Sun. May 26, 2019

[J] Oral | O (Public)：Public

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | IC 2F

[O-01] Exploring Buratamori - How to make science accessible

convener:Kazutaka Mannen(Hot Springs Research Institute of Kanagawa Prefecture), Takayuki Ogata(Disaster Prevention Research Center for Island Regions, University of the Ryukyus), Chairperson:Takayuki Ogata

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[O01-01] Lessons from Buratamori – An introduction to the session

★Invited Papers

*Kazutaka Mannen[1] (1.Hot Springs Research Institute of Kanagawa Prefecture)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[O01-02] **The history of Buratamori**

★Invited Papers

*Mikio Hayashi[1] (1.Japan Broadcasting Corporation)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[O01-03] My experience as a geoscientific guide for the NHK-TV program Buratamori

★Invited Papers

*Masato Koyama[1] (1.Shizuoka Univ.)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[O01-04] A Visualized History by Buratamori

★Invited Papers

*Noriko Matsuda[1] (1.Kyoto Prefectural University)

2:45 PM - 3:15 PM JST | 5:45 AM - 6:15 AM UTC

[O01-05] General discussion 1

*Takayuki Ogata[1] (1.Disaster Prevention Research Center for Island Regions, University of the Ryukyus)

[J] Oral | O (Public)：Public

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | IC 2F

[O-01] Exploring Buratamori - How to make science accessible

convener:Kazutaka Mannen(Hot Springs Research Institute of Kanagawa Prefecture), Takayuki Ogata(Disaster Prevention Research Center for Island Regions, University of the Ryukyus), Chairperson:Kazutaka Mannen(Hot Springs Research Institute of Kanagawa Prefecture)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[O01-06] The role of experiment in NHK's entertainment / educational program "Buratamori"

★Invited Papers

*Shintaro Hayashi[1] (1.Akita University Graduate School of Education)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[O01-07] An attempt of field work for middle and high school students to comprehend an “area” in an integrated manner

★Invited Papers

*Takeshi Uemura[1], Shigeyuki Yokoi[2] (1.Osaka Prefectural Otemae Senior High School part-time course, 2.Kaijo Junior and Senior High School)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[O01-08] Desirable way of outreach activities in the Museum,learn by participating in the making process of "Buratamori".

★Invited Papers

*Inoue Motoko[1] (1.Saitama Museum of Natural History)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[O01-09] Methodology of Geoscientific Outreach of “Buratamori”

★Invited Papers

*Takayuki Ogata[1] (1.Disaster Prevention Research Center for Island Regions, University of the Ryukyus)

4:30 PM - 5:00 PM JST | 7:30 AM - 8:00 AM UTC

[O01-10] General discussion 2

*Kazutaka Mannen[1] (1.Hot Springs Research Institute of Kanagawa Prefecture)

[J] Oral | O (Public)：Public

10:15 AM - 11:25 AM JST | 1:15 AM - 2:25 AM UTC | IC 2F

[O-02] Recent Advances in Earth and Planetary Science

convener:Tatsuhiko Hara(International Institute of Seismology and Earthquake Engineering, Building Research Institute), Katsuyoshi Michibayashi(Department of Earth and Planetary Sciences, Nagoya University), Hajime Naruse(Department of Geology and Mineralogy, Graduate School of Science, Kyoto University), Yasuhito Sekine(Earth-Life Science Insitute, Tokyo Institute of Technology), Chairperson:Kou Yamada

10:15 AM - 10:50 AM JST | 1:15 AM - 1:50 AM UTC

[O02-01] The challenges of Asteroid Exploration Mission Hayabusa2 and its results up to now

★Invited Papers

*Makoto Yoshikawa[1] (1.Japan Aerospace Exploration Agency)

10:50 AM - 11:25 AM JST | 1:50 AM - 2:25 AM UTC

[O02-02] Earth's core revealed by ultrahigh-pressure experiments

★Invited Papers

*Kei Hirose[1,2] (1.Earth-Life Science Institute, Tokyo Institute of Technology, 2.Department of Earth and Planetary Science, The University of Tokyo)

[J] Oral | O (Public)：Public

11:30 AM - 12:15 PM JST | 2:30 AM - 3:15 AM UTC | IC 2F

[O-03] Poster presentations by senior high school students

convener:Tatsuhiko Hara(International Institute of Seismology and Earthquake Engineering, Building Research Institute), Katsuyoshi Michibayashi(Department of Earth and Planetary Sciences, Nagoya University), Miwa Kuri(International Research Institute of Disaster Science, Tohoku University), Kou Yamada(Waseda University), Chairperson:Kou Yamada, Katsuyoshi Michibayashi, Hajime Naruse(Kyoto University), Keiko Konya, Miwa Kuri(東北大学災害科学国際研究所)

11:30 AM - 12:15 PM JST | 2:30 AM - 3:15 AM UTC

[O03-01] Poster presentations by senior high school students

[J] Oral | O (Public)：Public

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 106 1F

[O-04] New earth and planetary science education created by hybrid community between society and JpGU

convener:Yasushi Fujiwara(Evening Classes; Integrated Course, Kanagawa Prefectual Mukainooka Technical High School), Hiroaki Akimoto(Faculty of Economics,Dokkyo University), Chairperson:Yasushi Fujiwara(Evening Classes; Integrated Course, Kanagawa Prefectual Mukainooka Technical High School), Hiroaki AKIMOTO(Dokkyo University)

1:45 PM - 2:15 PM JST | 4:45 AM - 5:15 AM UTC

[O04-01] In the next Course of Study, let's send information on world standard "geography / geography" from Japan to the world

★Invited Papers

*YOJI TAKIKAWA[1] (1.NPO Association of Science Curriculum Initiative NPO Galileo Science Workshop)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[O04-02] What a mantle scientist hopes geoscience education

★Invited Papers

*Natsue Abe[1] (1.R&D Center for Ocean Drilling Science Japan Agency for Marine-Earth Science and Technology)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[O04-03] New high-school compulsory subject “General Geography” and related cooperation of geographers and earth scientists for human resource development

★Invited Papers

*Takashi Oguchi[1] (1.Center for Spatial Information Science, The University of Tokyo)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[O04-04] Visualization of terrain by Red Relief Image Map(RRIM) and geoscience education

★Invited Papers

*Tatsuro Chiba[1] (1.Asia Air Survey Co., Ltd.)

[J] Oral | O (Public)：Public

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 106 1F

[O-04] New earth and planetary science education created by hybrid community between society and JpGU

convener:Yasushi Fujiwara(Evening Classes; Integrated Course, Kanagawa Prefectual Mukainooka Technical High School), Hiroaki Akimoto(Faculty of Economics,Dokkyo University), Chairperson:Yasushi Fujiwara(Evening Classes; Integrated Course, Kanagawa Prefectual Mukainooka Technical High School), Hiroaki AKIMOTO(Dokkyo University)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[O04-05] A lesson plan using Tsunami to cultivate the ability to think critically about a subject based on the data given in New government curriculum guidelines for "Basic Earth Science"

★Invited Papers

*Kodama Hidefumi[1] (1.Chiba Prefectural Matudokokusai High School)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[O04-06] The planning of “Integrated Geography” and its aimed competency

★Invited Papers

*Yasutaka Kogawa[1] (1.Okayama Prefectural Tsuyama High School)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[O04-07] Earth and planetary science education considered by the current student

★Invited Papers

*Hideto Otsuka[1] (1.Geology Course, Department of Science, Faculty of Science, Shinshu University, National University Corporation)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[O04-08] Invitation to Geography —Relationship Between Geography and Intellectual Curiosity in Daily Life–

★Invited Papers

*Takuya Miyao[1] (1.Master Program in Education, University of Tsukuba)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[O04-09] Let's build a bridge between "Rika" and society with new geography and geology education in class

★Invited Papers

*Naoki Hosaka[1] (1.science writer)

[J] Oral | O (Public)：Public

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 101 1F

[O-05] English improvement tips for Japanese scientists

convener:Chisato Yoshikawa(Japan Agency for Marine-Earth Science and Technology), Wonsuh Song(Waseda University), Rumi Ohgaito(Japan Agency for Marine-Earth Science and Technology), Chairperson:Chisato Yoshikawa(JAMSTEC), Wonsuh Song, RUMI OGAITO(JAMSTEC)

10:45 AM - 11:05 AM JST | 1:45 AM - 2:05 AM UTC

[O05-01] Giving a successful presentation in English: Mission Possible!

★Invited Papers

*Joel Laurier[1] (1.University of Tsukuba)

11:05 AM - 11:25 AM JST | 2:05 AM - 2:25 AM UTC

[O05-02] How to deliver good presentations in a foreign language

★Invited Papers

*S. Lan Smith[1] (1.Marine Ecosystem Dynamics Research Group, Research Centre for Global Change, Japan Agency for Marine-Earth Science and Technology)

[J] Oral | O (Public)：Public

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 103 1F

[O-06] How to cope with intensifyng storm and flood disasters

convener:Jun Matsumoto(Deaprtment of Geography, Tokyo Metropolitan University), Yukihiro Takahashi(Department of Cosmosciences, Graduate School of Science, Hokkaido University), Akira Wada(Tokyo Institute of Technology), Chairperson:Jun Matsumoto(Tokyo Metropolitan University)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[O06-01] Extreme rainfall and heat wave over Japan in 2018 summer: A series of extreme events and underlying global warming

★Invited Papers

*Hisashi Nakamura[1] (1.Research Center for Advanced Science and Technology, University of Tokyo)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[O06-02] Influence of meteorological disasters on marine ecosystem

★Invited Papers

*Yu Umezawa[1,2] (1.Tokyo University of Agriculture and Technology, 2.Study Group on Marine Environmental Problems, the Oceanographic Society of Japan)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[O06-03] Understanding of geomorphic condition indicating the flooding disaster and hazard mapping

★Invited Papers

*Yohta KUMAKI[1] (1.Senshu University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[O06-04] A role of free satellite remote sensing data as a case study of heavy rain disaster in July 2018

★Invited Papers

*Yuji Sakuno[1] (1.Graduate School of Engineering, Hiroshima University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[O06-05] State of the Crisis Mapping for heavy rain in west of Japan, 2018.

★Invited Papers

*Taichi Furuhashi[1] (1.Aoyama Gakuin University)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[O06-06] A Study on Spatial and Temporal Resolution of Evacunation Infomation for Effective Evacuation Behavior

★Invited Papers

*Michinori Hatayama[1] (1.Disaster Prevention Research Institute, Kyoto University)

[J] Oral | O (Public)：Public

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 103 1F

[O-06] How to cope with intensifyng storm and flood disasters

convener:Jun Matsumoto(Deaprtment of Geography, Tokyo Metropolitan University), Yukihiro Takahashi(Department of Cosmosciences, Graduate School of Science, Hokkaido University), Akira Wada(Tokyo Institute of Technology), Chairperson:Akira Wada(Tokyo Institute of Technology), Yukihiro Takahashi(Hokkaido University)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[O06-07] Multi-layered Countermeasures against Widespread Devastating Flood Disasters

★Invited Papers

*Koike Toshio[1] (1.International Centre for Water Hazard and Risk Management)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[O06-08] Technologies and wisdom in housings and buildings for protecting our lives from river floods

★Invited Papers

*Kazuo Tamura[1] (1.Seismic Design Laboratory)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[O06-09] State and Challenges of Disaster Waste Management - Lessons from Recent Disasters –

★Invited Papers

*Yuichi Moriguchi[1], Masahiro Osako[2] (1.Graduate School of Engineering, The University of Tokyo, 2.Center for Material Cycles and Wasre Management Research, National Institute for Environmental Studies)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[O06-10] Evacuation Planning for School Children and Community Residents

★Invited Papers

*Takeshi Sato[1], Yoshiaki Yazaki[2] (1.Tohoku University, 2.Institute of Safety Education for School Children)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[O06-11] Health Emergency and Nursing on Flood Disaster

★Invited Papers

*Sakiko Kanbara[1], Aiko Yamamoto[2] (1.University of Kochi, 2.Shitennoji University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[O06-12] General discussion

*Jun Matsumoto[1,2], Yukihiro Takahashi[3], Akira Wada[4] (1.Tokyo Metropolitan University, 2.JAMSTEC, 3.Hokkaido University, 4.Tokyo Institute of Technology)

[J] Oral | O (Public)：Public

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | Convention Hall B 2F

[O-07] Kitchen Earth Science: Let's stimulate your brain by hands-on experiments!

convener:Ichiro Kumagai(School of Science and Engineering, Meisei University), Miwa Kuri(International Research Institute of Disaster Science, Tohoku University), Kei Kurita, Mie Ichihara(Earthquake Research Institute, University of Tokyo), Chairperson:Ichiro Kumagai(Meisei University), Miwa Kuri(東北大学災害科学国際研究所), Mie Ichihara(Earthquake Research Institute, The University of Tokyo), Kei Kurita

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[O07-01] Analogue experiments for understanding a crystal morphology variation of igneous rocks using a no-calorie sweetener

*Kuniyuki Furukawa[1], Ririka Watanabe[1], Risa Ito[1], Saori Kotani[1] (1.Faculty of Business Administration, Aichi University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[O07-02] Making volcanic edifice with edible lava

*Tatsuo Kanamaru[1], Akihiko Fujinawa[2] (1.Department of Earth and Environmental Sciences, College of Humanities & Sciences, Nihon University, 2.Department of Earth Sciences, Faculty of Science, Ibaraki University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[O07-03] Columnar joint: Geometric pattern analysis and analogue experiment using starch pastes

*Yuri Akiba[1], Aika Takashima[1], Hiroyuki Shima[2] (1.Graduate School of Life and Environmental Sciences, University of Yamanashi, 2.Department of Environmental Sciences, University of Yamanashi)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[O07-04] Viscoelastic characterization of a solid projectile impact onto a dense potato starch suspension

Kazuya Egawa[2], *Hiroaki Katsuragi[1] (1.Graduate School of Environmental Studies, Nagoya University, 2.Department of Earth and Planetary Sciences, Nagoya University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[O07-05] Pattern formation within a sandpile formed by a mixture of grains: The selection of stratification and segregation patterns

★Invited Papers

*Michiko Shimokawa[1], Hidestugu Sakaguchi[2] (1.Fukuoka Institute of Technology, 2.Kyushu University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[O07-06] Measuring radiation by DIY Geiger Counter Kit GC10

*George HASHIMOTO[1], Yusuke KOSHIO[1] (1.Department of Earth Sciences, Okayama University)

[J] Oral | O (Public)：Public

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | Convention Hall B 2F

[O-08] How to make the image of the earth's phenomenon to the general people in the Geopark

convener:Noritaka Matsubara(Graduate School of Regional Resource Management, University of Hyogo), Yayoi ICHIHASHI(Sado Island Geopark Promotion Office), Hokuto Obara(Mine-Akiyoshidai Karst Plateau Geopark Promotion Council), Marekazu OHNO(Unzen Volcanic Area Geopark Promotion Office), Chairperson:Yayoi Ichihashi, Hokuto Obara, Hiroko Imai, Suzuka Koriyama(San'in Kaigan Geopark Promotion Council), Noritaka Matsubara(兵庫県立大学大学院)

10:45 AM - 11:15 AM JST | 1:45 AM - 2:15 AM UTC

[O08-01] Significance of the guide to introduce the landscape interestingly

★Invited Papers

*Daisuke Fukushima[1] (1.Sakurajima Museum)

11:15 AM - 11:45 AM JST | 2:15 AM - 2:45 AM UTC

[O08-02] Understanding of "geology" without difficult explanation. - Let's conduct experiment to tell about geology more easily. -

★Invited Papers

*Hikaru Yokoyama[1] (1.Hokusho University)

11:45 AM - 12:15 PM JST | 2:45 AM - 3:15 AM UTC

[O08-03] The appealing points and challenges of Japanese geoparks, as seen from a foreigner’s point of view.

★Invited Papers

*Jagoda Woloszyn[1] (1.Oki Islands UNESCO Global Geopark Promotion Committee)

[J] Oral | O (Public)：Public

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | Convention Hall B 2F

[O-08] How to make the image of the earth's phenomenon to the general people in the Geopark

convener:Noritaka Matsubara(Graduate School of Regional Resource Management, University of Hyogo), Yayoi ICHIHASHI(Sado Island Geopark Promotion Office), Hokuto Obara(Mine-Akiyoshidai Karst Plateau Geopark Promotion Council), Marekazu OHNO(Unzen Volcanic Area Geopark Promotion Office), Chairperson:Yayoi Ichihashi, Hokuto Obara, Hiroko Imai, Noritaka Matsubara(兵庫県立大学大学院), Suzuka Koriyama(San'in Kaigan Geopark Promotion Council)

1:45 PM - 2:15 PM JST | 4:45 AM - 5:15 AM UTC

[O08-04] What do we need to do fun geotours that interests the earth?

★Invited Papers

*kana nishitani[1] (1.Global nature club)

2:15 PM - 2:45 PM JST | 5:15 AM - 5:45 AM UTC

[O08-05] The Important Things in Communicating Earth's Activity to Local Residents: the Awareness during Four Years after Changing a Job from a Geoscience Postdoc to a Curator

★Invited Papers

*Kyoko Kanayama[1] (1.San'in Kaigan Geopark Museum of the Earth and Sea, Tottori Prefectural Government)

2:45 PM - 3:15 PM JST | 5:45 AM - 6:15 AM UTC

[O08-06] "Blatamori" How to communicate the earth activities valued by guide guides

★Invited Papers

*Makoto Hasuoka[1], Yusuke Suzuki[2], Hiroko Imai[3] (1.Bandai-san Geopark Council, 2.Izu Peninsula Geopark Promotion Council, 3.COM SUPPORT OFFICE)

[J] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A02 TOKYO BAY MAKUHARI HALL

[P-PS07] Formation and evolution of planetary materials in the Solar System

convener:Yoko Kebukawa(Faculty of Engineering, Yokohama National University), Wataru Fujiya(Ibaraki University, College of Science), Shin Ozawa(Department of Earth Science, Graduate School of Science, Tohoku University), Megumi Matsumoto(Graduate School of Science, Tohoku University), Chairperson:Megumi Matsumoto, Wataru Fujiya

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[PPS07-01] Investigation of sugars in meteorites

★Invited Papers

*Yoshihiro Furukawa[1], Yoshito Chikaraishi[2], Naohiko Ohkouchi[3], Nanako O. Ogawa[3], Tomoki Nakamura[1] (1.Graduate School of Science, Tohoku University, 2.Institute of Low Temperature Science, Hokkaido University, 3.JAMSTEC)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[PPS07-02] Establishment of ice sublimation method for detection of soluble organic matter contained in Antarctic micrometeorites in Antarctic glacier ice

*Yui Ishikawa[1], Yamamoto Kota[1], Hiroshi Naraoka[2], Toru Yada[3], Tatsuaki Okada[1,3] (1.Graduate School of Science, The University of Tokyo, 2.Graduate School of Science, Kyushu University, 3.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[PPS07-03] Magnesium-containing organic compounds in the Tagish Lake and Murchison meteorites.

*Minako Hashiguchi[1], Hiroshi Naraoka[2,1] (1.Research Center for Planetary Trace Organic Compounds, Kyushu University, 2.Department of Earth and Planetary Sciences, Kyushu University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[PPS07-04] Interactions between minerals and organic materials on thermal processes in meteorite parent bodies

*Naoki Hirakawa[1], Yoko Kebukawa[1], Kensei Kobayashi[1] (1.Yokohama National University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[PPS07-05] Organic matter in carbonaceous chondrite lithologies of Almahata Sitta meteorite, a polymict ureilite

*Yoko Kebukawa[1], Michael Zolensky[2], Cyrena Anne Goodrich[3], Motoo Ito[4], Nanako O. Ogawa[5], Yoshinori Takano[5], Naohiko Ohkouchi[5], Hiroki Suga[9], Matthew Marcus[6], David Kilcoyne[6], Takuji Ohigashi[7], Zia Rahman[2], Muawia H. Shaddad[8], Kensei Kobayashi[1] (1.Yokohama National University, 2.NASA Johnson Space Center, 3.Lunar and Planetary Institute, 4.Kochi Institute for Core Sample Research JAMSTEC, 5.Japan Agency for Marine-Earth Science and Technology, 6.Lawrence Berkeley National Laboratory, 7.Institute for Molecular Science, 8.University of Khartoum, 9.The University of Tokyo)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[PPS07-06] Thermal Evolution of Hydrous Minerals on Small Bodies: To Understand Thermal Histories of Ryugu and Bennu

*Kana Ishimaru[1], Shogo Tachibana[2] (1.University of Tokyo, 2.UTokyo Organization for Planetary and Space Science, University of Tokyo)

[J] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A03 TOKYO BAY MAKUHARI HALL

[P-EM19] Frontiers in the solar physics

convener:Shinsuke Imada(Institute for Space-Earth Environmental Research, Nagoya University), Takaaki Yokoyama(School of Science, University of Tokyo), Toshifumi Shimizu(Institute of Space and Astronautical Science, JAXA), Yukio Katsukawa(National Astronomical Observatory of Japan, National Institute of Natural Sciences), Chairperson:Shinsuke Imada

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[PEM19-01] The Sun-Geospace connection: toward the 25th solar cycle

★Invited Papers

*Yoshizumi Miyoshi[1], Shinsuke Imada[1] (1.Institute for Space-Earth Environmental Research, Nagoya University)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[PEM19-02] Unsolved problems of the solar wind turbulence

★Invited Papers

*Munehito Shoda[1] (1.Graduate School of Science, University of Tokyo)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[PEM19-03] The Solar-C_EUVST Epsilon mission

*Toshifumi Shimizu[1] (1.Institute of Space and Astronautical Science, JAXA)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[PEM19-04] Advanced Observations of the Solar Atmosphere by a Balloon-Borne Telescope SUNRISE-3

*Yukio Katsukawa[1], Carlos Quintero Noda[2], Masahito Kubo[1], Hirohisa Hara[1], Toshifumi Shimizu[2] (1.National Astronomical Observatory of Japan, 2.ISAS/JAXA)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[PEM19-05] Radiation magnetohydrodynamic modeling of solar coronal dynamics

*Haruhisa Iijima[1] (1.Institute for Space-Earth Environmental Research, Nagoya University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[PEM19-06] Detection and energy derivation of nano-flares based on deep learning

*Toshiki Kawai[1], Shinsuke Imada[1] (1.Institute for Space-Earth Environmental Research, Nagoya University)

[J] Oral | P (Space and Planetary Sciences)：P-AE Astronomy & Extrasolar Bodies

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 105 1F

[P-AE20] Exoplanet

convener:Masahiro Ikoma(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Norio Narita(University of Tokyo), Chairperson:Norio Narita(University of Tokyo), Masahiro Ikoma(The University of Tokyo)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[PAE20-01] Gravitational Microlensing Surveys for Exoplanets

★Invited Papers

*Daisuke Suzuki[1] (1.Institute of Space and Astronautical Science / Japan Aerospace Exploration Agency)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[PAE20-02] Doppler planet searches targeting stars in solar neighborhood

★Invited Papers

*Bunei Sato[1] (1.Tokyo Institute of Technology)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[PAE20-03] Development of MuSCAT3 for ground-based follow-up observations of TESS candidate exoplanets

*Norio Narita[1,2,3], Akihiko Fukui[2], Masahiro Ikoma[2], Motohide Tamura[1,2], Nobuhiko Kusakabe[1], Mayuko Mori[2], Tomoyasu Yamamuro[4] (1.Astrobiology Center, 2.University of Tokyo, 3.JST, 4.OptCraft)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[PAE20-04] Effect of metallicity and eddy diffusion on transmission spectra of hazy exoplanet atmospheres

*Yui Kawashima[1], Masahiro Ikoma[2] (1.SRON Netherlands Institute for Space Research, 2.The University of Tokyo)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[PAE20-05] Mineral clouds of fluffy aggregates: how they form in exoplanetary atmospheres and influence transmission spectra

*Kazumasa Ohno[1], Satoshi Okuzumi[1], Ryo Tazaki[2] (1.Department of Earth and Planetary Science, Tokyo Institute of Technology, 2.Astronomical Institute, Tohoku University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[PAE20-06] Orbital Architecture of Planetary Systems Formed by Giant Impacts

★Invited Papers

*Eiichiro Kokubo[1] (1.Division of Theoretical Astronomy, National Astronomical Observatory of Japan)

[J] Oral | P (Space and Planetary Sciences)：P-AE Astronomy & Extrasolar Bodies

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 105 1F

[P-AE20] Exoplanet

convener:Masahiro Ikoma(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Norio Narita(University of Tokyo), Chairperson:Masahiro Ikoma(The University of Tokyo), Norio Narita(University of Tokyo)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[PAE20-07] Thermal convection in the mantle of super-Earths

★Invited Papers

*Takehiro Miyagoshi[1], Masanori Kameyama[2], Masaki Ogawa[3] (1.Japan Agency for Marine-Earth Science and Technology, 2.Ehime University, 3.University of Tokyo)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[PAE20-08] Atmospheric escape from M-dwarf exoplanets and implications for habitability

*Chuanfei Dong[1] (1.Princeton University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[PAE20-09] Theoretical emission spectra of hot rocky super-Earths: Lack of alkali metals due to atmospheric escape

*Yuichi Ito[1,2], Masahiro Ikoma[2] (1.Department of Cosmosciences, Graduate school of Science, Hokkaido University, 2.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[PAE20-10] Hot Rocky Super-Earths atmospheres, a revision of gas phase metal chemistry and the relevance of reverse chemistry

*Sebastian Danielache[1,2], Takahashi Yuta[1], Miguel Yamila[3], Simoncini Eugenio[4], Grassi Tommaso[5] (1.Department of Materials & Life Sciences, Faculty of Science & Technology, Sophia University, 2.Tokyo Institute of Technology, Earth-Life Institute , 3.Leiden Observatory, Leiden University, 4.Simoncini Telai Gambassi Terme, 5.University Observatory Munich, Ludwig-Maximilians-University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[PAE20-11] A Climate of tidally locked terrestrial exoplanets

*Takanori Kodama[1] (1.University of Bordeaux)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[PAE20-12] Current status of WSO-UV/UVSPEX for discovery of Earth-like planets

*Shingo Kameda[1], Osada Naoya[1], Takanori Kodama[2], Go Murakami[3], Keigo Enya[3], Masahiro Ikoma[4], Norio Narita[5], Naoki Terada[6], Hitoshi Fujiwara[7] (1.School of Science, Rikkyo University, 2.University of Bordeaux, 3.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 4.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 5.National Astronomical Observatory of Japan, 6.Graduate School of Science, Tohoku University, 7.Faculty of Science and Technology, Seikei University)

[J] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 201B 2F

[P-CG23] Origin and evolution of materials in space

convener:Hitoshi Miura(Graduate School of Natural Sciences, Department of Information and Basic Science, Nagoya City University), Hideko Nomura(Department of Earth and Planetary Sciences, Tokyo Institute of Technology), Takafumi Ootsubo(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Aki Takigawa(Division of Earth and Planetary Science, Kyoto University), Chairperson:Ryo Tazaki, Aoi Takahashi

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[PCG23-01] Origin of cosmic dust: Galaxy-scale perspective

★Invited Papers

*Akio Inoue[1,2] (1.Osaka Sangyo University, 2.Waseda University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[PCG23-02] SPICA and future infrared observations of cosmic matters

★Invited Papers

*Issei Yamamura[1] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[PCG23-03] Engineering first light of a new mid-infrared instrument MIMIZUKU

*Takafumi Kamizuka[1], Takashi Miyata[1], Shigeyuki Sako[1], Ryou Ohsawa[1], Masahito S. Uchiyama[1], Tomohiro Mori[1], Yutaka Yoshida[1] (1.Institute of Astronomy, School of Science, the University of Tokyo)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[PCG23-04] Properties and space exposure of Quenched Nitrogen-included Carbonaceous Composite (QNCC)

*Izumi Endo[1], Itsuki Sakon[1], Takashi Onaka[1], Yoko Kebukawa[2], Kensei Kobayashi[2], MITA Hajime[4], Hajime Yano[3] (1.University of Tokyo, 2.Yokohama National University, 3.ISAS/JAXA, 4.Fukuoka Institute of Technology)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[PCG23-05] Shape dependence of dust absorption opacity in the Rayleigh domain

*Ryo Tazaki[1], Hidekazu Tanaka[1] (1.Astronomical Institute, Tohoku University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[PCG23-06] Modeling of the H_2 ortho-para spin conversion on grain surfaces in star- and planet-forming regions

*Kenji Furuya[1], W. M. C. Sameera[2], Tetsuya Hama[2], Naoki Watanabe[2], Yuri Aikawa[3] (1.Center for Computer Sciences, University of Tsukuba, 2.Institute of Low Temperature Science, Hokkaido University,, 3.The University of Tokyo)

[J] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 201B 2F

[P-CG23] Origin and evolution of materials in space

convener:Hitoshi Miura(Graduate School of Natural Sciences, Department of Information and Basic Science, Nagoya City University), Hideko Nomura(Department of Earth and Planetary Sciences, Tokyo Institute of Technology), Takafumi Ootsubo(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Aki Takigawa(Division of Earth and Planetary Science, Kyoto University), Chairperson:Kenji Furuya, Yuki Hibiya

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[PCG23-07] Thermal processes of primary silicate dust in protoplanetary disk: Constraints from oxygen isotope exchange kinetics between amorphous silicate and water vapor

★Invited Papers

*Daiki Yamamoto[1], Shogo Tachibana[2], Noriyuki Kawasaki[1], Minami Kuroda[1], Naoya Sakamoto[3], Hisayoshi Yurimoto[1,4] (1.Department of Natural History Sciences ,Hokkaido University, 2.UTokyo Organization for Planetary Space Science, The University of Tokyo , 3.Creative Research Institution, Hokkaido University , 4.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[PCG23-08] Birth-place of comet 17P/Holmes from its mass fractions of minerals

★Invited Papers

*Shinnaka Yoshiharu[1], Takafumi Ootsubo[2], Hideyo Kawakita[1], Mitsuru Yamaguchi[1], Mitsuhiko Honda[3], Jun-ichi Watanabe[4] (1.Kyoto Sangyo University, 2.JAXA/ISAS, 3.Kurume University, 4.NAOJ)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[PCG23-09] Comparison of grain properties in interplanetary dust from different types of parent bodies by mid-infrared spectroscopic observations with AKARI

*Aoi Takahashi[1], Takafumi Ootsubo[2], Hideo Matsuhara[2], Fumihiko Usui[3], Itsuki Sakon[4], Hiroki Chihara[5] (1.The Graduate University for Advanced Studies, 2.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 3.Kobe University, 4.University of Tokyo, 5.Osaka Sangyo University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[PCG23-10] Formation of forsterite crystal induced by ultraviolet irradiation of water ice ice on amorphous Mg_2SiO_4 particles

*Akira Kouchi[1], Yuki Kimura[1], Yasuhiro Oba[1], Tetsuya Hama[1], Naoki Watanabe[1], Shogo Tachibana[2], Akira Tsuchiyama[3], Satomi Enju[3], Takafumi Ootsubo[4] (1.Institute of Low Temperature Science, Hokkaido University, 2.UTokyo Organization for Planetary and Space Science, University of Tokyo, 3.Graduate School of Science, Kyoto University, 4.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[PCG23-11] Condensation experiments in the sytem Fe-Mg-Si-O-S using induction thermal plasma: implication to GEMS forming condition

*Satomi Enju[1], Hayate Kawano[1], Hisashi Komaki[2], Akira Tsuchiyama[1] (1.Department of Earth and Planetary Sciences, Graduate School of Science, Kyoto University, 2.JEOL Ltd.)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[PCG23-12] **The initial abundance of ^{92}Nb in the outer solar system.**

*Yuki Hibiya[1,2], Tsuyoshi Iizuka[2], Hatsuki Enomoto[2] (1.Japan Agency for Marine-Earth Science and Technology, 2.The University of Tokyo)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 301A 3F

[A-AS06] Progress in dense observation and numerical modeling of micro-scale meteorology

convener:Junshi Ito(Atmosphere and Ocean Research Institute, The University of Tokyo), Kentaro Araki(Meteorological Research Institute), Jun-ichi Furumoto(Research Institute for Sustainable Humanosphere, Kyoto University), Kuniaki Higashi(Research Institute for Sustainable Humanosphere, Kyoto University Metroweather Co., Ltd.), Chairperson:Junshi Ito(The University of Tokyo), Kentaro Araki(Meteorological Research Institute)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[AAS06-01] A Linear Array of Wind and Pressure Sensors for High Resolution in situ Measurements in Winter Tornadoes

★Invited Papers

*Kusunoki Kenichi[1], Hanako Inoue[1], Naoki Ishitsu[2], Chusei Fujiwara[3] (1.Meteorological Research Institute, 2.Alpha-denshi Co., Ltd. / Meteorological Research Institute, 3.East Japan Railway Company)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[AAS06-02] Mesoscale fixed point weather observation architecture by Drone fleet

*Yuichi Yaguchi[1], Masayuki Itaha[4], Shuzo Nakano[3], Kazuhiko Yamagishi[2], Tatsuya Iyobe[5] (1.The University of Aizu, 2.e-Robotics Fukushima Co., Ltd., 3.East-Japan Accounting Center Co., Ltd., 4.Japan Environment Research Co., Ltd., 5.Iyobe Shoji Ltd.)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[AAS06-03] Potential of dense weather event observation using surface optical fiber cable and DAS technology

*Tsunehisa KIMURA[1] (1.Schlumberger)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[AAS06-04] Case study of environmental conditions and cloud microphysical properties of winter convective clouds developed in the Kanto plain

*Kentaro Araki[1], Shinsuke Satoh[2], Takuya Tajiri[1] (1.Meteorological Research Institute, 2.National Institute of Information and Communications Technology)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[AAS06-05] Numerical simulation of the urban effect on the atmospheric boundary layer structure in Tokyo using the SPUC urban canopy scheme

*Naoko Seino[1] (1.Meteorological Research Institute)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[AAS06-06] Surface layer model for instantaneous wind speeds designed by deep learning

*Junshi Ito[1,2], Hideaki Mouri[2] (1.Atmosphere and Ocean Research Institute, The University of Tokyo , 2.Meteorological Research Institute)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 303 3F

[A-OS21] Physical, biogeochemical, and ecological aspects and their mutual relations in the Indian Ocean

convener:Yukio Masumoto(Graduate School of Science, The University of Tokyo), Hiroaki Saito(Atmosphere and Ocean Research Institute, The University of Tokyo), Iwao Ueki(JAMSTEC Japan Agency for Marine-Earth Science and Technology), Chairperson:Yukio Masumoto

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[AOS21-01] Coastal upwelling events and barrier layer observed along the southwestern coast of Sumatra

*Takanori Horii[1], Iwao Ueki[1], Kentaro Ando[1] (1.Research and Development Center for Global Change (RCGC), Japan Agency for Marine-Earth Science and Technology (JAMSTEC))

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[AOS21-02] Mechanisms of the sea surface temperature cooling in the Somalia-Oman upwelling region during the summer monsoon

*Kusumi Takahiro[1], Shoichiro Kido[1], Tomoki Tozuka[1], Yukio Masumoto[1] (1.the Unversity of Tokyo)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[AOS21-03] Generation of meso-scale eddies in the southern Indian ocean

*Takuro Matsuta[1], Yukio Masumoto[1] (1.Graduate School of Science, The University of Tokyo)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[AOS21-04] Summary of R/V Hakuho-Maru observations (KH-18-6) for Integrated physical, biogeochemical, and ecosystem research in the eastern Indian Ocean

*Yukio Masumoto[1], Hiroaki Saito[2] (1.Graduate School of Science, The University of Tokyo, 2.Atmosphere and Ocean Research Institute)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[AOS21-05] Distribution and photodegradation of fluorescent dissolved organic matter in the eastern Indian Ocean

