry), as a core facility of a comprehensive program: “Study of Coupling Processes in the Solar-Terrestrial System”. Under these positive evaluations, high energy-efficient transmitter power amplifiers (SSPAs) has been developed and provided for the engineering verification test at the EISCAT Tromso site since 2016. In February 2020, NIPR has concluded an MOU with EISCAT to supply in-kind the Subarray Transmitter Units which have been selected through the international tendering process by the EISCAT_3D project office.
In this paper, we will overview the recent progress of the project and our prospect for the contribution to the EISCAT_3D project.

Current status of the ground-based multi-point network by the PWING Project and the Optical Mesosphere Thermosphere Imagers (OMTIs)

*Kazuo Shiokawa[1], Yuichi Otsuka[1]

1. Institute for Space-Earth Environmental Research, Nagoya University

Additional Coauthor: PWING Team (http://www.isee.nagoya-u.ac.jp/dimr/PWING/en/)

The PWING project (study of dynamical variation of Particles and Waves in the INner magnetosphere using Ground-based network observations, 2016-2020) deploy all-sky airglow/aurora imagers, 64-Hz sampled induction magnetometers, 40-kHz VLF receivers, and 64-Hz riometers at 8 stations at magnetic latitudes of ~60 degree around the north-pole to cover longitudinal variation of aurora and electromagnetic disturbances in the inner magnetosphere. The Optical Mesosphere Thermosphere Imagers (OMTIs) consist of 21 all-sky cooled-CCD imagers, 5 Fabry-Perot interferometers, 3 airglow temperature photometers, and 3 meridian-scanning photometers to measure two-dimensional airglow images in the mesopause region and in the thermosphere, wind and temperatures in the lower thermosphere, and airglow rotational temperatures in the mesopause region. These PWING and OMTIs instruments are in automatic operation at various locations from high to equatorial latitudes in Canada, US (Alaska), Russia, Norway, Finland, Iceland, Japan, Thailand, Indonesia, Nigeria, and Australia. In the presentation, we introduce current status and recent major results obtained by these multi-instrument ground networks around the world. Details of the PWING project and OMTIs can be seen at http://www.isee.nagoya-u.ac.jp/dimr/PWING/PWING_web_e.htm and at http://stdb2.isee.nagoya-u.ac.jp/omti/, respectively.

IUGONET data analysis system for a study of coupling processes in the solar-terrestrial system

*Atsuki Shinbori[1], Yoshimasa Tanaka[2], Norio Umemura[1], Shuji Abe[3], Satoru UeNo[4]

1. Institute for Space-Earth Environment Research (ISEE), Nagoya University, 2. National Institute of Polar Research, 3. International Center for Space Weather Science and Education (ICSWSE), Kyushu University, 4. Kwasan and Hida Observatories, Graduate School of Science, Kyoto University

The earth’ s atmosphere in a height range of more than 80 km is called the upper atmosphere, and this region is influenced by both the solar activity and the atmospheric waves propagating from the lower atmosphere. Therefore, in order to understand the physical mechanism of the short-term and long-term variations in the upper atmosphere and atmosphere-plasma interaction in this region, we need to perform an integrated analysis of various kinds of ground-based and satellite observation data taken by different technics. Since these observation data were separately being managed by each institute, it was difficult for users to effectively find and analyze them for promotion of an interdisciplinary study. To solve this problem, the Inter-university Upper atmosphere Global Observation NETwork (IUGONET) project [Hayashi et al., 2013] has been initiated in 2009, consisting of five institutes (Tohoku University, National Institute of Polar Research, Nagoya University, Kyoto University, and Kyushu University). In this project, we have added data information (metadata) for various kinds of ground-based observation data in the solar-terrestrial physics and built a practical database (IUGONET Type-A) to share them on the Internet. We have also developed several integrated data analysis tools (IUGONET Data Analysis Software: UDAS and UDAS egg: UDAS Easy Guide to Generate your load routines) as one of the functions of Space Physics Environment Data Analysis Software (SPEDAS) [Angelopoulos et al., 2019] to analyze and visualize various kinds of ground-based and satellite observation data. In the IUGONET Type-A, users can easily learn characteristics of observation data through the quick look images/plots and how to use several basic commands to visualize the data. Recently, we have added a new function of UDAS Web (ASCII Downloader) to convert CDF into ASCII files on this website so that users can easily read and analysis the observational data with their own tools. We have further started to develop the SPEDAS MATLAB software. In order to enhance an international use of these IUGONET products and to promote an interdisciplinary study of coupling processes on the sun-earth system, we have held tutorial seminars and workshops several times in Japan and foreign countries (India, Indonesia, Nigeria, Malaysia etc.). As a result, many scientific papers [e.g., Dao et al., 2017; Batubara et al., 2018; Koushik et al., 2018] and Master/Doctor theses become published by preparing an analysis environment, and the IUGONET products effectively works as an international platform. This fact suggests that the IUGONET project is in the position enough to serve the subjects of a large research project: Study of coupling processes in the solar-terrestrial system (Master Plan 2014/2017/2020, Load Map 2014) through a collaboration with other ground-based and satellite observation plans and international programs. Judging from the above situations, the common data analysis platform developed by the IUGONET project leads to new scientific results of coupling process in the solar-terrestrial system, human development and strong international cooperation to a whole equatorial region (South America, Africa) in addition to India and Indonesia in future. Therefore, it can be concluded that the IUGONET activity plays an important role in promoting the equatorial and polar atmospheric observations, international collaboration and data science (data assimilation), which are three main subjects of Master Plan (2014/2017/2020).

Statistical study of Sporadic Sodium Layers (SSLs) above Tromsø (2)

*Satonori Nozawa[1], Takuo T. Tsuda[2], Norihito Saito[3], Takuya Kawahara[4], Satoshi Wada[3], Yasunobu Ogawa[5], Hitoshi Fujiwara[6], Toru Takahashi[7], Tetsuya Kawabata[1], Chris Hall[8], Asgeir Brekke[8]

1. Institute for Space-Earth Environmental Research, Nagoya University, 2. The University of Electro-Communications, 3. RIKEN Center for Advanced Photonics, 4. Faculty of Engineering, Shinshu University, 5. National Institute of Polar Research, 6. Faculty of Science and Technology, Seikei University, 7. Department Physics, University of Oslo, 8. UiT The Arctic University of Norway

This study is the first statistical study of SSLs differentiating in-situ generated SSLs from advected SSLs at high latitudes, and evaluates necessary conditions for generating a SSL. Based on about 3000 hours of sodium density data obtained with the Tromsø sodium LIDAR over 7 year seasons (October-March) between 2012 and 2018, we have identified 36 events of Sporadic Sodium Layer (SSL) in the polar mesosphere and lower thermosphere (MLT) region. A SSL is a thin sodium layer (about 1-2 km) with high sodium density (usually factor of 2 or more higher than that of a normal layer), and its life time is said to be about a few minutes to a few hours. Observational results of SSLs are summarized as follows: (1) SSLs appeared for shorter than 5 % of the overall observational time, confirming it is a rare event at high latitude. (2) The advent altitude distributed from 94 km to 106 km; no clear trend is found. (3) The advent time distributed from 18 LT to 1 UT: no events are found before 18 LT or later 1 LT. (4) No relationship is found between advent time and altitude. (5) The peak density tends to be lower as height increasing. (6) Lifetimes do not show a clear relationship with advent altitudes. We have investigated necessary conditions for a SSL to form in the polar MLT region. Auroral electron precipitation as well as appearance of a sporadic E layer would be one of necessary conditions to form a SSL.

By using an advantage of five directional measurements, we have derived movement velocities of SSLs using detection times (i.e., advent times) at five positions by assuming a SSL has a linear front perpendicular to the movement direction, and have compared wind velocity. The movement directions are dominantly from south-eastward to south westward except for 3 events: most SSLs moved southward in the meridional direction. Based on comparison of the velocities, we have found that 29 out of 36 events (81%) are likely classified to be advection events, while 7 events are left for candidates of in-situ generation events. We will discuss difference of “advection” and “in-situ” events in terms of height/horizontal structures of sodium densities.

A journey of energy from solar wind to polar ionosphere as viewed from global MHD simulation

*Yusuke Ebihara[1], Takashi Tanaka[2]

1. Research Institute for Sustainable Humanosphere, Kyoto University, 2. International Center for Space Weather Science and Education, Kyushu University

The Sun emits different forms of energy to interplanetary space. The most significant form is the solar electromagnetic radiation that arrives at Earth's atmosphere directly. The second and third ones are the solar wind kinetic energy and the magnetic energy of the interplanetary magnetic field (IMF), which are the ultimate sources of the energy consumed in the polar ionosphere. Despite of numerous studies, the pathway and the conversion of the solar wind energy (including the solar wind kinetic energy and the magnetic energy of IMF) into the polar ionosphere are not well-known. The results obtained by the global magnetohydrodynamics (MHD) simulation suggest that the development of dynamo is a key in understanding the energy transfer and conversion. When the solar wind is supersonic, the first dynamo appears in the bow shock, which converts the solar wind kinetic energy to the internal energy and the magnetic energy. When the IMF is southward, the second dynamo appears in the mantle region, which converts the internal energy to the kinetic energy and the magnetic energy. The mantle dynamo is closely associated with the generation of the Region 1 field-aligned currents (FACs). A line integral of the Poynting flux, which is called a S-curve, shows a spiral with its center moving toward the polar ionosphere. The spiral shape is a manifestation of the magnetospheric convection, and the earthward displacement is caused by a twist of the flux tube associated with the FACs. When the near-Earth reconnection takes place in the plasma sheet, the third dynamo appears in the inner magnetosphere, which generates Region 1-sense FACs known as substorm current system. The fourth dynamo appears in the low-altitude magnetosphere when the ionospheric Hall current is partially blocked. The upward FAC associated with the forth dynamo is related to the westward traveling surge in the MHD simulation. However, the upward FAC is connected to the divergent (not convergent) Pedersen current, which is different from conventional wisdom. The EISCAT_3D observations are expected to resolve this problem, and provide insightful information about the interface between the magnetosphere and the ionosphere during the transient phenomena, such as an auroral expansion.

Review of the mid-latitude SuperDARN and the future of the SuperDARN

*Nozomu Nishitani[1]

1. Institute for Space-Earth Environmental Research, Nagoya University

The Super Dual Auroral Radar Network (SuperDARN) is a powerful tool for monitoring ionospheric plasma convection and electron density changes. The SuperDARN began its official operation in 1995 For the first few years, the SuperDARN field of view (FOV) was limited to high latitudes. About ten years later, the first purpose-built mid-latitude SuperDARN radars started operation at sites in Virginia and Hokkaido in 2005 and 2006, respectively. Subsequent construction of additional radars at mid-latitudes have greatly expanded the SuperDARN FOV, and made accessible a range of research topics that are distinctive to the subauroral and mid-latitude ionosphere. In this paper we review the accomplishments of the mid-latitude SuperDARN in several scientific and technical areas, as well as the history of the mid-latitude SuperDARN. We also discuss the future directions of the SuperDARN, including the expansion of SuperDARN FOV to even lower latitudes up to the equatorial region.

Kyushu university group operates global geomagnetic field observation through MAGDAS project and electric field observation by using multi-point FM-CW Radar from polar to equatorial ionosphere. Based on these observational data, we investigate global electromagnetic coupling from polar to equatorial ionosphere, including magnetosphere-ionosphere coupling at polar region, formation of global ionospheric current system, vertical coupling between atmosphere and ionosphere, day-side and night-side electromagnetic coupling of plasma dynamics around dip equator, global distribution of ULF pulsations, diagnoses of plasma sphere by using FLR. We are also working on theoretical research for clarifying above electromagnetic coupled system, and feed-back effect of ionospheric dynamics to magnetospheric dynamics . In this talk, we will introduce progress and new direction of our research project.

An FM-CW (Frequency Modulated Continuous Wave) radar is a type of HF (High Frequency) radar. We have installed three FM-CW stations along the Japanese longitude, at Japan, Russia and Philippine, in order to measure the electric fields that penetrate the ionosphere (Yumoto, 2006). One of the FM-CW project goals is to understand the relationship between Equatorial Electrojet (EEJ) and the generation mechanism of the Equatorial Spread F (ESF) associated with Equatorial Plasma Bubbles (EPBs). The ionospheric plasma-density irregularities, especially ESF, could result in the scintillation of trans-ionospheric GNSS/GPS signals. The study on the generation mechanisms of ESF is the important issue to estimate the occurrence of the ionospheric scintillation for the safety human activity using the space region. The abnormal magnetic field variation along the magnetic equator, EEJ, is reported to be associated with the ESF.

In 2018, we installed a new FM-CW radar at Sicaya Observatory in Peru. ICSWSE (International Center for Space Weather Science and Education, Kyushu University) also has the ground-based magnetometer network (MAGDAS) on the world including Peru MAGDAS chain. The Sicaya FM-CW observation will give the opportunity of the simultaneous ionospheric observation, the geomagnetic field variation recorded by MAGDAS system at Huancayo and the GPS scintillation status given by S4 index operated by IGP (The Geophysical Institute of Peru).