*Shigenobu Takeda[1] (1.Nagasaki University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[AOS21-06] Observed subsurface Chlorophyll maximum in the tropical eastern Indian Ocean during KH18-6 Leg3 cruise

*Iwao Ueki[1], Kosei Sasaoka[1] (1.JAMSTEC Japan Agency for Marine-Earth Science and Technology)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 301A 3F

[A-CG43] Adaptation for climate change and social implementation

convener:Yoichi Ishikawa(JAPAN Agency for Marine-Earth Science and Technology), Shingo Watanabe(Japan Agency for Marine-Earth Science and Technology), KOJI DAIRAKU(National Research Institute for Earth Science and Disaster Resilience), Chairperson:KOJI DAIRAKU(National Research Institute for Earth Science and Disaster Resilience), Yoichi Ishikawa(JAPAN Agency for Marine-Earth Science and Technology)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[ACG43-01] **Effects of afforestation and climate warming on evapotranspiration and river discharge in the upper Chao Phraya River basin**

*Kumiko TAKATA[1], Naota Hanasaki[1] (1.National Institute for Environmental Studies)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[ACG43-02] Hybrid downscaling using high-resolution RCM information and rainfall-runoff-inundation model simulations

*Yasutaka Wakazuki[1,2], Shiori Abe[4], Yosuke Nakamura[3,4] (1.Ibaraki University, 2.Japan Agency for Marine-Earth Science and Technology, 3.Public Works Research Institute, 4.Mitsui Consultants Co., Ltd.)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[ACG43-03] Development of a global water risk assessment tool to support investigation of adaptation to climate change in the private sector: Calibrating parameters of a global water resources model by Approximate Bayesian Computation

*Naota Hanasaki[1] (1.NIES National Institute of Environmental Studies)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[ACG43-04] Verification of SI-CAT ocean products around Japan

*Goro Yamanaka[1], Hideyuki Nakano[1], Kei Sakamoto[1], Takahiro Toyoda[1], Shogo Urakawa[1], Hiroyuki Tsujino[1], Shiro Nishikawa[2], Tsuyoshi Wakamatsu[2,3,4], Yoichi Ishikawa[2] (1.Meteorological Research Institute, 2.JAMSTEC, 3.Nansen Environmental and Remote Sensing Center, 4.Bjerknes Centre for Climate Research)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[ACG43-05] Downscaling and Reanalysis of Coastal Current System on the Ibaraki Coast with Included Freshwater Impact

*Josko Troselj[1], Yuki Imai[2], Junichi Ninomiya[3], Nobuhito Mori[1] (1.Coastal Engineering Laboratory, Disaster Prevention Research Institute, Kyoto University, 2.Graduate School of Engineering, Kyoto University, 3.Kanazawa University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[ACG43-06] Estimation of the Japanese sardine stock in relation to the future Kuroshio variability

*Haruka Nishikawa[1], Shiro Nishikawa[1], Tsuyoshi Wakamatsu[2,3], Yoichi Ishikawa[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.Nansen Environmental and Remote Sensing Center, 3.Bjerknes Center for Climate Research)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 301A 3F

[A-CG43] Adaptation for climate change and social implementation

convener:Yoichi Ishikawa(JAPAN Agency for Marine-Earth Science and Technology), Shingo Watanabe(Japan Agency for Marine-Earth Science and Technology), KOJI DAIRAKU(National Research Institute for Earth Science and Disaster Resilience), Chairperson:Yoichi Ishikawa(JAPAN Agency for Marine-Earth Science and Technology), KOJI DAIRAKU(National Research Institute for Earth Science and Disaster Resilience)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[ACG43-07] Recent progress of Japan's regional downscaling project (SI-CAT) and CORDEX Asia Empirical-Statistical Downscaling (ESD)

*KOJI DAIRAKU[1] (1.National Research Institute for Earth Science and Disaster Resilience)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[ACG43-08] Assessment of Flood Risk in Hokkaido, northern Japan, Associated with Climate Change

*Hoshino Tsuyoshi[1], Tomohito J Yamada[1], Dzung Nguyen-Le[1], Masaru Inatsu[1], Tomonori Satou[1], Hiroaki Kawase[2] (1.Hokkaido University, 2.Meteorological Research Institute)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[ACG43-09] Intensification of sub-daily and daily rainfall extremes from densely distributed records for Japan

*Megumi Watanabe[1], Sayaka Yoshikawa[1], Shinjiro Kanae[1] (1.Tokyo Institute of Technology)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[ACG43-10] A Content-Based Database System for Large Ensemble Future Climate Simulations

*Yujin Nakagawa[1], Shintaro Kawahara[1], Fumiaki Araki[1], Daisuke Matsuoka[1], Yoichi Ishikawa[1], Mikiko Fujita[1], Shiori Sugimoto[1], Yasuko Okada[1], Sho Kawazoe[1], Shingo Watanabe[1], Masayoshi Ishii[2], Ryo Mizuta[2], Akihiko Murata[2], Hiroaki Kawase[2] (1.Japan Agency for Marine-Earth Science and Technology, 2.Meteorological Research Institute)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[ACG43-11] Climate change impact assessment in Shikoku with the ensemble climate prediction database d4PDF

*kouhei yoshimura[1], Nasu Seigo[1], Patricia Sanchez[2] (1.Kochi University of Technology, 2.University of the Philippines Los Baños)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[ACG43-12] Caution zone quantification risk to sediment disaster adaptation due to climate change

*SEIKI KAWAGOE[1], YOSUKE SAITO[1], HIROMICHI SUZUKI[1] (1.Fukushima university)

[J] Oral | H (Human Geosciences)：H-GG Geography

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 102 1F

[H-GG02] Use, change, management of natural resources and environment: Interdisciplinary perspectives

convener:Yoshinori OTSUKI(Institute of Geography, Graduate School of Science, Tohoku University), Gen Ueda(Graduate School of Social Sciences, Hitotsubashi University), Takahisa Furuichi(Graduate School of Science, Hokkaido University), Toru Sasaki(Miyagi University of Education), Chairperson:Yoshinori OTSUKI, Gen UEDA

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[HGG02-01] Source identification of pottery based on chemical analysis of volcanic glass contained in ceramic paste
- Example for Usultan pottery in Chalchuapa, El Salvador, Central America -

*Shigeru Kitamura[1], Masakage Murano[2] (1.Faculty of Social Welfare, Hirosaki Gakuin University, 2.The Museum of Kyoto)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[HGG02-02] Preliminary magnetic biomonitoring study of the spatial distribution of roadside pollution using *Cryptomeria japonica* tree bark

*Nagisa Sawada[1], Kazuo Kawasaki[1] (1.University of toyama)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[HGG02-03] Preliminary environmental magnetic results from heavy metal contamination around the Erdenet Cu-Mo deposit, Mongolia.

*Kazuo Kawasaki[1], Ryuki Tonami[2], Solongo Tsetsgee[3], Baasansuren Gankhurel[3], Keisuke Fukushi[4] (1.Graduate School of Science and Engineering for Research, University of Toyama, 2.Department of Earth Sciences, University of Toyama, 3.Kanazawa University, 4.Institute of nature & Environmental Technology, Kanazawa University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[HGG02-04] Sediment and its movement as natural resources and environment

*Takahisa Furuichi[1], Sachi Wakasa[2], Shigeru Mizugaki[3], Masanori Nunokawa[3] (1.Graduate School of Agriculture, Hokkaido University, 2.Graduate School of International Resource Sciences, Akita University, 3.Civil Engineering Research Institute for Cold Region)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[HGG02-05] Reutilization of waste bamboo from oyster farming

*KIYOSHI SAIJO[1] (1.Miyagi University of Education)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[HGG02-06] Regional Impacts of Globally Important Agricultural Heritage Systems in Osaki City, Miyagi Prefecture

*Toru Sasaki[1] (1.Miyagi University of Education)

[J] Oral | H (Human Geosciences)：H-QR Quaternary research

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 102 1F

[H-QR05] Quaternary, Diachronic dynamics of human-environment interactions

convener:Mamoru Koarai(Earth Science course, College of Science, Ibaraki University), Ken Ikehara(Institute of Geology and Geoinformation, National Institute of Advanced Industrial Science and Technology), Masayuki Hyodo(Research Center for Inland Seas, Kobe University), Chairperson:Ken Ikehara(AIST), Kaori Aoki

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[HQR05-01] Disturbance of sea floor by large earthquake and formation of earthquake-induced event deposit: Where is a suitable location for deep-sea turbidite paleoseismology

★Invited Papers

*Ken Ikehara[1] (1.Institute of Geology and Geoinformation, National Institute of Advanced Industrial Science and Technology)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[HQR05-02] The Diatom Assemblages as the Indicators for Huge Tsunami Sedimentations and Recover Processes of Environment at Kesennuma Bay, Tohoku, Japan

*Kaoru Kashima[1], Ryozo Shiomi, Yu Fukumoto[3], Tsuyoshi Haraguchi[2] (1.Department of Earth and Planetary Sciences, Kyushu University, 2.Department of Geosicneces, Graduate School of Science, Osaka City University, 3.Ritsumeikan University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[HQR05-03] **Niger Delta dynamic phase in the Gulf of Guinea during the last 20 ka: Panacea for the sustainable development of the region**

*Onema Christopher Adojoh[1], Marret-Davies Fabienne[2], Tetsuji Muto[3] (1.Missouri Univetrsity of Science and Technology, Rolla, USA, Dept of Geoscience, Geological and Petroleum Engineering, 1400 North Bishop, Post Code 65401, 2.School of Environmental Sciences, University of Liverpool, L69 7ZT, UK, 3.Nagasaki University, Japan, Dept of Environmental Science and Fisheries, 1-14 Bunkyomachi, Nagasaki, 8528521)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[HQR05-04] K-feldspar post-IR IRSL ages suggest the presence of MIS 5a–c marine terraces in the eastern margin of the Kanto Plain, central Japan

★Invited Papers

*Toru Tamura[1,2], Hiroko Okazaki[3], Hiroomi Nakazato[4], Tomonori Naya[1], Rei Nakashima[1] (1.Geological Survey of Japan, AIST, 2.Graduate School of Frontier Sciences, University of Tokyo, 3.Natural History Museum and Institute, Chiba, 4.National Agriculture and Food Research Organization)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[HQR05-05] Tephrostratigraphy of drilled core C9010E off the Boso Peninsula: as a preliminary report

*Kaori Aoki[1], Makoto Kobayashi[1], Masanori Murata[1], Takehiko Suzuki[1] (1.Research Center for Volcanic Hazards and Their Mitigation, Tokyo Metropolitan University)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[HQR05-06] Late Quaternary fluvial terraces and piracies in the Tanagura area, along the upper reaches of Kuji River, NE Japan

*Yuichi Kato[1], Takehiko Suzuki[1] (1.Graduate school of Urvan Environmental Sciences, Tokyo Metropolitan University)

[J] Oral | H (Human Geosciences)：H-QR Quaternary research

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 102 1F

[H-QR05] Quaternary, Diachronic dynamics of human-environment interactions

convener:Mamoru Koarai(Earth Science course, College of Science, Ibaraki University), Ken Ikehara(Institute of Geology and Geoinformation, National Institute of Advanced Industrial Science and Technology), Masayuki Hyodo(Research Center for Inland Seas, Kobe University), Chairperson:Mamoru KOARAI(Ibaraki University), Tomonori Naya(産業技術総合研究所)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[HQR05-07] Landform features of Okinoshima of Munakata city

*Takahito Kuroki[1] (1.Faculty of Education, Univ. of Teacher Edu. Fukuoka)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[HQR05-08] Revision of geomorphology and geology of Tokyo Upland and Lowland, based on boring data and precise landform analysis

★Invited Papers

*Kunihiko Endo[1], Yusuke Suginaka[2], Shinzaburo Hori[2], Toshihiko Sugai[3], Takehiko Suzuki[4], Shigeko Ishiwata, Yo Uesugi, Reisuke Kondo[5], Tatsuro Chiba[6], Toshio Nakayama[7], Shigeto Osato[8], Marie Noguchi[9], Akio Sato[3], Takato Takemura[10] (1.Nihon University, 2.Research Center of Computational Mechanics, Inc., 3.Graduate School of Frontier Science, The University of Tokyo, 4.Faculty of Urban Environmental Sciences, Tokyo Metropolitan University, 5.Educational Development Center, Kogakkan University, 6.Asia Air Survey, 7.Civil Engineering Support & Training Center, Tokyo Metropolitan Government,, 8.Doshitsu Research Corporation, 9.Paleo Labo co.,ltd., 10.College of Humanities and Sciences, Nihon University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[HQR05-09] Sedimentological characteristics of the Ome Formation exposed on the western margin of Musasino Upland, central Japan

*Takako UTSUGAWA[1], Masaaki Shirai[2], Hiroka Kato[2], Sayuri Kato[3] (1.Department of Geography, Rissho University, 2.Department of Geography, Tokyo Metropolitan University, 3.Hamura City)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[HQR05-10] Stratigraphy of Tokyo Formation: re-examination of Kita-Ku Central Park core

*Tomonori Naya[1], Kentaro Sakata[1], Tsutomu Nakazawa[1], Takehiko Suzuki[2], Toshio Nakayama[3] (1.Geological Survey of Japan, AIST, 2.Tokyo Metropolitan University, 3.Tokyo Metropolitan Government)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[HQR05-11] S-wave veolocity structure and ground motion characteristics of "loam terraces": Examples from the eastern part of Utsunomiya City, Tochigi Prefecture, central Japan

★Invited Papers

*Tsutomu Nakazawa[1], Ikuo Cho[1], Kentaro Sakata[1] (1.Geological Survey of Japan, AIST)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[HQR05-12] The relationship between liquefaction distribution and microtopography classification during the 1948 Fukui earthquake - Toward improvement of liquefaction hazard map -

*Haruka Tani[1], Masanobu Shishikura[2] (1.Housei University, 2.Institute of Earthquake and Volcano Geology, National Institute of Advanced Industrial Science and Technology)

[J] Oral | H (Human Geosciences)：H-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 104 1F

[H-CG30] Safety of nuclear power plants against inland earthquakes

convener:Daisuke Suetsugu(Department of Deep Earth Structure and Dynamics Research, Japan Agency for Marine-Earth Science and Technology), Satoshi Kaneshima(Department of Earth and Planetary Sciences, Kyushu University), Takeshi Sagiya(Disaster Mitigation Research Center, Nagoya University), Kohta Juraku(Department of Humanities, Social and Health Sciences, School of Engineering, Tokyo Denki University), Chairperson:Daisuke Suetsugu, Kohta Juraku

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[HCG30-01] Thickness of the seismogenic layer beneath the Japanese Islands and its relation to crustal earthquakes

*Junichi Nakajima[1] (1.Department of Earth and Planetary Sciences, Tokyo Institute of Technology)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[HCG30-02] Problems with active fault evaluation in nuclear safety regulation

*Yasuhiro Suzuki[1] (1.Nagoya University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[HCG30-03] The longer active fault is, is the larger ground motion generated? – Surface and buried rupture earthquakes-

*Takao Kagawa[1] (1.Tottori University Graduate School of Engineering)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[HCG30-04] Seismic safety of nuclear power plants against inland crustal earthquakes and the "science vs. engineering problem"

*Katsuhiko Ishibashi[1] (1.Emeritus Professor, Kobe University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[HCG30-05] Challenges to Seismic Safety of Nuclear Power Plants

*Tatsuya Itoi[1] (1.The University of Tokyo)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[HCG30-06] Strong motion at Ooi nuclear power plant

*Kunihiko Shimazaki[1] (1.University of Tokyo)

[J] Oral | H (Human Geosciences)：H-CG Complex & General

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 105 1F

[H-CG32] Interdisciplinary approach to earth surface processes related to deposition, erosion and sediment transport

convener:Koji Seike(Geological Survey of Japan, AIST), Naofumi Yamaguchi(Center for Water Environment Studies, Ibaraki University), Hajime Naruse(Department of Geology and Mineralogy, Graduate School of Science, Kyoto University), Hideko Takayanagi(Institute of Geology and Paleontology, Graduate School of Science, Tohoku University), Chairperson:Koji Seike

1:50 PM - 2:20 PM JST | 4:50 AM - 5:20 AM UTC

[HCG32-01] Long-term beach observation and future shoreline prediction

★Invited Papers

*Masayuki Banno[1] (1.Port and Airport Research Institute)

2:20 PM - 2:35 PM JST | 5:20 AM - 5:35 AM UTC

[HCG32-02] Migration of sand waves observed in Okinose area of Osaka Bay

*Kojima Hibiki[1], Tetsuo Matsuno[2,3], Mamoru Sano[2], Nobukazu Seama[3,2], Noritaka Endo[4], Ken'ichi Ohkushi[1], Atsushi Tani[1] (1.Graduate School of Human Development and Environment, Kobe University, 2.Kobe Ocean Bottom Exploration Center(KOBEC), Kobe University, 3.Graduate School of Science / Faculty of Science, Kobe University, 4.School of Geoscience and Civil Engineering College of Science and Engineering, Kanazawa University)

2:35 PM - 2:50 PM JST | 5:35 AM - 5:50 AM UTC

[HCG32-03] Inverse analysis of lobe/gully on Mars: examination by 2D Voellmy fluid model

Kyohei Noumura[1], *Hajime Naruse[1] (1.Department of Geology and Mineralogy, Graduate School of Science, Kyoto University)

2:50 PM - 3:05 PM JST | 5:50 AM - 6:05 AM UTC

[HCG32-04] Development of provenance study using quartz shapes and surface microtextures

*Hiromi Itamiya[1], Ritsuko Sugita[1], Toshihiko Sugai[2] (1.National Research Institute of Police Science, 2.The University of Tokyo)

[J] Oral | H (Human Geosciences)：H-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 105 1F

[H-CG32] Interdisciplinary approach to earth surface processes related to deposition, erosion and sediment transport

convener:Koji Seike(Geological Survey of Japan, AIST), Naofumi Yamaguchi(Center for Water Environment Studies, Ibaraki University), Hajime Naruse(Department of Geology and Mineralogy, Graduate School of Science, Kyoto University), Hideko Takayanagi(Institute of Geology and Paleontology, Graduate School of Science, Tohoku University), Chairperson:Hideko Takayanagi(Tohoku University), Koji Seike

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[HCG32-05] Detrital heavy mineral record and Nd-Sr isotopic signature in Bengal Fan

*Kohki Yoshida[1], Cruz Jarrett[2], Manoj M.C.[3], Nozomi Hatano[5], Christian France-Lanord[4], Takeshi Kuritani[6] (1.Department of Geology, Faculty of Science, Shinshu University, 2.Florida State University, 3.Birbal Sahni Institute of Palaeosciences, 4.CNRS- Universite de Lorraine, 5.Graduate School of Science and Technology, Shinshu University, 6.Hokkaido University)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[HCG32-06] Evaluation of plant-fragment concentration mechanism in the turbiditic sediments in the Bouma Sequence by biomarker analysis in the Kawabata Formation, Yubari area, central Hokkaido, Japan.

*Hiroyasu Asahi[1], Satoshi Furota[2], Ken Sawada[3] (1.Graduate School of Science, Hokkaido University, 2.Japan Agency for Marine-Earth Science and Technology, 3.Department of Earth and Planetary Sciences, Faculty of Science, Hokkaido University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[HCG32-07] Tectonic behavior of a forearc basin reconstructed using turbidites: an example from the Plio-Pleistocene Kakegawa Group, central Japan

*Sone Haruki[1] (1.Graduate school of Shimane University, Natural Science and Technology, Major in Science of Environmental systems, Geoscience corse)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[HCG32-08] Most benthos floats up in liquefied sandy substrates: quantitative evaluation by measuring living-organism density

*Koji Seike[1], Shinji Sasa[2], Kotaro Shirai[3], Kaoru Kubota[4] (1.Geological Survey of Japan, AIST, 2.Port and Airport Research Institute, 3.AORI, The University of Tokyo, 4.Kochi Institute for Core Sample Research, JAMSTEC)

[J] Oral | H (Human Geosciences)：H-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 202 2F

[H-CG33] Useful life-support systems in closed bio-ecosystems

convener:Kaori Tomita-Yokotani(Faculty of Life and Environmental Sciences University of Tsukuba), Masanori Shinohara(Teikyo University of Science), Shunta Kimura(Graduate School of Life and Environmental Sciences, University of Tsukuba), Chairperson:Shunta Kimura

3:32 PM - 3:47 PM JST | 6:32 AM - 6:47 AM UTC

[HCG33-01] Closed bio-ecosystems in extraterrestrial environments-Research in closed bio-ecosystems

*Kaori Tomita-Yokotani[1] (1.Faculty of Life and Environmental Sciences University of Tsukuba)

3:47 PM - 4:07 PM JST | 6:47 AM - 7:07 AM UTC

[HCG33-02] Concept and Studies of Aquaculture in Space -In the Past and Future-

★Invited Papers

*Masato Endo[1] (1.Tokyo University of Marine Science and Technology)

4:07 PM - 4:27 PM JST | 7:07 AM - 7:27 AM UTC

[HCG33-03] Protection effects of gasotransmitters against oxidation damager in vascular endothelial cells

★Invited Papers

*Shigeki Yoshida[1] (1.University of Tsukuba)

4:27 PM - 4:42 PM JST | 7:27 AM - 7:42 AM UTC

[HCG33-04] Study on nutrition intake and food selection to maintain health for habitation in space

*Yasuko Kimura[1], Shunta Kimura[2,3], Hiroshi Katoh[4], Kaori Tomita-Yokotani[2] (1.Jumonji University, 2.University of Tsukuba, 3.The University of Tokyo, 4.Mie University)

4:42 PM - 4:57 PM JST | 7:42 AM - 7:57 AM UTC

[HCG33-05] Limit of "rational optimism", Earth as CELSS, and sustainability of human-being

*Masanori Shinohara[1] (1.Teikyo University of Science)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | Convention Hall A 2F

[S-SS13] Strong Ground Motion and Earthquake Disaster

convener:Masayuki Kuriyama(Central Research Institute of Electric Power Industry), Kazuhiro Somei(Geo-Research Institute), Chairperson:Yoshinari Hayashi(Faculty of Safety Science, Kansai University), Dianshu Ju(Ohsaki Research Institute, Inc.)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SSS13-01] Investigation of the effect of jog deviations on Riedel fractures by three-dimensional elasto-plastic analysis

*Tomohiro Toyoda[1], Toshihiro Noda[2], Shotaro Yamada[1], Akira Asaoka[3] (1.Nagoya University, Graduate School of Engineering, 2.Nagoya University, Disaster Mitigation Research Center, 3.Association for the development of earthquake prediction)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SSS13-02] A survey on earthquake prediction and public warning in seismological community

*Yoshinari Hayashi[1] (1.Faculty of Societal Safety Sciences, Kansai University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SSS13-03] Long-period strong ground motion of the Tokyo Bay area during the events occurred in the plate triple junction area

*Tomiichi Uetake[1] (1.R&D Department, TEPCO research Institute, Tokyo Electric Power Company)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SSS13-04] **Time-frequency and engineering characteristics on offshore ground motion**

*CHEN Su[1], FU Lei[1], LI Xiaojun[1] (1.Institute of Geophysics, China Earthquake Administration)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SSS13-05] **Long-period Ground Motion from Hypothetical Megathrust Earthquakes along the Nankai Through using the Ambient Seismic Field**

*Loic Viens[1], Tomotaka Iwata[1] (1.Disaster Prevention Research Institute, Kyoto University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SSS13-06] Fault model and strong ground motion evaluation for the Nankai megathrust earthquake

*Dianshu Ju[1], Hiroyuki Fujiwara[2], Nobuyuki Morikawa[2] (1.Ohsaki Research Institute, Inc., 2.National Research Institute for Earth Science and Disaster Resilience)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | Convention Hall A 2F

[S-SS13] Strong Ground Motion and Earthquake Disaster

convener:Masayuki Kuriyama(Central Research Institute of Electric Power Industry), Kazuhiro Somei(Geo-Research Institute), Chairperson:Susumu Kurahashi(Aichi Institute of Technology), Masahiro Korenaga(Railway Technical Research Institute)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SSS13-07] One cause of the strong ground motion characteristics in Mukawa town during the 2018 Hokkaido eastern Iburi earthquake

*Nobuo TAKAI[1], Michiko Shigefuji[2], Takahiro Maeda[3], Masayoshi Ichiyanagi[1], Hiroaki Takahashi[1] (1.Hokkaido University, 2.Kyushu University, 3.NIED)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SSS13-08] Estimation of SMGA source model during the 2018 Hokkaido Eastern Iburi (Mw6.6) earthquake

*Susumu Kurahashi[1], Kojiro Irikura[1] (1.Aichi Institute of Technology)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SSS13-09] Strong ground motion prediction for the source fault model of Futagawa and Hinagu active fault zones (1) -Construction of the basin velocity structure model-

*Kimiyuki Asano[1], Tomotaka Iwata[1], Masayuki Yoshimi[2], Hiroe Miyake[3], Haruko Sekiguchi[1], Shinichi Matsushima[1], Hiroshi Kawase[1], Fumiaki Nagashima[1], Hiroaki Yamanaka[4], Kosuke Chimoto[4], Nobuyuki Yamada[5], Tatsuo Kanno[6], Michiko Shigefuji[6], Shigeki Senna[7], Takahiro Maeda[7], Atsushi Wakai[7], Asako Iwaki[7], Kaoru Jin[9], Hidetaka Saomoto[2], Seiji Tsuno[8], Masahiro Korenaga[8], Takeshi Sugiyama, Haruhiko Suzuki[9], Hisanori Matsuyama[9], Shunpei Manabe[9], Atsushi Yatagai[9], Shigeru Okamoto[10], Masaki Suehiro[10] (1.Disaster Prevention Research Institute, Kyoto University, 2.Geological Survey of Japan, AIST, 3.University of Tokyo, 4.Tokyo Institute of Technology, 5.Kochi University, 6.Kyushu University, 7.National Research Institute for Earth Science and Disaster Resilience, 8.Railway Technical Research Institute, 9.OYO Corporation, 10.Hanshin Consultants Co., Ltd.)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SSS13-10] Strong ground motion prediction for the source fault model of Futagawa and Hinagu active fault zones (2)-Strong ground motion prediction -

*Tomotaka Iwata[1], Kimiyuki Asano[1], Masayuki Yoshimi[2], Hiroe Miyake[3], Haruko Sekiguchi[1], Shinichi Matsushima[1], Hiroshi Kawase[1], Fumiaki Nagashima[1], Hiroaki Yamanaka[4], Kosuke Chimoto[4], Nobuyuki Yamada[5], Tatsuo Kanno[6], Michiko Shigefuji[6], Shigeki Senna[7], Takahiro Maeda[7], Asako Iwaki[7], Kaoru Jin[7], Hidetaka Saomoto[2], Seiji Tsuno[8], Masahiro Korenaga[8], Syunpei Manabe[9], Haruhiko Suzuki[9], Hisanori Matsuyama[9], Yatagai Atsushi[9] (1.Disaster Prevention Research Institute, Kyoto University, 2.Geological Survey of Japan, AIST, 3.University of Tokyo, 4.Tokyo Institute of Technology, 5.Kochi University, 6.Kyushu University, 7.National Research Institute for Earth Science and Disaster Resilience, 8.Railway Technical Research Institute, 9.OYO Corporation)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SSS13-11] Near-surface geophysical survey and hearing survey of housing damages at Yasunaga district, Mashiki Town stricken by the 2016 Kumamoto Earthquakes

*Tomio INAZAKI[1], Takanori Ogahara[1], Hiroshi Kisanuki[2] (1.Public Works Research Institute, Tsukuba Central Institute, 2.PWRI (Present Address: OYO Corporation))

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SSS13-12] Evaluation on Influence of Shallow Subsurface Structures to Earthquake Ground Motions in the Kumamoto Plain, Using the Borehole Seismic Data

*Masahiro Korenaga[1], Seiji Tsuno[1], Hiroaki Yamanaka[2], Kosuke Chimoto[2] (1.Railway Technical Research Institute, 2.Tokyo Institute of Technology)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | Convention Hall A 2F

[S-SS13] Strong Ground Motion and Earthquake Disaster

convener:Masayuki Kuriyama(Central Research Institute of Electric Power Industry), Kazuhiro Somei(Geo-Research Institute), Chairperson:Kentaro Kasamatsu(Kajima Corporation), Kazuhito Hikima(Tokyo Electric Power Company Holdings, Inc.)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SSS13-13] Factors of large amplitude ground motions excited by small to moderate earthquakes - Examination of KiK-net Kuriyama-nishi of the 2013 Tochigi-ken Hokubu Earthquake (Mj6.3) -

*Kentaro Kasamatsu[1], Kenichi Kato[2], Tetsushi Watanabe[2], Tetsuo Shiota[3] (1.Kajima Corporation, 2.Kobori Research complex inc., 3.Shikoku Electric Power CO.,Inc.)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SSS13-14] Source modeling and strong ground motion simulation in the Tokyo metropolitan area of the 1923 Kanto earthquake based on seismic intensity inversion analysis

*Fumino Suzuki[1], Kenichi Kato[1], Katsuhisa Kanda[1], Takashi Ikeda[1] (1.KOBORI RESEARCH COMPLEX INC.)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SSS13-15] A Simple Fault Model to Calculate Strong Ground Motions Including Fling Steps for the Main Shock of the 2016 Kumamoto Earthquake

*Atsushi Nozu[1], Yosuke Nagasaka[1], Shuanglan Wu[1] (1.Port and Airport Research Institute)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SSS13-16] Fling-steps displacements by the discrete wavenumber method

*SHUANGLAN WU[1], Atsushi Nozu[1], Yosuke Nagasaka[1] (1.PORT AND AIRPORT RESEARCH INSTITUTE)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SSS13-17] Extension of characterized source model for long-period strong motions near surface-rupture-earthquakes

*Kojiro Irikura[1], Susumu Kurahashi[1], Yasuhiro Matsumoto[2] (1.Aichi Institute of Technology, 2.KOZO_KEIKAKU Engineering, Inc.)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SSS13-18] A Study for the cause of earthquake damages by the 2014 Nakagano-ken Hokubu earthquake (M_J6.7) – consideration using the strong motion simulation –

*Kazuhito Hikima[1], Ryoichi Nakamura[2], Tomiichi Uetake[1] (1.Tokyo Electric Power Company Holdings, Inc., 2.Earthquake Research Institute, Univ. of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Convention Hall A 2F

[S-SS13] Strong Ground Motion and Earthquake Disaster

convener:Masayuki Kuriyama(Central Research Institute of Electric Power Industry), Kazuhiro Somei(Geo-Research Institute), Chairperson:Yosuke Nagasaka(Port and Airport Research Institute), Masumi Yamada(Disaster Prevention Research Institute, Kyoto University)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SSS13-19] Strong ground motion simulation of the Northern Osaka earthquake of June 18, 2018

*Yosuke Nagasaka[1], Atsushi Nozu[1] (1.Port and Airport Research Institute)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SSS13-20] **Strong Motion of the 2018 Mw 6.4 Hualien, Taiwan Earthquake and Its Impact on Seismic Design Code in Taiwan**

*Chun-Hsiang Kuo[1], Jyun-Yan Huang[1], Che-Min Lin[1], Kuo-Liang Wen[2] (1.NCREE National Center for Research on Earthquake Engineering of Taiwan, 2.NCU National Central University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SSS13-21] Simulation of Rupture Directivity Effect for the February 6, 2018 Hualien, Taiwan Earthquake

*Cheng-Feng Wu[1], Huey-Chu Huang[1] (1.Department of Earth and Environmental Sciences, National Chung Cheng University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SSS13-22] Strong motions and estimation of the sursurface soil structure for the 2018 Hualien earthquake in Taiwan

*Masumi Yamada[1], Ikuo Cho[2], Chun-Hsiang Kuo[3], Che-min Lin[3], Ken Miyakoshi[4], Yujia Guo[4], Takumi Hayashida[5], Yasuhiro Matsumoto[6], James Mori[1], Yin-Tung Yen[7], Keng-Chang Kuo[8] (1.Disaster Prevention Research Institute, Kyoto University, 2.National Institute of Advanced Industrial Science and Technology , 3.National Center for Research on Earthquake Engineering, 4.Geo-Research Institute, 5.Building Research Institute, 6.Kozo Keikaku Engineering, 7.Sinotech Engineering Consultants, 8.Kaohsiung university of Science and Technology)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SSS13-23] **Effect of Near Surface Geology on the Recorded Ground Motion of the Nepal Earthquake in Kumaon Himalaya**

*SOHAN LAL[1], Anand Joshi[1], M.L. Sharma[1] (1.Indian Institute of Technology Roorkee)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[SSS13-24] Broadband Source Modeling for the Himalayan Collision Zone

*Hiroe Miyake[1], Babita Sharma[2], Kazuki Koketsu[1], Soma Nath Sapkota[3] (1.Earthquake Research Institute, University of Tokyo, 2.National Centre for Seismology, Ministry of Earth Sciences, India, 3.Department of Mine and Geology, Nepal)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A03 TOKYO BAY MAKUHARI HALL

[S-SS16] Crustal Deformation

convener:Mako Ohzono(Institute of Seismology and Volcanology, Graduate School of Science, Hokkaido University), Tadafumi Ochi(Institute of Earthquake and Volcano Geology, Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology), Masayuki Kano(Graduate school of science, Tohoku University), Chairperson:Yoshiyuki Tanaka(Earth and Planetary Science, The University of Tokyo), Masayuki Kano(東北大学 大学院理学研究科 地球物理学専攻)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SSS16-01] Development of New GEONET Analysis Strategy

*yasuaki kakiage[1], satoshi abe[1], kazuyuki ohashi[1], hideo hamazaki[1], kazuyuki tanaka[1], satoshi kawamoto[1], yuki hatanaka[1] (1.GSI of Japan)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SSS16-02] Relationship between deformation of the forearc wedge of Southwest Japan and the 1707 Hoei earthquake

*Yukinobu Okamura[1], Masanobu Shishikura[1] (1.Research Institute of Earthquake and Vocano Geology, National Institute of Advanced Industrial Science and Technology)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SSS16-03] A possible slow slip event beneath the Kii Peninsula inferred from historical tilt records in 1970's

*Masayuki Kano[1], Yasuyuki Kano[2] (1.Graduate school of science, Tohoku University, 2.Earthquake Research Institute, The University of Tokyo)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SSS16-04] The effect of the steady plate subduction in the case of southwest Japan

*Yuto Iwase[1], Takeo Ito[1] (1.Graduate School of Environmental Science, Nagoya University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SSS16-05] Development of Mechanical Coupling Model on Subducting Plate Interfaces

*Hiroshi Kimura[1], Takeo Ito[1], Keiichi Tadokoro[1], Ryohei Sasajima[2] (1.Department of Earth and Planetary Sciences, Nagoya University, 2.Research Center For Earthquake Prediction, Disaster Prevention Research Institute, Kyoto University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SSS16-06] Monitoring vertical deformation with optical lattice clock –an application of relativistic geodesy

*Yoshiyuki Tanaka[1], Yuichi Imanishi[2], Yoshiaki Tamura[3] (1.Earth and Planetary Science, The University of Tokyo, 2.Earthquake Research Institute, The University of Tokyo, 3.Mizusawa VLBI Observatory, National Astronomical Observatory of Japan)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A03 TOKYO BAY MAKUHARI HALL

[S-SS16] Crustal Deformation

convener:Mako Ohzono(Institute of Seismology and Volcanology, Graduate School of Science, Hokkaido University), Tadafumi Ochi(Institute of Earthquake and Volcano Geology, Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology), Masayuki Kano(Graduate school of science, Tohoku University), Chairperson:Yuji Himematsu(Graduate School of Science, Hokkaido University), Atsushi Mukai(Faculty of Urban Management, Fukuyama City University)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SSS16-07] Surface Deformation before and after the 2016 Kumamoto Earthquake Detected by SAR

*Manabu Hashimoto[1] (1.Disaster Prevention Research Institute, Kyoto University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SSS16-08] Co- and post-seismic crustal deformations associated with the 2016 Kumamoto earthquake sequence using ALOS-2/PALSAR-2 data

*Yuji Himematsu[1], Masato Furuya[1] (1.Graduate School of Science, Hokkaido University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SSS16-09] GNSS time series analysis of postseismic deformation induced by 2016 Kumamoto earthquake (M7.3)

*Satoshi Fuwa[1], Mako Ohzono[1] (1.Hokkaido University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SSS16-10] **The viscoelastic crustal response to the magma discharge/recharge in the upper crust: implications for the uplift of the Aira caldera before and after the 1914 eruption of the Sakurajima volcano**

*Tadashi Yamasaki[1], Freysteinn Sigmundsson[2], Masato Iguchi[3] (1.Geological Survey of Japan, AIST, 2.Nordic Volcanological Center, University of Iceland, 3.DPRI, Kyoto University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SSS16-11] Factors controlling annual changes in groundwater migration in the fault fracture zone of Manpukuji fault

*Atsushi Mukai[1], Shigeaki Otsuka[2], Yoichi Fukuda[3] (1.Faculty of Urban Management, Fukuyama City University, 2.Kobe Gakuin University, 3.Graduate School of Science, Kyoto Univ.)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A03 TOKYO BAY MAKUHARI HALL

[S-SS16] Crustal Deformation

convener:Mako Ohzono(Institute of Seismology and Volcanology, Graduate School of Science, Hokkaido University), Tadafumi Ochi(Institute of Earthquake and Volcano Geology, Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology), Masayuki Kano(Graduate school of science, Tohoku University), Chairperson:Takao Tabei(Department of Global Environment and Disaster Prevention, Faculty of Science and Technology, Kochi University), Takeo Ito

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SSS16-12] Rapid uplift in SW Taiwan caused by fold growth

*Yoshiki Takei[1], Youichiro Takada[2] (1.Department of Natural History Sciences, Graduate School of Science, Hokkaido University, 2.Hokkaido University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SSS16-13] Construction of GNSS monitoring system in Nepal for the earthquake potential evaluation in the Himalayan Frontal Zone

*Takao Tabei[1], Mako Ohzono[2], Kazuki Koketsu[3], Hiroe Miyake[3], Rajendra Bhandari[4], Janak B. Chand[4], Bishow R. Silwal[4], Soma N. Sapkota[4] (1.Department of Global Environment and Disaster Prevention, Faculty of Science and Technology, Kochi University, 2.Institute of Seismology and Volcanology, Graduate School of Science, Hokkaido University, 3.Earthquake Researech Institute, University of Tokyo, 4.Department of Mines and Geology, Nepal)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SSS16-14] The kinematic model along the Sumatran fault using a new dense GNSS observation (AGNeSS+) in Banda Aceh

*Takeo Ito[1], Takao Tabei[2], Fumiaki Kimata[3], Makoto OKUBO[2], Tadashi Yamashina[2], Cecep Pratama[4], Didik Sugiyanto[5], Mukusin Umar[5], Nazli Ismail[5], Irwandi Nurdin[5] (1.Nagoya Univ, 2.Kochi Univ, 3.Tono Research Institute of Earthquake Science, 4.Gadjah Mada University, 5.Syiah Kuala University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SSS16-15] Mechanical modeling of interseismic deformation in the Central Andes: implications for back-arc shortening

*Shaoyang Li[1,2], Fuqiang Shi[3], Marcos Moreno[4], Jun'ichi Fukuda[1] (1.Earthquake Research Institute, University of Tokyo, Tokyo, Japan, 2.Department of Earth and Environmental Sciences, The University of Iowa, Iowa City, IA, USA, 3.Shaanxi Earthquake Agency, Xi'an, China, 4.Departamento de Geofísica, Facultad de Ciencias Físicas y Matemáticas, Universidad de Concepción, Concepción, Chile)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SSS16-16] Inferring regional stress field based on SAR analysis and dynamic simulation of the 2018 Palu earthquake

*Takafumi Yokota[1], Ryosuke Ando[1], Yosuke Aoki[2] (1.Graduate School of Science, University of Tokyo , 2.Earthquake Research Institute, University of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-EM Earth's Electromagnetism

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[S-EM18] Geomagnetism, paleomagnetism and rock magnetism

convener:Hisayoshi Shimizu(Earthquake Research Institute, University of Tokyo), Masahiko Sato(Department of Earth and Planetary Science, The University of Tokyo), Chairperson:Masahiko Sato(Department of Earth and Planetary Science, University of Tokyo), Akira Baba(山梨県富士山科学研究所)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SEM18-01] On the formation process of the Mt.Hoei, Fuji volcano.
A scenario based on the emplacement temperature inferred from paleomagnetic method.

*Akira Baba[1], Hidetoshi Shibuya[2], Toshitsugu Fujii[1], Tatsuro Chiba[3] (1.Mount Fuji Research Institute, 2.Department of Earth and Environmental Sciences, Faculty of Advanced Science and Technology, Kumamoto University, 3.Asia Air Survey Co., Ltd.)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SEM18-02] Reconstruction of paleointensity during 5 to 9 th century from Mt. Fuji lavas

Hiromichi Komatsu[2], *Tadahiro Hatakeyama[1,4], Akira Baba[3] (1.Information Processing Center, Okayama University of Science, 2.Faculty of Biosphere-Geosphere Science, Okayama University of Science, 3.Mount Fuji Research Institute, Yamanashi Prefecture, 4.Graduate School of Biosphere-Geosphere Science, Okayama University of Science)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SEM18-03] Reconstruction of full-vector archaeomagnetic reference curve in East Asia from 200 CE to 1100 CE

*Yu Kitahara[1], Daiki Nishiyama[2], Masao Ohno[1], Yuhji Yamamoto[3], Tadahiro Hatakeyama[4] (1.Faculty of Social and Cultural Studies, Kyushu University, 2.Faculty of Science, Kochi University, 3.Center for Advanced Marine Core Research, Kochi University, 4.Information Processing Center, Okayama University of Science)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SEM18-04] A high resolution paleomagnetic record across and around the Matuyama-Brunhes polarity transition from the Chiba composite section

*Makoto Okada[1], Yuki Haneda[2], Yusuke Suganuma[3,4] (1.Department of Earth Sciences, Faculty of Science, Ibaraki University, 2.Graduate School of Scinece and Engineering, Ibaraki Univeristy, 3.National Institute of Polar Research, 4.Graduate University for Advanced Studies)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SEM18-05] Brunhes-Matuyama contact aureole surrounding the Kurobegawa Granite

*Koji Fukuma[1], Hisatoshi Ito[2], Mami Takehara[3], Ryuji Yamada[4], Takashi Kubo[5] (1.Department of Environmental System Science, Faculty of Science and Engineering, Doshisha University, 2.Central Research Institute of Electric Power Industry, 3.National Institute of Polar Research, 4.National Research Institute for Earth Science and Disaster Prevention, 5.MAIBUNKAN)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SEM18-06] Paleomagnetic study of the IODP Site U1335 sediments in the eastern equatorial Pacific - relative paleointensity and inclination anomaly over the last 8 Myr

*Yuhji Yamamoto[1], Toshitsugu Yamazaki[2] (1.Center for Advanced Marine Core Research, Kochi University, 2.Atmosphere and Ocean Research Institute, University of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-EM Earth's Electromagnetism

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[S-EM18] Geomagnetism, paleomagnetism and rock magnetism

convener:Hisayoshi Shimizu(Earthquake Research Institute, University of Tokyo), Masahiko Sato(Department of Earth and Planetary Science, The University of Tokyo), Chairperson:Yu Kitahara(Graduate School of Social and Cultual Studies, Kyushu University), Hisayoshi Shimizu(The University of Tokyo)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SEM18-07] Sensor Response Estimate and Calibration of Superconducting Rock Magnetometers

*Hirokuni Oda[1], Chuang Xuan[2] (1.Institute of Geology and Geoinformation, Geological Survey of Japan, AIST, 2.University of Southampton)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SEM18-08] Magnetic separation of ordinary solid particles using a pokcet size magnetic circuit

*Chiaki Uyeda[1] (1.Institute of earth and Space Science Graduate School of Science Osaka University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SEM18-09] Experimental evaluation of remanence carriers in coercivity-blocking temperature diagram

*Masahiko Sato[1], Takuma Terada[2], Nobutatsu Mochizuki[3], Ayako Ito[2], Hideo Tsunakawa[2] (1.The University of Tokyo, 2.Tokyo Institute of Technology, 3.Kumamoto University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SEM18-10] **Mineralogical study on magnetite exsolution and host plagioclase crystal**

*Yujiro Tamura[1], Ryoichi Nakada[2], Masahiko Sato[3], Shinji Yamamoto[4] (1.Graduate schoole of Environment and Information Sciences, Departmennt of Natural Environment, Yokohama National University, 2.Kochi Institute of Core Sample Reserch, Japan Agency for Marine-Earth Science and Technology, 3.Department of Earth and Planetary Science, The University of Tokyo, 4.Graduate schoole of Environment and Information Sciences, Yokohama National University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SEM18-11] Numerous nano-sized magnetite and hematite inclusions in muscovite in loess

*Masayuki Hyodo[1], Takuro Sano[2], Megumi Matsumoto[3], Yusuke Seto[2], Kota Suzuki[2], Tianshui Yang[4] (1.Research Center for Inland Seas, Kobe University, 2.Graduate School of Science, Kobe University, 3.Graduate School of Science, Tohoku University, 4.China University of Geosciences)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SEM18-12] Density separation and magnetic measurements of magnetotactic bacteria *Magnetospirillum magnetotacticum* MS-1

*Kohei Masaoka[1], Yuki Morono[2], Naotaka Tomioka[2], Go-Ichiro Uramoto[1], Yuhji Yamamoto[1] (1.Kochi University, 2.Kochi Institute for Core Sample Research, Japan Agency for Marine-Earth Science and Technology)

[J] Oral | S (Solid Earth Sciences)：S-EM Earth's Electromagnetism

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[S-EM18] Geomagnetism, paleomagnetism and rock magnetism

convener:Hisayoshi Shimizu(Earthquake Research Institute, University of Tokyo), Masahiko Sato(Department of Earth and Planetary Science, The University of Tokyo), Chairperson:Masahiko Sato(Department of Earth and Planetary Science, University of Tokyo), Hisayoshi Shimizu(The University of Tokyo)

1:45 PM - 2:05 PM JST | 4:45 AM - 5:05 AM UTC

[SEM18-13] Effects of the intrinsic magnetic field on the atmospheric escape from terrestrial planets

★Invited Papers

*Kanako Seki[1], Shotaro Sakai[1], Shogo Inui[1], Ryoya Sakata[1], Naoki Terada[2], Hiroyuki Shinagawa[3], David A. Brain[4] (1.Graduate School of Science, University of Tokyo, 2.Graduate School of Science, Tohoku University, 3.NICT, 4.LASP, University of Colorado, Boulder)

2:05 PM - 2:20 PM JST | 5:05 AM - 5:20 AM UTC

[SEM18-14] Numerical modeling of a lunar dynamo and its long-term evolution

*Fumi Hyodo[1], Futoshi Takahashi[2], Satoshi Kaneshima[2], Hisayoshi Shimizu[3], Hideo Tsunakawa[4] (1.Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University, 2.Department of Earth and Planetary Sciences, Kyushu University, 3.Earthquake Research Institute, University of Tokyo, 4.Deparment of Earth and Planetary Sciences, Tokyo Institute of Technology)

2:20 PM - 2:40 PM JST | 5:20 AM - 5:40 AM UTC

[SEM18-15] Investigation of sub-grid scale (SGS) model in dynamo simulations with small Ekman and magnetic Prandtl numbers

★Invited Papers

*Hiroaki Matsui[1] (1.Dept. of Earth and Planetary Sciences, University of California, Davis)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SEM18-16] Growth rates of kinematic dynamos in a finite domain

*Ataru Sakuraba[1] (1.Department of Earth and Planetary Science, University of Tokyo)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SEM18-17] Detection of jerk-like magnetic field variation in a numerical dynamo model using wavelet analysis

*Futoshi Takahashi[1], Yoshiki Manabe[2] (1.Faculty of Sciences, Kyushu University, 2.Department of Earth and Planetary Sciences, Kyushu University)

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A07 TOKYO BAY MAKUHARI HALL

[S-VC36] Volcanic and igneous activities, and these long-term forecasting

convener:Teruki Oikawa(GSJ, National Institute of Advanced Industrial Science and Technology), Takeshi Hasegawa(Department of Earth Sciences, College of Science, Ibaraki University), Daisuke MIURA(Department of Physical Science, Graduate School of Science, Osaka Prefecture University), Nobuo Geshi(Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology), Chairperson:Daisuke Miura, Nobuo Geshi(GSJ/AIST)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SVC36-01] The entire magmatic history of the Toba Caldera Complex that influenced human evolution, northern Sumatra, inferred from zircon U-Pb geochronology

*Hisatoshi Ito[1] (1.Central Research Institute of Electric Power Industry)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SVC36-02] Pre-eruptive magmatic processes of "Hakone Tokyo Pumice eruption"

*Ryo Tsujihara[1,2], Tetsu Kogiso[1], Takashi Sano[3], Hidemi Ishibashi[4] (1.Graduate School of Human and Environmental Studies, Kyoto University, 2.Asia Air Survey Co., Ltd., 3.National Museum of Nature and Science, 4.Faculty of Science, Shizuoka University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SVC36-03] Transition of magma plumbing system deduced from the melt inclusions contained in tephra minerals originated from Aso central cones.

*ryota nagaishi[1], Toshiaki Hasenaka[2], Masayuki Torii[2], ATSUSHI YASUDA[3], Natsumi Hokanishi[3] (1.Graduate of Science and Technology, Kumamoto University, 2.Center for water cycle, marin environment and disaster management , 3.Earthquake Reserach Institute, The University of Tokyo)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SVC36-04] Pre-eruptive magma dynamics of the climactic 110ka eruption of Toya caldera, Japan

*Akihiko Tomiya[1], Yoshihiko Goto[2], Tohru Danhara[3], Shanaka L de Silva[4] (1.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology, 2.Muroran Institute of Technology, 3.Kyoto Fission-Track Co., Ltd., 4.Oregon State University, College of Earth, Ocean and Atmospheric Sciences)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SVC36-05] Voluminous silicic magma formation for the 30 ka Aira catastrophic caldera-forming eruption: contributions of crust-derived mafic and felsic magmas

*Ayumu Nishihara[1], Yoshiyuki Tatsumi[2,1], Keiko Suzuki-Kamata[2,1], Katsuya Kaneko[1,2], Jun-Ichi Kimura[3], Qing Chang[3], Hironobu Hinata[4], Takashi Miyazaki[3], Bogdan Stefanov Vaglarov[3] (1.Department of Planetology, Graduate School of Science , Kobe University, 2.Kobe Ocean-Bottom Exploration Center, 3.Department of Solid Earth Geochemistry, Japan Agency for Marine-Earth Science and Technology, 4.Kobe Municipal Tarumi Junior High School)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SVC36-06] Stratigraphy and petrological relations of pre-Aso volcanic rocks in Tateno district, Minami-Aso village

*Shota Togawa[1], Toshiaki Hasenaka[2], Masayuki Torii[2], Yasushi Mori[3] (1.Graduate school of science and technology, 2.Center for Water Cycle, Marine Environment and Disaster management, Kumamoto University, 3.Kitakyushu Museum of Natural History and Human History)

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A07 TOKYO BAY MAKUHARI HALL

[S-VC36] Volcanic and igneous activities, and these long-term forecasting

convener:Teruki Oikawa(GSJ, National Institute of Advanced Industrial Science and Technology), Takeshi Hasegawa(Department of Earth Sciences, College of Science, Ibaraki University), Daisuke MIURA(Department of Physical Science, Graduate School of Science, Osaka Prefecture University), Nobuo Geshi(Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology), Chairperson:Nobuo Geshi(GSJ/AIST), Daisuke Miura

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SVC36-07] Caldera structure delineated by airborne gravity gradiometry

*Atusi NINOMIYA[1], Hiromasa ISHIKAWA[1], Shunsuke NOGAMI[1], Yoshio NAKASATO[1] (1.Sumiko Resources Exploration and Development Co., Ltd.)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SVC36-08] The initial fine ash deposit of the Shikotsu caldera-forming eruption at ca. 45 ka

*Chiharu Tomijima[1], Daisuke MIURA[1], Shimpei Uesawa[2], Mizuho Amma-Miyasaka[3] (1.Department of Physical Science, Graduate School of Science, Osaka Prefecture University, 2.Central Research Institute of Electric Power Industry, 3.Graduate School of Sciences, Hokkaido University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SVC36-09] Characterization of the Small-volume Pyroclastic Flows from the Kuchinoerabu-jima Volcano during 2018-2019, Southwest Japan

*Ryuta FURUKAWA[1], Teruki Oikawa[1], Nobuo Geshi[1] (1.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SVC36-10] An explanation of size and position of Mt. Fuji

*Yasushi Harada[1], Miyu Takahashi[1] (1.School of Marine Science and Technology, Tokai University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SVC36-11] Arc magmatism in the northernmost part of Kamchatka caused by the aseismic subducted Bering slab

*Tatsuji Nishizawa[1], Hitomi Nakamura[2,3,4,5], Tatiana Churikova[6,7], Boris Gordeychik[6,8], Maria Pevzner[9], Osamu Ishizuka[2,10], Hikaru Iwamori[3,4,11] (1.Volcanic Fluid Research Center, School of Science, Tokyo Institute of Technology, 2.Institute of Earthquake and Volcano Geology, Geological Survey of Japan, AIST, 3.Department of Solid Earth Geochemistry, Japan Agency for Marine-Earth Science and Technology, 4.Depeartment of Earth and Planetary Sciences, School of Science, Tokyo Institute of Technology, 5.ORCeNG, Chiba Institute of Technology, 6.GZG, Abt. Geochemie, Universität Göttingen, 7.Institute of Volcanology and Seismology, Far East Branch, Russian Academy of Sciences, 8.Institute of Experimental Mineralogy, Russian Academy of Sciences, 9.Geological Institute, Russian Academy of Sciences, 10.R & D Center for Ocean Drilling Science, Japan Agency for Marine-Earth Science and Technology, 11.Earthquake Research Institute, The University of Tokyo)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SVC36-12] Redox state of magma in the deep crust beneath NE Japan arc: constraints from cumulate xenoliths from Ichinomegata Maar

*Naoya Tsushima[1], Michihiko Nakamura[1], Yasuhiro Yanagida, Takeyoshi Yoshida[1] (1.Division of Earth and Planetary Materials Science, Department of Earth Science, Graduate School of Science, Tohoku University)

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A07 TOKYO BAY MAKUHARI HALL

[S-VC36] Volcanic and igneous activities, and these long-term forecasting

convener:Teruki Oikawa(GSJ, National Institute of Advanced Industrial Science and Technology), Takeshi Hasegawa(Department of Earth Sciences, College of Science, Ibaraki University), Daisuke MIURA(Department of Physical Science, Graduate School of Science, Osaka Prefecture University), Nobuo Geshi(Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology), Chairperson:RYUTA FURUKAWA, Teruki Oikawa

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SVC36-13] Deformation of a rhyolite lava below the Curie temperature: the Sanukayam lava in Kouzusima Island, Japan

*Takuma Kamio[1], Kuniyuki Furukawa[2], Tatsuo Kanamaru[3], Koji Uno[1] (1.Okayama University, 2.Aichi University, 3.Nihon University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SVC36-14] Evolution of magmatic chemistry for the Asama-Maekake volcano since 10ka revealed by whole-rock chemical analysis of pumice obtained by the trenching of air-fall tephra deposits

*Masaki Takahashi[1], Maya Yasui[1], Tatsuo Kanamaru[1] (1.Department of Earth and Environmental Sciences, College of Humanities and Sciences, Nihon University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SVC36-15] Late Pleistocene–Holocene tephra ejecta in the trench log at the southern apron of Esan volcanic complex, Japan

*Daisuke MIURA[1], Ryuta FURUKAWA[2], Kenichi Arai[3] (1.Graduate School of Science, Osaka Prefecture University, 2.Institute of Earthquake and Volcano Geology, GSJ/AIST, 3.Asia Air Survey)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SVC36-16] **Transition of eruption sequence and magma plumbing system at the 1.4 ka Nakamachineshiri eruption of Me-Akandake volcano, eastern Hokkaido, Japan.**

*Kosuke Ishige[1,2], Mitsuhiro Nakagawa[1] (1.Department of Natural History Sciences, Graduate School of Science, Hokkaido University, 2.Mitsubishi Materials Corporation)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SVC36-17] Kilo-year-evolution of magma plumbing system with dominant modes of eruption at Suwanosejima volcano, Southwest Japan

*Taketo Shimano[1], ATSUSHI YASUDA[2] (1.Graduate School of Environment and Disaster Research, Tokoha University, 2.Earthquake Research Institute, University of Tokyo)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SVC36-18] Temporal variation of the magma compositions of the Miyakejima volcano during the last 2700 years

*Nobuo Geshi[1], Teruki Oikawa[1] (1.Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology)

[J] Oral | S (Solid Earth Sciences)：S-TT Technology & Techniques

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A07 TOKYO BAY MAKUHARI HALL

[S-TT44] Airborne surveys and monitoring of the Earth

convener:Shigekazu Kusumoto(Graduate School of Science and Engineering for Research, University of Toyama), Takao Koyama(Earthquake Research Institute, University of Tokyo), Yuji Mitsuhata(AdvancedIndustrial Science and Technology), Shigeo Okuma(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST)), Chairperson:Shigekazu Kusumoto, Takao Koyama(東京大学 地震研究所 火山センター), Shigeo Okuma(産業技術総合研究所), Yuji Mitsuhata(国立研究開発法人　産業技術総合研究所)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[STT44-01] A Case Study on the Application of a Magnetic Survey Using Magnetometers Carried by Multicopter-type Drones

★Invited Papers

*Shiga Nobuhiko[1], Harada Haruo[1], Wada Kazushige[1] (1.Mitsui Mineral Development Engineering Co., Ltd.)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[STT44-02] Development for upgrading the generalization capability of the seismic damage detection of building based on the deep-learning utilizing aerial photographs

★Invited Papers

*Shohei Naito[1], Hiromitsu Tomozawa[2], Yuji Mori[2], Naokazu Monma[3], Hiromitsu Nakamura[1], Hiroyuki Fujiwara[1] (1.National Research Institute for Earth Science and Disaster Resilience, 2.Mizuho Information and Research Institute, Inc., 3.Pasco Corporation)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[STT44-03] The resistivity distribution under the ground on bedrock creep slopes in Kii mountain area by the airborne electromagnetic survey

*Atsuhiko Kinoshita[1,2], Yasutaka Tanaka[2], Wataru Sakurai[1], Taro Uchida[1], Koichiro Hayashi[3], Katsushi Kawato[4], Minoru Okumura[4] (1.National Institute for Land and Infrastructure Management, 2.Sediment Disaster Prevention Technology Center, Kinki Developing Regional Bureau, Ministry of Land, Infrastructure, Transport and Tourism , 3.OYO Corporation, 4.NIPPON ENGINEERING CONSULTANTS CO.,LTD.)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[STT44-04] Study of UAV photogrammetry toward efficiently grasping volcanic landform

*Yuichi Iwasa[1], Takeshi Matsushima[2] (1.department of earth and planetary sciences, graduate school of sciences, Kyushu University, 2.SEVO, Kyushu Univ.)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[STT44-05] Volcanic gas measurements using UAVs

*Takeshi Hashimoto[1], Akihiko Terada[2], Toshiya Mori[3], Ryo Tanaka[1] (1.Institute of Seismology and Volcanology, Graduate School of Science, Hokkaido University, 2.Volcanic Fluid Research Center, Tokyo Institute of Technology, 3.Geochemical Research Center, Graduate School of Science, The University of Tokyo)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[STT44-06] Repeated Drone Magnetic Survey over Usu Volcano, Hokkaido Japan

*Shigeo Okuma[1], Masahiko Makino[2], Tadashi Nakatsuka[1], Ayumu Miyakawa[1], Makoto Yanagida[3], Minoru Okumura[4] (1.Institute of Geology and Geoinformation, Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST), 2.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST), 3.Hanshin Consultants Co., Ltd., 4.Nippon Engineering Consultants Co., Ltd.)

[J] Oral | S (Solid Earth Sciences)：S-TT Technology & Techniques

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 304 3F

[S-TT47] Creating future of solid Earth science with high performance computing (HPC)

convener:Takane Hori(R&D Center for Earthquake and Tsunami, Japan Agency for Marine-Earth Science and Technology), Yuji Yagi(Graduate School of Life and Environmental Sciences, University of Tsukuba, Tsukuba), Katsuhiko Shiomi(National Research Institute for Earth Science and Disaster Resilience), Chairperson:Takane Hori

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[STT47-01] Expectations to more realistic Green's function with modeling errorfor the real-time estimation of the coseismic fault model

*Yusaku Ohta[1] (1.Research Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[STT47-02] Development of high-performance low order unstructured implicit finite-element solvers for solid earth science problems

★Invited Papers

*Kohei Fujita[1], Tsuyoshi Ichimura[1], Takuma Yamaguchi[1] (1.Earthquake Research Institute, The University of Tokyo)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[STT47-03] Optimal spectral element method for elastic wave computation

*Kei Hasegawa[1], Nobuaki Fuji[2], Kensuke Konishi[3] (1.Earthquake Research Institute, University of Tokyo, 2.Institut de Physique du Globe de Paris, 3.Institute of Earth Sciences, Academia Sinica)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[STT47-04] Multi scale tsunami simulation from earthquake initiation to tsunami run-up into the coastal area and high performance particle simulator

*Mitsuteru Asai[1], Mikito Furuichi[2], Daisuke Nishiura[2] (1.Kyushu University, 2.JAMSTEC)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[STT47-05] Digital-Ensemble Concept for Making Resilient Society against Natural Hazard

*Satoru Oishi[1] (1.RIKEN Center for Computational Science)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[STT47-06] Expected Role of High Performance Computing to Promote Earthquake Research

★Invited Papers

*Naoshi Hirata[1] (1.Earthquake Research Institute, the University of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-CG56] Ocean Floor Geosciences

convener:Kyoko Okino(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:shuhei Totsuka, Ayanori Misawa

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SCG56-01] The restoration of precipitation record of iron hydroxide about seven years in Nagahama Bay, Satsuma Iwo-jima, Kagoshima.

*Naoya Sakamoto[1], Shoichi Kiyokawa[2] (1.Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University, 2.Department of Earth and Planetary Sciences, Faculty of Science, Kyushu University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SCG56-02] Mineralogical and geochemical study of hydrothermal deposits beneath the seafloor at the Gondou field in the Okinawa Trough

*Shuhei Totsuka[1], Jun-ichiro Ishibashi[2], Kazuhiko Shimada[2], Kei Ikehata[3], Hideaki Machiyama[4], Koichi Iijima[4], Hirofumi Yamamoto[4], Hidenori Kumagai[4], Ken Ikehara[5], Toru Yamasaki[5], Yutaro Takaya[6], Toshiro Nagase[7], Thomas Tindell[8], Kotaro Yonezu[8], Yuki Tada[8] (1.Department of Earth and Planetary Sciences, Graduate School of Sciences, Kyushu University, 2.Department of Earth and Planetary Sciences, Faculty of Science, Kyushu University, 3.Faculty of Life and Environmental Sciences, University of Tsukuba, 4.Research and Development Center for Submarine Resources, JAMSTEC, 5.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology, 6.Department of Resources and Environmental Engineering School of Creative Science and Enginerring, Waseda University, 7.Tohoku University Museum, 8.Department of Earth Resources Engineering, Faculty of Engineering, Kyushu University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SCG56-03] Strontium isotope study of sulfate minerals obtained by scientific drilling from seafloor hydrothermal fields in the Okinawa Trough

Akihi Tsutsumi[1], Naru Tsukamoto[1], Kazuhiko Shimada[1], *Jun-ichiro Ishibashi[1], Ryuichi Shinjo[2] (1.Department of Earth and Planetary Sciences, Kyushu University, 2.Faculty of Science, University of Ryukyus)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SCG56-04] Numerical modeling of seafloor hydrothermal system in the Izena Caldron, Okinawa Trough

*Shohei Albert Tomita[1], Katsuaki Koike[1], Tada-nori Goto[1], Katsuhiko Suzuki[2], Takafumi Kasaya[2] (1.Graduate School of Engineering, Kyoto University, 2. Japan Agency for Marine-Earth Science and Technology)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SCG56-05] Electrical conductivity and spectral IP characteristics in the rock samples obtained in seafloor hydrothermal area and interpretation of them

*Yusuke Ohta[1], Tada-nori Goto[1], Katsuaki Koike[1], Weiren Lin[1], Koki Kashiwaya[1], Tadai Osamu[3], Takafumi Kasaya[2], Toshiya Kanamatsu[2], Hidenori Kumagai[2], Hideaki Machiyama[2] (1.Kyoto University, 2.Japan Agency for Marine-Earth Science and Technology, 3.Marine Works Japan)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SCG56-06] Geological structure north offshore Ishigaki-Jima estimated from seismic reflection survey

*Ayanori Misawa[1], Seishiro Furuyama[2,1], Masahiko Sato[3,1], Jih-Shin Chang[1], Takahiko Inoue[1], Kohsaku Arai[1] (1.Geological Survey of Japan, AIST, 2.Tokyo University of Marine Science and Technology, 3.The University of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-CG56] Ocean Floor Geosciences

convener:Kyoko Okino(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:Keishiro Azami, Erika Tanaka

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SCG56-07] The first report of the evidence for hydrothermal activity in old oceanic plate

*Keishiro Azami[1], Shiki Machida[2], Naoto Hirano[3], Tetsu Kogiso[4], Yasuhiro Kato[1,2] (1.Department of System Innovation, School of Engineering, The University of Tokyo, 2.Ocean Resources Research Center for Next Generation, Chiba Institute of Technology, 3.Center for Northeast Asian Studies, Tohoku University, 4.Graduate School of Human and Environmental Studies, Kyoto University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SCG56-08] X-ray computed tomography characterization of the distribution of biogenic apatite and sedimentary structures in pelagic clay around Minamitorishima Island, western North Pacific

*Yoichi Usui[1], Koichi Iijima[1], Hideaki Machiyama[1], Yuji Ichiyama[2,1], Erika Tanaka[3], Koichiro Fujinaga[4,3], Kazutaka Yasukawa[3,4] (1.Japan Agency for Marine-Earth Science and Technology, 2.Chiba University, 3.The University of Tokyo, 4.Chiba Institute of Technology)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SCG56-09] Geochemistry and distribution of REY-rich mud in the eastern off the Takuyo-Daigo Seamount within the Minamitorishima EEZ

*Koichiro Fujinaga[1,2], Kazutaka Yasukawa[3,1], Tatsuo Nozaki[4,2,1,5], Shiki Machida[1,2], Yutaro Takaya[6,2,1], Junichiro Ohta[1,2], Moei Yano[3], Ryo Shimomura[3], Erika Tanaka[3], Kazuhide Mimura[3], Koichi Horinouchi[3], Kenji Matsumoto[3], Yoichi Usui[4], Hirofumi Yamamoto[4], Kentaro Nakamura[3], Yasuhiro Kato[2,3,1], KM17-14C cruise members (1.Ocean Resources Research Center for Next Generation, Chiba Institute of Technology, 2.Frontier Research Centerfor Energy and Resources, School of Engineering, The University of Tokyo, 3.Department of Systems Innovation, School of Engineering, The University of Tokyo, 4.Japan Agencyfor Marine-Earth Science and Technology, 5.Department of Planetology, Graduate Schoolof Science, Kobe University, 6.Department of Resources and Environmental Engineering School of Creative Science and Engineering, Waseda University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SCG56-10] Extended lateral correlation of deep-sea sediments around the Minamitorishima EEZ based on downhole variation of bulk chemical composition

*Erika Tanaka[1], Kentaro Nakamura[1], Kazutaka Yasukawa[1,2], Koichiro Fujinaga[2], Koichi Iijima[3], Shiki Machida[2], Yasuhiro Kato[1,2] (1.School of Engineering, The University of Tokyo, 2.ORCeNG, Chiba Institute of Technology, 3.JAMSTEC)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SCG56-11] Tectonics of the abyssal basins surrounding the Ontong Java Plateau

*Masao Nakanishi[1], Shoka Shimizu[2], Daisuke Suetsugu[3], Takashi Sano[4] (1.Department of Earth Sciences, Graduate School of Science, Chiba University, 2.Department of Earth Sciences, Graduate School of Science and Technology, Chiba University, 3. Department of Deep Earth Structure and Dynamics Research, Japan Agency for Marine-Earth Science and Technology, 4.Department of Geology and Paleontology, National Museum of Nature and Science)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SCG56-12] The Cretaceous Normal Superchron: records from the Pacific, Indian and Atlantic oceanic crust

*Nobukazu Seama[1,2], Jerome Dyment[3], Taichi Sato[4,5], Yves Gallet[6], Kyoko Okino[7], Roi Granot[8], Yoshifumi Nogi[9], Nobutatsu Mochizuki[10], Toshitsugu Yamazaki[7] (1.Department of Planetology, Kobe University, 2.KOBEC (Kobe Ocean-Bottom Exploration Center), Kobe University, 3.Institut de Physique du Globe de Paris, 4.National Institute of Advanced Industrial Science and Technology, 5.The Institute for Geoscience Research (TIGeR), Curtin University , 6.French Centre National de la Recherche Scientifique, 7.Atmosphere and Ocean Research Institute, The University of Tokyo, 8.Department of Geological and Environmental Sciences, Ben-Gurion University, 9.National Institute of Polar Research, 10.Priority Organization for Innovation and Excellence, Kumamoto University)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-CG56] Ocean Floor Geosciences

convener:Kyoko Okino(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:Chie Honsho, Tadashi Ishikawa

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SCG56-13] Offshore Postseismic Deformation of the 2011 Tohoku Earthquake Revisited: Application of an Improved GPS-Acoustic Positioning Method Considering Sloping Sound Speed Structure

*Chie Honsho[1], Motoyuki Kido[2], Fumiaki Tomita[3], Naoki Uchida[1] (1.Research Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University, 2.International Research Institute of Disaster Science, Tohoku University, 3.Graduate School of Science, Hokkaido University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SCG56-14] Comprehensive analysis for the forearc structure and dynamics by using the S-net data

*Naoki Uchida[1], Ryosuke Azuma[1], Akira Ishigami[1], Tomomi Okada[1], Ryota Takagi[1], Genti Toyokuni[1], Norihito Umino[1], Yusaku Ohta[1], Makiko Sato[1], Syuichi Suzuki[1], Hidenobu Takahashi[1], Kazuya Tateiwa[1], Dapeng Zhao[1], Takashi NAKAYAMA[1], Akira Hasegawa[1], Ryota Hino[1], Satoshi Hirahara[1], Toru Matsuzawa[1], Keisuke Yoshida[1] (1.Research Center for Prediction of Earthquakes and Volcanic Eruptions Graduate School of Science, Tohoku University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SCG56-15] Shallow slow slip event inferred from GNSS-A seafloor geodesy

*Tadashi Ishikawa[1], Yusuke Yokota[2] (1.Hydrographic and Oceanographic Department, Japan Coast Guard, 2.Institute of Industrial Science, the University of Tokyo)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SCG56-16] Assessing strike-slip motion at the Shionomisaki Canyon along the Nankai oblique subduction zone using acoustic ranging system