During 15-18 March 2019, we have the high-time resolution (every 3 minutes) Ionosonde campaign observation in Sicaya. The geomagnetic activity was the weak disturbed with Dst index -41 nT at 12:00 UT on 17 March 2019. The amplitude of EEJ was smaller than the normal EEJ variation and the depressed EEJ structure was recorded at the Sicaya in the evening sector on 17 March with the high S4 value at Brazil (where is located on the east side from Sicaya). The Sicaya Ionogram shows the long-term ESF on 17 March with the couple hours. We will demonstrate the comparison of Ionospheric irregularities with the magnetic activity in the equatorial region for the GPS scintillation.

The accurate probing of the three-dimensional (3-D) structure of the ionosphere endures a unique set of challenges that include for example high campaign costs, poor distribution of instruments and collected data, and geometric limitations. To remedy these challenges, over the East-Asian sector (covering 110°–160°E and 10°–60°N, and extending from 80 to 20,000 km in altitude) a near real-time regional 3-D computerized ionospheric tomography (CIT) technique has been developed using a plethora of GPS (Global Positioning System) observations of total electron content. A validation of the CIT results using ionosonde and occulation data shows the technique adequately reconstructs the regional ionosphere vertical structure, however, with room for improvement in estimating the peak height and avoiding physically unrealistic negative densities in the final solution. This paper presents preliminary results from a technique that addresses these problems, by incorporating CIT results into a data assimilation (DA) technique. The DA technique adds ionosonde bottomside measurements into CIT results, thereby improving the accuracy of the reconstructed peak height and bottomside 3-D structure. Further, we assume that ionosphere electron densities are better described by probability log-nomal distribution, which introduces the non-negativity constraint.

A study of equatorial plasma bubble structure using VHF radar and GNSS scintillations over the low-latitude region

*Acharaporn Bumrungkit[1], Susumu Saito[2], Pornchai Supnithi[1]

1. King Mongkut's Institute of Technology Ladkrabang (KMITL), 2. Electronic Navigation Research Institute (ENRI), National Institute of Maritime, Port, and Aviation Technology (MPAT)

The ionospheric irregularity can cause the deleterious effects on the signal in space, such as global navigation satellite system (GNSS) signals. In low-latitude region, the irregularity of the electron density in the ionosphere frequently occurs, which is called the equatorial plasma bubble (EPB). The amplitude GNSS scintillations are caused by the Fresnel diffraction with the irregularities 300 to 500 meters scale sizes depending on the wavelengths corresponding to the signal frequency, which are L1 (1575.4 MHz), L2 (1227.6 MHz), and L5 (1176.45 MHz). The ionospheric irregularity with spatial scale sizes of a few meters associated with EPBs have been detected by VHF band. Multi-beam observations by a VHF radar can show precise spatial structures of EPBs. In this work, we aim to achieve a better understanding of the EPB effects on the multi-frequency GNSS signals by analyzing the amplitude scintillation index (S4) and relate it with the EPB structures. The multi-constellation and multi-frequency (MC/MF) GNSS scintillation receiver which is installed at Kototabang (geographic; 0.20S, 100.32E) is utilized to observe the signals from GPS and Galileo constellations at the frequencies of L1 and L5. The Equatorial Atmosphere Radar (EAR) which is located at the same site and operated at 47.0 MHz is used to detect the EPB structures. We compare the EPB structures shown by the EAR with the S4 indices at each ionospheric pierce points (IPPs) of GNSS signals. Figure 1 shows the spatial distribution of EAR echoes which are mapped at a certain altitude of 350 kilometers and the GNSS IPPs with S4 indices which are mapped from the altitudes of 250 (the black dots) and 350 (the red dots) kilometers to the same altitude of the EAR echoes. With this result, the three-dimensional relationship between the EPB structure and GNSS signal paths can be found. We consider inside the echo area, the S4 value of GPS satellite (G26) is equal to 0.07 and Galileo (E30) is 0.13. In this case, the signal of the G26 passes through only the lower portion of the EPB, which would be considered as the reason why the S4 enhancement is not significant but just noticeable. Further detailed analysis of the S4 enhancements of MC/MF GNSS signals with EPB structures will be presented at the meeting.

Evolution of a Mesospheric Bore in a Duct Observed by Ground-Based Double-Layer Imagers and Satellite Observations Over the Tibetan Plateau Region

*Qinzeng Li[1], Jiyao Xu[1], Jia Yue[2], Xiao Liu[3], Wei Yuan[1]

1. State Key Laboratory of Space Weather, National Space Science Center, Chinese Academy of Sciences, Beijing, China, 2. Department of Atmospheric and Planetary Sciences, Hampton University, Hampton, Virginia, USA, 3. School of Mathematics and Information Science, Henan Normal University, Xinxiang, China

A mesospheric bore event was observed in the airglow layers of both OH and OI (557.7 nm) bands by two all-sky airglow imagers in Lhasa (29.66ºN, 90.98ºE) on the Tibetan Plateau and the Day Night Band (DNB) of the Visible Infrared Imaging Radiometer Suite (VIIRS) onboard the Suomi National Polar-orbiting Partnership (NPP) satellite on the night of 16–17 December 2014. Simultaneous temperature and OH intensity observations from the SABER instrument onboard the TIMED satellite and wind measurement by a Doppler meteor radar were used to characterize the environment of the bore propagation. A large mesospheric inversion layer was identified from the temperature measured by the SABER instrument. The observed winds in the height range of the OH layer were almost orthogonal to the propagation direction of the mesospheric bore. Both hydraulic jump theory and observations showed that the duct initially shrank followed by an expansion. The duct mainly existed in the OH layer but was weak in the OI layer, as revealed by the double-layer imaging and satellite observations. The horizontal wavelengths and observed phase speeds of the bore packet decreased as the duct shrank and increased as the duct expanded. The intensity amplitude of the bore packet decreased slowly and then decreased sharply after dissipation. With the variation of the depth of the duct, the bore may have leak out of the duct. The presented study advances the understanding of mesospheric bore evolution and how the ducted environment influences the propagation of the bore.

Solar wind as a Source of Magnetospheric Plasma

*Robert Colby Allen[1], Sarah K Vines[1], Stefano A Livi[2], Don G Mitchell[1], Chris P Paranicas[1], Kareem Sorathia[1], Sam Bingham[1]

1. Johns Hopkins University Applied Physics Laboratory, 2. Southwest Research Institute

Understanding the sources and subsequent evolution of plasma within a planetary magnetosphere holds intrinsic importance for magnetospheric dynamics. For example, the balance of endogenic and solar wind plasma can be used to study the relative importance of different solar wind-magnetosphere interactions (e.g., magnetic reconnection versus Kelvin-Helmholtz instabilities) as a source of magnetospheric plasma, which can provide insight into the properties and evolution of certain planetary magnetospheres. Recent observational studies have utilized ion charge state composition to determine when and where solar wind ion populations can access a magnetosphere. These populations have subsequently been observed within injection events, bringing these solar wind-originating particles to within geosychronous orbit. Additionally, recent global modeling of the Earth system has explored the various possible pathways of solar wind entry through the use of test particle simulations. Together these studies have found that solar wind-originating plasma enters the magnetosphere through both magnetic reconnection and Kelvin-Helmholtz instabilities, as well as through cusp dynamics, and can subsequently reach the inner magnetospheric region. This presentation will focus on observational and modelling results investigating these pathways of solar wind access to the magnetosphere, and the resulting effect on magnetospheric ion composition in the inner magnetosphere.

Magnetic field dipolarization and low-energy O^+ ion flux variations in the inner magnetosphere observed by Arase

*Masahito Nose[1], Ayako Matsuoka[2], Yoshizumi Miyoshi[1], Kazushi Asamura[2], Mariko Teramoto[3], Tomoaki Hori[1], Iku Shinohara[2]

1. Institute for Space-Earth Environmental Research, Nagoya University, 2. Research Division for Space Plasma, Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 3. Kyushu Institute of Technology

Recent studies employing the Van Allen Probes [Chaston et al., 2015; Nosé et al., 2016; Gkioulidou et al., 2019] have shown that unidirectional/bidirectional energy-dispersed O^+ flux appears a few minutes after substorms in the inner magnetosphere and lasts for ~10 min with a decrease in its energy from ~5 keV to 10–100 eV. Nosé et al. [2016] found that the unidirectional energy-dispersed O^+ flux is observed in 80% of the total events and that its direction is parallel (antiparallel) to the magnetic field when the Van Allen Probes are located below (above) the geomagnetic equator. This strongly implies that these O^+ ions are extracted from the ionosphere at the onset of substorms and flow along the magnetic field toward the geomagnetic equator. Low-energy O^+ ions may be scattered near the geomagnetic equator and remain there, although the scattering mechanism is yet unknown. They will contribute to the O^+ content of the inner magnetospheric plasma, and the resultant increase in the O^+ density may provide a precondition for the O^+-rich ring current.

In the present study, we examine the low-energy O^+ ion flux variations observed by the Arase satellite in the inner magnetosphere. Magnetic field dipolarization is selected from the magnetic field data obtained by the fluxgate magnetometer (MGF) [Matsuoka et al., 2018] in the period of April 1–October 31, 2017 and July 1, 2018–January 31, 2019, and we find 243 events. Data from the low-energy particle experiments–ion mass analyzer (LEPi) [Asamura et al., 2018] are examined to check if the selected dipolarization events are accompanied by low-energy O^+ ion flux variations in the direction along the local magnetic field. There are some events of the low-energy O^+ ion flux enhancement, which (1) starts ~10 minutes after the dipolarization onset, (2) has energy-dispersed signatures with decreasing energy down to a few 10s of eV, (3) appears down to L ~ 4 with the lowest energy (10 eV), (4) can be observed in both storm and non-storm periods, and (5) has a field-aligned distribution (α ~ 0° below the equator and α ~ 180° above the equator). In the presentation, we will show the analysis results in more detail and discuss their contribution to the O^+ content of the inner magnetospheric plasma.

Jupiter’s plasma circulation and particle precipitation associated with the inner magnetosphere probed with the Hisaki satellite

*Tomoki Kimura[1], Fuminori Tsuchiya[1], Chihiro Tao[2], Kazuo Yoshioka[3], Hajime Kita[4], Go Murakami[4], Atsushi Yamazaki[4], Reina Hikida[3], Fumiharu Suzuki[3], Ryoichi Koga[1], George Clark[5], Zhonghua Yao[6], Yasutaka Hiraki[7], Fran Bagenal[8], Peter Delamere[9], Keiichiro Fukazawa[10], Ichiro Yoshikawa[3], Masaki Fujimoto[4], Hisaki Science team

1. Tohoku University, 2. NICT, 3. University of Tokyo, 4. JAXA/ISAS, 5. Johns Hopkins University / Applied Physics Laboratory, 6. Liege University , 7. Advanced Knowledge Laboratory, Inc., 8. University of Colorado Boulder, 9. University of Alaska Fairbanks, 10. Kyoto University

The extreme ultraviolet (EUV) space telescope Hisaki is the first small scientific satellite mission of the Japan Aerospace Exploration Agency. The scientific scope of the mission is to investigate the dynamics of space and the atmospheric environments of planets in our solar system. Since its launch on 14 September, 2013 to the present day, Hisaki has observed Jupiter's aurora and Io plasma torus for more than 1200 days, which is an average of 200 observation days per year. The continuous long-term monitoring unveiled the dynamics in the aurora and torus, which are closely associated with the plasma circulation in the inner magnetosphere and particle precipitations into Jupiter’s upper atmosphere.

The plasma circulation from the inner to middle magnetosphere was found to be enhanced during large volcanic eruptions at Io in 2015 (Yoshikawa, 2017; Tsuchiya et al., 2018a; Kimura et al., 2018). Accompanying enhancement of neutral atom escape from Io's atmosphere (Koga et al., 2018a, b, and 19), radially outward mass and energy transports in the torus drastically changed during the Io volcanic eruptions, which are successfully quantified based on the Hisaki EUV spectroscopy (Yoshioka et al., 2018; Hikida et al., 2019). Radial profile of plasma and our analytic model of plasma mass loading process suggested that the outward transport is likely driven by the interchange instability (Tsuchiya et al., 2018a; Kimura et al., 2018). A hot plasma sector embedded in the torus was found in the Hisaki long-term monitoring data, and subcorotation speed of the hot plasma sector is dependent on the volcanic activities (Tsuchiya et al., 2018b). Correlations of the torus brightness structure with the dawn-dusk electric field structure and radiation belts are also discussed based on the GMRT radio arrays and Hisaki observations (Murakami et al., 2016; Kita et al., 2019).

Synergies with the Hubble Space Telescope and Juno spacecraft also provide new insights into the plasma precipitation in the inner and middle magnetosphere. Based on the HST-Hisaki coordinated observation, Kimura et al. (2015, 17) found simultaneous occurrence of the large-scale hot plasma injection in the inner magnetosphere with the middle magnetospheric disturbance based on imaging and monitoring of the short-lived auroral brightenings. They were recurring with a period of 2-3 days during the solar wind quiet period. Juno in-situ plasma measurements by Yao et al. (2019) suggested that the short-lived auroral brightening is triggered by the global reconfiguration of magnetosphere, which is likely associated with the centrifugally-driven magnetotail reconnection. The solar wind response of Jupiter's UV aurora monitored with Hisaki and Juno discovered a mysterious 10-hour time lag of the short-lived auroral brightening with respect to the solar wind shock arrival at Jupiter's polar region (Kita et al., 2019). The hot plasma injection at the central torus in the deep inner magnetosphere follows the short-lived auroral intensification (Suzuki et al., 2018), which implies a global energy and/or mass transport from the middle/outer to the inner magnetosphere (Kimura et al., 2017; Yoshikawa et al., 2017; Tsuchiya et al., 2018a).