*Motoyuki Kido[1], Eiichiro Araki[2], Takeshi Tsuji[3], Ryusuke Yamamoto[4], Yoshifumi Kawada[1] (1.International Research Institute for Disaster Science, Tohoku University, 2.JAMSTEC, 3.Dept. Earth Resources Engineering, Kyushu University, 4.School of Science, Tohoku University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SCG56-17] Development of seafloor realtime observation network for crustal deformation in the Nankai Trough: tiltmeter installation

*Eiichiro Araki[1], Takashi Yokobiki[1], Toshinori Kimura[1], Shuhei Nishida[1], Yuya Machida[1], Shuichi Kodaira[1] (1.Japan Agency for Marine-Earth Science and Technology)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SCG56-18] Calibration of the DONET pressure sensor network in the Nankai trough seismogenic zone using a mobile pressure gauge

*Yuya Machida[1], Shuhei Nishida[1], Toshinori Kimura[1], Eiichiro Araki[1] (1.Japan Agency for Marine-Earth Science and Technology)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-CG56] Ocean Floor Geosciences

convener:Kyoko Okino(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:Misae Imano, Tetsuo No

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SCG56-19] Analysis of GNSS/Acoustic geodetic data including the period of the transponder replacement

*Ikuta Ryoya[1], Koto Mizuno[1], Horng-Yue Chen[3], Masataka Ando[2], Takeru Komi[1] (1.Faculty of Science, Shizuoka University, 2.Center for Integrated Research and Education of Natural Hazards, Shizuoka University, 3.Institute of Earth Science, Academia Sinica)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SCG56-20] IPR (Indirect Path Ranging): a new approach for long-distance acoustic ranging with a moored relay node

*Ryusuke Yamamoto[1], Ryota Hino[1], Motoyuki Kido[2] (1.Graduate School of Science, Tohoku University, 2.International Research Institute of Disaster Science, Tohoku University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SCG56-21] Development of a kinematic GNSS-A positioning method using the extended Kalman-filter to detect precise vertical displacement

*Fumiaki Tomita[1], Motoyuki Kido[2], Chie Honsho[3], Ryo Matsui[3] (1.Graduate School of Science, Hokkaido University, 2.International Research Institute of Disaster Science, Tohoku University, 3.Graduate School of Science, Tohoku University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SCG56-22] DOP-based accuracy evaluation of GNSS-A positioning on a drifting moored buoy quantified using sea trial observation data

*Misae Imano[1], Motoyuki Kido[2,3], Chie Honsho[3], Yusaku Ohta[3], Ryota Hino[3] (1.Graduate School of Science, Tohoku University, 2.nternational Research Institute for Disaster Science, Tohoku University, 3.Reserch Center for Prediction of Earthquakes and Volcanic Eruptions Graduate School of Science, Tohoku University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SCG56-23] Analysis for GNSS/acoustic ocean bottom crustal deformation considering the heterogeneity of sound speed structure in ocean

*Natsuki Kinugasa[1], Keiichi Tadokoro[1], Yukihiro Terada[2], Teruyuki Kato[3] (1.Graduate School of Environmental Studies, Nagoya University, 2.National Institute of Technology, Kochi College, 3.Hot Springs Research Institute of Kanagawa Prefectural Government)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[SCG56-24] Seismic imaging using ocean bottom nodes in the Ishikari Basin, Japan Sea

*Tetsuo No[1], Takeshi Sato[1], Shuichi Kodaira[1], Satoshi Shimizu[2], Tetsuya Yokota[2], Karl Hosgood[3], Masako Robb[3], Tetsuro Tsuru[4] (1.JAMSTEC, 2.Nippon Marine Enterprises, 3.Emerson E&P Software, 4.Tokyo University of Marine Science and Technology)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 304 3F

[S-CG62] Potentiality of Machine Learning in Solid Earth Sciences

convener:Takahiko Uchide(Research Institute of Earthquake and Volcano Geology, Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST)), Hirokuni Oda(Institute of Geology and Geoinformation, Geological Survey of Japan, AIST), Chairperson:Takahiko Uchide(Geological Survey of Japan, AIST), Hirokuni Oda

9:00 AM - 9:20 AM JST | 12:00 AM - 12:20 AM UTC

[SCG62-01] The Promise of Machine Learning in Solid Earth Geoscience: Examples from Seismology

★Invited Papers

*Gregory C Beroza[1], Mostafa Mousavi[1], Weiqiang Zhu[1], Karianne J Bergen[2], Paul A Johnson[3], Maarten V De Hoop[4] (1.Stanford University, 2.Harvard University, 3.Los Alamos National Laboratory, 4.Rice University)

9:20 AM - 9:35 AM JST | 12:20 AM - 12:35 AM UTC

[SCG62-02] **Automatic Approach to Low-Frequency Earthquakes Detection in Southwest Japan Based on Deep Learning Technique**

*Yu Junyu[1], Yuji Yagi[1], Takanori Matsuzawa[2], Ryo Okuwaki[1] (1.Graduate School of Life and Environmental Sciences,University of Tsukuba, Tsukuba, 2.National Research Institute for Earth Science and Disaster Resilience)

9:35 AM - 9:50 AM JST | 12:35 AM - 12:50 AM UTC

[SCG62-03] Broadband ground motion waveform synthesis utilizing AI-based upsampling technique (2)

*Takahiro Maeda[1], Asako Iwaki[1], Hiroyuki Fujiwara[1], Kazutoshi Matsuzaki[2], Hiromitsu Tomozawa[2], Yuji Mori[2], Misato Tsuchiya[2], Naofumi Miyata[2] (1.National Research Institute for Earth Science and Disaster Resilience, 2.Mizuho Information & Research Institute, Inc.)

9:50 AM - 10:05 AM JST | 12:50 AM - 1:05 AM UTC

[SCG62-04] Forecast trial of postseismic deformetion after the 2011 Tohoku-Oki earthquake by recurrent neural network

*Norifumi Yamaga[1], Yuta Mitsui[2] (1.Graduate School of Science and Technology, Shizuoka University, 2.Shizuoka University)

10:05 AM - 10:25 AM JST | 1:05 AM - 1:25 AM UTC

[SCG62-05] Deep Learning Approaches for Eruption Prediction of Sakurajima

★Invited Papers

*Tsuyoshi Murata[1] (1.Tokyo Institute of Technology)

[J] Oral | G (General) : General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 104 1F

[G-01] Disaster prevention education

convener:Hitoshi Nakai(Kobuchisawa Research Institute for Nature and Education), Jiro Komori(Teikyo Heisei University), Shintaro Hayashi(Akita University Graduate School of Education), Chairperson:Jiro Komori(Teikyo Heisei University)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[G01-01] New high school compulsory subjects"Chiri-sougou(Comprehensive geography)"! : Possibility to promote disaster education

*Shintaro Hayashi[1] (1.Akita University Graduate School of Education)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[G01-02] Kyushu University's multidisciplinary disaster prevention education for students near nuclear power plants after 2016 Kumamoto earthquake

*Megumi Sugimoto[1,2], Silvia Peppoloni[2] (1.Kyushu University, 2.International Association for Promoting Geoethics)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[G01-03] The cases of the limit of dam impoundment during floods and necessity of information sharing at local disaster prevention

*Jiro Komori[1], Yuuri Masuhara[1] (1.Teikyo Heisei University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[G01-04] Disaster Tradition and Disaster Education of 2008 Sichuan Earthquake

★Invited Papers

*FU SIQI[1], Shiroshita Hideyuki[1] (1.Kansai University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[G01-05] Preparedness for Nankai Trough Earthquake: Incorporating Understandings of Uncertainties in Disaster Prevention Education Schemes

*Manabu Hashimoto[1], Mika Shimizu[2] (1.Disaster Prevention Research Institute, Kyoto University, 2.Center for the Promotion of Interdisciplinary Education and Research, Kyoto University)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[G01-06] Importance of issuing evacuation for individual family

★Invited Papers

*Suzuki Shigeyuki[1] (1.Okayama University)

[J] Oral | G (General) : General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 103 1F

[G-02] Geoscinece Outreach

convener:Takeyuki Ueki(Faculty of Risk and Crisis Management, Chiba Institute of Science), Jiro Komori(Teikyo Heisei University), Naoko HASEGAWA(Ochanomizu University), Satoko Oki(Faculty of Environment and information Studies), Chairperson:Satoko Oki

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[G02-01] Outreach of geography on general books

*Naoko HASEGAWA[1], Yuuki NAKAGAWA[1] (1.Ochanomizu University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[G02-02] **Dissemination of geographical and archaeological thinking by museum exhibitions: Practical approaches using three-dimensional models**

*Yuichi S. Hayakawa[1,2], Sahoko Aki[2] (1.Faculty of Environmental Earth Science, Hokkaido University, 2.Center for Spatial Information Science, The University of Tokyo)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[G02-03] Introduction of Guide Skill Up Course and Its Effect in the Izu Peninsula Geopark

*Tsuda Kazuhide[1], Hiroshi Ono[1], Hiroshi Yamazaki[1], Akifumi Matsuo[1], Hideki Ono[2] (1.NPO Whole Earth Institute, 2.Izu Peninsula Geopark Promotion Conucil Bureau)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[G02-04] Testcase of Science Cafe with Confrontation Axis Considerd to Complex of Earth and Space Science

*Harufumi Tamazawa[1,2], Yuko Ikkatai[3] (1. Disaster Prevention Research Institute, Kyoto University, 2.Faculty of Fine Arts, Kyoto City University of Arts, 3.kabli Institute for the Physics and Mathematics of the Universe, University of Tokyo)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[G02-05] Literacy for Rumors of Earthquake Occurrence

*Yoshiaki Orihara[1], Masashi Kamogawa[2], Toshiyasu Nagao[1] (1.Institute of Oceanic Research and Development, Tokai University, 2.Department of Physics, Tokyo Gakugei University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[G02-06] **Regional crustal movements and gigantic tsunami traces recorded by ghost forests: Importance of outreach activities and education for disaster prevention**

★Invited Papers

*Kiyoyuki Shigeno[1], Futoshi Nanayama[2,6], Kazuaki Watanabe[2], Masayuki Ishii[3], Kazuhito Ishiwata[4], Shigeto Inokuma[5], Keita Fukatsu[7] (1.Meiji consultant co.,Ltd., 2.Geological Survey of Japan, AIST, 3.Ishii Professional Engineer Office, 4.Betsukai municipal museum, 5.Nemuro City museum history and nature, 6.CWMD, Kumamoto Univ., 7.Notsuke Peninsula Nature Center)

[J] Oral | G (General) : General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 103 1F

[G-02] Geoscinece Outreach

convener:Takeyuki Ueki(Faculty of Risk and Crisis Management, Chiba Institute of Science), Jiro Komori(Teikyo Heisei University), Naoko HASEGAWA(Ochanomizu University), Satoko Oki(Faculty of Environment and information Studies), Chairperson:Naoko HASEGAWA

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[G02-07] **Constructing quaking model in the geological club activity and discussion activities around crack investigation**

*Ryo S Nakamura[1] (1.Miyagi Rifu high school)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[G02-08] The Impact of Middle School Students' "BOSAI Narratives" on the Community of Tosashimizu City

*Risako Tokoro[1], Kei Usui[1], Ayana Kawasaki[2], Tosei Nagamatsu[3], Satoko Oki[2] (1.Keio University, Faculty of Policy Management, 2.Keio University, Faculty of Environment and Information Studies, 3.Keio Research Institute at SFC)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[G02-09] **Disaster Prevention Education Programs to Increase Risk Perception**

*Erina Hyuga[1], Hitomi Sasaki[1], Satoko Oki[1] (1.Keio University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[G02-10] Geoscience education for infants using geological specimen

*Naoki Morita[1,2], Mana Yasui[2,3], Hiroshi Hagiya[2,4] (1.Meisei University, 2.Non-Profit Organization Science and Art, 3.Waseda research institute for science and engineering, 4.Tokyo City University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[G02-11] Introducing Narrative Approach to Earthquake Disaster Prevention (BOSAI) Teacher Training: Practice in Saitama Prefecture

*Ami Pareek[1], Satoko Oki[1], Kohei Yamaguchi[1], Mirei Toba[1] (1.Keio University)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[G02-12] Practice of Disaster Education in Mexico: "Cultural Tuning" Based on Comparative Study of Public Educational Curriculum Between Japan and Mexico

*Takuya Iwahori[1], Genta Nakano[1], Katsuya Yamori[1] (1.Disaster Prevention Research Insutitute, Kyoto University)

[J] Oral | G (General) : General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 104 1F

[G-03] Geoscience education from elementary school to university students

convener:Masatsune Hatakeyama(Seiko Gakuin High School), Chairperson:Toshihiro Niwa

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[G03-01] "Science reading" in the Oki Island Library Let's science reading! The story of Light deliver "science reading and demonstration experiments in the Oki Island Library

*Kunihiro Abe[1] (1.Shimane Penunsula Shinjiko Narumi, Kuibiki Geopark Promotion Committee)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[G03-02] Difference in elementary students' understanding of a solar eclipse by using different ICT devices

*Koji Imai[1], Yasuhiro Murayama[1], Takahiro Yamanishi[2] (1.National Institute of Information and Communications Technology, 2.MITSUBISHI MINATOMIRAI INDUSTRIAL MUSEUM)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[G03-03] Let's learn landform and disaster risk

*Yuki Kurisu[1] (1.Geospatial Information Authority of Japan)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[G03-04] Demonstration of the serpentinite dehydration at a laboratory in school

*Soichi Omori[1], Yukinobu Katsumata[2] (1.The Faculty of Liberal Arts, The Open University of Japan, 2.Natural and Environmental Sciences Program, The Open University of Japan)

10:00 AM - 10:20 AM JST | 1:00 AM - 1:20 AM UTC

[G03-05] Educational activities of the Earth and planetary science in the collaboration of schools, science museums, and scientists using digital globe

*Akinori Saito[1], Takuya Tsugawa[2] (1.Department of Geophysics, Graduate School of Science, Kyoto University, 2.National Institute of Information and Communications Technology)

[J] Oral | G (General) : General

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 104 1F

[G-03] Geoscience education from elementary school to university students

convener:Masatsune Hatakeyama(Seiko Gakuin High School), Chairperson:Masatsune Hatakeyama(Seikogakuin High school)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[G03-06] **Improving Awareness of Marine Conservation and Sustainability among Taiwanese Middle School Students by Teaching Slow Fish Movement**

*Ya-Yin Liao[1], Liang-Ting Tsai[2], Ting-Kuang Yeh[3], Cheng-Chieh Chang[1] (1.National Taiwan Ocean University Institute of Education , 2.Taiwan Marine Education Center, 3.National Taiwan Normal University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[G03-07] Prototyping of the teachable moment presetation for recent earthquakes in Japan (2) - - -The case of the 3 January 2019 Kumamoto earthquake (M5.1) on and improvement from the previous prototype- - -

*Reiji Kobayashi[1] (1.Graduate School of Science and Engineering, Kagoshima University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[G03-08] Development of web application for polarizing microscope observation

*Fumitoshi Morisato[1] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[G03-09] Usage and Utilization of 3D display function on GSI Maps

*Ryoichi Kojiroi[1] (1.Geospatial Information Authority of Japan)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[G03-10] Bringing field- and laboratory work into the classroom by using online modules in the edX platform

*Alejandra Quintanilla-Terminel[1], Matej Pec[1], Oliver Jagoutz[1] (1.Massachusetts Institute of Technology)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 301B 3F

[M-IS24] Integrated Analysis of Geoscience Observations from the Floor to Surface of the Ocean

convener:Keisuke Ariyoshi(Japan Agency for Marine-Earth Science and Technology), Motoyuki Kido(International Research Institute for Disaster Science, Tohoku University), Daisuke Inazu(Tokyo University of Marine Science and Technology), Narumi Takahashi(National Research Institute for Earth Science and Disaster Resilience), Chairperson:Keisuke Ariyoshi, Motoyuki Kido

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[MIS24-01] Meteorological Observations at Shionomisaki in cooperation with “Chikyu”, Shinsei-maru and Seisui-maru

*Akira Kuwano-Yoshida[1], Keisuke Ariyoshi[2], Kosei Komatsu[3], Yoshihiro Tachibana[4], Mikiko Fujita[2], Masato I. Nodzu[5], Hatsumi Nishikawa[10], Yoshimi Kawai[2], Naoki Kishita[6], Lyndon Mark Olaguera[5], MIHARU KUBO[8], Kentaro Hase[7], Yuya Matsuyama[6], Minami Masuda[9], Kenta Irie[11], Tetsuji Yoshida[10], Yusuke Watanabe[7], Kosuke Matsuda[12], Syunsuke Aoki[7], Shingo Watanabe[2], Akira Kurisu[13], Shota Yamasaki[7], Hidetaka Hirata[14], Shizuka Akiyama[7], Yoshinori Shigeta[15], Akira Miyata[15], Kai Matsubara[15], Yoshitaka Tada[15], Yasushi Watarai[16], Yusuke Nakamura[16] (1.Disaster Prevention Research Institute, Kyoto University, 2.Japan Agency for Marine-Earth Science and Technology, 3.Graduate School of Frontier Sciences, The University of Tokyo, 4.Faculty of Bioresources, Mie University,, 5.Tokyo Metropolitan University, 6.Kyushu University, 7.Kyoto University, 8.University of The Ryukyus, 9.Hirosaki University, 10.Hokkaido University, 11.Tokyo Gakugei University, 12.Tokyo University of Marine Science and Technology, 13.Okayama University, 14.Nagoya University, 15.Tottori University of Environmental Studies, 16.Rissho University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[MIS24-02] GNSS-A data analysis to estimate the sound speed profile

*Tadashi Ishikawa[1], Yusuke Yokota[2], Shun-ichi Watanabe[1] (1.Hydrographic and Oceanographic Department, Japan Coast Guard, 2.Institute of Industrial Science, the University of Tokyo)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[MIS24-03] Comparison of Ocean Bottom Pressure Observation Timeseries with Result of Real Ocean Estimating Models around the Pacific Rim Earthquake Zone

*Yoichiro Dobashi[1], Daisuke Inazu[2] (1.Tokyo University of Marine Science and Technology, 2.Tokyo University of Marine Science and Technology department of marine resouces and energy)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[MIS24-04] Experimental challenges for interpretation of in-situ observation of bottom pressure recorders (BPRs) at the seafloor

★Invited Papers

*Hiroyuki Matsumoto[1], Toshinori Kimura[1], Shuhei Nishida[1], Yuya Machida[1], Eiichiro Araki[1] (1.Japan Agency for Marine-Earth Science and Technology (JAMSTEC))

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[MIS24-05] Continuous bottom pressure observation by real-time buoy system for tsunami and crustal displacement

*Narumi Takahashi[1], Kentaro Imai[2], Motoyuki Kido[3], Yusaku Ohta[3], Tatsuya Fukuda[2], Yasuhisa Ishihara[2], Hiroshi OCHI[2], Kensuke Suzuki[2], Ryota Hino[3] (1.National Research Institute for Earth Science and Disaster Resilience, 2.Japan Agency for Marine-Earth Science and Technology, 3.Tohoku Univerisity)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[MIS24-06] Looking into the ocean and Earth’s interior from their boundary

★Invited Papers

*Yoshio Fukao[1] (1.CEAT / Japan Agency for Marine-Earth Science & Technology)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 301A 3F

[M-IS25] Recent weather disasters: factors and impact on the atmosphere, hydrosphere, and human beings

convener:Kazuaki Nishii(Graduate School of Bioresources, Mie University), Chairperson:Kazuaki Nishii(三重大学)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[MIS25-01] Heavy Rainfall Event in Middle Viet Nam on 8-9 December 2018 and current QPE/QPF at VNMHA

★Invited Papers

*Kazuo Saito[1,2,3], Le Duc[4,3], Du Duc Tien[5], Mai Khanh Hung[5] (1.Japan Meteorological Business Suport Center, 2.Atmosphere and Ocean Research Institute, the University of Tokyo, 3.Meteorological Research Institute, 4.Japan Agency for Marine-Earth Science and Technology, 5.National Center for Hydro-Meteorological Forecasting, Viet Nam Meteorological and Hydrological Administration)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[MIS25-02] High-resolution flow-simulation in Typhoon 21, 2018: tremendous loss of water plants in South Lake Biwa

★Invited Papers

*Satoshi Nakada[1], Hiroki Haga[2], Maho Iwaki[1], Keisuke Hatano[3], Koji Mabuchi[1], Noriko Takamura[1] (1.National Institute for Environmental Studies, 2.Lake Biwa Museum, 3.Japan Water Agency)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[MIS25-03] Northern mid-latitude warming prolonged for more than 6 months in 2018 well-predicted by the JMA's operational seasonal prediction system

*Chiaki Kobayashi[1], Ichiro Ishikawa[1] (1.Meteorological Research Institute)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[MIS25-04] Synoptic-scale Predictability of Heavy Rain over Western Japan in July 2018

*Akira Kuwano-Yoshida[1] (1.Disaster Prevention Research Institute, Kyoto University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[MIS25-05] Anomalous Moisture Transport and Oceanic Evaporation during a Torrential Rainfall Event over Western Japan in Early July 2018

*Shion Sekizawa[1], Takafumi Miyasaka[1,2], Hisashi Nakamura[1], Akihiko Shinpo[3], Kazuto Takemura[3], Shuhei Maeda[3] (1.Research Center for Advanced Science and Technology, University of Tokyo, 2.Meteorological Research Institute, 3.Japan Meteorological Agency)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[MIS25-06] Leading modes of atmospheric circulation variability during the heavy rain event in July 2018

*Kazuaki Nishii[1], Bunmei Taguchi[2], Hisashi Nakamura[2] (1.Graduate School of Bioresources, Mie University, 2.Research Center for Advanced Science and Technology, The University of Tokyo)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-GI General Geosciences, Information Geosciences & Simulations

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 301B 3F

[M-GI37] Earth and planetary informatics with huge data management

convener:Ken T. Murata(National Institute of Information and Communications Technology), Rie Honda(Department of Science and Technology, System of Natual Science, Kochi University), Susumu Nonogaki(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Takeshi Horinouchi(Faculty of Environmental Earth Science, Hokkaido University), Chairperson:Susumu Nonogaki, Ken Murata(National Institute of Information and Communications Technology)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[MGI37-01] Exploration of the earth environment using meteorological satellite "Himawari"

*ryuta ando[1], Shigeto Watanabe[1], Ken T. Murata[2] (1.Hokkaido Information University, 2.National Institute of Information and Communications Technology)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[MGI37-02] Kochi radar network composed of compact X-band radars

*Koji Sassa[1], Toshiaki Takaki[2], Ken T Murata[3] (1.Natural Science Cluster, Kochi University, 2.Furuno Electric Co.,Ltd., 3.National Institute of Information and Communication Technology)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[MGI37-03] Rain Echo Classification by Deep Learning Using Observation Big Data of Phased Array Weather Radar

*Shinsuke Satoh[1], Hiroshi HANADO[1], Seiji Kawamura[1], Tomohiko Konno[1], Michiaki Iwazume[1], Shigenori Otsuka[2], Takemasa Miyoshi[2] (1.National Institute of Information and Communications Technology, 2.RIKEN Center for Computational Science)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[MGI37-04] Communication area map of LoRa in Chikuma city using community bus services

*Kohei Mizuani[1], Ken T. Murata[1], Yoshiaki Muroyama[1], Kazunori Yamamoto[1], Kazuya Muranaga[2], Takamichi Mizuhara[3], Praphan Pavarangkoon[1] (1.National Institute of Information and Communications Technology, 2.Systems Engineering Consultants Co., LTD., 3.CLEALINK TECHNOLOGY Co.,Ltd.)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[MGI37-05] Development of an inexpensive and small balloon observation device, and its application in observing the Earth's upper atmosphere

*Taku Takada[1], Yui Sasaoka[1], Shiya Ueta[1], Ken T. Murata[2], Hidehiko Suzuki[3] (1.National Institute of Technology, Kochi College, 2.National Institute of Information and Communications Technology, 3.Meiji University)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-GI General Geosciences, Information Geosciences & Simulations

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 301B 3F

[M-GI37] Earth and planetary informatics with huge data management

convener:Ken T. Murata(National Institute of Information and Communications Technology), Rie Honda(Department of Science and Technology, System of Natual Science, Kochi University), Susumu Nonogaki(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Takeshi Horinouchi(Faculty of Environmental Earth Science, Hokkaido University), Chairperson:Rie Honda, Ken Murata(National Institute of Information and Communications Technology)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[MGI37-06] Introduction of “ChOWDER”: A tiled display driver that augment large scale visualization of geoscience.

*Tomohiro Kawanabe[1], Kenji Ono[2], Atsushi Higuchi[3], Koichi Toyoshima[3], Kazunori Yamamoto[4], Kazuya Muranaga[5], Ken T. Murata[4] (1.RIKEN , 2.Kyushu Univ., 3.Chiba Univ., 4.NICT, 5.Systems Engineering Consultants Co.,LTD.)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[MGI37-07] Data archive and integrated data analysis tools developed by ERG Science Center

*Tomoaki Hori[1], Yoshizumi Miyoshi[1], Masafumi Shoji[1], Mariko Teramoto[1], Tzu-Fang Chang[1], Satoshi Kurita[1], Shoya Matsuda[2], Yasunori Tsugawa[1], Tomonori Segawa[1], Norio Umemura[1], Nozomu Nishitani[1], Takako Kondo[1], Hiroyasu Yonaha[1], Yukinaga Miyashita[3], Kunihiro Keika[4], Kanako Seki[4], Yoshimasa Tanaka[5], Iku Shinohara[2] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.Japan Aerospace Exploration Agency / Institute of Space and Astronautical Science, 3.Korea Astronomy and Space Science Institute, 4.Graduate School of Science, The University of Tokyo, 5.National Institute of Polar Research)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[MGI37-08] KOSEN-1 CubeSat mission for Jupiter's radio science

*Kazumasa Imai[1], Nobuto Hirakoso[2], Taku Takada[1], Kentarou Kitamura[3], Masafumi Imai[4], KOSEN-1 Team[5], Charles A. Higgins[6], James R. Thieman[7], NASA Radio JOVE Team[8] (1.Department of Social Design Engineering, National Institute of Technology, Kochi College, 2.Department of Mechanical Engineering, National Institute of Technology, Gunma College, 3.Department of Mechanical and Electrical Engineering, National Institute of Technology, Tokuyama College, 4.University of Iowa, 5.KOSEN-1 Team, 6.Middle Tennessee State University, 7.University of Maryland Baltimore County, 8.NASA Radio JOVE Team)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[MGI37-09] Problems of acquisition of auroral image data and data processing

*Ryuho Kataoka[1], Ken T. Murata[2], Yoshizumi Miyoshi[3], Herbert Akihito Uchida[1], Yoko Fukuda[4], Atsushi Yamashita[5], Masayuki Tanaka[6] (1.National Institute of Polar Research, 2.National Institute of Information and Communication Technology, 3.Nagoya University, 4.National Institute for Environmental Studies, 5.The University of Tokyo, 6.Tokyo Institute of Techonology)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[MGI37-10] Innovative progress in ground observation of snow crystals and weather conditions by citizen science

★Invited Papers

*Kentaro Araki[1] (1.Meteorological Research Institute)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[MGI37-11] Efforts of landslide susceptibility mapping for slope disaster risk evaluation

*Kazunori Hayashi[1], Akihiko Wakai[2], Go Sato[3], Takashi Kimura[4], Ken T. Murata[5], Akino Watanabe [2] (1.Okuyama Boring Co., Ltd., 2.Gunma University, 3.Teikyo Heisei University, 4.National Research Institute for Earth Science and Disaster, 5.National Institute of Information and Communications Technology)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-AG Applied Geosciences

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 302 3F

[M-AG41] Dynamics of radionuclides emitted from Fukuchima Dai-ichi Nuclear Power Plant in the environment

convener:Yoshio Takahashi(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Kazuyuki Kita(Faculty of Science, Ibaraki University), Yuichi Onda(Center for Research on Isotopes and Environmental Dynamics, University of Tsukuba), Daisuke Tsumune(Central Research Institute of Electric Power Industry), Chairperson:Yoshio Takahashi(東京大学), Yuichi Onda(Center for Research on Isotopes and Environmental Dynamics, University of Tsukuba)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[MAG41-01] Investigation on basic physical and chemical properties of radio-Cs micro particles

*Yasuhito Igarashi[1], Kazuyuki Kita[2], Yukihiko Satou[3], Tomoaki Okuda[4], Yoshinari Abe[5], Keisuke Sueki[6], SHINOHARA ATSUSHI[7], Kazuhiko Ninomiya[7], Tsutomu Ohtshuki[1], Koichi Takamiya[1] (1.Institute for Integrated Radiation and Nuclear Science, Kyoto University, 2.Graduate School of Science and Engineering, Ibaraki University, 3.Collaborative Laboratories for Advanced Decommissioning Science, Japan Atomic Energy Agency, 4.Department of Applied Chemistry, Keio University, 5.Faculty of Science,Tokyo University of Science, 6.Center for Research in Isotopes and Environmental Dynamics, University of Tsukuba, 7.Graduate School of Science, Osaka University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[MAG41-02] Dynamics of radioactive microparticles released from the Fukushima nuclear plant: heating and dissolution characteristics

★Invited Papers

*Taiga Okumura[1], Noriko Yamaguchi[2], Terumi Dohi[3], Kenso Fujiwara[3], Kazuki Iijima[3], Toshihiro Kogure[1] (1.The University of Tokyo, 2.National Agriculture and Food Research Organization, 3.Japan Atomic Energy Agency)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[MAG41-03] Dynamics of atmospheric ^{131}I just after the Fukushima accident related to ^{137}Cs by analysis of published data

*Haruo Tsuruta[1], Yuichi Moriguchi[2], Teruyuki Nakajima[3] (1.Remote Sensing Technology Center of Japan, 2.The University of Tokyo, 3.Japan Aerospace Exploration Agency)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[MAG41-04] Distribution of ^{237}Np and Plutonium isotope in terrestrial environment in Fukushima Prefecture

*Miho Fukuda[1], Zheng Jian[1], yamazaki Shinnnosuke[1], Tatsuo Aono[1] (1.National Institute for Quantum and Radiological Science and Technology, National Institute of Radiological Science)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[MAG41-05] Study on deposition of ^{134}Cs and ^{137}Cs from atmosphere to freshwater environment using a mountainous lake, Lake Haruna in Gunma Prefecture, Japan

*Seiya Nagao[1], Shouhei Miyasaka[2], Shun Watanabe[3], Kyuma Suzuki[3], Shinya Ochiai[1] (1.Institute of Nature and Environmental Technology, Kanazawa University, 2.Graduate School of Natural Science and Technology, Kanazawa University, 3.Gunma Prefectural Fisheries Experimental Station)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[MAG41-06] Spatial variability of radiocesium deposition through the tree canopy via branchflow and stemflow

*Zul Hilmi Saidin[1], Yuichi Onda[2], Hiroaki Kato[2], Momo Kurihara[2], Kazuki Nanko[3], Delphis F. Levia[4] (1.Graduate School of Life and Environmental Sciences, University of Tsukuba, Tsukuba, Ibaraki, Japan, 2.Center for Research in Isotopes and Environmental Dynamics, University of Tsukuba, Tsukuba, Ibaraki, Japan, 3.Department of Disaster Prevention, Meteorology and Hydrology, Forestry and Forest Products Research Institute, Tsukuba, Ibaraki, Japan, 4.Departments of Geography, University of Delaware, Newark, Delaware, USA)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-AG Applied Geosciences

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 302 3F

[M-AG41] Dynamics of radionuclides emitted from Fukuchima Dai-ichi Nuclear Power Plant in the environment

convener:Yoshio Takahashi(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Kazuyuki Kita(Faculty of Science, Ibaraki University), Yuichi Onda(Center for Research on Isotopes and Environmental Dynamics, University of Tsukuba), Daisuke Tsumune(Central Research Institute of Electric Power Industry), Chairperson:Kazuyuki Kita(Ibaraki University), Daisuke Tsumune(Central Research Institute of Electric Power Industry)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[MAG41-07] Temporal changes in vertical distributions of radiocesium in forest soils after the FDNPP accident

★Invited Papers

*Junko Takahashi[1], Daichi Hihara[1], Takuya Sasaki[1], Yuichi Onda[1] (1.Center for Research in Isotopes and Environmental Dynamics, University of Tsukuba)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[MAG41-08] Change of sediment sources in suspended sediments due to surface decontamination in the Niida river catchment area affected by the Fukushima Daiichi nuclear power plant accident

*Yuichi Onda[1], Yuki Yamanaka[1], Yoshifumi Wakiyama[2], Keisuke Taniguchi[3], Takaaki Kubo[1] (1.Center for Research on Isotopes and Environmental Dynamics, University of Tsukuba, 2.Institute of Environmental Radioactivity, Fukushima University, 3.Fukushima Prefectural Centre for Environmental Creation)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[MAG41-09] Neasrshore transport of suspended radiocesium In the Fuksima Coast derived from Niida River induced by Typhoon Wipha

*Natsuki Tokunaga[1], Yusuke Uchiyama[1], Daisuke Tsumune[2], Masatoshi Yamada[5], Yutaka Tateda[2], Yukari Ito[3], Takashi Ishimaru[3], Yutaka Watanabe[7], Ken Ikehara[4], Miho Fukuda[6] (1.Kobe University, 2.Central Research Institute of Electric Power Industry, 3.Tokyo University of Marine Science and Technology, 4.National Institute of Advanced Industrial Science and Technology, 5.Hirosaki University, 6.National Institute of Radiological Sciences, 7.Hokkaido University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[MAG41-10] Particle size distribution and radiocesium concentration in suspended particles within the high turbidity layer at near sea bottom off Fukushima prefecture

*Hideki Kaeriyama[1], Naoki Furuichi[2], Kouichi Sugimatsu[3], Yuya Shigenobu[1], Shizuho Miki[1], Takami Morita[1], Daisuke Ambe[1], Tadafumi Ichikawa[1] (1.National Research Institute of Fisheries Science, Japan Fisheries Research and Education Agency, 2.National Research Institute of Fisheries Engineering, Japan Fisheries Research and Education Agency, 3.Seikai National Research Institute, Japan Fisheries Research and Education Agency)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[MAG41-11] Fukushima-derived radiocesium in the subarctic region of the North Pacific Ocean in the summer of 2017

★Invited Papers

*Yuichiro Kumamoto[1], Michio Aoyama[2], Yasunori Hamajima[3], Akihiko Murata[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.Fukushima University, 3.Kanazawa University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[MAG41-12] **Temporal and spatial variations of radiocaesium in the East China Sea and Sea of Japan until 2018**

*Michio Aoyama[1], Yayoi Inomata[2], Yasunori Hamajima[2] (1.Institute of Environmnetal Radioactivity, Fukushima University, 2.Institute of Nature and Environmental Technology, Kanazawa University)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-TT Technology & Techniques

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 201A 2F

[M-TT48] Frontiers in Geochemistry

convener:Hirochika Sumino(Department of Basic Science, Graduate School of Arts and Sciences, The University of Tokyo), Tetsuya Yokoyama(Department of Earth and Planetary Sciences, School of Science, Tokyo Institute of Technology), Hajime Obata(Marine inorganic chemistry division, Atmosphere and Ocean Research Institute, University of Tokyo), Chairperson:Hirochika Sumino, Hajime Obata(Atmosphere and Ocean Research Institute, University of Tokyo), Tetsuya Yokoyama(Tokyo Institute of Technology)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[MTT48-01] Data science approaches to geochemical data analysis

★Invited Papers

*Kenta Ueki[1] (1.Japan Agency for Marine-Earth Science and Technology)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[MTT48-02] Rapid *in situ* analyses of hydrogen and sulfur isotope ratios in basaltic glass by SIMS and their appilications

*Kenji Shimizu[1], Takayuki Ushikubo[1], Tomokazu Murai[2], Fumihiro Matsuura[2], Yuichiro Ueno[2] (1.Kochi Core Center, Japan Agency for Marine-Earth Science and Technology, 2.Tokyo Institute of Technology)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[MTT48-03] Determination of siderophile elements in metallic materials using multiple spot laser ablation-ICP-MS technique

*Yoshiki Makino[1], Yasuo Kuroki[2], Takafumi Hirata[1] (1.Geochemical Research Center, Graduate School of Science, The University of Tokyo, 2.Thermo Fisher Scientific)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[MTT48-04] Iron isotopic compositions of Luna 16, 20, 24 soils

★Invited Papers

*Satoki Okabayashi[1], Tetsuya Yokoyama[1], Takafumi Hirata[2], Kazuo Terakado[3], Erick M. Galimov[4] (1.Tokyo Institute of Technology, 2.The University of Tokyo, 3.Japan Space Forum, 4.Russian Academy of Science)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[MTT48-05] Synthesis of calcite reference materials for *in situ* U–Pb dating through crystallization from amorphous calcium carbonates

*Yusuke Miyajima[1], Ayaka Saito[1], Hiroyuki Kagi[1], Tatsunori Yokoyama[2], Takafumi Hirata[1] (1.Geochemical Research Center, Graduate School of Science, The University of Tokyo, 2.Tono Geoscience Center, Japan Atomic Energy Agency (JAEA))

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[MTT48-06] Magnetic mapping of a speleothem from the southern Pacific with a scanning SQUID microscopy and its magnetic mineralogy

*Naoto Fukuyo[1,2], Hirokuni Oda[3], Yusuke Yokoyama[1,2], Geoffrey Clark[4], Yuhji Yamamoto[5] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Department of Earth and Planetary Science, The University of Tokyo, 3.Institute of Geology and Geoinformation, 4.College of Asia and the Pacific,The Australian National University, 5.Center for Advanced Marine Core Research, Kochi University)

[J] Oral | M (Multidisciplinary and Interdisciplinary) : M-TT Technology & Techniques

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 201A 2F

[M-TT48] Frontiers in Geochemistry

convener:Hirochika Sumino(Department of Basic Science, Graduate School of Arts and Sciences, The University of Tokyo), Tetsuya Yokoyama(Department of Earth and Planetary Sciences, School of Science, Tokyo Institute of Technology), Hajime Obata(Marine inorganic chemistry division, Atmosphere and Ocean Research Institute, University of Tokyo), Chairperson:Hirochika Sumino, Hajime Obata(Atmosphere and Ocean Research Institute, University of Tokyo), Tetsuya Yokoyama(Tokyo Institute of Technology)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[MTT48-07] Uptake and accumulation of methylmercury by marine phytoplankton

★Invited Papers

*Yuya Tada[1], Kohji Marumoto[1] (1. National Institute For Minamata Disease)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[MTT48-08] A protocol for simultaneous analysis of archaeal core and intact polar lipids using normal-phase HPLC/ESI-MS

*Shunsuke Horai[1], Hiroshi Naraoka[1,2] (1.Kyushu University, 2.Research Center for Planetary Trace Organic Compounds)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[MTT48-09] Assessment of Northeastern Japan Tree-Ring Oxygen Isotopes for Reconstructing Early Summer Hydroclimate and Spring Arctic Oscillation

*Wataru Sakashita[1,2,3], Yusuke Yokoyama[3], Hiroko Miyahara[2], Takahiro AZE[3], Stephen Obrochta[4], Motonari Ohyama[5], Hitoshi Yonenobu[6] (1.Forestry and Forest Products Research Institute, 2.Musashino Art University, 3.Atmosphere and Ocean Research Institute, The University of Tokyo, 4.Akita Univeristy, 5.Tohoku University, 6.Naruto University of Education)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[MTT48-10] **Development of the rotational diamond anvil cell for high-pressure deformation experiments and its measurement systems**

★Invited Papers

*Shintaro Azuma[1,2], Ryuichi Nomura[3,4], Kentaro Uesugi[5], Yu Nishihara[4], Doi Shunta[4], Takeshi Arimoto[4], Tetsuo Irifune[4] (1.Tokyo Tech., 2.Kyushu Univ., 3.Kyoto Univ., 4.Ehime Univ., 5.JASRI)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[MTT48-11] Speciation of metal ions in hydrosphere: Further classification of intermediately hard ligands in HSAB theory

*Makoto Nagasawa[1], Masato Tanaka[1], Asami Miyaji[2], Yoshio Takahashi[1] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 2.Hiroshima University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[MTT48-12] Difference in the partition behaviors and speciation between scandium and other rare earth elements in nickel laterite ore deposits

Haibo Qin[1], Kenzo Sanematsu[2], Arcilla Carlo[3], *Yoshio Takahashi[1] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 2.Institute for Geo-Resources and Environment, National Institute of Advanced Industrial Science and Technology (AIST), 3.National Institute of Geological Sciences, College of Science, University of the Philippines)

Mon. May 27, 2019

[J] Oral | U (Union)：Union

9:30 AM - 10:30 AM JST | 12:30 AM - 1:30 AM UTC | 101 1F

[U-05] Large-scale Research Projects: Master Plan 2020 and its beyond

convener:Eiichi Tajika(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Shigeko Haruyama(Department of Environmental Science, Graduate School of Bioresouces,Mie University), Ryoichi Fujii(Research Organization of Information and Systems), Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Chairperson:Eiichi Tajika, Shigeko Haruyama

9:45 AM - 10:08 AM JST | 12:45 AM - 1:08 AM UTC

[U05-01] International Astro-Bioscience Research Center

★Invited Papers

*Yukio Isozaki[1] (1.Department of Earth Science and Astronomy, Multi-disciplinary Sciences - General Systems Studies, Graduate School of Arts and Sciences, The University of Tokyo)

10:08 AM - 10:30 AM JST | 1:08 AM - 1:30 AM UTC

[U05-02] Study of coupling processes in the solar-terrestrial system

★Invited Papers

*Mamoru Yamamoto[1], Hiroyuki Hashiguchi[1], Tatsuhiro Yokoyama[1], Hiroshi Miyaoka[2], Yasunobu Ogawa[2], Kazuo Shiokawa[3], Satonori Nozawa[3], Akimasa Yoshikawa[4], Toshitaka Tsuda[5,1] (1.Research Institute for Sustainable Humanosphere, Kyoto University, 2.National Institute of Polar Research, 3.Institute for Space-Earth Environmental Laboratory, Nagoya University, 4.International Center for Space Weather Science and Education, Kyushu University, 5.Research Organization of Information and Systems)

[J] Oral | U (Union)：Union

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 101 1F

[U-05] Large-scale Research Projects: Master Plan 2020 and its beyond

convener:Eiichi Tajika(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Shigeko Haruyama(Department of Environmental Science, Graduate School of Bioresouces,Mie University), Ryoichi Fujii(Research Organization of Information and Systems), Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Chairperson:Shigeko Haruyama, Hodaka Kawahata

10:45 AM - 11:08 AM JST | 1:45 AM - 2:08 AM UTC

[U05-03] Development of the global earth observation system using satellites

★Invited Papers

*Shinichi Sobue[1], Yoshiaki HONDA[3], Shuichi Rokugawa[2], Akira Iwasaki[2], Nobuhiro Takahashi[4], Yukari Takayabu[2], Riko Oki[1], Toshiyoshi Kimura[1], Teruyuki Nakajima[1], Takeo Tadono[1], Kosuke Yamamoto[1] (1.Japan Aerospace Exploration Agency, 2.University of Tokyo, 3.Chiba University, 4.Nagoya University)

11:08 AM - 11:31 AM JST | 2:08 AM - 2:31 AM UTC

[U05-04] Promotion of Scientific Research on Climate and Earth System Sciences Using Aircrafts

★Invited Papers

*Makoto Koike[1,2] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 2.The Meteorological Society of Japan)

11:31 AM - 11:54 AM JST | 2:31 AM - 2:54 AM UTC

[U05-05] Global deployment of Deep Argo floats toward accurate prediction of future climate and ecosystem changes

★Invited Papers

*Toshiyuki Hibiya[1] (1. Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo)

11:54 AM - 12:15 PM JST | 2:54 AM - 3:15 AM UTC

[U05-06] A new aspect of the polar science: integrated observations of the ice sheet mass loss for better prediction of the sea level rise

★Invited Papers

*Takuji Nakamura[1], Shin Sugiyama[2], Ayako Abe-Ouchi[3], Teruo Aoki[4], Yoshifumi Nogi[1], Takeshi Tamura[1] (1.National Institute of Polar Research, 2.Institute of Low Temperature Science, Hokkaido Univ., 3.Atmosphere and Ocean Research Institute, the University of Tokyo, 4.The Graduate School of Natural Science and Technology, Okayama University)

[J] Oral | U (Union)：Union

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 101 1F

[U-05] Large-scale Research Projects: Master Plan 2020 and its beyond

convener:Eiichi Tajika(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Shigeko Haruyama(Department of Environmental Science, Graduate School of Bioresouces,Mie University), Ryoichi Fujii(Research Organization of Information and Systems), Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Chairperson:Hodaka Kawahata, Eiichi Tajika

1:45 PM - 2:08 PM JST | 4:45 AM - 5:08 AM UTC

[U05-07] New frontier of Earth, Space and Life Sciences pioneered by the innovative developments of new-generation mass spectrometry

★Invited Papers

*Kentaro Terada[1] (1.Department of Earth and Space Science, Graduate School of Science, Osaka University)

2:08 PM - 2:31 PM JST | 5:08 AM - 5:31 AM UTC

[U05-08] Building of archive and curating system for astrogeoscience materials

★Invited Papers

*Tsuyoshi Komiya[1] (1.Department of Earth Science & Astronomy Graduate School of Arts and Sciences The University of Tokyo)

2:31 PM - 2:54 PM JST | 5:31 AM - 5:54 AM UTC

[U05-09] Innovative 4D imaging of subduction-zones through real-time observatories, ultra-deep drilling and high-pressure experiments

★Invited Papers

*Masataka Kinoshita[1], Naoshi Hirata[1], Masanao Shinohara[1], Tetsuo Irifune[2], Hiroyuki Kagi[7], Teruyuki Kato[3], Shigeaki Ono[4], Katsuyoshi Michibayashi[6], Natsue Abe[4], Fumio Inagaki[4], Kentaro Omura[5], Kazushige Obara[1] (1.Earthquake Research Institute, University of Tokyo, 2.Ehime University, 3.Hot Springs Research Institute, 4.JAMSTEC, 5.NIED, 6.Nagoya Univ., 7.Geochemical Research Center, Univ. Tokyo)

2:54 PM - 3:15 PM JST | 5:54 AM - 6:15 AM UTC

[U05-10] Construction of the Cooperative Research Infrastructure for Intelligent Muography in Earth and Planetary Sciences, Other Sciences, and Society

★Invited Papers

*Hiroyuki Tanaka[1] (1.Earthquake Research Institute, the University of Tokyo)

[J] Oral | U (Union)：Union

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 101 1F

[U-05] Large-scale Research Projects: Master Plan 2020 and its beyond

convener:Eiichi Tajika(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Shigeko Haruyama(Department of Environmental Science, Graduate School of Bioresouces,Mie University), Ryoichi Fujii(Research Organization of Information and Systems), Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Chairperson:Eiichi Tajika, Shigeko Haruyama

3:30 PM - 3:53 PM JST | 6:30 AM - 6:53 AM UTC

[U05-11] Consortium for Planetary Exploration

★Invited Papers

*Yoshi-Yuki Hayashi[1], Shigeto Watanabe[2,5], Taishi Nakamoto[3,4] (1.Department of Planetology/CPS, Graduate School of Science, Kobe University, 2.SGEPSS, 3.The Japanese Society for Planetary Sciences, 4.Dept. of Earth and Planetary Sciences, Tokyo Institute of Technology, 5.Hokkaido Information University)

3:53 PM - 4:16 PM JST | 6:53 AM - 7:16 AM UTC

[U05-12] Japanese contribution to CAESAR: comet astrobiology exploration sample return

★Invited Papers

*Tomoki Nakamura[1], Kazuhiko Yamada[2], Yoshihiro Furukawa[1], Yuki Kimura[3], Aki Takigawa[4], Tomohiro Usui[2], Hitoshi Kuninaka[2], Team CAESAR SRC team (1.Tohoku University, 2.ISAS/JAXA, 3.Hokkaido University, 4.Kyoto University)

4:16 PM - 4:38 PM JST | 7:16 AM - 7:38 AM UTC

[U05-13] Strategic Mars exploration: Orbiter and EDL demonstration mission for space weather, climate, and aquatic environment

★Invited Papers

*Kanako Seki[1], Shigeto Watanabe[2], Taishi Nakamoto[3], Naoki Terada[4], Atsushi Yamazaki[5], Ayako Matsuoka[5], Tomohiro Usui[5], Yasuhito Sekine[3], Kazuhisa Fujita[5], Shoichiro Yokota[6], Satoshi Kasahara[1], Yoshifumi Saito[5], Hiromu Nakagawa[4], Atsushi Kumamoto[4], Hiroyuki Maezawa[7], Mars Orbiter and EDL Technology Demonstration Mission Planning Team (1.Graduate School of Science, University of Tokyo, 2.Department of Cosmosciences, Hokkaido University, 3.Tokyo Institute of Technology, 4.Graduate School of Science, Tohoku University, 5.ISAS, JAXA, 6.Graduate School of Science, Osaka University, 7.Department of Physical Science, Osaka Prefecture University)

[J] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A01 TOKYO BAY MAKUHARI HALL

[P-PS06] Planetary Sciences

convener:Kenji Kurosaki(Department of Physics, Nagoya University), Yusuke Nakauchi(Japan Aerospace Exploration Agency), Chairperson:Kiyoshi Kuramoto(Hokkaido University), Takanori Sasaki(Department of Astronomy, Kyoto University)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[PPS06-01] Current status of the PLANETS telescope project for planetary and exoplanetary atmospheric monitoring

*Takeshi Sakanoi[1], Masato Kagitani[1], Yasumasa Hirahara[2], Jeffery Kuhn[3], Svetalana Berdyugina[4], Marcelo Emilio[5], Hiromu Nakagawa[6], Mikio Kurita[7], Yasumasa Kasaba[1], Takahiro Obara[1], Shoichi Okano[1] (1.Planetary Plasma and Atmospheric Research Center, Graduate School of Science, Tohoku University, 2.Graduate School of Environmental Studies, Nagoya University, 3.IfA, University of Hawaii, U.S.A., 4.KIS, Germany, 5.Universidade Estadual de Ponta Grossa, Brazil, 6.Graduate School of Science, Tohoku University, 7.Graduate School of Science, Kyoto University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[PPS06-02] Martian Moon eXploration MMX: science objectives and their promotion

*Kiyoshi Kuramoto[1,2], Yasuhiro Kawakatsu[2], Masaki Fujimoto[2], Jean Pierre Bibring[3], David Lawrence[4], Hidenori Genda[5], Naru Hirata[6], Takeshi Imamura[7], Shingo Kameda[8], Koji Matsumoto[9], Hideaki Miyamoto[7], Tomokatsu Morota[10], Hiroshi Nagaoka[2], Hiromu Nakagawa[11], Tomoki Nakamura[11], Kazunori Ogawa[12], Hisashi Otake[2], Masanobu Ozaki[2], Sho Sasaki[13], Hiroki Senshu[14], Shogo Tachibana[7,2], Naoki Terada[11], Tomohiro Usui[2], Koji Wada[14], Sei-ichiro WATANABE[10], MMX study team (1.Hokkaido Univ., 2.JAXA, 3.IAS, 4.APL, 5.ELSI, 6.Aizu Univ., 7.Univ. of Tokyo, 8.Rikkyo Univ., 9.NAOJ, 10.Nagoya Univ., 11.Tohoku Univ., 12.Kobe Univ., 13.Osaka Univ., 14.Chiba Inst. Tech.)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[PPS06-03] Implantation of Martian Materials in the Inner Solar System by a Mega Impact on Mars

*Ryuki Hyodo[1], Hidenori Genda[1] (1.Tokyo Institute of Technology, Earth Life Science Institute)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[PPS06-04] Hydrodynamic escape of a reduced proto-atmosphere on early Mars

*Tatsuya Yoshida[1], Kiyoshi Kuramoto[1] (1.Hokkaido University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[PPS06-05] Orbital evolution of Martian moons by rotating Martian proto-atmosphere with low angular momentum

*Ryo Matsuoka[1], Kiyoshi Kuramoto[1] (1.Department of Cosmosciences, Graduateschool of Science, Hokkaido University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[PPS06-06] N-body simulations of Moon formation with cooling evolution of the protolunar disk

*Takanori Sasaki[1], Natsuki Hosono[2] (1.Department of Astronomy, Kyoto University, 2.Japan Agency for Marine-Earth Science and Technology)

[J] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A01 TOKYO BAY MAKUHARI HALL

[P-PS06] Planetary Sciences

convener:Kenji Kurosaki(Department of Physics, Nagoya University), Yusuke Nakauchi(Japan Aerospace Exploration Agency), Chairperson:Hiroyuki Kurokawa(東京工業大学 地球生命研究所), Yuki Tanaka(Tokyo Institute of Technology)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[PPS06-07] Possibility of giant planet formation by pebble accretion in Class 0/I YSOs

*Yuki Tanaka[1], Yusuke Tsukamoto[2] (1.Tokyo Institute of Technology, 2.Kagoshima University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[PPS06-08] The effect of the three-dimensional gas flow around an embedded planet on pebble accretion

*Ayumu Kuwahara[1], Hiroyuki Kurokawa[2] (1.Tokyo Institute of Technology, 2.Earth-Life Science Institute)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[PPS06-09] Icy pebble accretion onto terrestrial planets: the effect of gas flow

*Hiroyuki Kurokawa[1], Ayumu Kuwahara[2], Satoshi Okuzumi[2] (1.Earth-Life Science Institute, Tokyo Institute of Technology, 2.Tokyo Institute of Technology)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[PPS06-10] Delivery of ammonia ice to Ceres by pebble accretion

*Yuto Nara[1], Satoshi Okuzumi[1], Hiroyuki Kurokawa[2] (1.Tokyo Institute of Technology, 2.Earth-Life Science Institute, Tokyo Institute of Technology)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[PPS06-11] Volatile-driven cryovolcanic eruption on asteroid Ceres as a probe to its interior

*Koki Yumoto[1], Yuichiro Cho[1], Seiji Sugita[1] (1.Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[PPS06-12] Ice sheet formation on synchrnously rotating earth-like planets in M-dwarf abitable zones

Soma Arai[1], Kiyoshi Kuramoto[1], *Masaki Ishiwatari[1], Shunichi Kamata[1] (1.Department of Cosmosciences, Graduate school of Science, Hokkaido University)

[J] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A01 TOKYO BAY MAKUHARI HALL

[P-PS06] Planetary Sciences

convener:Kenji Kurosaki(Department of Physics, Nagoya University), Yusuke Nakauchi(Japan Aerospace Exploration Agency), Chairperson:荻原 正博(国立天文台), Yuri Fujii(Nagoya University)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[PPS06-13] Three-dimensional linear calculation for non-isothermal type 1 planetary migration

*Kohei Okada[1], Hidekazu Tanaka[1] (1.Tohoku University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[PPS06-14] Dependence of Central star mass on Protoplanetary disk evolution

*Ryuunosuke Nakano[1], Takeru Suzuki[1], Masahiro Ogihara[2], Eiichiro Kokubo[2] (1.University of Tokyo, 2.National Astronomical Observatory of Japan)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[PPS06-15] Radiation Hydrodynamic Simulations of the Formation of Circumplanetary Disks

*Yuri Fujii[1], Oliver Gressel[2], Kengo Tomida[3], Udo Zieglar[2] (1.Institute for Advanced Research, Nagoya University, 2.Leibniz Institute for Astrophysics Potsdam, 3.Osaka University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[PPS06-16] Inefficient Magnetic Accretion Heating in Protoplanetary Disks: Evolution of The Snow Line

*Shoji Mori[1], Xuening Bai[2], Satoshi Okuzumi[3] (1.Department of Astronomy, The University of Tokyo, 2.Tsinghua Center for Astrophysics, Tsinghua University, 3.Department of Earth and Planetary Sciences, Tokyo Institute of Technology)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[PPS06-17] Formation of super-Earths and their atmospheres with *N*-body simulations

*Masahiro Ogihara[1], Yasunori Hori[2,1] (1.National Astronomical Observatory of Japan, 2.Astrobiology Center)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[PPS06-18] The orbital stability of planets in resonances: the evolution of mass ratio

*Yuji Matsumoto[1], Masahiro Ogihara[2] (1.Academia Sinica Institute of Astronomy and Astrophysics, 2.National Astronomical Observatory of Japan)

[J] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A01 TOKYO BAY MAKUHARI HALL

[P-PS06] Planetary Sciences

convener:Kenji Kurosaki(Department of Physics, Nagoya University), Yusuke Nakauchi(Japan Aerospace Exploration Agency), Chairperson:Kenji Kurosaki(名古屋大学大学院 理学研究科), Yusuke Nakauchi(JAXA/ISAS)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[PPS06-19] Experimental study on the structure of shock remnant magnetization

*Shota Kato[1], Masahiko Sato[1], Kosuke Kurosawa[2], Masashi Ushioda[3], Sunao Hasegawa[4] (1.The University of Tokyo, 2.Planetary Exploration Research Center, Chiba Institute of Technology, 3.Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology, 4.Japan Aerospace Exploration Agency)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[PPS06-20] Low-dispersion spectra of lunar impact flashes in 2018 Geminids

*Masahisa Yanagisawa[1], Yuki Uchida[1], Seiya Kurihara[1], Shinsuke Abe[2], Ryota Fuse[2], Keisuke Onodera[3,4], Ryuhei Yamada[5] (1.The University of Electro-Communications, 2.Nihon University, 3.SOKENDAI (The Graduate University for Advanced Studies), 4.Institute of Space and Astronautical Science/Japan Aerospace Exploration Agency, 5.The University of Aizu)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[PPS06-21] High velocity cratering experiments on sand-gypsum targets simulating asteroids

*Ryo Sugimura[1], Masahiko Arakawa[1], Minami Yasui[1], Takuya Ishiguro[1] (1.Kobe University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[PPS06-22] Experimental study on collisional processes of highly porous ice balls simulating Saturn's ring particles

*Yukari Toyoda[1], Minami Yasui[1], Masahiko Arakawa[1] (1.Graduate School of Science, Kobe University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[PPS06-23] IN-SITU FORMATION OF THE URANIAN SATELLITES FROM WIDE DEBRIS DISK FORMED BY GIANT IMPACT

*Ishizawa Yuya[1], Takanori Sasaki[1], Natsuki Hosono[2] (1.Department of Astronomy, Kyoto University, 2.JAMSTEC)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[PPS06-24] Effect on the obliquity due to a giant impact on a rotating ice giant

*Kenji Kurosaki[1], Shu-ichiro Inutsuka[1] (1.Department of Physics, Nagoya University)

[J] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A02 TOKYO BAY MAKUHARI HALL

[P-PS07] Formation and evolution of planetary materials in the Solar System

convener:Yoko Kebukawa(Faculty of Engineering, Yokohama National University), Wataru Fujiya(Ibaraki University, College of Science), Shin Ozawa(Department of Earth Science, Graduate School of Science, Tohoku University), Megumi Matsumoto(Graduate School of Science, Tohoku University), Chairperson:Wataru Fujiya, Shin Ozawa

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[PPS07-07] **Evaluation of shock metamorphism of eucrites by X-ray diffraction analysis**

*Rei Kanemaru[1], Naoya Imae[2,1], Akira Yamaguchi[2,1], Hirotugu Nishido[3] (1.The Graduate University for Advanced Studyies, 2.National Institute of Polar Research, 3.Okayama University of scienece)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[PPS07-08] Hf-W dating of main-group pallasites

*Yoshitaka Homma[1], Tsuyoshi Iizuka[1], Akira Ishikawa[2] (1.Department of Earth and Planetary Science, The University of Tokyo, 2.Department of Earth and Planetary Sciences, Tokyo Institute of Technology)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[PPS07-09] Mineralogical study of TCIs in CM carbonaceous chondrites

*Akane Iemoto[1], Yusuke Seto[1], Akira Miyake[2] (1.Graduate School of Science, Kobe University, 2.Graduate School of Science, Kyoto University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[PPS07-10] Importance of 10Be as a key indicator of (solar) cosmic ray irradiation in the early solar system

*Hajime Hiyagon[1], Yuuki Tanimura[1], Tomoya Nakamura[1], Kohei Fukuda[3], Wataru Fujiya[4], Naoji Sugiura[1], Takanori Kagoshima[2], Naoto Takahata[2], Yuji Sano[2] (1.Graduate School of Science, The University of Tokyo, 2.Atmosphere and Ocean Research Institute, the University of Tokyo, 3.Department of Geoscience, University of Wisconsin-Madison, 4.College of Science, Ibaraki University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[PPS07-11] **3D microstructure of a cosmic symplectite in primitive carbonaceous chondrite Acfer 094**

*Megumi Matsumoto[1,2], Akira Tsuchiyama[1], Junya Matsuno[1], Aiko Nakato[1,3], Akira Miyake[1], Motoo Ito[4], Naotaka Tomioka[4], Yu Kodama[5], Kentaro Uesugi[6], Akihisa Takeuchi[6], Tsukasa Nakano[7], Epifanio Vaccaro[8] (1.Graduate School of Science, Kyoto Univ., 2.Graduate School of Science, Tohoku Univ., 3.JAXA, ISAS, 4.JAMSTEC, 5.Marine Work Japan LTD., 6.JASRI, 7.AIST, Geological Survey Japan, 8.Natural History Museum, London)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[PPS07-12] Chondrule-like objects and refractory inclusions in GEMS-bearing Antarctic micrometeorites and an interplanetary dust particle.

*Takaaki Noguchi[1], Noriaki Ohashi[2], John P. Bradley[3], Daisuke Nakashima[4], Tomoki Nakamura[4], Makoto Kimura[5], Takayuki Ushikubo[6], Noriko T. Kita[7], Naoya Imae[5] (1.Department of Arts and Science, Kyushu University, 2.NEC Networks and System Integration Co., 3.Univ. of Hawaii at Manoa, 4.Tohoku Univ., 5.National Institute of Polar Research, 6.Kochi Institute for Core Sample Research, JAMSTEC, 7.Univ. of Wisconsin-Madison)

[J] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A02 TOKYO BAY MAKUHARI HALL

[P-PS07] Formation and evolution of planetary materials in the Solar System

convener:Yoko Kebukawa(Faculty of Engineering, Yokohama National University), Wataru Fujiya(Ibaraki University, College of Science), Shin Ozawa(Department of Earth Science, Graduate School of Science, Tohoku University), Megumi Matsumoto(Graduate School of Science, Tohoku University), Chairperson:Yoko Kebukawa, Shin Ozawa

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[PPS07-13] Spectral and mineralogical properties of naturally-heated carbonaceous chondrites; implication to heating processes on the surface of hydrous asteroids

★Invited Papers

*Moe Matsuoka[1], Tomoki Nakamura[2], Takahiro Hiroi[3], Nobuyoshi Miyajima[4], Naoya Imae[5,6], Akira Yamaguchi[5], Hideyasu Kojima[5,6] (1.Japan Aerospace Exploration Agency(JAXA), 2.Department of Earth and Planetary Materials Sciences, Faculty of Science, Tohoku University, 3.Department of Earth, Environmental and Planetary Sciences, Brown University, 4.Bayerisches Geoinstitut, University of Bayreuth, 5.National Institute of Polar Research, 6.Department of Polar Science, School of Multidisciplinary Science, SOKENDAI)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[PPS07-14] Heterogeneity of oxygen and carbon isotopic compositions within carbonate grains in the Yamato 791198 CM chondrite and evolution of isotope ratios during aqueous alteration

*Wataru Fujiya[1], YUTO AOKI[1], Takayuki Ushikubo[2], Ko Hashizume[1] (1.Ibaraki University, College of Science, 2.Kochi Institute for Core Sample research, Japan Agency for Marine-Earth Science and Technology)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[PPS07-15] Characteristics of Oxygen isotope ratios of chondrules and isolated olivine grains from Tagish Lake C2 chondrite

*Takayuki Ushikubo[1], Makoto Kimura[2] (1.Kochi Institute for Core Sample Research, Japan Agency for Marine-Earth Science and Technology, 2.National Institute for Polar Research)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[PPS07-16] Extreme ^{16}O-rich CAIs in Isheyevo chondrite

*Naoya Sakamoto[1], Noriyuki Kawasaki[2] (1.Creative Research Institution, Hokkaido University, 2.Natural History Sciences, Hokkaido University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[PPS07-17] Variations in initial ^{26}Al/^{27}Al ratios among fine-grained CAIs in the reduced CV chondrites

*Noriyuki Kawasaki[1], Changkun Park[2], Naoya Sakamoto[1], Hisayoshi Yurimoto[1,3] (1.Hokkaido University, 2.KOPRI, 3.ISAS/JAXA)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[PPS07-18] Petrographic study of compact type A CAIs with partial melting process

*Akimasa Suzumura[1], Yusuke Seto[2], Shoichi Itoh[1] (1.Graduate school of Science, Kyoto University, 2.Graduate school of Science, Kobe University)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 102 1F

[A-OS13] Ocean circulation and material cycle in coastal seas

convener:Kiyoshi Tanaka(University of Tokyo), Akihiko Morimoto(Ehime University), Yuichi Hayami(Saga University), Kazuhiko Ichimi(Seto Inland Sea Regional Research Center, Kagawa University), Chairperson:Kiyoshi Tanaka, Akihiko Morimoto

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[AOS13-01] On-demand development of bay-scale models using the Japanese Coastal Ocean Monitoring and Forecasting System

*Kei Sakamoto[1], Hideyuki Nakano[1], Shogo Urakawa[1], Takahiro Toyoda[1], Hiroyuki Tsujino[1], Goro Yamanaka[1] (1.Meteorological Research Institute)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[AOS13-02] Long term measurement of the current at the bay head in the Suruga Bay, Japan. part 2

*Takaaki Katsumata[1,4], Masato Niki[2], Akihiko Tanaka[1], Hiroyuki Tan[1,3], Kyoko Takashima[2], Takashige Sugimoto (1.Liberal Arts Education Center, Shimizu Campus, Tokai University., 2.School of Marine Science and Technology, Tokai University, 3.Japan Unmanned Vehicle exploration Agency, 4.NPO, the association for the environmental conservation of the ocean)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[AOS13-03] Bottom-water intrusion and subsequent water exchange induced by Yamase around Mutsu Bay

*Satomi Fujisaki[1], Atsuhiko Isobe[1], Izumi Ogida[2], Yuki Kosaka[2] (1.Kyushu university, 2.Aomori Prefectural Fisheries Research Institute)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[AOS13-04] The Generation Process of the Bottom Intrusion in the Bungo Channel

*Kana Maetani[1], Akihiko Morimoto[2], Xinyu Guo[2], Toru Miyama[3] (1.Graduate School of Science and Engineering, Ehime University, 2.Center for Marine Environmental Studies, Ehime University, 3.Japan Agency for Marine-Earth Science and Technology)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[AOS13-05] Characteristics of bottom intrusion in the Bungo Channel

*Akihiko Morimoto[1], Shuya Fujita[1], Hidetaka Takeoka[1], Xinyu Guo[1] (1.Ehime University)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[AOS13-06] Role of Kuroshio Current in fish resource variability off southwest Japan

*Yushi Morioka[1], Sergey Varlamov[1], Yasumasa Miyazawa[1] (1.Japan Agency for Marine-Earth Science and Technology)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 102 1F

[A-OS13] Ocean circulation and material cycle in coastal seas

convener:Kiyoshi Tanaka(University of Tokyo), Akihiko Morimoto(Ehime University), Yuichi Hayami(Saga University), Kazuhiko Ichimi(Seto Inland Sea Regional Research Center, Kagawa University), Chairperson:Akihiko Morimoto, Yuichi Hayami

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[AOS13-07] Variation in hypoxic water mass in Ariake Sea -what consumed the dissolved oxygen?-

*Yuichi Hayami[1], Naoki Fujii[1], Hiroyuki Takasu[2], Yu Umezawa[3], Minoru Wada[2] (1.Saga University, 2.Nagasaki University, 3.Tokyo University of Agriculture and Technology)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[AOS13-08] Influence of Nori aquaculture-induced change in light environment on phytoplankton dynamics

*Naoya Minamiura[1], Soichi Yamaguchi[1] (1.Kyushu University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[AOS13-09] **Enhanced West Philippine Sea intrusion diminishes hypoxia conditions in the Pearl River estuary**

*Hon-Kit Lui[1,2], Chen-Tung Arthur Chen[1], Wei-Ping Hou[2], Jian-Ming Liau[2] (1.Department of Oceanography, National Sun Yat-sen University, 2.Taiwan Ocean Research Institute, National Applied Research Laboratories)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[AOS13-10] North Pacific seawater radiocarbon recorded in abalone shells obtained from Otsuchi Bay, Japan

*Ota Kosuke[1], Yusuke Yokoyama[1,2], Yosuke Miyairi[2], Jun Hayakawa[2], Naomi Sato[2], Hideki Fukuda[2], Kiyoshi Tanaka[2] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 2.Atmosphere and Ocean Research Institute, The University of Tokyo)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[AOS13-11] Spreading of Radioactive Cesium off Joban coast through Large River Discharge

*Kiyoshi Tanaka[1], Seiya Nagao[2], Yujiro Kitade[3], Masato Niki[4], Takaaki Katsumata[4], Toru Miyama[5] (1.University of Tokyo, 2.Kanazawa University, 3.Tokyo University of Marine Science and Technology, 4.Tokai University, 5.Japan Agency for Marine-Earth Science and Technology)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[AOS13-12] Development of a river-ocean seamless model for simulating river discharges around Kyushu

*Takahiro Tsutsumi[1], Shinichiro Kida[2], Ryusuke Kuroki[3], Yosuke Alexandre Yamashiki[3] (1.Interdisciplinary Graduate School of Engineering Science, Kyushu University, 2.Research Institute for Applied Mechanics, Kyushu University, 3.Graduate School of Advanced Integrated Studies in Human Survivability, Kyoto University)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 102 1F

[A-OS15] Freshwater discharge through rivers and estuaries to the ocean

convener:Shinichiro Kida(Research Institute for Applied Mechanics, Kyushu University), Dai Yamazaki(Institute of Industrial Sciences, The University of Tokyo), Yosuke Alexandre Yamashiki(Earth & Planetary Water Resources Assessment Laboratory Graduate School of Advanced Integrated Studies in Human Survivability Kyoto University), Humio Mitsudera(Institute of Low Temperature Science, Hokkaido University), Chairperson:Shinichiro Kida(RIAM, Kyushu University), Humio Mitsudera(Hokkaido University, Institute of Low Temperature Science), Yosuke Yamashiki(GSAIS Kyoto University)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[AOS15-01] The forefront research for flow and water quality estimations in coastal area using geo-stationary and polar orbital satellites data

★Invited Papers

*Yuji Sakuno[1] (1.Graduate School of Engineering, Hiroshima University)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[AOS15-02] Rainfall-Runoff-Inundation Processes and Modeling in a Humid Tropical River Basin

★Invited Papers

*Takahiro Sayama[1], Kodai Yamamoto[2], Ryoko Araki[2], Apip Apip[3], Eva Mia Siska[1], Kaoru Takara[4] (1.Disaster Prevention Research Institute, Kyoto University, 2.Graduate School of Engineering, Kyoto University, 3.LIPI, Indonesia, 4.Graduate School of Advanced Integrated Studies in Human Survivability, Kyoto University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[AOS15-03] Role of river inflows from Kamchatka Peninsula in the Okhotsk Sea