Cold ions perpendicularly heated by fast magnetosonic waves in the inner magnetosphere observed by Arase (ERG) satellite

*Kazushi Asamura[1], Masafumi Shoji[2], Yoshizumi Miyoshi[2], Ryosuke Fujii[2], Atsushi Miyazaki[2], Yasumasa Kasaba[3], Yoshiya Kasahara[4], Ayako Matsuoka[1], Vania Koleva Jordanova[5]

1. ISAS/JAXA, 2. Nagoya U., 3. Tohoku U., 4. Kanazawa U., 5. LANL

Fast magnetosonic (MS) waves are commonly observed in the equatorial region of the inner magnetosphere. Past numerical simulations show MS waves can accelerate cold ions through cyclotron resonance, although the observational evidence is still unclear. Arase (ERG) satellite found events of perpendicular heating of cold ions simultaneously with plasma wave activities of the MS waves. We found more than 200 events of the perpendicular heating of low-energy (10eV/q - a few keV/q) ions in a period between April 2017 to June 2018, and 70% of them coincide with the MS waves. These heated ions are distributed to all the MLT regions within magnetic latitude of +/-10deg, which is consistent with the region where the MS waves frequently observed.

We have applied the WPIA (wave-particle interaction analysis) method to the selected ion heating event with the MS waves. The results show that the MS waves accelerate the ions with pitch angles near 90 degrees. Moreover, we found these ions give their energy to EMIC waves which appears just below the local proton cyclotron frequency. Since MS waves are considered to be generated by the ring distrbution of ions, this analysis indicates energy transfer from higher-energy ions to the cold ions in the inner magnetosphere.

We present MAVEN observations of magnetosonic waves at the local proton cyclotron frequency in the Martian magnetosphere. As a consequence of the lack of a global magnetic field of internal origin, the upper atmosphere of Mars directly interacts with the solar wind, thereby forming an induced magnetosphere. The majority of the solar wind plasma diverts around the obstacle, but some fraction of the hot magnetosheath protons have access to the upper ionosphere of Mars due to their large gyroradii with respect to the size of the induced magnetosphere. As a result, ring/shell-like proton velocity distribution functions are formed just below the induced magnetospheric boundary in the presence of cold, dense protons of ionospheric origin.

Below the induced magnetospheric boundary, MAVEN detected narrowband compressional waves at the local proton cyclotron frequency (and its harmonics for some cases) typically in the presence of both hot ring protons and cold ionospheric protons. The occurrence of the waves at the local proton cyclotron frequency is strongly controlled by solar extreme ultraviolet (EUV) conditions, showing a distinct preference for high EUV. The wave properties and their dependence on local and upstream conditions can be mostly explained by a proton Bernstein mode instability driven by a positive perpendicular slope in proton velocity distribution functions. The wave properties and their association with ring protons exhibit striking similarities to the magnetosonic waves observed in the terrestrial inner magnetosphere. These "Martian magnetosonic waves" potentially facilitate energy transport from the precipitating hot protons of magnetosheath origin to the cold ionospheric protons.

Formation of Energy-Dispersed Narrow band structure in the Plasmaspheric Region

*Junhyun Lee[1], Ensang Lee[1], Khan-huk Kim[1]

1. Kyung Hee University

Ions in the plasmasphere show various spectral structures on their energy spectrograms. In this study we investigate an energy-dispersed narrow band structure on the energy-time spectrogram using the observations from the Helium Oxygen Proton Electron (HOPE) instrument onboard the Van Allen Probes (VAP) satellites. The band structure shows that the energy of the peak flux gradually decreases as the satellite moves away from Earth while keeping the width of the flux in energy narrow. In most cases, the nose-like structures, which have much broader energy bands, are observed in the preceding orbit. The band structure appears on the lowest energy edge of the preceding nose-like structure after the nose-like structure vanishes. Statistical analysis for the observations from October 2012 to December 2017 shows that the band structure occurs more frequently in the dusk sector and the energy of its innermost tip depends on the magnetic local time similar to the nose-like structure. These results suggest that loss of ions in the nose-like structure leads to the formation of the band structure. However, not all nose-like structures come to the band structure. Most of the band structures are observed for a period when solar wind speed is slow while the nose-like structures disappear without the formation of the band structure when they are formed under fast solar wind conditions.

The distribution of ring current ions is controlled by transportation, acceleration and loss processes in the magnetosphere. Various structures in the energy-time spectra of ion fluxes are observed by Earth-orbiting satellites. Besides the well-known structures such as “nose” or “wedge” structures, the “trunk” structure was found by Van Allen Probes. The structure looks like an elephant trunk and the energy of peak flux decreases toward the Earth along a satellite trajectory. A case study by Van Allen Probes showed that trunk structures are seen in energy spectra of helium and oxygen ions. However, the detailed characteristics of the trunk have not been well understood, and a statistical survey using long-term observation data is necessary to examine the details. In this study, we investigate characteristics of the trunk structure using the Low-energy particle experiments-ion mass analyzer (LEPi) / Medium-energy particle experiments-ion mass analyzer (MEP-i) onboard the Arase satellite for the period from April 2017 to March 2019. A number of trunk structures were identified in helium and oxygen ions as well as protons.

We analyze geomagnetic activity, local time, latitude and L-value dependences of the trunk. The minimum L-shell point of the trunk is distributed mostly around L = 2.0 –2.5 off the equator, extending from dusk to pre-midnight. Geomagnetic storm and substorm dependences are similar between the event and the non-event periods. We also perform particle backward tracing simulations using a dipole magnetic field and a SAPS electric field model in addition to some standard empirical models of large-scale convection electric field. As a result, we show that the trunk structure can be formed when the Alfven layer is deformed due to a local and temporally enhanced electric field.

The previous study suggested that an impulsively enhanced electric field or a temporary gap of injection from the tail region combined with the charge exchange process could cause the formation of the trunk. However, our result suggests a different generation mechanism: Temporary and local electric field enhancements causes the transportation of ions to low L-shell region and the formation of trunk structure.

Beside the trunk structures, “inverse trunk” in which the energy of peak flux increases in the lower L-shell are also found from the Arase observations. We show statistical characteristics of trunk and inverse trunk structures on the basis of the Arase observations and the forming mechanism of Trunk shown by simulations.

Graduate School of Science, The University of Tokyo, 7. Graduate School of Science, Osaka University, 8. Graduate School of Natural Science and Technology, Kanazawa University, 9. Graduate School of Science, Tohoku University

In the terrestrial magnetosphere, poloidal ultra-low frequency (ULF) waves are frequently observed during substorm activities (Engebretson et al., 1992; Ren et al., 2015; Shi et al., 2018). Understanding the relation between substorm and poloidal ULF wave excitation is connected to investigation of energy flow from the solar wind to the magnetosphere. Recently, Yamamoto et al. (2019) found that protons at 10–30 keV injected by a substorm excite eastward propagating poloidal waves through drift-bounce resonance. These protons showed rapid temporal variations in flux intensity and the radial gradient of their phase space density, which triggered two wave packets of the poloidal waves. However, case studies of the drift-bounce resonance for this energy range (< ~50 keV) are seldom reported, and hence poloidal waves excited through other excitation scenarios remain to be investigated.

In the present study, we examined poloidal Pc 5 waves and steady spatial structure of energetic proton distributions observed by the Arase satellite (Miyoshi et al., 2018) on 19 November 2018. The poloidal waves with a frequency of 4.5 mHz were detected by Arase during 02:40-03:40 UT. The apogee of Arase satellite was located at ~21 MLT, and its geomagnetic latitude ranged from 0° to 10° during the event. The energetic protons at ~5 and ~15 keV penetrated down to L = 5.1–5.4 and created the multiple-nose structure (e.g., Ferradas et al., 2016). Since the SuperMAG Auroral Electrojet (SME) index (Newell and Gjerloev, 2011) increased up to ~260 nT just before the Arase satellite detected the nose structure, the multiple-nose structure is associated with a small substorm (so-called substorm nose structure).

The proton pitch angle distributions at 10–20 keV measured by the LEP-i and MEP-i instruments onboard Arase showed clear “fishbone-like” structure, and the phase of the proton flux oscillations varies with pitch angles. These features indicate that the proton fluxes are modulated through drift-bounce resonance (e.g., Zhu et al., 2020). Using the ion sounding technique (e.g., Su et al., 1977; Kivelson and Southwood, 1983), we also estimated the azimuthal wave number (m number) of the poloidal waves. We obtained the m number to be +150 (eastward propagation) from the LEP-i measurements. While the energy gradient of proton phase space density (f_{H+}) at 10–20 keV was negative during most of the wave period, the radial gradient of f_{H+} was anti-earthward and about 10 times greater than the energy gradient. In the linear theory of Southwood et al. (1969), steep anti-earthward gradient can excite poloidal waves if m number of the wave is positive. Therefore, we propose that the anti-earthward gradient formed by the substorm nose structure excites the poloidal waves through drift-bounce resonance. The radial extent of the poloidal waves coincides with that of the steep anti-earthward gradient (L = 5.3–6.1). This supports our interpretation. We also calculated the wave growth rate derived by Southwood et al. (1969), and found that the wave growth rate exceeds the damping rate by the ionosphere (γ / ω ~ 0.3, where γ and ω are the wave growth rate and the wave angular frequency, respectively). Thus we consider that the

©2020. Japan Geoscience Union. All Right Reserved.

poloidal waves were observed even on the nigh side, where the ionospheric damping is strong (γ_{damp}/ω ~ 0.1, Newton et al., 1978).

Study of the excitation mechanism of storm-time Pc5 ULF waves by ring current ions based on the drift-kinetic simulation

*Tomotsugu Yamakawa[1], Kanako Seki[1], Takanobu Amano[1], Naoko Takahashi[1], Yoshizumi Miyoshi[2]

Internally driven ULF waves are electromagnetic fluctuations in the inner magnetosphere, and can be generated by ring current ions associated with ion injections from the magnetotail during substorms. The excitation mechanism and global distribution of ULF waves are keys to understand dynamic variation of the outer radiation belt electrons, since ULF waves in the Pc5 range (1.67-6.67 mHz) are considered to contribute to the radial diffusion of radiation belt electrons [e.g. Elkington et al., 2003]. Promising candidates of excitation mechanism of internally driven ULF waves is drift-bounce resonance [Southwood, 1976]. Although previous spacecraft observations have suggested the resonant excitation [e.g., Dai et al., 2013; Yeoman and Wright., 2001], there are other possibilities such as periodic pressure inhomogeneity formed by time-dependent particle injections. Recently, Yamakawa et al. [2019] confirmed for the first time the drift resonance excitation of storm-time Pc5 waves in 3D dipole structure under the initial condition of phase space density (PSD) with north-south symmetry based on the drift-kinetic simulation. However, drift-bounce resonance excitation of ULF waves was not detected in the case of the symmetric initial PSD distribution, while this type of resonance was suggested by some spacecraft observations [e.g. Oimatsu et al., 2018]. This study aims to investigate the condition for the excitation of ULF waves associated with drift-bounce resonance based on the global drift-kinetic model.

In order to simulate the excitation of internally driven ULF waves, we perform a kinetic simulation for ring current particles using GEMSIS-RC model [Amano et al., 2011], in which five-dimensional drift-kinetic equation for the phase space density (PSD) of ring current ions and Maxwell equations are solved self-consistently under assumption that the first adiabatic invariant is conserved. In order to simulate consequence of ion injection from the plasma sheet, we set a localized high-pressure region around midnight consisting of H+ ions as an initial distribution. We compare two cases of the initial velocity distribution; the Maxwellian velocity distribution with the isotropic temperature of 16 keV (Case a) and the velocity distribution with asymmetric distribution in pitch angle direction in addition to the background Maxwellian distribution (Case b). In Case a, the simulation results show the drift resonance excitation of poloidal, toroidal, and compressional mode Pc5 waves in the dayside dusk sector. These waves are fundamental mode waves with azimuthal wave number m ~ - 20 propagating westward. Global distribution of the excited poloidal Pc5 waves indicates that they are excited where the local growth rate resultant from the positive PSD gradient in energy is positive [Yamakawa et al., 2019]. In Case b, excitation of the second harmonic poloidal Pc3 ULF waves due to the drift-bounce resonance was identified in the dayside dusk sector. Ions contributing to the growth of poloidal mode ULF waves tend to have the pitch angle of about 90 degrees for Pc5 waves and oblique pitch angle for Pc3 waves. We will also report on characteristics of excited ULF waves with a focus of the relative contribution of the drift and drift-bounce resonances.