*Toru Miyama[1], Humio Mitsudera[2] (1.Application Laboratory, Japan Agency for Marine-Earth Science and Technology, , 2.Institute of Low Temperature Science, Hokkaido University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[AOS15-04] CHLOROPHYLL ESTIMATION OF LAKE AND COASTAL WATER USING REMOTE SENSING APPROACH

*Shweta Yadav[1], Yamashiki Yosuke[1], Junichi Susaki[1], Kanako Ishikawa[2], Yoh Yamashita[1] (1.Kyoto University, 2.LBERI)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[AOS15-05] Maritime-continent coastal region as land-sea-air triple boundary layer and bio-anthroposphere

*Manabu D. Yamanaka[1] (1.Research Institute for Humanity and Nature / Professor Emeritus of Kobe University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[AOS15-06] River-ocean interaction at the Ganges-Brahmaputra river mouth

*Shinichiro Kida[1], Dai Yamazaki[2] (1.Research Institute for Applied Mechanics, Kyushu University, 2.Institute of Industrial Sciences, The University of Tokyo)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 303 3F

[A-OS16] Chemical and Biological Oceanography

convener:Namiha Yamada(National Institute of Advanced Industrial Science and Technology), Sayaka Yasunaka(Japan Agency for Marine-Earth Science and Technology), Hiroaki Saito(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:Tsuneo Ono(Japan Fisheries Research and Education Agency), Naohiro Kosugi(気象研究所)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[AOS16-01] Variability of the growth rate for dissolved inorganic carbon in surface seawater along the 165°E line

*Chiho Tanizaki[1], Hisashi Ono[2], Masao Ishii[2], Atsushi Kojima[1], Shinji Masuda[1], Kazutaka Enyo[1], Daisuke Sasano[1], Toshiya NAKANO[1] (1.Japan Meteorological Agency, 2.Meteorological Research Institute, Japan Meteorological Agency)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[AOS16-02] Seasonal variations of oceanic CO_2 disequilibrium and anthropogenic CO_2 in the subarctic North Pacific

*Bofeng Li[1], Shukuta Satori[1], Kasai Hiromi[2], Hiroshi Kuroda[2], Taniuchi Yukiko[2], Daisuke Hasegawa[3], Yutaka Watanabe[1] (1.Hokkaido University, 2.Hokkaido National Fisheries Research Institute, Japan Fisheries and Education Research , 3.Tohoku National Fisheries Research Institute, Japan Fisheries and Education Research)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[AOS16-03] An evaluation of current and future ocean acidification based on pCO_2 database around Okinawa Island

*Naohiro Kosugi[1], Hiroyuki Tsujino[1], Masao Ishii[1] (1.Meteorological Research Institute)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[AOS16-04] Reconstruction of spatiotemporal change of anthropogenic fixed nitrogen in the western North Pacific

*Yutaka Watanabe[1], Kouichi Fujita[1], BOFENG LI[1] (1.Hokkaido University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[AOS16-05] On the mechanism of significant increasing trend of silicate in intermediate layer of Oyashio region

*Tsuneo Ono[1] (1.Fisheries Research and Education Agency)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[AOS16-06] Systematics of aluminum, manganese, iron, cobalt, and lead in the North Pacific Ocean observed during ocean-section study of GEOTRACES Japan

*Yoshiki Sohrin[1], Linjie Zheng[1] (1.Institute for Chemical Research, Kyoto University)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 301A 3F

[A-OS19] Dynamics of oceanic and atmospheric waves, vortices, and circulations

convener:Yuki Tanaka(Graduate School of Science, The University of Tokyo), Ryo Furue(APL/JAMSTEC), Yukiharu Hisaki(University of the Ryukyus), Norihiko Sugimoto(Keio University, Department of Physics), Chairperson:Norihiko Sugimoto, Ryo Furue

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[AOS19-01] Instability of Ekman pumping

★Invited Papers

*Yoshiaki Miyamoto[1], Daivd S Nolan[2], Norihiko Sugimoto[3] (1.Faculty of Environment and Information Studies, Keio University, 2.Rosenstiel School of Marine and Atmospheric Science, University of Miami, 3.Keio University, Department of Physics)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[AOS19-02] Extratropical Cyclone Structures around Japan -Comparison between Extratropical Cyclones Developing around Japan and those in Northwestern Atlantic Ocean-

*Eigo Tochimoto[1], Hiroshi Niino[1] (1.Atmosphere and Ocean Research Institute, The University of Tokyo)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[AOS19-03] Application of a new wave energy flux formulation to assessment of tropical wave propagation dynamics: Diagnostics for the tropical synoptic-scale wave disturbances in the Maritime Continent-northern Australian region

*Fukutomi Yoshiki[1], Hidenori Aiki[1] (1.Institute for Space-Earth Environmental Reasearch, Nagoya University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[AOS19-04] Direct measurement of turbulent fluxes at sea-air interface by micrometeorological technique

★Invited Papers

*Fumiyoshi Kondo[1], Shujiro Komiya[2], Kosuke Noborio[3], Hidenori Aiki[4], Kunio Kutsuwada[5], Mitsuo Uematsu[6], Osamu Tsukamoto[7] (1.Japan Coast Guard Academy, 2.Max Planck Institute for Biogeochemistry, 3.Meiji University, 4.Nagoya University , 5.Tokai University, 6.The University of Tokyo, 7.Okayama University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[AOS19-05] Swell-Dominant Surface Waves Inherent in the Shape of the Rias Coast facing the western North Pacific

*Kosei Komatsu[1,2], Takaki Fujii[1,2], Kiyoshi Tanaka[2] (1.Graduate School of Frontier Sciences, The University of Tokyo, 2.Atmosphere and Ocean Research Institute, The University of Tokyo)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[AOS19-06] **Variabilities of the Sea Surface Height in the Kuril Basin of the Okhotsk Sea: Coherent shelf-trapped mode and Rossby wave-like mode**

*Vigan Mensah[1], Kay I. Ohshima[1] (1.Institute of Low Temperature Science)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 301A 3F

[A-OS19] Dynamics of oceanic and atmospheric waves, vortices, and circulations

convener:Yuki Tanaka(Graduate School of Science, The University of Tokyo), Ryo Furue(APL/JAMSTEC), Yukiharu Hisaki(University of the Ryukyus), Norihiko Sugimoto(Keio University, Department of Physics), Chairperson:Yukiharu Hisaki(琉球大学理学部), Hidenori AIKI

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[AOS19-07] Dynamics of water exchange processes at a deep submarine canyon off the western coast of the Sakhaline which causes the origin of the cold water belt along the Soya Warm Current

★Invited Papers

*Humio Mitsudera[1], Hiroyuki Iida[2] (1.Institute of Low Temperature Science, Hokkaido University, 2.Graduate School of Environmental Science)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[AOS19-08] Generation Mechanism of Tropical Instability Waves in the Equatorial Pacific Ocean

*Yuki Tanaka[1], Toshiyuki Hibiya[1] (1.Graduate School of Science, The University of Tokyo)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[AOS19-09] Annual Rossby waves below the pycnocline in the Indian Ocean

*Motoki Nagura[1] (1.Japan Agency for Marine-Earth Science and Technology)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[AOS19-10] Eddies observed by Argo floats

★Invited Papers

*Katsuro Katsumata[1] (1.JAMSTEC)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[AOS19-11] Rhythmic Phenomena in Nonlinear Systems and Oceanic General Circulation

*Shinya Shimokawa[1], Tomonori Matsuura[2] (1.National Research Institute for Earth Science and Disaster Prevention, 2.University of Toyama)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[AOS19-12] Control of the ocean circulation by bottom topography and generation of mesoscale disturbances

*Yuri Kase[1], Tomonori Matsuura[1] (1.National university corporation University of Toyama)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-HW Hydrology & Water Environment

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 105 1F

[A-HW24] Isotope Hydrology 2019

convener:Masaya Yasuhara(Rissho Univ.), Kohei Kazahaya(Geological Survey of Japan, AIST), Shinji Ohsawa(Institute for Geothermal Sciences, Graduate School of Science, Kyoto University), Kazuyoshi Asai(Geo Science Laboratory), Chairperson:Masaya Yasuhara(Rissho Univ.), Noritoshi Morikawa(産業技術総合研究所活断層・火山研究部門)

9:00 AM - 9:30 AM JST | 12:00 AM - 12:30 AM UTC

[AHW24-01] The use of natural abundances of stable isotopes to elucidate the nitrogen dynamics in plant-soil systems

★Invited Papers

*Keisuke Koba[1] (1.Center for Ecological Research, Kyoto University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[AHW24-02] Reconstruction of local temporal variation on atmospheric sulfur hexafluoride concentration in the Kyoto Basin by multiple environmental tracer and mass transport analyses

*Koki Kashiwaya[1], Taishi Hori[1], Ryuta Hazama[2], Yoichi Sakuma[3], Katsuaki Koike[1] (1.Kyoto University, 2.Osaka Sangyo University, 3.Tokyo Institute of Technology)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[AHW24-03] Quantitative reconstruction of the humidity in the moisture source region based on the ^{17}O-excess in precipitation on a subtropical island

Yuina Uechi[1], *Ryu Uemura[1] (1.University of the Ryukyus)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[AHW24-04] Identification of deep groundwater recharge system in an intermontane basin

*Takashi Nakamura[1], Kei Nishida[1], Naim Mohamad[2], Bijay Man Shakya[1], Kazuyoshi Asai[4], Sresh Das Shrestha[3] (1.ICRE, University of YAMANASHI, 2.University of Yamanashi, 3.CDG, Tribhuvan University, 4.Geo-Science Laboratory)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-HW Hydrology & Water Environment

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 105 1F

[A-HW24] Isotope Hydrology 2019

convener:Masaya Yasuhara(Rissho Univ.), Kohei Kazahaya(Geological Survey of Japan, AIST), Shinji Ohsawa(Institute for Geothermal Sciences, Graduate School of Science, Kyoto University), Kazuyoshi Asai(Geo Science Laboratory), Chairperson:Noritoshi Morikawa(産業技術総合研究所活断層・火山研究部門), Kazuyoshi Asai(Geo-Science Laboratory), Kohei Kazahaya(Geological Survey of Japan, AIST)

10:45 AM - 11:15 AM JST | 1:45 AM - 2:15 AM UTC

[AHW24-05] The discharge rate of the Arima-type deep brine discharge in Ooshika-mura, Nagano Prefecture

★Invited Papers

*Fumitake Kusuhara[1] (1.Central Research Institute of Electric Power Industry)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[AHW24-06] Sublacustrine hydrothermal system of the active crater lake, Yudamari of Aso Volcano inferred from Mg budget of the lake

*Shinji Ohsawa[1], Takeshi Saito[2], Kazuhiro Amita[3] (1.Institute for Geothermal Sciences, Graduate School of Science, Kyoto University, 2.Academic Assembly School of Science and Technology, Shinshu University, 3.Graduate School of Engineering Science, Akita University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[AHW24-07] Spatial distribution of chemical compositions, hydrogen and oxygen isotopic ratios of stream water of the Shimanto River area, southwestern Japan

*Masaaki Takahashi[1], Hinako Shimizu[1], Kohei Kazahaya[1], Masaya Yasuhara[2,1] (1.The National Institute of Advanced Industrial Science and Technology, 2.Rissho University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[AHW24-08] An isotopic study on shallow groundwater origins in a densely-populated area in Shinagawa, central Tokyo, Japan

*Masaya Yasuhara[1], Akihiko Inamura[2], Takashi Nakamura[3], Kazuyoshi Asai[4] (1.Rissho Univ., 2.Geological Survey of Japan, AIST, 3.Yamanashi Univ., 4.Geo Science Laboratory)

[J] Oral | H (Human Geosciences)：H-DS Disaster geosciences

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 106 1F

[H-DS14] Geohazards in humid, tectonically active countries and their precursors

convener:Masahiro Chigira(Disaster Prevention Research Institute, Kyoto University), Hiroshi YAGI(Faculty of Art, Science and Education, Yamagata University), Satoru Kojima(Department of Civil Engineering, Gifu University), Taro Uchida(National Institute for Land and Infrastructure Management), Chairperson:Satoshi Ishimaru

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[HDS14-01] The sources of landslides occurred by the 2018 Hokkaido Eastern Iburi Earthquake

*Satoshi Ishimaru[1], Wataru Hirose[1], Gentaro Kawakami[1], Ryo Takahashi[1], Yoshihiro Kase[1], Ken'ichi Koshimizu[1], Hiromichi Koyasu[1], Masahiro Chigira[2], Jun Tajika[3] (1.Geological Survey of Hokkaido, 2.Kyoto University, 3.Docon Co., Ltd.)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[HDS14-02] Feature of landslide of pyroclastic fall deposits induced by 2018 Hokkaido Eastern Iburi Earthquake, and its relation with damage

*Jun Tajika[1], Kazuo Amemiya[2], Masahiro Chigira[3], Satoshi Ishimaru[4], Akio Koike[1], Hidetoshi Kon[1], Kenji Kizaki[5], Nobuo Yamane[6] (1.Docon Co.,Ltd., 2.Bousai Chishitsu Kogyo Co.,Ltd., 3.Kyoto University, 4.Geological Survey of Hokkaido, HRO, 5.Kizaki PE Office, 6.Terre Research Co.)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[HDS14-03] Influence of slope cutting on failures induced by the July heavy rain, and the Iburi-tobu earthquake, 2018.

*Hidehisa Nagata[1] (1.Fu-Sui-Do Company Limited)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[HDS14-04] Slope failures occurred in the southwest part of the Izu-oshima Island in geological time, NE Japan

*Takehiko Suzuki[1], Masahiro Chigira[2] (1.Faculty of Urban Environmental Sciences, Tokyo Metropolitan University, 2.Disaster Prevention Research Institute, Kyoto University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[HDS14-05] The strain rate observation by the borehole inclinometer on the bedrock creep slopes in Akadani-west area

*Atsuhiko Kinoshita[1,2], Yasutaka Tanaka[2], Wataru Sakurai[1], Taro Uchida[1], Koichiro Hayashi[3], Yasuuchi Kubota[3], Katsushi Kawato[4] (1.National Institute for Land and Infrastructure Management, 2.Sediment Disaster Prevention Technology Center, Kinki Developing Regional Bureau, Ministry of Land, Infrastructure, Transport and Tourism , 3.OYO Corporation, 4.NIPPON ENGINEERING CONSULTANTS CO., LTD.)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[HDS14-06] Assessing Potential Landslide Areas Due to Earthquake Using Three-Dimensional Resistivity Datasets from Across a Wide Area

*Yusuke Sakai[1], Taro Uchida[1], YASUMASA FUJIWARA[2] (1.National Institute for Land and Infrastructure Management , 2.Eight-Japan Engineering Consultants)

[J] Oral | H (Human Geosciences)：H-DS Disaster geosciences

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 106 1F

[H-DS14] Geohazards in humid, tectonically active countries and their precursors

convener:Masahiro Chigira(Disaster Prevention Research Institute, Kyoto University), Hiroshi YAGI(Faculty of Art, Science and Education, Yamagata University), Satoru Kojima(Department of Civil Engineering, Gifu University), Taro Uchida(National Institute for Land and Infrastructure Management), Chairperson:Chigira Masahiro, Taro Uchida

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[HDS14-07] Prediction of shallow landslides and debris flow by rainstorm: dynamic hazard mapping toward disaster mitigation

*Yuki Matsushi[1] (1.Disaster Prevention Research Institute, Kyoto University)

2:00 PM - 2:30 PM JST | 5:00 AM - 5:30 AM UTC

[HDS14-08] Land slide warning judgment mesh information of the Meteorological Agency using the Soil Water Index

★Invited Papers

*KENJI OKADA[1] (1.Japan Meteorological Agency)

2:30 PM - 3:00 PM JST | 5:30 AM - 6:00 AM UTC

[HDS14-09] A future direction of remedial measures for sediment disaster reduction from the viewpoint of enhancing a workable early warning system

★Invited Papers

*Masaru Kunitomo[1,2,3,4], Shigetaka Takiguchi[1,2,3,4], Fumiaki Akazawa[1,2,3,4], Kazuyuki Imai[1,2,3,4] (1.Ministry of Land, Infrastructure, Transport and Tourism, 2.Water and Disaster Management Bureau, 3.Sediment and Erosion Control Department, 4.Sediment and Erosion Control Planning Division)

[J] Oral | S (Solid Earth Sciences)：S-GD Geodesy

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 304 3F

[S-GD03] Geodesy General Contributions/Global Geodetic Observing System

convener:Koji Matsuo(Geospatial Information Authority of Japan), Yusuke Yokota(Institute of Industrial Science, The University of Tokyo), Takahiro Wakasugi(Geospatial Information Authority of Japan), Chairperson:Kensuke Kokado(GSI of Japan), Yusuke Yokota

1:50 PM - 2:05 PM JST | 4:50 AM - 5:05 AM UTC

[SGD03-01] Activities and future perspective of GGOS Working Group Japan

*Basara Miyahara[1] (1.GSI of Japan)

2:05 PM - 2:20 PM JST | 5:05 AM - 5:20 AM UTC

[SGD03-02] Discussion

*Koji Matsuo[1] (1.Geospatial Information Authority of Japan)

2:20 PM - 2:35 PM JST | 5:20 AM - 5:35 AM UTC

[SGD03-03] VLBI-GNSS Co-location Survey at the Ishioka Geodetic Observing Station

*Saho Matsumoto[1], Michiko Umei[1], Haruka Ueshiba[1], Shinobu Kurihara[1], Tadao Kikkawa[1], Takahiro Wakasugi[1] (1.GSI of Japan)

2:35 PM - 2:50 PM JST | 5:35 AM - 5:50 AM UTC

[SGD03-04] Research of Crustal Deformation Model for Next Version of Japanese Geodetic Datum

*Kensuke Kokado[1] (1.GSI of Japan)

2:50 PM - 3:05 PM JST | 5:50 AM - 6:05 AM UTC

[SGD03-05] Construction of a laser-strainmeter network for accurate seismic and geodetic observations

*Akito Araya[1], Akiteru Takamori[1], Wataru Morii[2], Akio Katsumata[3], Akio Kobayashi[3], Takeo Ito[4], Takashi Okuda[4], Makoto Okubo[5] (1.Earthquake Research Institute, University of Tokyo, 2.Disaster Prevention Research Institute, Kyoto University, 3.Meteorological Research Institute, Japan Meteorological Agency, 4.Graduate School of Environmental Studies, Nagoya University, 5.Natural Science Cluster, Kochi University)

[J] Oral | S (Solid Earth Sciences)：S-GD Geodesy

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 304 3F

[S-GD03] Geodesy General Contributions/Global Geodetic Observing System

convener:Koji Matsuo(Geospatial Information Authority of Japan), Yusuke Yokota(Institute of Industrial Science, The University of Tokyo), Takahiro Wakasugi(Geospatial Information Authority of Japan), Chairperson:Yuji Harada(Macau University of Science and Technology), Koji Matsuo

3:35 PM - 3:50 PM JST | 6:35 AM - 6:50 AM UTC

[SGD03-06] UNAVCO GNSS Data: Real-time High-rate Streams, Geodetic Earthquake Magnitudes, Cloud Computing and Future Machine Learning Frameworks

*David A Phillips[1], Kathleen Hodgkinson[1], David Mencin[1], Charles Meertens[1], Thomas Herring[2], Walter Szeliga[3], Timothy Melbourne[3], Mark Murray[4], Glen Mattioli[1], Christine Puskas[1] (1.UNAVCO, Inc. Boulder, 2.Massachusetts Institute of Technology, 3.Central Washington University, 4.USGS)

3:50 PM - 4:05 PM JST | 6:50 AM - 7:05 AM UTC

[SGD03-07] **On application of GNSS-techniques for early tsunami warning in the Sea of Japan**

*Grigorii Viktorovich Nechaev[1,2,3], Nikolai Shestakov[2,3], Hiroaki Takahashi[1], Mako Ohzono[1] (1.Institute of Seismology and Volcanology, Graduate Schooll of Science, Hokkaido University, 2.Far Eastern Federal University, 3.Institute for Applied Mathematics FEB RAS)

4:05 PM - 4:20 PM JST | 7:05 AM - 7:20 AM UTC

[SGD03-08] Measurements of occurrence of solar conjunction with the orbits of Asian QZSS/IGSO satellites

Cancelled

*Fujinobu Takahashi[1] (1.Yokohama National University)

4:20 PM - 4:35 PM JST | 7:20 AM - 7:35 AM UTC

[SGD03-09] Sea level evaluation in northern Australian coast

*Yuta Tokui[1], Kosuke Heki[1] (1.Hokkaido University)

4:35 PM - 4:50 PM JST | 7:35 AM - 7:50 AM UTC

[SGD03-10] Implications from geomagnetic observation for the interannual fluctuations of Earth rotation

*Seiki Asari[1], Masanori Kurihara[1], Kenji Morinaga[1], Shingo Nagamachi[1] (1.Kakioka Magnetic Observatory, Japan Meteorological Agency)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A09 TOKYO BAY MAKUHARI HALL

[S-SS11] Seismic wave propagation: Theory and Application

convener:Kiwamu Nishida(Earthquake Research Institute, University of Tokyo), Kazuya Shiraishi(Japan Agency for Marine-Earth Science and Technology), Takao Nibe(JAPEX), Kaoru Sawazaki(National Research Institute for Earth Science and Disaster Resilience), Chairperson:Tsutomu Takahashi(JAMSTEC)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SSS11-01] Power Spectrum of Random Heterogeneity of the Solid Earth

*Haruo Sato[1] (1.Tohoku Unvieristy)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SSS11-02] Estimation of spatio-temporal changes of seismic scattering property associated with the 2008 Iwate-Miyagi Nairiku earthquake from sparse modeling of seismic ambient noise CCFs

*Takashi Hirose[1], Hisashi Nakahara[1], Takeshi Nishimura[1], Michel Campillo[2] (1.Graduate School of Science, Tohoku University, 2.University Grenoble Alpes, CNRS, ISTerre)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SSS11-03] Surface roughness of the Philippine Sea plate at Nankai subduction zone

*Tsutomu Takahashi[1], Ayako Nakanishi[1], Shuichi Kodaira[1], Yoshiyuki Kaneda[2] (1.JAMSTEC, 2.Kagawa University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SSS11-04] Source location of volcanic earthquakes and tremors at Sakurajima volcano based on seismic correlation

*Theodorus Permana[1], Takeshi Nishimura[1], Hisashi Nakahara[1] (1.Solid Earth Physics Laboratory, Department of Geophysics, Graduate School of Science, Tohoku University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SSS11-05] **Crustal Structure Investigation in Northern Taiwan - Localized Wavefield Inversion of TAIGER T6 Wide Angle Refraction/Reflection Data**

*Fandy Adji Fachtony[1], How-wei Chen[1] (1.Institute of Geophysics, National Central University)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SSS11-06] Self-organized criticality induced by randomness in block-spring models and the Gutenberg=Richter law

*Hidetsugu Sakaguchi [1] (1.Kyushi University)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A09 TOKYO BAY MAKUHARI HALL

[S-SS11] Seismic wave propagation: Theory and Application

convener:Kiwamu Nishida(Earthquake Research Institute, University of Tokyo), Kazuya Shiraishi(Japan Agency for Marine-Earth Science and Technology), Takao Nibe(JAPEX), Kaoru Sawazaki(National Research Institute for Earth Science and Disaster Resilience), Chairperson:Kiwamu Nishida(東京大学地震研究所)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SSS11-07] Land-Atmosphere Interaction in the low-frequency seismic band and inversion for shallow elasticity structure

*Toshiro Tanimoto[1], Jiong Wang[1] (1.Department of Earth Science, University of California, Santa Barbara, CA93106, USA)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SSS11-08] Noise correlation analysis of S-net records

*Ryota Takagi[1], Genti Toyokuni[1], Mare Yamamoto[1] (1.Research Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SSS11-09] Atmospheric waves from the gas explosion in Sapporo on December 16, 2018, recorded by seismometers

*Kazunori Yoshizawa[1] (1.Faculty of Science, Hokkaido University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SSS11-10] Time-lapse monitoring of seismic velocity associated with the 2011 Shinmoedake eruption using seismic interferometry

*Kiwamu Nishida[1], Yuta Mizutani[1] (1.Earthquake Research Institute, University of Tokyo)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SSS11-11] Temporal variations of seismic velocity and azimuthal anisotropy in near-surface rock and soil at KiK-net downhole array sites

*Taka'aki Taira[1], Li-Wei Chen[1], Hiroe Miyake[2] (1.Berkeley Seismological Laboratory, University of California, Berkeley, 2.The University of Tokyo)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[SSS11-12] Denoising Ambient Seismic Field Correlation Functions with Deep Autoencoders

*Loic Viens[1], Chris Van Houtte[2] (1.Disaster Prevention Research Institute, Kyoto University, 2.GNS Science)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | Convention Hall A 2F

[S-SS13] Strong Ground Motion and Earthquake Disaster

convener:Masayuki Kuriyama(Central Research Institute of Electric Power Industry), Kazuhiro Somei(Geo-Research Institute), Chairperson:Nobuyuki Morikawa(National Research Institute for Earth Science and Disaster Resilience), Ryoichi Nakamura(Earthquake Research Institute, The University of Tokyo)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SSS13-25] **Determination of dynamic characteristics of existing buildings at various site conditions in Eskisehir, Turkey**

*Onur Kaplan[1], Seiji Tsuno[2], Hiroaki Yamanaka[3], Mehmet Safa Arslan[4], Oguz Ozel[4] (1.Eskisehir Technical University, 2.Railway Technical Research Institute , 3.Tokyo Institute of Technology , 4.Istanbul University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SSS13-26] **ICDP DSeis 10: Near-field Observations for the M5.5 Orkney, South Africa Earthquake**

Tatsunari Yasutomi[1], *James Mori[1], Hiroshi Ogasawara[2] (1.Earthquake Hazards Division, Disaster Prevention Research Institute, Kyoto University, 2.Ritsumeikan University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SSS13-27] Number of earthquakes from seismic activity model of the national seismic hazard maps for Japan

*Nobuyuki Morikawa[1], Junichi Miyakoshi[2], Hiroyuki Fujiwara[1] (1.National Research Institute for Earth Science and Disaster Resilience, 2.Ohsaki Research Institute, Inc.)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SSS13-28] Comparative examination of the Probabilistic Seismic Hazard Maps in Japan with observed maximum seismic intensities for various periods

*Takamoto Muneta[1], Kazuki Koketsu[1] (1.Earthquake Research Institute, The University of Tokyo)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SSS13-29] A Study on the Ground Motion Characteristics close to the Basin Edge

Ryota Hamabe[2], *Shinichi Matsushima[1], Takashi Azuma[3], Florent De Martin[4] (1.Disaster Prevention Research Institute, Kyoto University, 2.Graduate School of Engineering, Kyoto University, 3.National Institute of Advanced Industrial Science and Technology, 4.French Geological Survey)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SSS13-30] Spectrum Characteristics of MeSO-net seismograms – Effect of Underground Installation -

*Ryoichi Nakamura[1], Hiroshi Tsuruoka[1], Aitaro Kato[1], Shin'ichi Sakai[1], Naoshi Hirata[1], Takahiro Shiina[1] (1.Earthquake Research Institute, The University of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | Convention Hall A 2F

[S-SS13] Strong Ground Motion and Earthquake Disaster

convener:Masayuki Kuriyama(Central Research Institute of Electric Power Industry), Kazuhiro Somei(Geo-Research Institute), Chairperson:Yasumaro Kakehi(Department of Planetology, Graduate School of Science, Kobe University), Hisashi Nakahara(Solid Earth Physics Laboratory, Department of Geophysics, Graduate School of Science, Tohoku University)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SSS13-31] Interpretation of attenuation of high-frequency waves from the intraslab, interplate, and outer-rise earthqukakes of Northeastern Japan

*Yasumaro Kakehi[1], Yu Ogasawara[1] (1.Graduate School of Science, Kobe University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SSS13-32] **Effect analysis of soil interlayer on seismic dynamic response and failure mode of metro station structure**

*Shuai Huang[1], Yuejun Lyu[1], Yanju Peng[1] (1.Institute of Crustal Dynamics,China Earthquake Administration)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SSS13-33] **Investigation on the Applicability of V_{S30} Estimation Models for the Beijing Plain Area**

*Yi Fang, Yanju Peng, Zhijie Jiang

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SSS13-34] Early prediction of PGA and Sa using ANN

*Ting Yu Hsu[1] (1.Taiwan Tech)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SSS13-35] Analysis of strong-motion acceleration records based on the Generalized Pareto distribution

*Hisashi Nakahara[1] (1.Solid Earth Physics Laboratory, Department of Geophysics, Graduate School of Science, Tohoku University)

[J] Oral | S (Solid Earth Sciences)：S-EM Earth's Electromagnetism

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 304 3F

[S-EM19] Electromagnetic Induction in the Earth and Planetary Interiors, and Tectono-Electromagnetism

convener:Koki Aizawa(Institute of Seismology and Volcanology, Faculty of Sciences, Kyushu University), Tetsuo Matsuno(Kobe Ocean Bottom Exploration Center, Kobe University), Chairperson:Tetsuo Matsuno, Koki Aizawa

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SEM19-01] Repeated measurements of the Self-Potential at Akita-Yakeyama, Iwate and Kurikoma volcanoes

*Shin'ya Sakanaka[1], Yasiaki Sawada[3], Kenta Kato[2], Inoue Yusuke[1], Kobayashi Takuya[1], Ryuichi Takei[1], YUYA TADA[2], Muhammad Faizul Nizam Bin Zainudin[2], Tomoya Moriwaki[2] (1.Graduate school of International Resource Sciences, Akita University, 2.Faculty of International Resource Sciences, Akita University, 3.Faculty of International Resource Sciences, Akita University (gradusted in 2018))

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SEM19-02] Evaluation of surface conductivity of unsaturated Berea sandstone and porous glasses

*Ryosuke Umezawa[1], Makoto Katsura[1], Satoru Nakashima[1] (1.Department of Earth and Space Science, Graduate School of Science, Osaka University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SEM19-03] Observational and theoretical waveforms of electromagnetic signals generated by the motional induction effect before the arrival of seismic waves

*Ken'ichi Yamazaki[1] (1.Disaster Prevention Research Institute, Kyoto University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SEM19-04] Effect of reference data on geomagnetic transfer functions

*Shinya Sato[1], Tada-nori Goto[1] (1.Kyoto Univesity, Graduate School of Engineering)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SEM19-05] Reliability estimation of magnetotelluric inversion result based on the Principle Component Analysis and Markov Chain Monte-Carlo method

Hisatoshi Koji[1], *Tada-nori Goto[1] (1.Graduate School of Engineering, Kyoto University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SEM19-06] Probing one-dimensional electrical anisotropy in the oceanic upper mantle from seafloor magnetotelluric array data

*Tetsuo Matsuno[1], Kiyoshi Baba[2], Hisashi Utada[2] (1.Kobe Ocean Bottom Exploration Center, Kobe University, 2.Earthquake Research Institute, The University of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-EM Earth's Electromagnetism

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 304 3F

[S-EM19] Electromagnetic Induction in the Earth and Planetary Interiors, and Tectono-Electromagnetism

convener:Koki Aizawa(Institute of Seismology and Volcanology, Faculty of Sciences, Kyushu University), Tetsuo Matsuno(Kobe Ocean Bottom Exploration Center, Kobe University), Chairperson:Koki Aizawa, Tetsuo Matsuno

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SEM19-07] The Analysis of magnetotelluric sounding data on Kikai submarine caldera.

*Toki Hirose[1], Tetsuo Matsuno[2,1], Nobukazu Seama[1,2], Yuki Okizono[4], Hiroshi Ichihara[3], Hiroko Sugioka[1,2], Yoshiyuki Tatsumi[2,1] (1.Department of Planetology, Graduate School of Science, Kobe University, 2.Kobe ocean Bottom Exploration Center, Kobe University, 3.Graduate school of environmental studies, Nagoya University, 4.Department of Planetology, Faculty of Science, Kobe University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SEM19-08] Role of Fluids in the earthquake generation: The Nagamachi-Rifu reverse fault, NE Honshu, Japan

*Sabri Bulent Tank[1], Yasuo Ogawa[2] (1.Bogazici University, 2.Tokyo Institute of Technology)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SEM19-09] Audio-frequency Magnetotelluric Survey of the Tsuyama-hoppou Fault, Yamasaki Fault Zone, southwest Japan.