Recent Progress in ULF Wave's Interaction with Cold Electrons and Ions in the Earth's Inner Magnetosphere

*Jie Ren[1], Qiugang Zong[1], Xuzhi Zhou[1], Chao Yue[1], Robert Rankin[2]

1. Peking University, 2. University of Alaska

In terms of particle energy and species, the inner magnetosphere can be divided into three regions, including the inner and outer radiation belts, ring current and plasmasphere. It is widely accepted that ULF waves can cause the acceleration and transport of outer radiation belt electrons and ring current ions through drift/drift-bounce resonance. Recent studies in the last two or three years presented the observational evidence of cold particle acceleration/energization by ULF waves. Cold plasmaspheric electrons can be rapidly accelerated by the poloidal-mode ULF wave electric fields via drift-bounce resonance, which show bi-directional pitch angle distributions, phase space density enhancement and density enhancement. The spatial distributions in the equatorial plane, occurrence conditions as well as resonant energy range of the cold plasmaspheric electrons also have been investigated using six years Van Allen Probes data. Different species of cold plasmaspheric ions can be energized to different energies due to the mass dependence of **E**x**B** effect by ULF waves. Besides, observations suggest that the polarization drift can lead to the real acceleration of cold O^+ ions. The recent progress can promote our understanding of ULF waves' impact on the cold particles, and let the science community realize the potential research value of ULF waves in the dynamics of cold plasma environment.

Nonlinear drift resonance between electrons and ULF waves under the convection electric field

*Li Li[1,2], Yoshiharu Omura[2], Xuzhi Zhou[1]

1. Peking Univ., 2. Kyoto Univ.

In the Earth's inner magnetosphere, charged particles can be accelerated and transported by ultralow frequency (ULF) waves via drift resonance. We study the effects of the convection electric field on the nonlinear drift resonance process, which provides an inhomogeneity factor defined as the ratio of the driving amplitude to the square of the pendulum trapping frequency. The factor varies with magnetic local time and oscillates quasi-periodically at the particle drift frequency, which can externally drive the pendulum equation that describes the particle motion in the ULF wave field. To better understand the particle behavior governed by the driven pendulum equation, we carry out simulations to obtain the evolution of electron distribution functions in energy and L-shell phase space. We find that resonant electrons can remain trapped by the low-*m* ULF waves under strong convection electric field, whereas for high-*m* ULF waves, the electrons trajectories can be significantly modified. More interestingly, the electron drift frequency is close to the nonlinear trapping frequency for intermediate-*m* ULF waves, which result in chaotic motion of resonant electrons. These findings provides improved understanding of the nature of coherent and diffusive transports of particles in the inner magnetosphere.

[P-EM19] Dynamics of the Inner Magnetospheric System

convener:Kunihiro Keika(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Aleksandr Y Ukhorskiy(Johns Hopkins University Applied Physics Laboratory), Yoshizumi Miyoshi(Institute for Space-Earth Environmental Research, Nagoya University), Lynn M Kistler(University of New Hampshire Main Campus)

The inner magnetosphere is highly variable because dynamical
variations of incoming energy from the solar wind, magnetospheric tail,
and the ionosphere. Cross-regional/cross-scale/cross-energy couplings
are key processes to understand this dynamical system, and coordinated
observations by multi-satellites and ground-based observations are
very essential to reveal these processes. In the 24th solar cycle,
a number of satellites such as Van Allen Probes, MMS, THEMIS, DSX and
Arase, coordinated ground-based observations (THEMIS-GBO, SuperDARN,
EISCAT, magnetometers, riometer, etc), and numerical simulations
(global kinetic model, MHD model, micro PIC, hybrid simulations) have
successfully investigated the inner magnetosphere system. Papers on recent results
on the inner magnetosphere and/or its coupling with the other regions,
including the ionosphere and the outer magnetosphere are invited. And
presentations on new projects for the inner magnetosphere are also
welcome.

The near-Earth radiation environment is a force to contend with when designing satellites and their instruments. Solar storms can accelerate and transport energetic particles closer to Earth, populating Earth’ s radiation belts and increasing a satellite’ s radiation dosage. A major application to the field of space weather is therefore knowing and understanding the near-Earth radiation environment. We use Van Allen Probe MagEIS and REPT data throughout mission lifetime to look at electron fluxes at different energies, pitch angles, and L shells, creating a daily average flux model that can be used to deduce what fluences were observed by any satellite that flew within Van Allen Probe’ s seven-year mission. We supplement Van Allen Probe fluxes with THEMIS statistical fluxes at higher L shells. This model can be applied to better understand satellite degradation issues related to the radiation environment. It is an improvement from previous empirical models in this regard by virtue of the fact that actual fluxes from a specific storm (or storms) can be deduced and compared to real satellite degradation data.

Precipitation of energetic electrons from the outer radiation belt (ORB) affects significantly the ionosphere and the upper atmosphere at middle to high latitudes. The precipitations result from effective acceleration and scattering of ORB electrons due to intense substorm and wave activity. The dynamics of electrons during magnetic storms on the late declining phase of the current 24th solar cycle (the years 2017 –2019) was investigated using experimental data acquired from joint Taiwan-Japan Arase/ERG mission, the high-apogee spacecraft of low inclination, and by a fleet of low-Earth’ s orbit sun-synchronous NOAA POES satellites. The fluxes of precipitating electrons measured by POES at low heights and high latitudes are compared with those measured in the heart of ORB by Arase/ERG satellite in order to determine the electron sources and losses at different stages of magnetic storms.

Plasmaspheric hiss is an important whistler-mode emission shaping the Van Allen radiation belt environment. How the plasmaspheric hiss waves are generated, propagate, and dissipate remains under intense debate. With the five spacecraft of Van Allen Probes, Exploration of energization and Radiation in Geospace (Arase), and Geostationary Operational Environmental Satellites missions at widely spaced locations, we present here the first comprehensive observations of hiss waves growing from the substorm-injected electron instability, spreading within the plasmasphere, and dissipating over a large spatial scale. During substorms, hot electrons were injected energy-dispersively into the plasmasphere near the dawnside and, probably through a combination of linear and nonlinear cyclotron resonances, generated whistler-mode waves with globally drifting frequencies. These waves were able to propagate from the dawnside to the noonside, with the frequency-drifting feature retained. Approximately 5 hr of magnetic local time away from the source region in the dayside sector, the wave power was dissipated to e^{-4} of its original level.

Propagation characteristics of whistler-mode chorus waves in the outer radiation belt deduced from the Arase PWE observation

*Satoshi Kurita[1], Yoshizumi Miyoshi[1], Yoshiya Kasahara[2], Hirotsugu Kojima[3], Shoya Matsuda[4], Ayako Matsuoka[4], Iku Shinohara[4]

1. Institute for Space-Earth Environmental Research, Nagoya University, 2. Information Media Center, Kanazawa University, 3. Research Institute for Sustainable Humanosphere, Kyoto University, 4. ISAS/JAXA

Whistler-mode chorus is electromagnetic waves in nature observed in the frequency range from 0.1 to 0.8 times of electron gyrofrequency, fce, and they frequently appear in the dawn and noon side magnetosphere. Chorus waves often have a gap of wave power at 0.5 fce, and the waves below and above 0.5 fce are called lower-band (LBC) and upper-band chorus (UBC), respectively. These waves has been considered as the primary driver of the electron dynamics in the Earth’ s inner magnetosphere, since they can resonate with electrons in the wide energy range and cause the acceleration and loss of the electrons. Characteristics of the waves such as the wave normal angle, wave power, and their latitudinal distributions are of interest since these parameters strongly control the time scale for acceleration and loss of electrons. The characteristics of LBC was investigated by using the 11 year Cluster measurements [Santolik et al., 2014], while those of UBC has not been well clarified yet. In this study, we investigate characteristics of both LBC and UBC observed by the Arase satellite using the data processed by Onboard Frequency Analyzer (OFA), which is one of the receivers of the Plasma Wave Experiment (PWE). OFA computes power spectral density of wave electric and magnetic fields in the frequency range from 64 Hz to 20 kHz, and spectral matrices of the electric and magnetic fields are also provided. Applying the singular value decomposition technique [Santolik et al., 2003] to the magnetic spectral matrix computed by OFA, we derive occurrence frequency distributions of wave normal angle and wave magnetic field power as a function of magnetic latitudes. The parameters of LBC and UBC are separately analyzed, and we also classify the magnetic local time of the wave observations into dayside and night side. In the presentation, we will show the latitudinal distributions of wave normal angle of LBC and UBC and discuss the different propagation characteristics between LBC and UBC. We also represent latitudinal wave magnetic field power distributions to discuss the propagation effect on the wave power, that is, convective growth and damping of LBC and UBC. We will also discuss day/night difference of the parameters between LBC and UBC.

To understand the global characteristics of electromagnetic ion cyclotron (EMIC) waves in the magnetosphere, we performed a statistical study of EMIC wave properties waves based on the Van Allen Probes (RBSP) and Exploration of energization and Radiation in Geospace (ERG) observations in 2017-2018. Our previous study found significant dependencies of EMIC wave distributions on geomagnetic conditions. H-band EMIC waves outside the plasmasphere had two peak occurrence regions at 10-14 MLT at L˜7-8 during the recovery phase and at 4-8 MLT at L>8 during the non-storm intervals. He-band EMIC waves inside the plasmasphere were dominantly observed at 10-20 MLT during the main phase. In this study, we focus on EMIC wave properties and discuss possible drivers of EMIC wave excitation depending on geomagnetic conditions. In preliminary results by RBSP, we found that the wave powers of He-band EMIC waves are strongly enhanced during the disturbed intervals, while H-band EMIC waves have no significant wave power variations under different conditions. The other two properties (polarization and wave normal angle) showed no clear tendencies among geomagnetic activities. He-band EMIC waves were predominantly observed with left-hand polarization and higher wave normal angles, while H-band EMIC waves showed a mixture of left-hand and linear polarizations with lower wave normal angles. From these observations, we suggest that energetic particle input is the major free energy source of intense He-band EMIC waves at which the cold and dense plasma dominates. Under this condition, the growth rate of EMIC waves can have a maximum at lower frequency regions and they easily excite with strong wave power. We will combine ERG observations to extend spatial coverage up to L=12 and higher magnetic latitudes, in order to understand the generation and propagation effects on EMIC wave properties in the magnetosphere.

Theoretical and simulation studies suggest that the EMIC waves with various frequency changes are generated through the nonlinear wave particle interaction with the energetic protons. The nonlinear EMIC emissions with are studied by the Arase satellite data analysis in the Earth’ s inner magnetosphere. Wave-particle interaction analysis (WPIA) method which calculate the inner product between the electromagnetic fields and the particle velocities and their phase differences has been developed to show the direct evidence of the energy transfer between the plasma waves and particles. We apply the WPIA method for the EMIC rising tone emissions observed by Arase satellite on 11th Dec. 2017. We perform parametric analyses on the energy and pitch angle of the particles to identify the region causing the efficient energy transfer with the EMIC waves in the proton distribution function. We also show statistical errors which come from the ion particle detector (LEP-i). The errors from the counting statistics and the ambiguity of the looking direction of the ion detectors are estimated. We estimate the minimum integral time in the WPIA method with which we can neglect the counting statistics. The bootstrap method, one of the Monte-Carlo method, is employed to estimate the random sampling errors in the looking direction considering the azimuthal and elevation angle response obtained in laboratory experiments. We discuss significance of the energy transfer by calculating the confidence interval of the WPIA results.

[P-EM19] Dynamics of the Inner Magnetospheric System

convener:Kunihiro Keika(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Aleksandr Y Ukhorskiy(Johns Hopkins University Applied Physics Laboratory), Yoshizumi Miyoshi(Institute for Space-Earth Environmental Research, Nagoya University), Lynn M Kistler(University of New Hampshire Main Campus)

The inner magnetosphere is highly variable because dynamical
variations of incoming energy from the solar wind, magnetospheric tail,
and the ionosphere. Cross-regional/cross-scale/cross-energy couplings
are key processes to understand this dynamical system, and coordinated
observations by multi-satellites and ground-based observations are
very essential to reveal these processes. In the 24th solar cycle,
a number of satellites such as Van Allen Probes, MMS, THEMIS, DSX and
Arase, coordinated ground-based observations (THEMIS-GBO, SuperDARN,
EISCAT, magnetometers, riometer, etc), and numerical simulations
(global kinetic model, MHD model, micro PIC, hybrid simulations) have
successfully investigated the inner magnetosphere system. Papers on recent results
on the inner magnetosphere and/or its coupling with the other regions,
including the ionosphere and the outer magnetosphere are invited. And
presentations on new projects for the inner magnetosphere are also
welcome.

The energetic electron content in the Van Allen radiation belts surrounding the Earth can vary dramatically on timescales from minutes to days, and these strong electron fluxes present a hazard for spacecraft traversing the belts. Electron dynamics in the belts is governed by various competing acceleration, transport and loss processes in which wave-particle interactions play an important role. The response of the belts to solar wind driving is yet largely unpredictable. We investigate here the response of outer radiation belt electron fluxes to driving by sheath regions preceding interplanetary coronal mass ejections and the associated wave activity in the inner magnetosphere. To employ the energy and radial distance resolved electron flux measurements of the Van Allen Probes, we consider events from 2012 to 2018. We perform a statistical study of the events using superposed epoch analysis, where the sheaths are superposed separately from the ejecta and are resampled to the same average duration. Our results show that the ULF wave power in the Pc5 and EMIC range, as measured by geostationary GOES satellites, peaks in the sheath and declines during the ejecta. On the other hand, chorus wave power (measured by Van Allen Probes) stays at about the same level during the sheath and ejecta despite on average stronger geomagnetic activity during the ejecta. The electron fluxes are primarily enhanced at source (tens of keV) and seed (hundreds of keV) energies throughout the outer belt, whereas depletion events are more common at MeV energies at larger radial distances. Depletion progresses to lower energies with increasing radial distance from the Earth. Geoeffective events, defined by the SYM-H index, result in enhancement and depletion of the outer belt electron fluxes more often than events that do not drive strong geomagnetic activity. Additionally, case studies of electron phase space density shed light on the dominating belt processes during sheath events.