*Satoru Yamaguchi[1], Daisuke Takakuwa[2], Akira Mimura[1], Kazuki Fkue[1], Shigehiro Katoh[3], Hideki Murakami[4], Shinichi Takakura[5] (1.Department of Geosciences, Graduate School of Science, Osaka City University, 2.Faculty of Science, Osaka City University, 3.The Museum of Nature and Human Activities, 4.Science and Technology Unit, Research and Education Faculty, Kochi University, 5.Geological Survey of Japan, Institute of Advanced Industrial Science and Technology)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SEM19-10] Three dimensional resistivity structure around the focal region of the 2016 Kumamoto earthquakes

*Koki Aizawa[1], Hisashi Asaue[2], Katsuaki Koike[3], Shinichi Takakura[4], Toru Yoshinaga[10], Makoto Uyeshima[5], Takao Koyama[5], Ryokei Yoshimura[7], Ken'ichi Yamazaki[7], Shintaro Komatsu[7], Yusuke Yamashita[7], Hiroshi Ichihara[9], Mitsuru Utsugi[8], Kaori Tsukamoto[12], Dan Muramatsu[12], Yoshiko Teguri[1,11], Kazunari Uchida[1], Hideaki Hase[6], Azusa Shito[1], Satoshi Matsumoto[1], Takeshi Matsushima[1], Hiroshi Shimizu[1] (1.Institute of Seismology and Volcanology, Faculty of Sciences, Kyushu University, 2.Laboratory on Innovative Techniques for Infrastructures, Kyoto University, 3.Environmental Geosphere Engineering, Department of Urban Management, Graduate School of Engineering, Kyoto University, 4.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology, 5.Earthquake Research Institute, University of Tokyo, 6.GERD, 7.Disaster Prevention Research Institute, Kyoto University, 8.Aso Volcanological Laboratory, Institute for Geothermal Sciences, Graduate School of Science, Kyoto University, 9.Earthquake and Volcano Research Center, Graduate School of Environmental Studies, Nagoya University, 10.Kumamoto University, 11.Japan Meteorological Agency, 12.Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SEM19-11] **A research report on the fundamental investigations of an electrical resistivity structure beneath Chugoku and Shikoku regions, southwestern Japan(2018)**

*Ichiro Shiozaki[1], Tomofumi Uto[1], Makoto Uyeshima[2], Hiroshi Hataoka[3], Yasuo Ikezoe[3], Shinji Yamamoto[3], Tatsuya Noguchi[1], Daiki Furuichi[4], Yuki Murayama[4], Kohei Matsushita[4], Hideki Murakami[5], Naoto Oshiman[6], Yoshihisa Iio[6], Kazuya Ando[7] (1.Graduate School of Engineering, Tottori University, 2.Earthquake Research Institute, The University of Tokyo, 3.Technical Department, Tottori University, 4.Faculty of Engineering, Tottori University, 5.Research and Education Faculty , Kochi University, 6.Disaster Prevention Research Institute, Kyoto University, 7.San'in Kaigan Geopark Museum of the Earth and Sea)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SEM19-12] Fluid distribution beneath central and southern Kyushu imaged by 3-D electrical resistivity model

*Maki Hata[1], Hiroshi Munekane[2], Hisashi Utada[1], Tsuneomi Kagiyama[3] (1.Earthquake Research Institute, the University of Tokyo , 2.Geospatial Information Aurhotiry of Japan, 3.Aso Geopark Promotion Council)

[J] Oral | S (Solid Earth Sciences)：S-GL Geology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A09 TOKYO BAY MAKUHARI HALL

[S-GL28] Regional geology and tectonics

convener:Makoto Otsubo(Geological Survey of Japan, Research Institute of Earthquake and Volcano Geology), Jun Hosoi(Geological Survey of Japan, Institute of Geology and Geoinformation, AIST), Chairperson:Makoto Otsubo(Research Institute of Earthquake and Volcano Geology, Geological Survey of Japan)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SGL28-01] Lithology and zircon U-Pb geochronology of Paleoproterozoic and Paleozoic granitic complex in Maizuru Terrane from Tsuwano area, Shimane Prefecture, SW Japan

*Kosuke Kimura[1], Yasutaka Hayasaka[1], Tomoyuki Shibata[1], Kenta Kawaguchi[1], Hiroshi Fujiwara[1] (1.Hiroshima University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SGL28-02] Tectonic significance of new Zircon U-Pb ages of sedimentary complexes in the northern Hidaka Belt, central Hokkaido, northern Japan

*Futoshi Nanayama[1,5], Toru Yamasaki[1], Jun Tajika[2], Hideki Iwano[3], Tohru Danhara[3], Takafumi Hirata[4] (1.Geological Survey of Japan, AIST, 2.Docon Co. Ltd, 3.Kyoto Fission-Track Co.Ltd, 4.Tokyo Univ., 5.CWMD, Kumamoto Univ.)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SGL28-03] New age constraints and tectonic significance of Late Oligocene marine biosiliceous deposits in the Hidaka Belt, northeastern Hokkaido, northern Japan

*Futoshi Nanayama[1,6], Hiroshi Kurita[2], Toru Yamasaki[1], Jun Tajika[3], Hideki Iwano[4], Tohru Danhara[4], Takafumi Hirata[5] (1.Geological Survey of Japan, AIST, 2.Niigata Univ., 3.Docon Co. Ltd, 4.Kyoto Fission-Track Co. Ltd, 5.Tokyo Univ., 6.CWMD, Kumamoto Univ.)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SGL28-04] Late Cretaceous sea-level changes and tectonic history recorded in the forearc sedimentary successions of the Northeast Japan

*Jun Arimoto[1], Reishi Takashima[2], Hiroshi Nishi[2], Yuji Orihashi[3], Toshiro Yamanaka[4] (1.Department of Earth Science, Graduate School of Science, Tohoku University, 2.The Center for Academic Resources and Archives, Tohoku University, 3.Department of Earth and Environmental Sciences, Graduate School of Hirosaki University, 4.Tokyo University of Marine Science and Technology)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SGL28-05] Paleo-stress analysis in coherent zone, an exhumed Cretacesou accretionary complex, Shimanto Belt, in Konan city and Geisei villege, Kochi prefecture, SW Japan

*Makoto Hashiguchi[1], Yoshitaka Hashimoto[1] (1.Kochi University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SGL28-06] Relationship between accretion of limestone blocks and subduction tectonics in Japan

*Koji Wakita[1] (1.Yamaguchi University)

[J] Oral | S (Solid Earth Sciences)：S-GL Geology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A09 TOKYO BAY MAKUHARI HALL

[S-GL28] Regional geology and tectonics

convener:Makoto Otsubo(Geological Survey of Japan, Research Institute of Earthquake and Volcano Geology), Jun Hosoi(Geological Survey of Japan, Institute of Geology and Geoinformation, AIST), Chairperson:Jun Hosoi(Geological Survey of Japan)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SGL28-07] Discovery of faulted basin margin from the middle Miocene Tottori Grope, Tottori Prefecture, Southwest Japan and its significance

*Yuta Maruyma[1] (1.Shimane Umiversity)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SGL28-08] Fault activity during Quaternary Period off the Shimane Peninsula based on the profiles acquired by the high-resolution seismic survey

*Masaaki Tanaka[1], Norihiro Matsuda[1], Masaru Nakamura[1], Yuichi Shimizu[1], Masanori Shimazaki[2], Kazuhito Hatakeyama[2] (1.The Chugoku Electric Power Co., Inc., 2.Sogo Geophysical Exploration Co., Ltd.)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SGL28-09] Paleomagnetic directions of early Miocene sediments in central Japan and tectonic implications

*Hiroyuki Hoshi[1], Takuro Matsuo[2] (1.Department of Earth Sciences, Aichi University of Education, 2.Aichi Prefectural Kariya High School)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SGL28-10] Revised Cenozoic chronostratigraphy and tectonics in the Yatsuo Area, Toyama Prefecture, central Japan

*Takeshi Nakajima[1], Hideki Iwano[2], Tohru Danhara[2], Tohru Yamashita[2], Yukio Yanagisawa[1], Yoshihiro Tanimura[3], Mahito Watanabe[1], Takayuki Sawaki[1], Satoshi Nakanishi[4], Hiroyuki Mitsuishi[4], Okiyuki Yamashina[4], Seiichi Imahori[5] (1.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology, 2.Kyoto Fission-Track Co., Ltd., 3.National Museum of Nature and Science, 4.JX Nippon Oil & Gas Exploration Corporation, 5.JX Nippon Oil & Gas Exploration Technical Services Corporation)

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 105 1F

[S-VC35] Mitigation of volcanic disasters - basic and applied researches

convener:Shinji Takarada(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Mitsuhiro Yoshimoto(Mount Fuji Research Institute, Yamanashi Prefectural Government), Yasuhiro Ishimine(Research and Education Center for Natural Hazards, Kagoshima University), Tomohiro Kubo(National Research Institute for Earth Science and Disaster Prevention), Chairperson:Tomohiro Kubo(防災科学技術研究所), Shinji Takarada(Geological Survey of Japan/AIST)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SVC35-01] A working hypothesis for source craters and sequence of the 1707 Hoei eruption of Fuji Volcano, Japan

*Masato Koyama[1] (1.Shizuoka Univ.)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SVC35-02] Consideration of the formation process of Mt.Hoei, Fuji volcano

*Akira Baba[1], Toshitsugu Fujii[1], Tatsuro Chiba[2], Mitsuhiro Yoshimoto[1], Fumikatsu NISHIZAWA[1], Hidetoshi Shibuya[3] (1.Mount Fuji Research Institute, 2.Asia Air Survey Co., Ltd., 3.Department of Earth and Environmental Sciences, Faculty of Advanced Science and Technology, Kumamoto University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SVC35-03] Airborne LiDAR Bathymetry reveals underwater topography of Lake Motosu - The level of water raised by lava inflow -

*Tatsuro Chiba[1], Sin-ichi kaneta[1], Makoto Ohashi[1] (1.Asia Air Survey Co., Ltd.)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SVC35-04] Volcano monitoring using satellite thermal infrared imagery of CIRC (Compact Infrared Camera)

*Yuki Takakura[1], Koji Nakau[1], Junichiro Ishizawa[1] (1.Japan Aerospace Exploration Agency)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SVC35-05] Impact absorption properties of wooden buildings roof subjected to ballistic block collision

*Kohei Tateyama[1], Hiroyuki Yamada[2], Mitsuhiro Yoshimoto[3], Ryo Honda[3], Toshitsugu Fujii[3] (1.Ritsumeikan University, 2.National defense academy, 3.Mount Fuji Research Institute, Yamanashi Prefectural Government)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SVC35-06] Distribution of ballistic ejecta of the phreatic eruption at Kusatsu-Shirane volcano, on 23 Jan, 2018, part 2

*Mitsuhiro Yoshimoto[1], Ryuta FURUKAWA[2,3], Yoshihiro Ishizuka[2], Yusuke Minami[2], Masashi NAGAI[4], Shuichi Hosokawa[3], Ryo Honda[1], Taisuke Yasuda[1], Akihiko Terada[5], Tatsuji Nishizawa[5], Yasuhiro Ishimine[6], Kenichi Arai[7], Hisashi Sasaki[7], Shino Naruke[7], Yuko Sekiguchi[3], Takahiro Yanada[3], Yasuo Ishizaki[8], Nobuko Kametani[8], Fukashi Maeno[9] (1.Mount Fuji Research Institute, Yamanashi Prefectural Government, 2.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology, 3.Japan Meteorological Agency, 4.Volcano Research Department, National Research Institute for Earth Science and Disaster Resilience, 5.Volcanic Fluid Research Center, Tokyo Institute of Technology, 6.Research and Education Center for Natural Hazards, Kagoshima University, 7.Asia Air Survey Co., Ltd., 8. Graduate School of Science and Engineering, University of Toyama, 9.Earthquake Research Institute, University of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 105 1F

[S-VC35] Mitigation of volcanic disasters - basic and applied researches

convener:Shinji Takarada(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Mitsuhiro Yoshimoto(Mount Fuji Research Institute, Yamanashi Prefectural Government), Yasuhiro Ishimine(Research and Education Center for Natural Hazards, Kagoshima University), Tomohiro Kubo(National Research Institute for Earth Science and Disaster Prevention), Chairperson:Mitsuhiro Yoshimoto(山梨県富士山科学研究所), Yasuhiro Ishimine(鹿児島大学地域防災教育研究センター)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SVC35-07] Developing Ash-fall impact forecasting content.

*Tomohiro Kubo[1], Yosuke Miyagi[1], Setsuya Nakada[1], Eisuke Fujita[1], Masamitsu Miyamura[1] (1.National Research Institute for Earth Science and Disaster Prevention)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SVC35-08] New Websites and a Pamphlet of IVHHN

*Yasuhiro Ishimine[1] (1.Research and Education Center for Natural Hazards, Kagoshima University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SVC35-09] State of river water pollution derived from the recent volcanic activity of Mt Iwo-Yama, Kirishima volcanoes

*Yoshikazu Kikawada[1], Haruka Yamamoto[2], Wei Deng, Megumi Fukai (1.Faculty of Science and Technology, Sophia University, 2.Graduate School of Science and Technology, Sophia University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SVC35-10] Development of information tools for evacuation and rescue in the event of volcanic disaster

*Yosuke Miyagi[1], Setsuya Nakada[1], Tomohiro Kubo[1], Mitsuhiro Yoshimoto[2], Ryo Honda[2] (1.National Research Institute for Earth Science and Disaster Resilience, 2.Mount Fuji Research Institute, Yamanashi Prefectural Government)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SVC35-11] **Ignimbrite, tephra-fall, caldera and fatalities of major volcanoes in the East and Southeast Asia**

*Shinji Takarada[1], Joel Calupas Bandibas[1] (1.Geological Survey of Japan, AIST)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[SVC35-12] On the climber’s attitudes to the Volcanic mitigation for active volcanoes.

*Hideyuki Itoh[1], Chizuru Totani[2], Mizuho Arai[2] (1.Faculty of policy studies, Iwate prefectural University, 2.Asia air Survey, Co.Ltd.)

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | IC 2F

[S-VC38] Active Volcanism

convener:Yuta Maeda(Nagoya University), Takahiro Miwa(National research institute for earth science and disaster prevention), Takeshi Nishimura(Department of Geophysics, Graduate School of Science, Tohoku University), Chairperson:Takehiko Suzuki, Maya Yasui

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SVC38-01] Tephrochoronology in the southwest part of basaltic Izu-oshima volcanic island during last 20,000 years, off Tokyo, Pacific Ocean

*Takehiko Suzuki[1], Satoshi Terayama[1], Jun Matsukaze[1], Yuichi Kato[1] (1.Faculty of Urban Environmental Sciences, Tokyo Metropolitan University)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SVC38-02] **Tephrostratigraphy at Daisan-yama and Jinai-jima, and correlation with eruption deposits from Mamashitaura Volcanoes in Niijima Volcano, Izu-islands**

*Makoto Kobayashi[1], Masanori Murata[1], Kaori Aoki[1], Daisuke Ishimura[1,2], Takehiko Suzuki[1,2] (1.Research Center for Volcanic Hazards and Their Mitigations, Tokyo Metropolitan Univ., 2.Department of Geography, Tokyo Metropolitan Univ.)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SVC38-03] Constration of pre-eruptive process using crystal clot: A case study of Unzen 1991-95 eruption

*Kurumi Iwahashi[1], ATSUSHI YASUDA[1] (1.Earthquake Research Institute,The University of Tokyo)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SVC38-04] Petrological study of Pinatubo 1991 eruption ~ Discussions of magma plumbing model~

*Tomohisa Tamura[1,2], Mitsuhiro Nakagawa[2] (1.West Japan Engineering Consultants, Inc., 2.Earth and Planetary System Science, Hokkaido University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SVC38-05] Rediscovery of the Higuruma Debris Avalanche Deposit in Asama-Kurofu Volcano

*Maya Yasui[1], Masaki Takahashi[1], Tatsuo Kanamaru[1] (1.College of Humanities and Sciences, Nihon University)

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | IC 2F

[S-VC39] Hydrothermal systems of volcanoes

convener:Yasuhiro Fujimitsu(Department of Earth Resources Engineering, Faculty of Engineering, Kyushu University), Wataru Kanda(Volcanic Fluid Research Center, School of Science, Tokyo Institute of Technology), Takeshi Ohba(Department of chemistry, School of Science, Tokia University), Chairperson:Yasuhiro Fujimitsu(Faculty of Engineering, Kyushu University), Takeshi Ohba, Wataru Kanda

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SVC39-01] Hydrothermal system of Tokachidake volcano, Japan: Examination from multi-disciplinary surveys

*Ryo Takahashi[1], Noritoshi Okazaki[1], Makoto Tamura[1] (1.Geological Survey of Hokkaido, Hokkaido Research Organization)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SVC39-02] Fumarole and hot spring activities after the 2015 eruption of Hakone Volcano and their relationships with the seismicity and crustal deformation

*Kazutaka Mannen[1], Masatake Harada[1], Yohei Yukutake[1], George Kikugawa[1] (1.Hot Springs Research Institute of Kanagawa Prefecture)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SVC39-03] A possible geothermal source at around 4 km depth estimated by the seismic observation in Ibusuki geothermal area

*Junzo Kasahara[1,3], Yoko Hasada[2,1], Hiroyasu Kuzume[1] (1.ENAA, 2.Daiwa Exploration and Consulting Co., 3.Shizuoka Univ.)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SVC39-04] Time variation in the chemical and isotopic composition of fumarolic gases at Kusatsu-Shirane volcano Japan

*Takeshi Ohba[1], Muga Yaguchi[2], Nozomi Numanami[1], Kotaro Toyama[3], Hirochika Sumino[3], Urumu Tsunogai[4], Masanori Ito[4], Ryo Shingubara[4] (1.Department of chemistry, School of Science, Tokia University, 2.Meteorological Research Institute, JMA, 3.The University of Tokyo Graduate School of Arts and Sciences Department of Basic Science, 4.Nagoya University Graduate School of Environmental Studies)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SVC39-05] Behavior of Arsenic and Mercury related to hydrothermal activities in Kirishima, Satsuma Iwojima, and Yamagawa, Kyushu Japan

*Motoya Habuchi[1], Harue Masuda[1], Tsuyoshi Shintani[1], Shuzo Furuya[1], Keigo Mori[1], Jun-ichiro Ishibashi[2], Takeshi Matsushima[2], Akinori Takeuchi[3], Syogo Oshima[4], Reo Ikawa[5] (1.Osaka City University, 2.Kyushu University, 3.National Institute for Environmental Studies, 4.West Japan Engineering Consultants, Inc., 5.National Institute of Advanced Industrial Science and Technology)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SVC39-06] The chemical composition of thermal waters from spring and hot pool at Mt. Iwoyama of Kirishima volcano

*Muga Yaguchi[1], Takeshi Ohba[2], Kotaro Toyama[3], Fukuoka Regional Headquarters JMA[4], Kagoshima Meteorological Office JMA[4] (1.Meteorological Research Institute, 2.Tokai University, 3.Graduate School of the University of Tokyo, 4.Japan Meteorological Agency)

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | IC 2F

[S-VC39] Hydrothermal systems of volcanoes

convener:Yasuhiro Fujimitsu(Department of Earth Resources Engineering, Faculty of Engineering, Kyushu University), Wataru Kanda(Volcanic Fluid Research Center, School of Science, Tokyo Institute of Technology), Takeshi Ohba(Department of chemistry, School of Science, Tokia University), Chairperson:Yasuhiro Fujimitsu(Faculty of Engineering, Kyushu University), Takeshi Ohba, Wataru Kanda

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SVC39-07] Re-examination of origin of the variety in magmatic-hydrothermal fluids

*Hiroshi Shinohara[1] (1.Geological Survey of Japan, AIST)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SVC39-08] **Constraining electrical resistivity structure of volcanoes using multiphase flow modelling: an example of Miyake-jima**

*Marceau Gresse[1], Makoto Uyeshima[1], Takao Koyama[1], Maki Hata[1], Hideaki Hase[2], Koki Aizawa[3], Yusuke Yamaya[4], Yoichi Sasai[5], Jacques Zlotnicki[6], Tawat Rung-Arunwan[1], Hideki Ueda[7] (1.Earthquake Research Institute, The University of Tokyo, Tokyo, Japan, 2.Geothermal Energy Research & Development Co., Ltd., Tokyo, Japan, 3.Institute of Seismology and Volcanology, Faculty of Science, Kyushu University, Fukuoka, Japan., 4.Planning Division, National Institute of Advanced Industrial Science and Technology, Tokyo, Japan, 5.Earthquake Prediction Research Centre, Tokai University, Shizuoka, Japan, 6.CNRS, OPGC-UMR6524, Aubière, France, 7.National Research Institute for Earth Science and Disaster Resilience, Tsukuba, Japan)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SVC39-09] MT survey and 3-D resistivity structure in the Niseko area, southwestern Hokkaido

*Makoto Tamura[1], Toru Mogi[2], Junna Kanahiro[2], Daisuke Oka[1], Junya Maruyama[1], Takahiro Suzuki[1], Noritoshi Okazaki[1] (1.Geological Survey of Hokkaido, Hokkaido Research Organization, 2.Division of Sustainable Resource Engineering, Fucluty of Engineering, Hokkaido University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SVC39-10] **Hydrothermal fluid activity of the Tatun Volcano Group, Taiwan, revealed by self-potentials and seismicity**

*Hong-Jia Chen[1], Zhi-Xian Yang[1], Chien-Chih Chen[1,2], Cheng-Horng Lin[3,4] (1.Department of Earth Sciences, National Central University, Taiwan., 2.Earthquake-Disaster & Risk Evaluation and Management, National Central University, Taoyuan, Taiwan., 3.Institute of Earth Sciences, Academia Sinica, Taipei, Taiwan., 4.Taiwan Volcano Observatory at Tatun, Taipei, Taiwan.)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SVC39-11] Utilizing the electrical conductivity distribution to unravel the hydrothermal system beneath Mt.Hasan composite volcano and its vicinity, southwest Cappodocia, Turkey

*Sabri Bulent Tank[1], Mustafa Karas[1] (1.Bogazici University)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SVC39-12] Three-dimensional Magnetotelluric Inversion to map geothermal structures in Eburru Geothermal field, Kenya.

*JUSTUS MAITHYA[1], Yasuhiro FUJIMITSU[2] (1.Graduate School of Engineering, Department of Earth Resources Engineering, Kyushu University, 2.Faculty of Engineering, Department of Earth Resources Engineering, Kyushu University)

[J] Oral | S (Solid Earth Sciences)：S-TT Technology & Techniques

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 303 3F

[S-TT45] Synthetic Aperture Radar

convener:Youhei Kinoshita(University of Tsukuba), Yu Morishita(Geospatial Information Authority of Japan), Shoko Kobayashi(Tamagawa University), Takahiro Abe(Earth Observation Research Center, Japan Aerospace Exploration Agency), Chairperson:Shoko Kobayashi(Tamagawa University), Kazuya Ishitsuka(Kyoto University)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[STT45-01] Extraction of ground changes near the crater by the eruption of Kilauea volcano.

*Fujiyama Kaho[1], Masanobu Shimada[1], Yuki Kimoto[1], Kenta Yoshioka[1] (1.TokyoDenki University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[STT45-02] ALOS-2 observation of the 2017 Sefidsang earthquake, northeastern Iran: a blind shallow-dipping thrust event near the Eastern Kopeh Dagh

*Nematollah Ghayournajarkar[1], Yo Fukushima[2] (1.Graduate School of Science, Tohoku University, 2.International Research Institute of Disaster Science, Tohoku University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[STT45-03] **InSAR ground displacements and slip distribution associated with secondary fault slips of the 2016 Kumamoto earthquake**

*Yo Fukushima[1], Daisuke Ishimura[2] (1.International Research Institute of Disaster Science, Tohoku University, 2.Department of Geology, Tokyo Metropolitan University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[STT45-04] Surface displacements at the Kumamoto plain using persistent scatterer interferometry and comparison with groundwater levels

*Kazuya Ishitsuka[1], Takeshi Tsuji[2] (1.Kyoto Univ., 2.Kyushu Univ.)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[STT45-05] Forest fire detection in the low biomass dry forest with JICA-JAXA Forest Early Warning System in the Tropics (JJ-FAST).

*Manabu Watanabe[1], Christian Naohide koyama[1], Masato Hayashi[2], Izumi Nagatani[2], Takeo Tadono[2], Masanobu Shimada[1,2] (1.School of Science and Engineering, Tokyo denki university, 2.JAXA/EORC)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[STT45-06] Nominal operation results of Japanese ALOS-2

★Invited Papers

*Shinichi Sobue[1] (1.Japan Aerospace Exploration Agency)

[J] Oral | S (Solid Earth Sciences)：S-TT Technology & Techniques

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 303 3F

[S-TT45] Synthetic Aperture Radar

convener:Youhei Kinoshita(University of Tsukuba), Yu Morishita(Geospatial Information Authority of Japan), Shoko Kobayashi(Tamagawa University), Takahiro Abe(Earth Observation Research Center, Japan Aerospace Exploration Agency), Chairperson:Yohei Kinoshita(RESTEC), Takahiro Abe(JAXA)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[STT45-07] Estimation of velocity distribution of Shirase Glacier derived from SAR data obtained by ERS-1/2 tandem mission

*Koichiro Doi[1,2], Yuichi Aoyama[1,2], Kazuki Nakamura[3], Tsutomu Yamanokuchi[4], Kazuo Shibuya[1] (1.National Institute of Polar Research, 2.SOKENDAI, 3.College of Engineering, Nihon University, 4.RESTEC)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[STT45-08] Heavy rainfall-induced displacement of more than 2.5m in the Kushiro Marsh in 2016, detected by ALOS-2 SAR

*Satoshi Fujiwara[1], Yu Morishita[1], Takayuki Nakano[1], Yuji Miura[1], Yasuaki Kakiage[1], MURAMATSU Hiroki[1], Hiroshi Une[1] (1.GSI of Japan)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[STT45-09] Surface deformation of Asama Volcano, Japan, detected by time-series InSAR combining persistent and distributed scatterers, 2014-2018

*Yosuke Aoki[1], Xiaowen Wang[1] (1.Earthquake Research Institute, University of Tokyo)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[STT45-10] Improvement of Airborne L-band-SAR (Pi-SAR-L2) Coherence by Pixel by Pixel Resampling

*Makoto Murakami[1], Masato Furuya[1], Taku Ozawa[4], Youichiro Takada[1], Yosuke Aoki[3], Masanobu Shimada[2], Shohei Narita[1] (1.Hokkaido University, 2.Tokyo Denki University, School of Science and engineerring, 3.Earthquake Research Institute, The University of Tokyo, 4. National Research Institute for Earth Science and Disaster Resilience)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[STT45-11] Ionospheric delay estimation in SAR interferometry: Significance of the method using the split-spectrum double-difference interferogram

*Taku Ozawa[1] (1.National Research Institute for Earth Science and Disaster Resilience)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[STT45-12] Detecting surface displacement accosiated with the 2018 slow slip event around Boso peninsla by use of Sentinel-1 InSAR with atmospheric correction

*Youhei Kinoshita[1], Tadahiro Nimura[1], Ryoichi Furuta[1] (1.RESTEC, Remote Sensing Technology Center of Japan)

[J] Oral | S (Solid Earth Sciences)：S-TT Technology & Techniques

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[S-TT46] Seismic Big Data Analysis Based on the State-of-the-Art of Bayesian Statistics

convener:Hiromichi Nagao(Earthquake Research Institute, The University of Tokyo), Aitaro Kato(Earthquake Research Institute, the University of Tokyo), Takuto Maeda(Graduate School of Science and Technology, Hirosaki University), Keisuke Yano(The university of Tokyo), Chairperson:Nana Yoshimitsu(Earthquake Research Institute, The University of Tokyo), Takeru Matsuda(Graduate School of Information Science and Technology, The University of Tokyo)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[STT46-01] A bad inversion result suggests bad modeling

★Invited Papers

*Yukitoshi Fukahata[1], Yuji Yagi[2] (1.Disaster Prevention Research Institute, Kyoto University, 2.Graduate School of Life and Environmental Sciences, University of Tsukuba)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[STT46-02] A seismic wavefield estimation in a dense seismograph network: An optimization for the MeSO-net

*Takahiro Shiina[1], Takuto Maeda[2], Masayuki Kano[3], Aitaro Kato[1], Naoshi Hirata[1] (1.Earthquake Research Institute, The University of Tokyo, 2.Graduate School of Science and Technology, Hirosaki University, 3.Graduate school of science, Tohoku University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[STT46-03] Uncertainty quantification based on 4DVar data assimilation for massive simulation models

*Shin-ichi Ito[1], Masayuki Kano[2], Hiromichi Nagao[1] (1.The University of Tokyo, 2.Tohoku University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[STT46-04] Bayesian approach for statistical modeling and forecasting of aftershock activities

★Invited Papers

*Takahiro Omi[1] (1.Institue of Industrial Science, the University of Tokyo)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[STT46-05] **Bias Correction for the Distribution of Aftershocks Within Short-Term Period Immediately After Large Main Shock**

*Kosuke Morikawa[1], Hiromichi Nagao[2], Shin-ichi Ito[2], Shin'ichi Sakai[2], Naoshi Hirata[2] (1.Osaka University, 2.Earthquake Research Institute, The University of Tokyo)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[STT46-06] Deep-learning-based Earthquake Detection for Continuous Seismic Network Records

*Keisuke Yano[1], Takahiro Shiina[2], Sumito Kurata[1], Aitaro Kato[2], Fumiyasu Komaki[1], Shin'ichi Sakai[2], Naoshi Hirata[2] (1.Graduate School of Information Science and Technology, The University of Tokyo, , 2.Earthquake Research Institute, The University of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-CG56] Ocean Floor Geosciences

convener:Kyoko Okino(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:Arata Kioka, Atsushi Noda

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SCG56-25] Observational plans of the South Sandwich Arc by R/V Hakuho Maru: Toward understanding formation and evolution of the world southernmost arc-trench system

*Asuka Yamaguchi[1], Kenichiro Tani[2], Minoru Ikehara[3] (1.Atomosphere and Ocean Research Institute, The University of Tokyo, 2.National Museum of Nature and Science, 3.Center for Advanced Marine Core Research, Kochi University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SCG56-26] Seismic imaging of the source zone of the 2011 Tohoku-oki earthquake

*Dapeng Zhao[1], Xin Liu[1] (1.Department of Geophysics, Tohoku University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SCG56-27] Drastic export of organic carbon to hadal trench driven by megathrust earthquake

*A. Kioka[1], T. Schwestermann[1], J. Moernaut[1], K. Ikehara[2], T. Kanamatsu[3], C. M. McHugh[4], C. dos Santos Ferreira[5], G. Wiemer[5], N. Haghipour[6], A. J. Kopf[5], T. I. Eglinton[6], M. Strasser[1,5] (1.Universität Innsbruck, Austria, 2.GSJ-AIST, Japan, 3.JAMSTEC, Japan, 4.Queens-CUNY, USA, 5.MARUM-U. Bremen, Germany, 6.ETH Zürich, Switzerland)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SCG56-28] How do trench-fill sediments subduct under the accretionary wedge?

*Atsushi Noda[1], Hiroaki Koge[2], Yasuhiro Yamada[3], Ayumu Miyakawa[1], Juichiro Ashi[2] (1.National Institute of Advanced Industrial Science and Technology, 2.Atomosphere and Ocean Research Institute, The University of Tokyo, 3.Japan Agency for Marine-Earth Science and Technology)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SCG56-29] Formation process of a slope basin in the Nankai Accretionary prism reconstructed from high-resolution SBP integrated with core data of ODP Site 1175 and Site 1176

*Yuichi Okuma[1], Asuka Yamaguchi[1], Hiroaki Koge[1], Rina Fukuchi[1], Juichiro Ashi[1] (1.Atmosphere and Ocean Research Institute, the University of Tokyo)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SCG56-30] About the turbidity current considered that it occurred in the northern Suruga Bay, Central Japan by the typhoon No.24. -The traces of the accidents and the phenomenon at the sea floor detected the OBSs Array-

*Nakao Nagisa[1], Hisatoshi Baba[2], Hiroshi Sato[3], Kayoko Tsuruga[4], Izumi Sakamoto[2], Takahito Nishimiya[5], Masanao Shinohara[3], Shintaro Abe[6] (1.Tokai University, 2.Department of Marine and Earth Science, Tokai University, 3.Earthquake Research Institute, University of Tokyo, 4.Tokyo University of Marine Science and Technology, 5.Meteorological Research Institute, Japan Meteorological Agency, 6.Association for the Development of Earthquake Prediction)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-CG60] Investigation of inputs to subduction zones: Influence of tectonic processes on the incoming plate

convener:Makoto Yamano(Earthquake Research Institute, the University of Tokyo), Tomoaki Morishita(School of Geoscience and Civil Engineering, College of Science and Technology, Kanazawa University), Gou Fujie(Japan Agency for Marine-Earth Science and Technology), Chairperson:Shigeaki Ono(Japan Agency for Marine-Earth Science and Technology)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SCG60-01] Geophysical-petrological studies of the Chile triple junction and their significance: MIRAI research cruise MR-1806Leg2

*Masataka Kinoshita[1,5], Hikaru Iwamori[1,5], Tomoaki Nishikawa[2], Ryo Anma[3], Sofia Lagarrigue[4], Natsue Abe[5], Yuka Yokoyama[6], Andres Veloso Espinosa[4], Alessandra Isabella Rivero Cortes[7], Gabriela Pia Lazcano Prado[7], Ivan Andres Arriagada Bascuñan[7], Satoru Haraguchi[5], Kosuke Ota[9], Yuji Orihashi[8], Kaishi Nakao[8], Shogo Numata[8], Hajime Shiobara[1], Hiroko Sugioka[10], Aki Ito[5], Nicolás Pérez-Estay[11] (1.Earthquake Research Institute, University of Tokyo, 2.DPRI, Kyoto Univ., 3.Tokushima Univ., 4.Pontificia Universidad Catolica de Chile, 5.JAMSTEC, 6.Tokai Univ., 7.Andres Bello University, 8.Hirosaki Univ., 9.AORI, Univ. Tokyo, 10.Graduate School of Science, Kobe Univ., 11.Ministerio de relaciones exteriores, Chile)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SCG60-02] Heat flow measurement on the seaward side of the Kuril Trench off Hokkaido

*Kouta Sasaki[1], Makoto Yamano[1], Yoshifumi Kawada[2], Masataka Kinoshita[1], Kiichiro Kawamura[3] (1.Earthquake Research Institute, the University of Tokyo, 2.International Research Institute of Disaster Science, Tohoku University, 3.Yamaguchi University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SCG60-03] Comparison of experimental and intermediate-depth earthquake b-value: difference in hydration degree of the oceanic mantle between Tohoku and Hokkaido

★Invited Papers

*Saeko Kita[1], Thomas P. Ferrand[2] (1.International Institute of Seismology and Earthquake Engineering, BRI, 2.ERI, University of Tokyo)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SCG60-04] Variations in bend faulting and the nature of the incoming oceanic plate off northeast Japan arc

*Gou Fujie[1], Koichiro Obana[1], Yojiro Yamamoto[1], Tomoaki Yamada[2], Takehi Isse[2], Shuichi Kodaira[1], Seiichi Miura[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.Earthquake Research Institute, Univ. of Tokyo)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SCG60-05] Seismicity in the trench-outer rise region off Fukushima and Ibaraki, southern Japan Trench

*Koichiro Obana[1], Gou Fujie[1], Yojiro Yamamoto[1], Yuka Kaiho[1], Yasuyuki Nakamura[1], Seiichi Miura[1], Tsutomu Takahashi[1], Shuichi Kodaira[1] (1.Research and Development Center for Earthquake and Tsunami, Japan Agency for Marine-Earth Science and Technology)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SCG60-06] Influence of water–rock interactions on the strength of outer-rise faults

★Invited Papers

*Ken-ichi Hirauchi[1] (1.Department of Geosciences, Faculty of Science, Shizuoka University)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-CG60] Investigation of inputs to subduction zones: Influence of tectonic processes on the incoming plate

convener:Makoto Yamano(Earthquake Research Institute, the University of Tokyo), Tomoaki Morishita(School of Geoscience and Civil Engineering, College of Science and Technology, Kanazawa University), Gou Fujie(Japan Agency for Marine-Earth Science and Technology), Chairperson:Makoto Yamano(Earthquake Research Institute, University of Tokyo)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SCG60-07] Seismic image of the incoming oceanic crust entering the central part of the Japan Trench: structural variation caused by petite-spot, bend fault and seamount

*Shuichi Kodaira[1,2], Akane Ohira[1,2], Gou Fujie[1], Tetsuo No[1], Yasuyuki Nakamura[1], Yuka Kaiho[1], Seiichi Miura[1] (1.R&D Center for Earthquake and Tsunami Japan Agency for Marine-Earth Science and Technology, 2.Graduate School of Environment and Information Sciences, Yokohama National University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SCG60-08] Dependence of calculation parameters on tsunami height from the outer-rise earthquakes

*Toshitaka Baba[1], Naotaka YAMAMOTO CHIKASADA[2], Yasuyuki Nakamura[3], Gou Fujie[3], Koichiro Obana[3], Seiichi Miura[3], Shuichi Kodaira[3] (1.Graduate School of Science and Technology, Tokushima University, 2.National Research Institute for Earth Science and Disaster Resilience, 3.Japan Agency for Marine-Earth Science and Technology)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SCG60-09] Bathymetry data analysis and multi-channel seismic reflection survey in the 1933 Sanriku earthquake (Mw 8.4) rupture region

*Tomoko Hanyu[1], Jin-Oh Park[1], Yukari Kido[2] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Japan Agency for Marine-Earth Science and Technology)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SCG60-10] Sedimentation process and deformation process before sinking of sediment on oceanic plate: examples in northwest Pacific Ocean and Sumatra

★Invited Papers

*Kiichiro Kawamura[1] (1.Yamaguchi University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SCG60-11] Exploring more asthenospheric melt: the preliminary report of KS-18-9 cruise, R/V Shinseimaru

*Naoto Hirano[1], Taku Yutani[2,1], Yuki Katsuragi[1], Jeffrey Anthony Oalmann[3], Fidel Costa Rodriguez[3], KS-18-9 Onboard Scientific Party (1.Tohoku University, 2.University of Bayreuth, 3.Nanyang Technological University)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SCG60-12] Inputs of Argon on oceanic plate at subduction zones

*Shigeaki Ono[1] (1.Japan Agency for Marine-Earth Science and Technology)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | Convention Hall A 2F

[S-CG61] Dynamics in mobile belts

convener:Yukitoshi Fukahata(Disaster Prevention Research Institute, Kyoto University), Toru Takeshita(Department of Natural History Sciences, Graduate School of Science, Hokkaido University), Hikaru Iwamori(Geochemical Evolution Research Program, Japan Agency for Marine-Earth Science and Technology), Chairperson:Toru Takeshita, Kenta Kobayashi

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SCG61-01] Fault zone development in the West Tottori area, Japan

*Kenta Kobayashi[1] (1.Department of Geology, Faculty of Science, Niigata University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SCG61-02] **Inerastic deformation around focal area of the 2000 Western Tottori EQ (M7.3) detected by "0.1 manten" Hyper Dense Seismic Observation (2)**