Electron fluxes interacting with localized oblique whistler mode waves in the Earth’s outer radiation belt

*Yikai Hsieh[1], Yuko Kubota[1], Yoshiharu Omura[1]

1. Reserach Institute for Sustainable Humanosphere, Kyoto University

Oblique whistler mode waves are observed frequently in dayside and dawnside of the Earth’s magnetosphere around the outer radiation belt. Through the nonlinear trapping, by coherent chorus waves, energetic resonant electrons (tens keV) can be accelerated rapidly and become relativistic electrons (a few MeV). Electron acceleration of velocity perpendicular to the background magnetic field of resonant electrons plays an important role in both cyclotron and Landau resonances. Green’s functions are treated as the results of wave-particle interactions between the target waves and the given electrons. We build up a database of Green’s functions for a large number of electrons interacting with oblique whistler mode chorus emissions. The formation processes of the outer radiation belt electron fluxes interacting with consecutive chorus emissions are traced by applying the convolution integrals for the Green’s functions. We trace the evolution of the radiation belt electron fluxes for a few minutes and find that MeV electrons are generated promptly due to the combination of cyclotron resonance and Landau resonance with oblique chorus waves. We compare the formation processes among waves with different wave normal angles, and the results show that chorus waves with larger wave normal angles can accelerate 10-30 keV electrons to MeV faster. We further trace the formation processes of MeV electron fluxes for oblique chorus emissions localized in longitude for an hour, and then compare the results among several different longitudinal ranges. The acceleration rate of electrons is highly related to the longitudinal range of chorus occurrence.

Deformation of electron pitch angle distributions by Upper Band Chorus: Numerical verification for Arase observations

*Shinji Saito[1], Satoshi Kurita[2], Yoshizumi Miyoshi[2]

1. National Institute of Information and Communications Technology, 2. ISEE, Nagoya Univ.

Arase satellite observed deformation of electron pitch angle distributions associated with upper band whistler chorus waves. The observation showed that time scale of the deformation is too fast to be described by quasi-linear theory. It suggests that assumption applied to quasi-linear theory, which is broad wave spectrum with random phase and linear correlation of diffusion coefficients with wave power, is not a dominant process in the electron scattering. To study the deformation of electron pitch angle distributions by observed upper band whistlers, we have done GEMSIS-RBW simulations with realistic physical parameters observed by Arase satellite during the event (2017/4/8 19:20:17 - 19:20:49). We compare simulation results with data obtained from Medium Energy Particle experiment-electron analyzer (MEP-e) on Arase satellite during the time interval. We will show numerical results of electron scattering process by upper band whistlers, and discuss contribution of non-diffusive electron scattering process to the deformation of electron pitch angle distributions.

The Earth's radiation belt exhibits a dramatic variation during the active condition of the magnetosphere such as magnetic storms. The dynamic variation of the radiation belt is, in part, contributed by various wave-particle interactions, including: (1) the radial diffusion of electrons driven by ultra-low-frequency (ULF) waves in Pc5 frequency ranges (1.6-6.7 mHz) and (2) the local acceleration caused by wave-particle interactions between whistler-mode chorus waves and radiation belt particles. Over the past decade, multi-point observations have separately shown the evidence for the contribution of ULF and whistler-mode chorus waves to the relativistic electron flux enhancement. However, the relative contribution of ULF and whistler-mode chorus waves has not been extensively studied yet. In this study, we aim to address (1) when and where ULF and whistler-mode chorus waves contribute to the radiation belt dynamics and (2) what affects the wave growth.

We first investigate the temporal contribution of both waves to the relativistic electron flux enhancement during a specific magnetic storm. The target event is 27 May 2017 storm, which is triggered by coronal mass ejections. Both Arase (post-midnight) and Van Allen Probe (RBSP)-B (dusk) show global enhancement of ULF waves during the early recovery phase, which corresponds to the global increase of relativistic electron fluxes. Observed whistler-mode chorus waves are also enhanced, but their activity is small than the ULF wave activity. On the other hand, observed whistler-mode chorus waves are enhanced later on, during the late recovery phase when relativistic electron fluxes significantly increase around L~3.5–4, while ULF wave activity is weak. The large electron anisotropy at an energy level of ~20–50 keV is seen only during the late recovery phase.

To understand the spatial contribution of ULF and whistler-mode chorus waves, we perform Comprehensive Ring Current Model (CRCM) coupled with Block-Adaptive-Tree Solar-Wind Roe-Type Upwind Scheme (BATS-R-US) simulation. The simulation qualitatively reproduces the global evolution of ULF waves during the May 2017 storm. The estimated electron anisotropy is large at the energy of 10–40 keV, which is consistent with observations. The global distribution shows that the electron anisotropy is large in the dawn sector during the main phase. We find that the area where the electron anisotropy is large shifts toward dusk during the early and late recovery phases. Comparison between the simulation and observations indicates that eastward-drifting electrons excite whistler-mode chorus waves in the dusk sector. We will further discuss what affects the wave growth, i.e., the effect of magnetic field curvature.

We simulate dynamics of the energetic electron distributions and the plasmasphere with the RAM-SCB simulation during magnetic storms, which calculates evolution of the electron distribution function and density of the thermal plasma with a self-consistent magnetic field. In the simulation of the March 2017 and September 2017 storms, we compare the simulated electron flux and thermal plasma density with the data from LEPe/MEPe/HEP/XEP and PWE/HFA. The RAM-SCB simulation reproduces successfully the observed variations of energetic electrons, such as, injections and subsequent energy dispersion spectra of electrons. Using the simulated distribution functions and the ambient density and magnetic field, we also calculate the linear-growth rate of whistler mode waves and compare them with the plasma wave observation data obtained by Arase. We also conduct a code-coupling simulation that consists of RAM-SCB and the self-consistent electron hybrid simulation as well as GEMSIS-RBW test particle simulations for wave-particle interactions.

Department of Advanced Environmental Science and Engineering, Faculty of Engineering Sciences, Kyushu University, Japan, 4. International Center for Space Weather Science and Education (ICSWSE), Kyushu University, Japan

In this research, we are studying proton flux variations in the inside the South Atlantic Anomaly (SAA) due to the inductive electric field computed by the time-varying background magnetic field provided by Tsyganenko model (TS05) during geomagnetic storm event of May 15, 2005. We have developed a 3D relativistic test particle simulation code using a guiding center theory, where the Tao-Chan-Brizard model was implemented. It is well-known that the South Atlantic Anomaly (SAA) is considered as a source of hazardousness for Low-Earth Orbit (LEO) environment. The objective of this investigation is to compute the proton flux variations in this critical zone to be able to estimate the corresponding radiation doses on spacecraft bodies, due to their passage inside the anomaly, and precisely, during intense geomagnetic storms. So far, it was found that during the main storm phase, the proton flux in the SAA varied greatly with respect to altitude and the protons could penetrate deeper toward the atmosphere by about 100 km. Numerical results were compared with satellite observations.

[P-EM20] Recent Advances in Ionosphere Observation and Modeling through New Observation Opportunities

convener:CHIYEN LIN(Center for Astronautical Physics and Engineering, National Central University, TAIWAN), Yen-Jung Wu(Space Sciences Laboratory, University of California, Berkeley), Yang-Yi Sun(China University of Geosciences), Charles Lin(Department of Earth Sciences, National Cheng Kung University)

Rapid developments in space technology are advancing our understanding of ionospheric space weather by increasing a great number of ground- and space-based observations over the recent decades. In the ground segment, the dense ground-based GNSS networks, radars, and airglow instruments have greatly extended the observational coverages. In the space segment, the extraordinary satellite missions, such as FORMOSAT-7/COSMIC-2, ESA-SWARM NASA-ICON and -GOLD, providing a variety of observations all over the world such as airglow, temperature, neutral winds, current, ion drifts, plasma density that contribute to the understanding of middle and upper atmospheric dynamics. Increasing ground based observations are also important for coordinations with these satellite missions.
With the large amount and diversity of datasets, theoretical and empirical models can be validated, and implemented for inclusion of new thermosphere and ionosphere phenomena. Furthermore, remarkable breakthrough of data assimilation techniques advances the ionosphere monitoring and forecast.
The purpose of this session is to solicit studies providing observations, theoretical and empirical modeling and data assimilation on the multiple scales of ionospheric phenomena, from global morphology to small-scale irregularities and traveling ionospheric disturbances. Studies from magnetically quiescent to storm conditions as well as influences from lower atmosphere will also be solicited.

A sudden stratospheric warming (SSW) is an extreme wintertime meteorological phenomenon occurring mostly over the Arctic region. Studies have shown that an Arctic SSW can influence the whole atmosphere including the ionosphere. In September 2019, a rare SSW event occurred in the Antarctic region, following strong wave-1 planetary wave activity (see attached figure). The event provides an opportunity to investigate its broader impact on the upper atmosphere, which has been largely unexplored in previous studies. Ionospheric data from ESA's Swarm satellite constellation mission show prominent 6-day variations in the dayside low-latitude region during the SSW, including 20-70% variations in the equatorial zonal electric field, 20-40% variations in the electron density, and 5-10% variations in the top-side total electron content. These ionospheric variations have characteristics of a westward-propagating wave with zonal wavenumber 1, and can be attributed to forcing from the middle atmosphere by the Rossby normal mode “quasi-6-day wave” (Q6DW). Geopotential height measurements by the Microwave Limb Sounder aboard NASA's Aura satellite reveal a burst of global Q6DW activity in the mesosphere and lower thermosphere at this time, which is one of the strongest in the record. These results suggest that an Antarctic SSW can lead to ionospheric variability by altering middle atmosphere dynamics and propagation characteristics of large-scale waves from the middle atmosphere to the upper atmosphere.

Recent Insights into the Thermosphere-Ionosphere Response to External Forcing from the Global-scale Observations of the Limb and Disk (GOLD) Mission

*Richard Eastes[1]

1. Laboratory for Atmospheric and Space Physics

Observations by the GOLD mission are able to follow spatial and temporal changes in the composition, density and temperature of Earth’ s thermosphere, providing fundamental information for understanding the Thermosphere-Ionosphere system. GOLD images the Earth from geostationary orbit at 47.5 degrees W longitude, observing on a 30-minute cadence from 06:10 to 0:40 UT (03:00-21:3 LT at the satellite). The observations performed include limb scans; stellar occultations; and images the sunlit and nightside disk. These data provide simultaneous, synoptic daytime imaging of the composition and temperature near 160 km for the first time. Repeated observations of peak densities in the low-latitude, nighttime equatorial ionization anomaly (EIA) and the depletions within it also provide a new perspective on that region. These observations are providing significant tests of current models, tests that may lead to advances in the capabilities of global-scale models of the thermosphere and ionosphere system. Observations also clearly indicate the presence of waves in the thermosphere. There are also clear indications of waves and tides propagating from lower altitudes. Examples of these observations, as well as their potential for advancing models of the thermosphere-ionosphere system, will be presented and discussed.

Comparing Equatorial Plasma Irregularities across Scale Sizes with GOLD and COSMIC

*Jeffrey Klenzing[1], Alexa Jean Halford[1], Jonathon Smith[1,2], Carlos Martinis[3]

1. NASA Goddard Space Flight Center, 2. Catholic University of America, 3. Boston University

Near the geomagnetic equator, large depleted plumes of plasma (whimsically referred to as “bubbles”) can form when bottomside ionospheric plasma is lifted up hundreds of kilometers, piercing through the ionospheric layer. This uplift is caused by a Rayleigh-Taylor instability in the bottomside ionosphere, which can grow over the course of several hours. These meso-scale structures (10s to 100s of km) can lead to the formation of fine-scale (10s to 100s of m) plasma irregularities in the vicinity of large plasma density gradients. These smaller scale structures are important because they are of the right scale size to interfere with GPS signals. This study will compare the formation times of the meso-scale bubbles from space-borne airglow images from GOLD with the fine-scale S4 measurements from the COSMIC spacecraft.

Multi-scale Ion Composition and Plasma Density Irregularities: Swarm-E Observations in the Topside Ionosphere

*Andrew W Yau[1]

1. University of Calgary

We present new simultaneous observations of both ion composition and plasma density variations in the topside ionosphere (325-1500 km altitude) using high sampling-resolution measurements from the Swarm-E (e-POP) ion mass spectrometer in the first 6 years of the mission (2013-2019). A statistical study of these observations reveals the frequent occurrences of multi-scale enhancements of heavy and minor ion composition in the topside auroral ionosphere during magnetic storms and substorms, as well as the corresponding occurrences of small-scale plasma density irregularities down to spatial scales of tens of meters. We compare and correlate the occurrence distributions and morphological characteristics between the two (composition enhancement and irregularities), and discuss the implications of the observed distributions on ionosphere-magnetosphere coupling.

The variation of the ionospheric electron density associated with active lightning

Yu-Cheng Lin[1], *Alfred Bing-Chih Chen[1], Chiawen Chuang[1]

1. National Cheng Kung University

Existing literature studies show that the thunderstorm generated in the troposphere is capable to disturb the ionospheric electron density by gravity waves generated in deep convections, or the change of the quasi-electrostatic field associated with sprites, or the direct heating of the electromagnetic pulses. The contribution of the above processes can be investigated by the variation of the ionospheric electron density above the thunderstorm regions at or after the lightning active time above thunderstorms. Unfortunately, the occurrence of lightning is unpredictable and irregular. Hence, it is difficult to study this variation by a direct and programmed measurement on the electron density above thunderstorms.

In this work, the long-term lightning activity monitored by the world-wide lightning location network (WWLLN) and the electron density profiles observed by COSMIC are employed to explore the electron density variation above the thunderstorms at their active time. The lightning active periods and regions were identified from 2006 to 2017 globally. Furthermore, the corresponding electron density profiles were extracted from the COSMIC database to exams the discrepancy respected to the density profiles at quiet time. Therefore, the variations of the ionospheric electron density caused by lightning can be assessed quantitatively in time, space and height. The results of this study indicate the elevation of the electron density by dense lightning activity is statistically significant, and the response time is less than 30 minutes. The diurnal vibration of the lightning and electron density elevation is also investigated and presented in this paper.

Global distribution of persistence of total electron content anomaly

*Yang-Yi Sun[1], Chieh-Hung Chen[1], JANN-YENQ Liu[2]

1. China University of Geosciences (Wuhan), 2. National Central University

Solar activities can disturb the ionosphere globally and induce ionospheric weather phenomena that transit rapidly through a large area. By contrast, sometimes the ionospheric plasma density can remain high or low over a certain location for a few days, which are difficult to be attributed to solar activities. This study shows the location preference of the positive and negative total electron content (TEC) anomalies persisting continuously longer than 24 hours (cross the two terminators) at middle and low latitudes (within ±60ºN geomagnetic latitudes). The TEC is obtained from the global ionospheric map (GIM) of the Center for Orbit Determination in Europe (CODE) under the geomagnetic quiet condition of Kp less than 3o during the period of 2005–2018. There are a few (less than 4%) TEC anomalies that can persist over 24 hours. The persistence of the positive TEC anomaly along the ring of fire on the western edge of the Pacific Ocean. The high persistence of the TEC anomalies at midlatitudes suggests that thermospheric neutral wind contributes to the anomaly formation. The temporal and spatial anomalies of the ionospheric electric field, atmospheric electric field (flash), atmospheric gravity wave, and neutral wind over the ring of fire should be further examined for explaining whether the persistence of the TEC anomalies associates with lithospheric activities.

[P-EM20] Recent Advances in Ionosphere Observation and Modeling through New Observation Opportunities

convener:CHIYEN LIN(Center for Astronautical Physics and Engineering, National Central University, TAIWAN), Yen-Jung Wu(Space Sciences Laboratory, University of California, Berkeley), Yang-Yi Sun(China University of Geosciences), Charles Lin(Department of Earth Sciences, National Cheng Kung University)

Rapid developments in space technology are advancing our understanding of ionospheric space weather by increasing a great number of ground- and space-based observations over the recent decades. In the ground segment, the dense ground-based GNSS networks, radars, and airglow instruments have greatly extended the observational coverages. In the space segment, the extraordinary satellite missions, such as FORMOSAT-7/COSMIC-2, ESA-SWARM NASA-ICON and -GOLD, providing a variety of observations all over the world such as airglow, temperature, neutral winds, current, ion drifts, plasma density that contribute to the understanding of middle and upper atmospheric dynamics. Increasing ground based observations are also important for coordinations with these satellite missions.
With the large amount and diversity of datasets, theoretical and empirical models can be validated, and implemented for inclusion of new thermosphere and ionosphere phenomena. Furthermore, remarkable breakthrough of data assimilation techniques advances the ionosphere monitoring and forecast.
The purpose of this session is to solicit studies providing observations, theoretical and empirical modeling and data assimilation on the multiple scales of ionospheric phenomena, from global morphology to small-scale irregularities and traveling ionospheric disturbances. Studies from magnetically quiescent to storm conditions as well as influences from lower atmosphere will also be solicited.

The ability to perform whole atmosphere data assimilation in the Whole Atmosphere Community Climate Model with thermosphere-ionosphere eXtension (WACCMX) is implemented using the Data Assimilation Research Testbed (DART) ensemble adjustment Kalman filter. This presentation primarily focuses on the recent implementation of the assimilation of ground-based Global Navigation Satellite System (GNSS) total electron content (TEC), and Constellation Observing System for Meteorology, Ionosphere, and Climate (COSMIC) radio occultation (RO) observations. The effectiveness of assimilating ground-based GNSS TEC and COSMIC RO observations in constraining the ionosphere is first demonstrated through a set of Observation System Experiments (OSEs). The OSE results demonstrate that the assimilation of the ionosphere observations results in a reduction of the bias in the ionosphere in both the analysis fields and short-term forecasts. Using the 2009 sudden stratospheric warming (SSW) as a case study, results are also presented that demonstrate the value of simultaneously assimilating observations in the lower-middle atmosphere (0-100 km) and the ionosphere.

COSMIC 2 Observation of Topside Ionosphere and Plasmasphere During A Substorm Event

*Qian Wu[1], William Schreiner[2], John Braun[2], Iurii Cherniak[2], Irina Zakharenkova[2], Nick Pedatella[1,2], Min-yang Chou[2]

1. National Center for Atmospheric Research, 2. COSMIC Program/UCP

The recently launched US-Taiwan joint COSMIC 2 mission offers an opportunity to view the topside the ionosphere at more local times in the equatorial region. Past observations of plasmasphere and topside ionosphere TEC are mostly from sun-synchronous satellites with fixed local times, which limited their coverages. In the early stage of the COSMIC 2 mission, satellites are at 750 km altitude with low inclination orbital angles (~ 24 deg). The mission was able to capture a substorm event and made plasmasphere observations. We observed a decrease of topside TEC, which is likely a result of plasmaspheric density depletion associated with the substorm. We will compare COSMIC 2 observed TEC to plasmapause model simulations. The model can simulate how the plasmaspheric depletion is related to the high Kp index. We will examine how the simulated Kp dependence at different local times compared to the COSMIC 2 observations. At the same time, we will show, how the ionospheric density profiles vary during the substorm

Extreme Ionospheric Response to a Minor Magnetic Storm in Deep Solar Minimum Revealed by Data Assimilation Results of FORMOSAT-7/COSMIC-2 and GNSS Total Electron Content

*Charles Lin[1], P. K. Rajesh[1], CHIYEN LIN[2], JANN-YENQ Liu[3], Chia-Hung Chen[1]

1. Department of Earth Sciences, National Cheng Kung University, 2. Center for Astronautical Physics and Engineering, National Central University, 3. Graduate Institute of Space Science and Engineering, National Central University

Global ionosphere specification (GIS) analysis results, wherein radio occultation total electron content (TEC) measurements of recently launched FORMOSAT-7/COSMIC-2 (F7/C2) constellation and ground-based global navigation satellite system TEC are assimilated, are used to examine ionospheric responses to a minor magnetic storm on 5 August 2019. The GIS gives three-dimensional global electron density specification at the top of every hour, assimilating these TEC data hourly by the Gauss-Markov Kalman filter with the initial state specified by the international reference ionosphere model. The assimilation analysis results reveal more than 300% electron density enhancements within the equatorial ionization anomaly crest, mostly appearing in the 200–300 km altitude range. Localized density enhancements are also seen to develop over the European longitude sector. The GIS outputs generated with the new low-latitude measurements by F7/C2 satellites show unexpected extreme ionosphere variations in response to a minor magnetic storm during deep solar minimum conditions when the background electron density is very low. During solar active periods, it normally requires larger geomagnetic storms to elevate the ionospheric electron density by more than 200%. The vertical ionospheric structures given by the GIS indicate the role of an enhanced fountain effect and storm-induced equatorward circulations in producing the observed positive storm responses.

Near real-time plasma irregularity monitoring by FORMOSAT-7/COSMIC-2

*Shih-Ping Chen[1], Charles Lin[1], Rajesh Panthalingal Krishnanunni[1], Richard Eastes[2], Jong-Min Choi[1]

1. Department of Earth Sciences, National Cheng-Kung University, 2. Laboratory for Atmospheric and Space Physics, University of Colorado

The global map of radio occultation scintillations is constructed by using the S4 index profiles of radio occultation (RO) observations onboard FORMOSAT-7/COSMIC-2 (F7/C2). This study provides comparisons between the RO S4 and the rate of TEC index(ROTI) in Brazil region, coherent scatter radar observation of the Jicamarca Unattended Long-term Investigations of the Ionosphere and Atmosphere(JULIA), and the airglow monitoring of Global-scale Observations of the Limb and Disk(GOLD). Result shows that the geographic location of the RO S4 and ground-based observed irregularities are highly correlated, and the bottom side boundary of the EPBs is the major source of strong occultation scintillations in F-region.

FORMOSAT-7/COSMIC-2 (FS-7/C-2), with the mission orbit of 550 km altitude, 24-deg inclination, and a period of 97 minutes, was launched on June 25, 2019. Tri-GNSS Radio occultation (RO) Receiver System (TGRS), Ion Velocity Meter (IVM), and RF Beacon (RFB) onboard FS-7/C-2 six small satellites allow scientists to observe the plasma structure and dynamics in the mid-latitude, low-latitude, and equatorial ionosphere. Measurements of FS-7/C-2 RO and IVM, as well as those of global ground-based GNSS receivers and other satellites, such as FORMOSAT-5/AIP, DMSP, etc. are used to study and have a better understanding of wavenumber-4 (Wave-4) and plasma depletion bays (PDBs).

Space Weather Products of FORMOSAT-7/COSMIC-2: Global Ionospheric Specification and Aided Abel Electron Density Profile

*CHIYEN LIN[1,2], Charles Lin[3], JANN-YENQ Liu[1,2], P. K. Rajesh[3], MINYANG CHOU[4], Ho-Fang Tsai[3]

1. Center for Astronautical Physics and Engineering, National Central University, 2. Institute of Space Science and Engineering, National Central University, 3. Department of Earth Sciences, National Cheng Kung University, 4. University Corporation for Atmospheric Research

FORMOSAT-7/COSMIC-2 (F7/C2) satellite mission was launched on 25 June 2019 and 6 satellites will deploy to the different operational orbital planes with an inclination of 24 degree and 550 km altitude height. Six satellites can provide thousands radio occultation (RO) observation events per day to observes the ionosphere. This study demonstrates two space weather data products based on F7/C2 RO sounding: Global Ionospheric Specification (GIS) electron density structure and Ne-Aided Abel electron density profile. GIS is the ionospheric data assimilation product based on the Gauss-Markov Kalman filter to assimilate the slant total electron content observed from ground-based GPS receiving stations and space-based RO instrumentations into background model to provide the continuity ionospheric three-dimensional electron density distribution. With horizontal and vertical ionospheric information obtained from ground- and space-based measurement, this data product can study large-scale ionospheric structural variation. On the other hand, the Ne-aided Abel inversion implement three-dimensional time-dependent electron density based on the climatological maps constructed from previous RO observations, which has an advantage of providing altitudinal information on the horizontal asymmetry, can reduce the error of spherical symmetry assumption in Abel inversion. In this study, observing simulation system experiment is conducted to estimate the accuracy and validation with ionosonde observation is applied to proof reliability. Comparing with typical Abel electron density profile, the Ne-aided Abel inversion can mitigate the artificial plasma caves in the daytime E-region. Moreover, GIS is also used to reconstruct the ionospheric variation during the September 27, 2019 minor geomagnetic storm.

The NASA Ionospheric Connection Explorer (ICON) mission carries a complement of 3 remote sensing instruments and an in-situ plasma instrument to explore the interaction of Earth’ s atmosphere with its plasma environment, with coverage from the boundary of space at 95 km to the altitude of maximum ionospheric plasma density. Launched in October of 2019 into a 27º 600-km circular orbit, it is now possible to report the first results from the mission. All of the instruments are working as planned, providing all of the expected calibrated data to support 6 retrieved products: cardinal neutral winds, neutral temperatures, daytime neutral composition, daytime and nighttime ionospheric density profiles, and in-situ plasma drifts and density. Intercomparison of these measurements show the varying physical connections between the atmosphere and the ionosphere, and allow researchers to understand the causes of the large day-to-day variability in the conditions in near-Earth space.

The NASA Ionospheric Connection Explorer (ICON) was launched in October 2019 to study the connection between terrestrial weather and space weather. One of the four science instruments is the Far-Ultra-Violet (FUV) Instrument. This Spectrographic Imager collects (altitude) limb view vertical profiles of the 135.6 nm emission from atomic oxygen and part of the molecular nitrogen Lyman-Birge-Hopfield band emission around 157 nm. These measurements are used to constrain models of the atomic oxygen to molecular nitrogen altitude profiles, their mixing ratio and the ionospheric density at the dayside, along with the ionospheric density on the nightside. We will present first results of the investigation into the variability of dayside ionospheric composition and night side density that have been obtained during the first half year of the ICON science mission.

Spatial-structure of mid-latitude sporadic-E episodes revealed by L-band ALOS/PALSAR InSAR observations

*Masato Furuya[1], Natsu Takaki

1. Department of Earth and Planetary Sciences Hokkaido University

Maeda et al (2016, GRL) reported the detection of mid-latitude sporadic E event in Japan, using both GNSS TEC and L-band InSAR observations. Subsequently, Furuya et al (2017, EPS) applied split-spectrum method to the InSAR data, which allowed to virtually perform dual-frequency radar observations and to separate the signals into ionospheric dispersive and (tropospheric) non-dispersive components. Based on the small-scale non-dispersive phases that were spatially correlated with the dispersive phases, Furuya et al (2017) interpreted that the correlations might indicate the presence of nitric oxide (NO) generated by the reactions of metals, Mg and Fe, with nitric oxide ion (NO+).
The sporadic E events reported in the two reports were rather large in terms of their enhanced TEC as well as spatial scale. As such, they could be detected by Japanese nationwide GNSS network (GEONET). Meanwhile, moderate- to smaller-sized sporadic E episodes are even more difficult to detect by traditional ionosonde and GNSS/TEC observations, because the spatial scales are expected to be smaller. Here we report our detetion of moderate-sized sporadic-E episodes, using Japanese L-band ALOS/PALSAR InSAR observations that enable us to examine the fine spatial structure with spatial resolutions on the order to less than 100 meters. Also, applying the split-spectrum method to the InSAR images, we have again found the presence of dispersive and non-dispersive phases that are spatially correlated with each other.

Global Rate of TEC Index (ROTI) Observed by Ground-Based GPS TEC in 2009 and 2013

*Shih An Wu[1], JANN-YENQ Liu[1]

1. Institute of Space Science, National Central University, Taiwan

Routine observations of the ionospherically imposed propagation effects upon GPS satellite signals are available online from Scripps Orbit and Permanent Array Center (SOPAC). With over 1500 ground-based stations now reporting data, ionospheric studies ranging from the analysis of single-site observations to the full global network have demonstrated the geophysical science yield possible from this remarkable resource. This study examines the standard deviation of TEC (total electron content) variations in a 10-minute interval to find the rate of TEC index (ROTI) around the receiving station on the ground. Results show that prominent ROTIs appear in the low-latitude ionosphere, plus and minus 30-degree dip, which begin at 1900 LT, reach their maximum at 2000-2100 LT, and vanish by about 2400 LT, especially in spring and autumn. A comparison shows that variations of ROTI well agree with S4 scintillations observed by FORMOSAT-3/COSMIC.

Design and Preliminary Results for Ionosphere Photometer on FengYun-3(D) Meteorological Satellite

*Liping Fu[1], Fang Jiang[1], Tian Mao[2], Nan Jia[1], Tianfang Wang[1], Ruyi Peng[1]

1. National Space Science Center,Chinese Academy of Sciences, 2. National Satellite Meteorological Centre

Far Ultraviolet Ionospheric PhotoMeter (IPM) is a innovation optical payload on Fenyun-3(D) meteorological satellite which was launched in Nov.15,2017. IPM contributes to the space weather science objectives by providing far ultraviolet remote sensing measurements of the daytime and nighttime atmosphere/ionosphere with high sensitivity. During sunlit atmospheric conditions, IPM measure the nadir irradiation at 135.6 nm and the N2 Lyman-Birge-Hopfield(LBH) Bands to retrieve the atmospheric O/N2 ratio. In conditions of atmospheric darkness, IPM measures the 135.6 nm recombination emission of O+ ions used to compute the nighttime ionosphere F layer peak electron density (NmF2) and integrated electron content (IEC). IPM is a high sensitivity photometer with 5-channel on the filer wheel, and the incidence light pass through the channels sequentially into the photomultiplier tube (PMT). Detecting ultraviolet emissions in the presence of bright visible light is one of the most difficult challenges for Earth pointing ultraviolet instrument, the integrated visible-to-IR albedo is on the order of 10^11R , the long wavelength continuum must be reduced by at least a factor of 10^9, IPM use an innovation technology to depress and measure the stray light. In this paper, we introduce the design of the IPM and the preliminary result on orbit.

Errors from asymmetric emission rate in spaceborne, limb sounding Doppler interferometry: A correction algorithm with application to ICON/MIGHTI

*Yen-Jung Wu[1], Brian J. Harding[1], Colin C. Triplett[1], Jonathan J. Makela[2], Kenneth D. Marr[3], Christoph R. Englert[3], John M. Harlander[4], Thomas J. Immel[1]

1. Space Sciences Laboratory, University of California, Berkeley, CA, USA, 2. Department of Electrical and Computer Engineering, University of Illinois, Urbana-Champaign, IL, USA, 3. Space Science Division, U.S. Naval Research Laboratory, Washington, DC, USA, 4. Space Systems Research Corporation, Alexandria, VA, USA

The Michelson Interferometer for Global High-resolution Thermospheric Imaging (MIGHTI) on NASA's Ionospheric Connection Explorer (ICON) mission is designed to measure the neutral wind and temperature between 90 km and ~300 km altitude. Using the Doppler Asymmetric Spatial Heterodyne (DASH) spectroscopy technique, observations from MIGHTI can be used to derive thermospheric winds by measuring Doppler shifts of the atomic oxygen red line (630.0 nm) and green line (557.7 nm). Harding et al. (2017) describe the wind retrieval algorithm in detail, and point out the large uncertainties that result near the terminators and equatorial arcs, regions of large spatial gradients in airglow volume emission rates (VER). The uncertainties originate from the assumption of a constant VER at every given altitude, resulting in errors where the assumption is not valid when limb sounders, such as MIGHTI, observe regions with significant VER gradients. In this work, we introduce a new wind retrieval algorithm with the ability to account for VER that is asymmetric along the line of sight with respect to the tangent point. Using the predicted ICON orbit and simulated global VER variation, the greatest impact of the symmetric airglow assumption to the ICON vector wind product is found within 30 degrees from the terminator when the spacecraft is in the dayside, causing an error of at least 10 m/s. The new algorithm developed in this study reduces the error near the terminator by a factor of 10.

[P-EM21] Surprises from the Subauroral Zone: Synthesizing Ground and Space-Based Observations and Theory

convener:Connors Martin G(Athabasca University), Kazuo Shiokawa(Institute for Space-Earth Environmental Research, Nagoya University)

Recent studies, including some facilitated by citizen science, have shown the subauroral ionosphere to be more active than previously suspected. Unusual emissions, from SAR arcs to STEVE, indicate previously little studied physical processes in this region. Some arise from conjugacy to the radiation belts, while others have origins which remain unclear. This session attempts to stimulate synthesis of observations from different domains to address phenomena which appear difficult to explain when examined from only one of the many new sources of information about the subauroral zone. Optical observations have expanded to include those with the very high resolution of amateur DSLR cameras, yet this sporadic source is well complemented by continuous observation from the few comprehensive subauroral observatories. As ever, conjugacy with spacecraft plays an important role in assessing possible sources of precipitation or waves that may stimulate the subauroral ionosphere, and there are indeed now many space assets (RBSP, Arase, THEMIS, MMS) with footprints at least sometimes in that region. Various polar-orbiting low-altitude satellites traverse it regularly. The installation of low-latitude poleward-looking incoherent scatter radars, with large fields of view in the subauroral zone, also provides context and the ability to extract physical parameters continuously. The sometimes-extreme conditions now known to exist in the subauroral region have stimulated theory to expand the parameter range needed to explain ionospheric phenomena. We welcome contributions integrating multiple sources of observation and theoretical approaches to hopefully transform what is initially surprising into a new view of an unsuspectedly active region.

Discussion

Magnetospheric-ionosphere dynamics associated with STEVE

*Toshi Nishimura[1], Jian Yang[2], Eric Donovan[3], Vassilis Angelopoulos[4], Nozomu Nishitani[5]

1. Boston University, 2. Southern University of Science and Technology, 3. University of Calgary, 4. University of California, Los Angeles, 5. Nagoya University

We present three STEVE (strong thermal emission velocity enhancement) events in conjunction with THEMIS in the magnetosphere, and DMSP and Swarm in the ionosphere, for determining equatorial and inter-hemispheric signatures of the STEVE purple/mauve arc and picket fence. Both types of STEVE emissions are associated with SAID (subauroral ion drifts), electron heating, and plasma waves. The magnetosphere observations show structured electrons and flows, and waves just outside the plasmasphere. Interestingly, the event with the picket fence had a >keV electron structure detached from the electron plasma sheet, while the event with only the mauve arc did not have precipitation or ultra-violet emission. We suggest that the electron precipitation drives the picket fence, and heating drives the mauve emission. We further present particle transport processes in the magnetosphere and discuss how magnetosphere conditions that are favorable to STEVE occur.

Magnetosphere-Ionosphere Coupling by Alfvén Waves at Sub-Auroral Latitudes

*Robert L Lysak[1], Yan Song[1], Colin L Waters[2], Murray D Sciffer[2], Yuki Obana[3]

1. University of Minnesota, 2. University of Newcastle, 3. Osaka Electrocommunication University

Most investigations of magnetosphere-ionosphere coupling have focused on the auroral zone where strong field-aligned currents flow. The sub-auroral region, however, is a region of very low ionospheric conductivity, leading to strong plasma flows often called sub-auroral polarization streams (SAPS). This suggests that the interaction of Alfvén waves in this region may have different characteristics than this interaction in the high conductivity auroral zone. The ionospheric conductivity profile is critically important for ground observations of ultra-low-frequency (ULF) waves. At very low conductivity, Alfvén waves will be strongly damped, indicating that the ground magnetic field will be very weak. On the other hand, at high conductivity, the ionosphere can shield field-aligned currents, again producing only weak ground magnetic fields. Such behavior has been seen in statistical studies of the ground fields on the dayside (Obana et al., 2005). Simple models of this process (e.g., Yoshikawa et al., 2002; Sciffer et al., 2004) have shown that the ratio of the ground magnetic field to the incident magnetic field in the ionosphere rises to a peak as the Pedersen conductance is enhanced, but then decreases as the Pedersen conductance is increased further. This question is investigated using a three-dimensional numerical model of ULF wave propagation in the magnetosphere. These results are relevant to the relationship between ground magnetic fields and the magnetic fields measured by low-altitude orbiting spacecraft, and may assist in the understanding of magnetosphere-ionosphere coupling during the sub-auroral emission called STEVE (Strong Thermal Emission from Velocity Enhancement).

Multi-wavelength imaging observations of STEVE at Athabasca, Canada

*Sneha Yadav[1,2], Kazuo Shiokawa[1], Yuichi Otsuka[1], Martin G Connors[3], Jean-Pierre St. Maurice[4,5]

1. Institute for Space-Earth Environmental Research, 2. Space Physics Laboratory, Vikram Sarabhai Space Centre, Trivandrum, India, 3. Department of Physics and Astronomy, University of Western Ontario, London, Ontario, Canada

STEVE (Strong Thermal Emission Velocity Enhancement) is a relatively new phenomenon in the area of auroral physics. Although STEVE has been recognized by amateur night sky watchers for about a decade, it is only recently that it has drawn attention of the space physics community. STEVE is distinctly different from traditional aurora and appears as a violet and green narrow band structure spreading over thousands of kilometers in the east-west direction. The purple STEVE emission is also accompanied usually by "Picket Fence" structure which are the distinct structures of green color. In this paper, we present the first multi-wavelength observations of STEVE using an all-sky imager at Athabasca (magnetic latitude = 61.7°N), Canada. This study is based on three STEVE events which were accompanied by picket fence structures in the green-line. Although the STEVE arc was dominant in 630.0 nm, weak emissions were also found in other wavelengths including OI at 844.6 nm, Hβ, and background continuum emission at 572.5 nm. The investigation on the evolutionary characteristics of the STEVE arc in 630.0 nm reveal that it detached from the auroral oval as a faint structure and moved equatorward. Similar to the arc in 630.0 nm, the arc in the 557.7 nm also detached from the auroral oval. In addition the 557.7 arc exhibited picket fence structure at later times. The picket fence was sometimes found to persist even after the 630.0 nm arc had disappeared. Based on the horizontal component of the geomagnetic field at Fort Smith (magnetic latitude 67.28°N), we find that the STEVE arc detachment, its equatorward motion, and its brightness coincided with additional magnetic activity in the recovery phase of a substorm. One of the distinctive features of our results is the appearance of dark bands at the poleward edge of the 557.7 nm arc. These dark bands might represent the so-called "black aurora". These results indicate that STEVE is not a sole consequence of F-region heating, but particle precipitation from the inner magnetosphere and associated field-aligned currents might play an important role to trigger STEVE.

Pi2 ULF modulation of energetic electron precipitations observed by using VLF/LF transmitter signals

*Hiroyo Ohya[1], Miyashita Takuya[1], Fuminori Tsuchiya[2], Asuka Hirai[2], Mitsunori Ozaki[3], Kazuo Shiokawa[4], Yoshizumi Miyoshi[4], Nozomu Nishitani[4], Tomoaki Hori[4], Mariko Teramoto[5], Martin G Connors[6], Simon G Shepherd[7], Yoshiya Kasahara[3], Atsushi Kumamoto[2], Masafumi Shoji[4], Iku Shinohara[8], Hiroyuki Nakata[1], Toshiaki Takano[1]

1. Graduate School of Engineering, Chiba University, 2. Tohoku University, 3. Kanazawa University, 4. Nagoya University, 5. Kyushu Institute of Technology, 6. Athabasca University, 7. Dartmouth College, 8. Japan Aerospace Exploration Agency

It has been expected that ULF (ultra low frequency, 1 mHz –1 Hz) magnetic pulsations modulate the precipitation of electrons in the magnetosphere [Coroniti and Kennell, 1970]. In this process, periodic change in the local magnetic field strength due to the ULF pulsations modulates the growth rate of whistler mode chorus waves and resultant pitch angle scattering rate. That is, flux of the precipitating electrons may depend on the strength of pitch angle diffusion coefficient at the same frequency as the ULF pulsations. There have been several studies of Pc5 (1.67–6.67 mHz, the periods: 150–600 s) ULF modulation of energetic electron precipitations (EEP) in the D-region ionosphere based on ground-based riometers and X-ray observations [e.g., Brito et al., 2012]. The EEPs associated with Pi2 pulsations (40-150 s) were reported [Asnes et al., 2004]. Auroral precipitations and energetic particle flux near the equator in nightside magnetosphere occur due to Pi2 modulation [Saka et al., 1999]. Precipitation of low energy electrons below 300 eV was reported when a Pi2 pulsation with short periods (less than 40 s) occurred [Tsunomura et al., 1990]. However, there have been few reports for the ULF modulation of high energy electrons that modulate the D-region ionosphere. In this study, we investigate the D-region signatures of the modulation due to the ULF waves using a network of VLF/LF transmitter signals in North America. The transmitter signals from NLK (USA, 24.8 kHz, L = 2.88), NDK (USA, 25.2 kHz, L = 2.98) and WWVB (USA, 60.0 kHz, L = 2.26) were observed by a receiver at ATHA (Athabasca, Canada, L = 4.31). We show the first observations of oscillations in intensities and phases on the NDK-ATH and WWVB-ATH paths with periods of 3-4 minutes during a small substorm at 05:25-05:50 UT on 4 June, 2017 (AE index = 140 nT). Based on ground-based magnetic observations, there were pulsations with the same periods with the VLF/LF oscillations both at high- and low-latitudes. The ground-based H-component magnetic field variations and Doppler velocity observed by the SuperDARN (Super Dual Auroral Radar Network) HF (high frequency, 8-20 MHz here) radars showed the same periodic changes as seen in the VLF/LF oscillations, suggesting that energetic electron precipitation over the WWVB-ATHA and NDK-ATHA paths was modulated by the ULF waves. Based on the ground-based magnetic field data, we conclude that the ULF wave was the Pi2 pulsations associated with the substorm, because propagation direction of the wave was westward (66.4 km/s) from the pre-midnight sector, the magnetic variations at low latitudes were in-phase over wide longitudes, and the magnetic variations at ATHA slightly preceded those at low latitudes. Rising-tone chorus emission was observed in the frequency range of 5-6 kHz at ATHA during the VLF/LF oscillations. Pitch angle scattering by the whistler-mode chorus wave is one of possible mechanism that accounts for the energetic electron precipitation. In this presentation, we will discuss possible causes of these VLF/LF oscillations.

High-latitude ionospheric structure caused by precipitation of energetic particles, strong ionospheric currents and convection results in changes of the GPS total electron content (TEC) and rapid variations of GPS signal amplitude and phase. The phase variations, called phase scintillation, are typically observed in the ionospheric cusp, polar cap and auroral zone. They are particularly intense during geomagnetic storms when the aurora and ionospheric convection expand further equatorward. The ionospheric structure is also affected at subauroral latitudes resulting in the GPS TEC changes and phase scintillation. The focus of this paper will be the subauroral GPS TEC and phase variations that are caused by storm-enhanced plasma density (SED) on the dayside, and subauroral polarization streams (SAPS) on the nightside. Phase scintillation index is computed for specialized GPS scintillation receivers in Canada and Norway, at sampling rate of 50 Hz. A proxy scintillation index is obtained from dual frequency measurements of geodetic-quality GPS receivers sampling at 1 Hz, which include receivers operated by the Norwegian Mapping Authority (NMA), Greenland GPS Network (GNET) and globally distributed receivers of RT-IGS network that are monitored by the Canadian Geodetic Survey in near-real-time.

[P-AE22] Exoplanets

convener:Masahiro Ikoma(Department of Earth and Planetary Science, The University of Tokyo), Norio Narita(The University of Tokyo), Yuka Fujii(National Astronomical Observatory of Japan)

Exoplanetary science, which began with the discovery of a hot Jupiter in 1995, reached a significant turning point by the detection of countless super-Earths by the Kepler space telescope. In 2018, the new space telescope TESS was launched to conduct an extensive survey of exoplanets orbiting nearby bright stars, opening a new era of characterization of exoplanet atmospheres. Moreover, recent observations have identified a growing number of terrestrial planets in the so-called habitable zone. While exoplanets have been targeted mainly for astronomy until recently, it would be fair to say that Earth and planetary science is finally becoming a research field to make a central contribution. This session aims at allowing participants to share their research results and new ideas regarding exoplanets and also inform the current status of their projects. Exoplanet science is a growing, interdisciplinary research field. We welcome participants from various fields.

Population studies of exoplanetary atmospheres with next generation of space and ground telescopes

*Giovanna Tinetti[1]

1. UCL

In most fields of astronomy (supernovae, brown dwarfs, black holes), revolutions in our understanding of the main processes often came from the study of statistical behaviour using large samples as opposed to individual studies. As the next generation of space and ground-based telescopes come online, we are potentially reaching this important step in the study of exoplanet atmospheres. It is therefore paramount to prepare for the new wealth of information and challenges associated with future large scale studies. In this paper I will briefly review the instruments coming online in the next decade and present state of art models and tools to analyse and interpret observations of exoplanetary atmospheres.

Solving atmospheric retrievals with deep learning.

*Ingo Waldmann[1]

1. University College London

The field of exoplanetary spectroscopy is as fast moving as it is new. Analysing currently available observations of exoplanetary atmospheres often invoke large and correlated parameter spaces that can be difficult to map or constrain. This is true for both: the data analysis of observations as well as the theoretical modelling of their atmospheres. In many aspects, data mining and non-linearity challenges encountered in other data intensive fields are directly transferable to the field of extrasolar planets as well as planetary sciences. In this talk, I will discuss the use of machine learning and in particular deep learning to help solve for complex likelihood spaces in the analysis of atmospheres. By efficiently exploiting the information content and sparsity of the data, we can gain significant new insights into atmospheric retrieval algorithms and how to optimally analyse low to mid-resolution spectra.

Condensates and Clouds in Exoplanetary Atmospheres: Some Lessons from our Solar System

*Tristan Guillot[1,2]

1. Observatoire de la Cote d Azur, 2. JSPS/University of Tokyo

We will soon enter a new era for exoplanetary research: That of the characterization of exoplanetary atmospheres. With instruments such as JWST, Ariel and a growing number of instruments on ground-based observatories of different sizes, we can expect to learn much about the composition, structure and atmospheric dynamics of these planets. Before we can attempt to identify potentially habitable worlds, we must first make sense of these observations and understand their implications in terms of structure, dynamics and formation mechanisms. The lesson from our Solar System is that planets and planetary atmospheres are complex systems, full of surprises and far from being fully understood. Proper caution should be exercised when analyzing spatially unresolved observations of exoplanets often at a single epoch.

Most of the complexity can be tied to the presence of condensating species and the formation of clouds. The case of water in Jupiter is a particularly striking example: While water should be entirely in vapor form below about 5 to 7 bars, the Galileo probe has found its abundance to be extremely low down to 22 bars into the planet. Juno microwave observations indicate that ammonia is depleted relatively globally except near Jupiter's equator and the analysis of the mechanisms behind this indicates that water should follow suit: Thus the low abundance of water measured in hot spots but also throughout the north equatorial belt in Jupiter is probably not an indication of a low water abundance in the planet but instead of its settling to deeper regions than anticipated by classical models. In this case, the high molecular weight of water compared to hydrogen is a key factor to consider. This mechanism should be prevalent in exoplanets and brown dwarfs with hydrogen atmospheres, as long as they are cool enough to contain abundant condensing species.

On the other hand, exoplanets may be considered as unique laboratories to learn about the compositions and structure of planets in general. For example, water does not condense in hot Jupiters - measurements of its abundance may therefore provide a more reliable estimate of a global, bulk value in the deep interior. The observation of water clouds and atmospheric dynamics in temperate hydrogen planets will be invaluable to further understand the physics of planetary atmospheres in general.

Twinkle: a visible and near-infrared space-based observatory for exoplanet and solar system spectroscopy

*Billy Nelson Edwards[1,2], Giovanna Tinetti[1,2], Marcell Tessenyi[2,1], Giorgio Savini[1,2], Jonathan Tennyson[1,2], Richard Archer[2], Ian Stotesbury[2], Max Joshua[2], Benjamin Wilcock[2]

1. University College London , 2. Blue Skies Space Ltd

The Twinkle Space Mission is a space-based observatory that has been conceived to measure the atmospheric composition of exoplanets, study bright stars and brown dwarfs, and reveal the surface mineralogy of solar system objects. The satellite is based on a high-heritage platform and will carry a 0.45 m telescope with a visible and near-infrared spectrograph providing simultaneous wavelength coverage from 0.5 - 4.5 μm. The spacecraft will be launched into a Sun-synchronous low-Earth polar orbit and will operate for a baseline lifetime of seven years.

Twinkle will have the capability to provide high-quality infrared spectroscopic characterisation of the atmospheres of hundreds of bright exoplanets, covering a wide range of planetary types. It will also be capable of providing phase curves for hot, short-period planets around bright stars and of providing ultra-precise photometric light curves to accurately constrain orbital parameters, including ephemerides and TTVs/TDVs present in multi-planet systems.

Twinkle is available for researchers around the globe in two ways:

1) joining its collaborative multi-year survey programme, which will observe hundreds of exoplanets and solar system objects; and

2) accessing dedicated telescope time on the spacecraft, which can be freely scheduled for any combination of science cases.

I will present an overview of Twinkle’s capabilities and discuss some example exoplanet surveys to highlight the broad range of targets the mission could observe, demonstrating the huge scientific potential of the spacecraft.

Detecting molecular lines in thermal emission spectra of temperate planets with SPICA/SMI

*Yuka Fujii[1], Taro Matsuo[2], Yui Kawashima[3], Kazumasa Ohno[4], Ayaka Okuya[4], Teruyuki Hirano[4]

1. Earth-Life Science Institute, Tokyo Institute of Technology, 2. Nagoya University, 3. Netherlands Institute for Space Research, 4. Tokyo Institute of Technology

We examine the utility of SPICA/SMI for characterizing the thermal emission spectra of exoplanets. The sensitivity at $> 10\ \mu$m is useful for the observations of relatively warm/cool planets (around 300K) as their planet-to-star contrast significantly improves at these wavelengths. We modeled the thermal emission spectra of temperate Jupiter-like planets and found that the prominent features of NH_3 and H_2O would be expected at the wavelengths of SPICA/SMI. Their high-frequency features are detectable with a reasonable amount of integration time. We found that combining the data at various orbital phases is critical to suppress the correlated photon noise due to the spectral features of the stellar light. The high-resolution spectroscopy with SPICA/SMI is also able to measure their line-of-sight velocities, which allows us not only to measure the orbital inclination (and thus the true mass) but also to search for large moons or the binary planet system (Ochiai et al., 2014). This is relevant for warm/cool planets as the companions are dynamically more stable around them than around hot Jupiters. We also examine the detectability of the atmospheric features of terrestrial planets around nearby low-mass stars, e.g., Proxima Centauri b. The high-resolution spectroscopy (12-18μm) and mid-resolution spectroscopy (18-40μm) of SMI would be useful to probe CO_2, N_2O, and H_2O, while the required integration time is much longer. We discuss the range of accessible targets and the requirements for the stability of the pre-processed data.

FUV-driven atmospheric escape from hot Jupiters

*Hiroto Mitani[1], Riouhei Nakatani[2], Naoki Yoshida[1]

1. The University of Tokyo, 2. RIKEN

Since the first discovery in 1995, many hot Jupiters have been detected. For some hot Jupiters, it is thought that the atmosphere escapes due to the radiation from the central star. Such processes can change the evolution of close-in giant planets. A light close-in giant planet can lose a significant amount of mass because of its weak gravity. Thus, atmospheric escape can possibly explain the small number of light planets near the central star (so-called sub-Jupiter desert).

Recent theoretical studies of atmospheric escape from hot Jupiters incorporate the Extreme-UV (EUV; >13.6 eV) heating. EUV heats the gas through photoionization of hydrogen. It does not yield any metallicity-dependent trend. On the hand, some recent observations suggest that sub-Jupiter desert depends on the metallicity of the central star. There can be other heating processes which depends on metallicity.

In this study, we show that Far-UV (FUV; <13.6eV) drives atmospheric escape, using hydrodynamical simulation including radiative transfer and non-equilibrium chemistry. FUV can heat gas through the photoelectric effect of dust grains. The process is well known in the study of inter-stellar medium, but not considered in the atmospheric escape studies.

We find that FUV can drive atmospheric escape if the central star is hot (>6000K), and close-in giant planets around the hot stars can evaporate in ~100Myr. We also find that FUV-driven atmospheric escape depends on the metallicity of the planetary atmosphere and the central star. The heating rate and the mass loss rate increase in the case of metal-rich planets. However, both the rates decrease for the case of metal-rich central stars because FUV fluxes decrease in the metal-rich stars. We discuss the FUV-driven atmospheric escape and its dependence on the metallicity of planets and stars.