★Invited Papers

*Satoshi Matsumoto[1], Yoshihisa Iio[2], Shin'ichi Sakai[3], Aitaro Kato[3], Takuo Shibutani[2], Yuto Hayashida[4], Group for 0.1 manten Hyper dense seismic observation (1.Institute of Seismology and Volcanology, Faculty of Sciences, Kyushu University, 2.Disaster Prevention Reasearch Institute, Kyoto University, 3.Earthquake Research Institute, University of Tokyo, 4.Graduate School of Science, Kyushu University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SCG61-03] Non-double couple micro-earthquakes in the focal area of the 2000 Western Tottori earthquake (M7.3) by "0.1 manten" hyper dense seismic observation

*Yuto Hayashida[1], Satoshi Matsumoto[2], Yoshihisa Iio[3], Shin'ichi Sakai[4], Aitaro Kato[4], Group for "0.1 Manten" hyper dense seismic observation Group registration (1.Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University, 2.Institute of Seismology and Volcanology, Faculty of Sciences, Kyushu University, 3.Disater Prevention Research Institute, Kyoto University, 4.Earthquake Research Institute, the University of Tokyo)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SCG61-04] Stress field in the Western Tottori and Western Shimane regions deduced by the dense seismic observations

*Yoshihisa Iio[1], Manten seicmic observation group, Manten seismic observation group in the Western Tottori region (1.Disater Prevention Research Institute, Kyoto University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SCG61-05] Modeling the spatiotemporal change in stress field around Hinagu fault zone through the 2016 Kumamoto earthquake sequence, in central Kyushu, Japan

*Ayaho Mitsuoka[1], Satoshi Matsumoto[2], Azusa Shito[2], Yusuke Yamashita[3], Manami Nakamoto[4], Masahiro Miyazaki[3], Shin'ichi Sakai[5], Yoshihisa Iio[3], Group for urgent joint seismic observation of the 2016 Kumamoto earthquake (1.Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University, 2.Institute of Seismology and Volcanology, Faculty of Sciences, Kyushu University, 3.Disaster Prevention Research Institute, Kyoto University, 4.Association for the Development of Earthquake Prediction, 5.Earthquake Research Institute, The University of Tokyo)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SCG61-06] **Development of the Median Tectonic Line Fault zone in Mie Prefecture, Southwest Japan : A Possible Interpretation for Strain Localization and Softening**

*Toru Takeshita[1], Dong Van Bui[1], Thomas Anthony Czertowicz[1], Shun Arai[2], Takafumi Yamamoto[3], Jun-ichi Ando[3], Norio Shigematsu[4], Koichiro Fujimoto[5] (1.Department of Natural History Sciences, Graduate School of Science, Hokkaido University, 2.Department of Earth Science, Graduate School of Science, Tohoku University, 3.Department of Earth and Planetary Systems Science, Hiroshima University, 4.AIST, 5.Tokyo Gakugei University)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Convention Hall A 2F

[S-CG61] Dynamics in mobile belts

convener:Yukitoshi Fukahata(Disaster Prevention Research Institute, Kyoto University), Toru Takeshita(Department of Natural History Sciences, Graduate School of Science, Hokkaido University), Hikaru Iwamori(Geochemical Evolution Research Program, Japan Agency for Marine-Earth Science and Technology), Chairperson:Tomomi Okada, Ryosuke Ando(Graduate School of Science, University of Tokyo)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SCG61-07] **What caused the Main Himalayan Thrust (MHT) to ramp? Insights from analogue and numerical models**

*Subhajit Ghosh[1,2], Arijit Laik[2], Santanu Bose[2,3], Nibir Mandal[4] (1.Earthquake Research Institute, The University of Tokyo, 1-1-1 Yayoi, Bunkyo-Ku, Tokyo 113-0032, 2.Department of Geology, University of Calcutta, 35, Ballygunge Circular Road, Kolkata 700019, India, 3.Department of Geology, Presidency University, 86/1 College Street, Kolkata 700073, India, 4.Department of Geological Sciences, Jadavpur University, Kolkata 700032, India)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SCG61-08] Control of fault weakening on the structural styles of underthrusting-dominated non-cohesive tectonic wedges

*Arthur Bauville[1], Mikito Furuichi[1] (1.Department of Mathematical Science and Advanced Techology, JAMSTEC)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SCG61-09] **Complexity of the 2016 *M* 7.8 Kaikoura, New Zealand, earthquake from seismic observation: inferences of overpressured fluid involvement**

*Tomomi Okada[1], Satoshi Matsumoto[2], Yoshihisa Iio[3], Federica Lanza[4], Clifford H Thurber[4], Miu Matsuno[1], Yuta Kawamura[2], Tadashi Sato[1], Stephen C Bannister[5], John Ristau[5], Martha K Savage[6], John Townend[6], Jarg Petttinga[7], Francesca Ghisetti[8], Richard H Sibson[9] (1.Research Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University, 2. Institute of Seismology and Volcanology, Faculty of Sciences, Kyushu University, 3. Disater Prevention Research Institute, Kyoto University, 4.University of Wisconsin-Madison, U.S.A., 5.GNS Science, New Zealand, 6.Victoria University of Wellington, New Zealand, 7.University of Canterbury, New Zealand, 8.TerraGeoLogica, New Zealand, 9.University of Otago, New Zealand)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SCG61-10] Dynamic Rupture Simulation Reproduces Spontaneous Multifault Rupture and Arrest During the 2016 Mw 7.9 Kaikoura Earthquake

*Ryosuke Ando[1], Yoshihiro Kaneko[2] (1.Graduate School of Science, University of Tokyo, 2.GNS science)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SCG61-11] Ductile deformation explains the physics of friction and genesis of earthquakes

*James Daniel Paul Moore[1], Stefan Nielsen[2], Lars N Hansen[3] (1.Earth Observatory of Singapore, 2.University of Durham, 3.University of Oxford)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[SCG61-12] The seismic moment, stress drop, and strain energy release for the rupture of asperities

*Mitsuhiro Matsu'ura[1] (1.Institute of Statistical Mathematics)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 103 1F

[M-IS08] Geopark

convener:Takayuki Ogata(Disaster Prevention Research Center for Island Regions, University of the Ryukyus), Tatsuto Aoki(School of Regional Development Studies, Kanazawa University), Noritaka Matsubara(Graduate School of Regional Resource Management, University of Hyogo), Keiichi Tadokoro(Research Center for Seismology, Volcanology and Earthquake and Volcano Research Center, Nagoya University), Chairperson:Takeyuki Ueki(Faculty of Risk and Crisis Management, Chiba Institute of Science), Marekazu OHNO(Unzen Volcanic Area Geopark promotion office), Takayuki Arima(Department of Tourism Management, Faculty of Economics, Teikyo University)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[MIS08-01] Normal faults observed in the Yonaguni-jima Island, Okinawa Prefecture, southwestern Japan

*Makoto Otsubo[1], Kiyokazu Oohashi[2], Takayuki Ogata[3], Tadahiro Shibata[4] (1.Geological Survey of Japan, 2.Yamaguchi University, 3.University of the Ryukyus, 4.Agency for Cultural Affairs)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[MIS08-02] Example of Study of the Itoigawa-Shizuoka Tectonic Line using “NIED Quake map!”

*Ko Takenouchi[1], Yousuke Ibaraki[1], Takahiko Ogawara[1], Hiroshi Miyajima[1], Makoto Matsubara[2], Azusa Nishizawa[2], Shin Aoi[2], Yoshihiro Hiramatsu[3], Kazuyuki Nakagawa[4] (1.Fossa Magna Museum, 2.National Research Institute for earth Science and Disaster Resilience, 3.Kanazawa University, 4.Jiji Press)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[MIS08-03] The Opening of ‘NIED Quake map!’ and result of questionnaire survey about interest of local seismicity

*Makoto MATSUBARA[1], Azusa Nishizawa[1], Shin Aoi[1], Ko Takenouchi[2], Yoshihiro Hiramatsu[3], Kazuyuki Nakagawa[4] (1.National Research Institute for Earth Science and Disaster Resilience, 2.Fossa Magna Museum, Itoigawa City, 3.School of Geosciences and Civil Engineering, College of Science and Engineering, Kanazawa University, 4.Jiji Press)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[MIS08-04] Bandaisan Geopark's traveling exhibitions and lectures on "Debris avalanche in the world"

*Hiroshi Sato[1], Tadahide UI[2] (1.Mt.Bandai Museum, 2.CeMI)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[MIS08-05] PLANETARY SCIENCE Education in Geoparks-Science Festival for Youth Formation experiment of Izumo Plain in Shimane convention

*Kunihiro Abe[1] (1.Shimane Penunsula Shinjiko Narumi, Kuibiki Geopark Promotion Committee)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[MIS08-06] ESD in Geopark: Systems thinking and Systems competence for renovating the school curriculum of local area study.

*Ryuta YAMAMOTO[1] (1.Center for professional development of teachers Shizuoka University)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A02 TOKYO BAY MAKUHARI HALL

[M-IS11] Aqua planetology

convener:Yasuhito Sekine(Earth-Life Science Insitute, Tokyo Institute of Technology), Tomohiro Usui(Earth-Life Science Institute, Tokyo Institute of Technology), Keisuke Fukushi(Institute of Nature & Environmental Technology, Kanazawa University), Takazo Shibuya(Japan Agency for Marine-Earth Science and Technology), Chairperson:Yasuhito Sekine(Dept. Earth & Planetary Sci., University of Tokyo), Tomohiro Usui, Takazo Shibuya(JAMSTEC)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[MIS11-01] An interior structure model of Pluto resolving its mysteries

*Shunichi Kamata[1], Francis Nimmo[2], Yasuhito Sekine[3], Kiyoshi Kuramoto[1], Naoki Noguchi[4], Jun Kimura[5], Atsushi Tani[6] (1.Hokkaido University, 2.University of California, Santa Cruz, 3.Tokyo Institute of Technology, 4.Tokushima University, 5.Osaka University, 6.Kobe University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[MIS11-02] Isotopic measurement of gas hydrate sample simulating environment of icy satellite and icy planet: Equipment development and consideration for observation method

*Kushi Kudo[1], Atsushi Tani[1], Naohiro Yoshida[2,3] (1.Graduate School of Human Development and Environment, Kobe University, 2.Department of Chemical Science and Engineering, School of Materials and Chemical Technology, Tokyo Institute of Technology, 3.Earth–Life Science Institute)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[MIS11-03] Dynamics of icy crust of the Enceladus with tidal heating and asymmetric distribution of heat generation in the rocky core

*Kaho Harada[1,2], Takashi Nakagawa[3], Manabu Morishige[2], Shigenobu Hirose[2] (1.Keio University, 2.JAMSTEC, 3.University of Hong Kong)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[MIS11-04] Chlorine-bearing aqueous fluid at crust/mantle boundary in mid-ocean ridge hydrothermal system: a case study of crustal diopsidite from Oman ophiolite

★Invited Papers

*Norikatsu Akizawa[1], Akira Miyake[2], Akira Tsuchiyama[2] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Graduate School of Science, Kyoto University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[MIS11-05] Phase relation of the $MgSO_4$-H_2O system under high pressure

*Tadashi Kondo[1], Keita Harada[1], Miki Sirata[1], Takumi Kikegawa[2] (1.Department of Earth and Space Science, Graduate School of Science Osaka University, 2.Institute for Material Structure Science, KEK)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[MIS11-06] The Origin of Earth's Volatile Composition: Effects of Impact-induced Atmospheric Erosion and Core Formation

*Sakuraba Haruka[1], Hiroyuki Kurokawa[2], Hidenori Genda[2], Kenji Ohta[1] (1.Tokyo Institute of Technology, 2.Earth-Life Science Institute)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A02 TOKYO BAY MAKUHARI HALL

[M-IS11] Aqua planetology

convener:Yasuhito Sekine(Earth-Life Science Insitute, Tokyo Institute of Technology), Tomohiro Usui(Earth-Life Science Institute, Tokyo Institute of Technology), Keisuke Fukushi(Institute of Nature & Environmental Technology, Kanazawa University), Takazo Shibuya(Japan Agency for Marine-Earth Science and Technology), Chairperson:Yasuhito Sekine(Dept. Earth & Planetary Sci., University of Tokyo), Keisuke Fukushi, Tomohiro Usui

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[MIS11-07] Finding of oxidized sulfur species in carbonates from a Martian meteorite Allan Hills 84001 using μ-XANES

*Kajitani Iori[1], Gaku Tanabe[1], Ryoichi Nakada[2], Tomohiro Usui[3], Mizuho Koike[3], Fumihiro Matsuura[4], Tetsuya Yokoyama[1] (1.Tokyo Institute of Technology, 2.Japan Agency for Marine-Earth Science and Technology, 3.Institute of Space and Astronautical Science, 4.Earth-Life Science Institute)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[MIS11-08] A study on Martian water environment based on the μ-XRF-XANES analysis for the secondary minerals formed in a nakhlite meteorite (Y 000593) vein

*Keika Suzuki[1], Hiroki Suga[1], Akira Yamaguchi[2], Tomohiro Usui[3], Oki Sekizawa[4], Kiyofumi Nitta[4], Yoshio Takahashi[1] (1.University of Tokyo, 2.National Institute of Polar Research, 3.JAXA, ISAS, 4.JASRI/SPring-8)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[MIS11-09] Influence of water and clay minerals for slope angles on Mars

*Yuhki Matsuoka[1], Ikuo Katayama[1], Rina Noguchi[2], Tomohiro Usui[2] (1.Department of Earth and Planetary Systems Science, Hiroshima University, 2.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[MIS11-10] **Dark Streak Features in Mongolia: Implications for Formation Mechanisms of Recurring Slope Lineae on Mars**

*Maya Nakamura[1,2], Yasuhito Sekine[1], Keisuke Fukushi[3], Noriko Hasebe[3], Davaadorj Davaasuren[4], Yoshio Takahashi[2], Hitoshi Hasegawa[5], Takuro Ogura[6], Koki Morida[3], Tuvshin Gerelmaa[4] (1.Earth-Life Science Institute, Tokyo Institute of Technology, 2.Department of Earth and Planetary Science, The University of Tokyo, 3.Institute of Nature & Environmental Technology, Kanazawa University, 4.Department of Geography, National University of Mongolia, 5.Department of Global Environment and Disaster Prevention, Kochi University, 6.Department of Socio-Cultural Environmental Science, The University of Tokyo)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[MIS11-11] The occurrence of perchlorate salt in and around the Taklimakan Desert, China

*Haibo Qin[1,2], Shitong Yang[1], Qing Chang[3], Chihiro Miyamoto[1], Yoshio Takahashi[1] (1.Department of Earth and Planetary Science, Graduate School of Science, 2.State Key Laboratory of Environmental Geochemistry, Institute of Geochemistry, Chinese Academy of Sciences, 3.Japan Agency for Marine-Earth Science and Technology)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[MIS11-12] Measurement technique to quantify OH radicals photochemically generated on the ice surface

*Akihiro Yabushita[1], Hiroaki Nishimoto[1], Akira Harata[1] (1.Interdisciplinary Graduate School of Engineering Sciences, Kyushu University)

[J] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 201A 2F

[M-IS13] Biogeochemistry

convener:Keisuke Koba(Center for Ecological Research, Kyoto University), Hideaki Shibata(Field Science Center fot Northern Biosphere, Hokkaido University), Naohiko Ohkouchi(Japan Agency for Marine-Earth Science and Technology), Youhei Yamashita(Faculty of Environmental Earth Science, Hokkaido University), Chairperson:Keisuke Koba(Kyoto University), Yoshiyuki Inagaki, Kazumichi Fujii

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[MIS13-01] **Root meets clays: Tree root plasticity in podzolized soil**

*Kazumichi Fujii[1], Naoki Makita[2], Martin Küttim[3], Shinya sugita[3] (1.Forestry and Forest Products Research Institute, 2.Shinshu University, 3.Tallinn University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[MIS13-02] Nitrogen transformation process in newly created salt marsh in the aftermath of the 2011 Great East Japan Earthquake

*Keitaro Fukushima[1], Kazuma Hashimoto[2], Megumi Kuroiwa[3], Katsuhide Yokoyama[2], Yuichi Suwa[3] (1.Center for Ecological Research, Kyoto University, 2.Graduate School of Urban Environmental Sciences, Tokyo Metropolitan University, 3.Faculty of Science and Engineering, Chuo University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[MIS13-03] Succession of soil nitrification potential at a glacier foreland in Svalbard

*Kentaro Hayashi[1], Yukiko Tanabe[2,3], Keisuke Ono[1], Maki Asano[4], Shohei Hattori[5], Masaki Uchida[2,3], Masahito Hayatsu[1] (1.Institute for Agro-Environmental Sciences, NARO, 2.National Institute of Polar Research, 3.SOKENDAI, 4.University of Tsukuba, 5.Tokyo Institute of Technology)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[MIS13-04] **Transition of soil organic carbon in a volcanic ash soil derived from Towada volcano, Japan**

*JITHYA NAWODI WIJESINGHE[1], Jun Koarashi[2], Mariko Atarashi Andoh[2], Yoko Saito Kokubu[3], Noriko Yamaguchi[4], Takashi Sase[5], Mamoru Hosono[6], Yudzuru Inoue[7], Yuki Mori[1], Syuntaro Hiradate[1] (1.Soil Science Laboratory, Faculty of Agriculture, Kyushu University, Fukuoka 819-0395, Japan, 2.Nuclear Science and Engineering Center, Japan Atomic Energy Agency, Ibaraki 319-1195, Japan, 3.Tono Geoscience Center, Japan Atomic Energy Agency,Gifu 509-5102, Japan, 4.National Agriculture and Food Research Organization, Institute for Agro-environmental Sciences, 3-1-3 Kan-nondai, Tsukuba, Ibaraki 305-8604, Japan, 5.Boreal Laboratory for Phytolith Research, Iwate 028-7302,Japan, 6.Tokyo Natural History Research Structure,Tokyo 162-0052, Japan, 7.Faculty of Applied Information Technology, Nagasaki Institute of Applied Science,Nagasaki 851-0193, Japan)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[MIS13-05] General pattern of carbon and nitrogen isotopic variation across a wide range of soils and its controlling factors

*Rota Wagai[1], Masako Kajiura[1], Yudzuru Inoue[2], Maki Asano[3], Chie Hayakawa[4] (1.NARO, Institute for Agro-Environmental Sciences, 2.Nagasaki Institute of Applied Science, 3.University of Tsukuba, 4.University of Tokyo)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[MIS13-06] Nutrient sources in some Japanese forest ecosystems: the contribution of precipitation, weathering and litter fall

*Yoshiyuki Inagaki[1], Kazumichi Fujii[1] (1.Forestry and Forest Products Research Institute)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 201A 2F

[M-IS13] Biogeochemistry

convener:Keisuke Koba(Center for Ecological Research, Kyoto University), Hideaki Shibata(Field Science Center fot Northern Biosphere, Hokkaido University), Naohiko Ohkouchi(Japan Agency for Marine-Earth Science and Technology), Youhei Yamashita(Faculty of Environmental Earth Science, Hokkaido University), Chairperson:Keisuke Koba(Kyoto University), Yohei Yamashita, Kazuya Nishina, Kazumichi Fujii

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[MIS13-07] Ultrahigh-resolution mass spectral analysis of dissolved organic matter in rainfall, throughfall and soil water in temperate forest stands, western Japan

*Junichiro Ide[1], Keitaro Yamase[2], Seonghun Jeong[3], Noki Makita[4], Hiroshi Nishimura[5], Keitaro Fukushima[6], Kyoichi Otsuki[7], Mizue Ohashi[8] (1.Institute of Decision Science for a Sustainable Society, Kyushu University, 2.Forestry and Forest Products Research Institute, Hyogo Prefectural Technology Center for Agriculture, Forestry and Fisheries, 3.Graduate School of Bioresources and Bioenvironmental Sciences, Kyushu University, 4.Faculty of Science, Shinshu University, 5.Research Institute for Sustainable Humanosphere, Kyoto University, 6.The Center for Ecological Research, Kyoto University, 7.Faculty of Agriculture, Kyushu University, 8.School of Human Science and Environment, University of Hyogo)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[MIS13-08] Basin-scale transport of allochthonous humic-like fluorescent dissolved organic matter by the North Pacific Intermediate water

*Youhei Yamashita[1], Jun Nishioka[2], Hajime Obata[3], Hiroshi Ogawa[3] (1.Faculty of Environmental and Earth Science, 2.Institute of Low Temperature Science, Hokkaido University, 3.Atmosphere and Ocean Research Institute, The University of Tokyo)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[MIS13-09] Bacterial contribution to dissolved organic matter in a large monomictic lake (Lake Biwa) indicated by amino acids enantiomers

*Yasuhiko T. Yamaguchi[1], Chikage Yoshimizu[2], Ichiro Tayasu[2], Keisuke Koba[3], Kazuhide Hayakawa[1] (1.Lake Biwa Environmental Research Institute, 2.Research Institute for Humanity and Nature, 3.Center for Ecological Research, Kyoto University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[MIS13-10] High-sensitivity tracer assay for oxygen consumption rate in ocean and lakes using ^{17}O as a tracer

*Urumu Tsunogai[1], Shogo Kashiwagi[1], Masanori Ito[1], Fumiko Nakagawa[1], Chiho Sukigara[1] (1.Graduate School of Environmental Studies, Nagoya University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[MIS13-11] Ecology of bacterioplankton inhabiting oxygenated hypolimnia of deep freshwater lakes

*Yusuke Okazaki[1] (1.National Institute of Advanced Industrial Science and Technology)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[MIS13-12] Nitrous oxide emission from the drainage and the production processes in oil palm plantation on peatland

*Kazuya Nishina[1], Lulie Melling[2], Ryuichi Hirata[1], Yoshiyuki Takahashi[1], Sakae Toyoda[3], Kotaro Terajima[3], Masayuki Itoh[4] (1.NIES National Institute of Environmental Studies, 2.SARAWAK Tropical Peat Research Institute, 3.Tokyo Institute of Technology, 4.University of Hyogo)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | Convention Hall B 2F

[M-IS14] Global climate change driven by the Southern Ocean and the Antarctic Ice Sheet

convener:Osamu Seki(Institute of Low Temperature Science, Hokkaido University), Akira Oka(Atmosphere and Ocean Research Institute, The University of Tokyo), Ryu Uemura(University of the Ryukyus), Ryosuke Makabe(National Institute of Polar Research), Chairperson:Yuji Kato(Kochi University)

9:00 AM - 9:25 AM JST | 12:00 AM - 12:25 AM UTC

[MIS14-01] Mass loss of the Antarctic ice sheet under the influence of ice-ocean interaction

★Invited Papers

*Shin Sugiyama[1] (1.Institute of Low Temperature Science, Hokkaido University)

9:25 AM - 9:40 AM JST | 12:25 AM - 12:40 AM UTC

[MIS14-02] Accurate chronology and climatic reconstruction around MIS 11 (interglacial period ~400,000 years ago) from Dome Fuji ice core, Antarctica

*Kenji Kawamura[1,2,3], Ikumi Oyabu[1], Shuji Aoki[4], Takakiyo Nakazawa[4], Ayako Abe-Ouchi[5,3], Fuyuki SAITO[3] (1.National Institute of Polar Research, Research Organization of Information and Systems, 2.SOKENDAI (The Graduate University of Advanced Studies), 3.JAMSTEC, 4.Tohoku University, 5.University of Tokyo)

9:40 AM - 9:55 AM JST | 12:40 AM - 12:55 AM UTC

[MIS14-03] Study on physics and layers of ice cores containing information of climate change over the past 720 k-years, and study on the "oldest ice"

*Shuji Fujita[1,2], Motohiro Hirabayashi[1], Iizuka Yoshinori[3], Hiroshi Ohno[4] (1.National Institute of Polar Research, Research Organization of Information and Systems(ROIS), 2.Department of Polar Science, The Graduate University for Advanced Studies (SOKENDAI), Japan, 3. Institute of Low Temperature Science, Hokkaido University, Japan, 4.Kitami Institute of Technology, Japan)

9:55 AM - 10:15 AM JST | 12:55 AM - 1:15 AM UTC

[MIS14-04] Reconstructions of the Antarctic Polar Front through the glacial/interglacials

★Invited Papers

*Hiroki Matsui[1], Yuji Kato[1,2], Itsuki Suto[3], Minoru Ikehara[1] (1.Center for Advanced Marine Core Research, Kochi University, 2.JSPS PD, 3.Graduate School of Environmental Studies, Nagoya University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[MIS14-05] **Integrated observations for marine earth science in the Indian sector of the Southern Ocean: Preliminary results of R/V Hakuho-maru KH-19-1 cruise**

*Minoru Ikehara[1], Kay I. Ohshima[2], Takuya Itaki[3], Hiroshi Sato[4], Masakazu Fujii[5], Michiyo Yamamoto-Kawai[6], Hiroki Matsui[1], Takahito Ikenoue[7], . Scientific Party of R/V Hakuho-maru KH-19-1 cruise (1.Center for Advanced Marine Core Research, Kochi University, 2.ILTS, Hokkaido University, 3.GSJ, AIST, 4.Senshu University, 5.National Institute of Polar Research, 6.Tokyo University of Marine Science and Technology, 7.Marine Ecology Research Institute)

[J] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | Convention Hall B 2F

[M-IS14] Global climate change driven by the Southern Ocean and the Antarctic Ice Sheet

convener:Osamu Seki(Institute of Low Temperature Science, Hokkaido University), Akira Oka(Atmosphere and Ocean Research Institute, The University of Tokyo), Ryu Uemura(University of the Ryukyus), Ryosuke Makabe(National Institute of Polar Research), Chairperson:Sam Sherriff-Tadano(University of Tokyo)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[MIS14-06] **High resolution ocean temperatures reconstructions over the last glacial-interglacial in the Kerguelen region, Southern Ocean.**

*Matthieu Civel[1,2], Xavier Crosta[3], Giuseppe Cortese[4], Elisabeth Michel[5], Alain Mazaud[5], Samuel Jaccard[6], Lena Thöle[6], Minoru Ikehara[1], Takuya Itaki[2] (1.Center for Advanced Marine Core Research, Kochi University, Japan, 2.Geological Survey of Japan, AIST, Tsukuba, Japan, 3.UMR 5805 CNRS EPOC, Université de Bordeaux, France, 4.GNS Science, Lower Hutt, New Zealand, 5.LSCE-IPSL, CEA-CNRS-UVSQ, 91198 Gif-sur-Yvette, France, 6.Institute of Geological Sciences & Oeschger Centre for Climate Change Research, University of Bern, Switzerland)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[MIS14-07] Present-day crustal motion and gravity change in East Antarctica: implications for the mantle viscosity and Holocene Antarctic Ice Sheet change inferred from GIA modeling

*Jun'ichi Okuno[1,2], Koichiro Doi[1,2], Yuichi Aoyama[1,2], Takeshige Ishiwa[1], Akihisa Hattori[2], Yoichi Fukuda[3] (1.National Institute of Polar Research, 2.SOKENDAI, 3.Kyoto University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[MIS14-08] **Reconstruction of the East Antarctic ice sheet variability during the last 3 myrs in the central & eastern Droning Maud Land, East Antarctica**

*Yusuke Suganuma[1,2], Moto Kawamata[2], Kota Katsuki[3], Tatsuo Kanamaru[4], Heitaro Kaneda[5], Takushi Koyama[6], Tanabe Yukiko[1,2], Daisuke Shibata[7], Takeshige Ishiwa[1], Takuya Itaki[8], Jun'ichi Okuno[1,2], Osamu Seki[9], Itsuki Suto[10], Masakazu Fujii[1,2], Hideki Miura[1,2] (1.National institute of Polar Research, 2.SOKENDAI, 3.Shimane University, 4.Nihon University, 5.Chiba University, 6.Oita University, 7.Tsukuba University, 8.GSJ, AIST, 9.Hokkaido University, 10.Nagoya University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[MIS14-09] Vertical ice flow motions obtained from year-round GNSS observations on Shirase Glacier, Antarctica

*Yuichi Aoyama[1,2], Koichiro Doi[1,2], Daisuke Hirano[3], Takeshi Tamura[1,2], Shigeru Aoki[3], Kazuo Shibuya[1] (1.National Institute of Polar Research, 2.SOKENDAI, 3.Institute of Low Temperature Science, Hokkaido University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[MIS14-10] **Operation plan and design of the Antarctic exploration AUV "MONACA"**

*Hirokazu Yamagata[1], Toshihiro Maki[1], Hiroshi Yoshida[2], Yoshifumi Nogi[3] (1.Institute of Industrial Science, The University of Tokyo, 2.Japan Marine Science and Technology Center, 3.National Institute of Polar Research)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[MIS14-11] Geophysical insights into tectonic, volcanic, sedimentation, and glacial processes in Indian and Southern Oceans: Preliminary geophysical results of R/V *Hakuho-maru* KH-19-1 cruise

*Masakazu Fujii[1], Hiroshi Sato[2], Minoru Ikehara[3], Yoshifumi Nogi[1], Taichi Sato[4], Yasuyuki Nakamura[5], Eri Helen Amsler[6], Sam Sherriff-Tadano[7] (1.National Institute of Polar Research and SOKENDAI, 2.Senshu University, 3.Kochi University, 4.AIST, 5.JAMSTEC, 6.University of Bern, 7.AORI, UTokyo)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | Convention Hall B 2F

[M-IS14] Global climate change driven by the Southern Ocean and the Antarctic Ice Sheet

convener:Osamu Seki(Institute of Low Temperature Science, Hokkaido University), Akira Oka(Atmosphere and Ocean Research Institute, The University of Tokyo), Ryu Uemura(University of the Ryukyus), Ryosuke Makabe(National Institute of Polar Research), Chairperson:Takeshige Ishiwa(National institute of Polar Research)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[MIS14-12] Simulations of glacial ocean carbon cycle with a parameterization of stratification dependence of vertical diffusivity

*Hidetaka Kobayashi[1], Akira Oka[1] (1.Atmosphere and Ocean Research Institute, The University of Tokyo)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[MIS14-13] Impacts of precession on the periodicity of climate and AMOC variabilities

*Sam Sherriff-Tadano[1] (1.Atmosphere and Ocean Research Institute, the University of Tokyo)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[MIS14-14] Warming and climate feedbacks in the southern high latitude driven by obliquity, precession-eccentricity, and atmospheric CO2

*Kanon Kino[1], Ayako Abe-Ouchi[1,2], Ryouta O'ishi[1], Fuyuki SAITO[2], Masakazu Yoshimori[1] (1.Atmosphere and Ocean Research Institute, the University of Tokyo, 2.Japan Agency for Marine-Earth Science and Technology)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[MIS14-15] Origin of Circumpolar Deep Water intruding onto the Amundsen and Bellingshausen Sea continental shelves

*Yoshihiro Nakayama[1,2], Menemenlis Dimitris[2], Hong Zhang[2], Michael Schodlok[2], Eric Rignot[2,3] (1.Institute of Low Temperature Science, Hokkaido University, 2.NASA's Jet Propulsion Laboratory, 3.Uniersity of California, Irvine)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[MIS14-16] Ocean and material circulation in the southern part of the Australian Antarctic Basin in 2018/2019 summer - preliminary results from Kaiyomaru KY18-04 cruise

*Katsuro Katsumata[1], Daisuke Hirano[2], Daiki Nomura[2], Kaihe Yamazaki[2], Yoichiro Koh[2], Masaaki Kiuchi[2], Shigeru Aoki[2], Hiroto Murase[3] (1.JAMSTEC, 2.Hokkaido Univ., 3.NRI-FSF)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[MIS14-17] Mooring observation aiming direct current measurement and quantitative evaluation of Meridional Circulation of Southern Ocean

*Kitade Yujiro[1], Kohei Mizobata[1], Kazuho Watanabe[1], Linquiao Chen[3], Gaopin Guo[3], Shigeru Aoki[2], Shyuki Ushio[4], Keishi Shimada[1], Kay I. Ohshima[2] (1.Tokyo University of Marine Science and Technology, 2.Hokkaido University, 3.Shanghi Ocean University, 4.National Institute of Polar Research)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 302 3F

[M-IS15] Evolution of Pelagic Realm

convener:Atsushi Matsuoka(Department of Geology, Faculty of Science, Niigata University), Katsunori Kimoto(Japan Agency for Marine-Earth Science and Technology), Toshiyuki Kurihara(Graduate School of Science and Technology, Niigata University), Tetsuji Onoue(Earth and Environmental Sciences, Graduate School of Science and Technology, Kumamoto University), Chairperson:Atsushi Matsuoka, Toshiyuki Kurihara

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[MIS15-01] **Environmental changes of the North Pacific Ocean through the Cenozoic era recorded in DSDP/ODP pelagic clay cores**

*Kazuhide Mimura[1], Katsushi Yamamoto[1], Kentaro Nakamura[1], Kazutaka Yasukawa[1,2], Junichiro Ohta[2], Koichiro Fujinaga[2,1], Shiki Machida[2], Yoichi Usui[3], Yasuhiro Kato[1,2] (1.Department of Systems Innovation, School of Engineering, the University of Tokyo, 2.ORCeNG, Chiba Institute of Technology, 3.JAMSTEC)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[MIS15-02] Reconstruction of oceanic redox conditions in the Lower Jurassic (Pliensbachian–Toarcian) pelagic deep-sea bedded chert sequence of the Mino Belt, central Japan

*Katsuhito Soda[1] (1.Department of Earth and Environmental Sciences, Faculty of Science, Kumamoto University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[MIS15-03] Conodont biostratigraphy of Anisian pelagic deep-sea sedimentary rocks deposited in the pelagic Panthalassa—Integration with radiolarian biozones—

*Shun Muto[1], Satoshi Takahashi[1], Satoshi Yamakita[2], Katsuhito Soda[3], Tetsuji Onoue[3] (1.Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo, 2.Faculty of Education, University of Miyazaki, 3.Faculty of Advanced Science and Technology)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[MIS15-04] Triassic marine Os isotope record reconstructed from a pelagic chert succession, Sakahogi section, Mino Belt, southwest Japan

★Invited Papers

*Tatsuo Nozaki[1,2,3,4], Takashi Nikaido[5], Tetsuji Onoue[6], Yutaro Takaya[7,1,2,4], Keiko Sato[1], Jun-Ichi Kimura[8], Qing Chang[8], Daisuke Yamashita[6], Honami Sato[4,1], Katsuhiko Suzuki[1], Yasuhiro Kato[2,4], Atsushi Matsuoka[5] (1.JAMSTEC/R&D CSR, 2.Univ. of Tokyo, 3.Kobe Univ., 4.ChibaTech, 5.Niigata Univ., 6.Kumamoto Univ., 7.Waseda Univ., 8.JAMSTEC/D-SEG)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[MIS15-05] **The preservation of radiolarians across the Jurassic-Cretaceous (J/K) boundary in the Bosso Valley section, Central Italy**

*XIN LI[1], Atsushi Matsuoka[2], Angela Bertinelli[3], Marco Chiari[4] (1.State Key Laboratory of Palaeobiology and Stratigraphy, Nanjing Institute of Geology and Palaeontology, Chinese Academy of Sciences, 2.Niigata University, 3.Università degli Studi di Perugia, 4. Istituto di Geoscienze e Georisorse)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[MIS15-06] Radiolarian faunas around the Jurassic-Cretaceous boundary in the Bosso Valley section, central Italy

*Atsushi Matsuoka[1], XIN LI[2], Marco Chiari[3], Angela Bertinelli[4] (1.Department of Geology, Faculty of Science, Niigata University, 2.Nanjing Institute of Geology and Palaeontology, Chinese Academy of Sciense, 3.C.N.R., Istituto di Geoscienze e Georisorse, sede secondaria di Firenze, 4. Dipartimento di Fisica e Geologia, Università degli Studi di Perugia)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 201B 2F

[M-IS17] History X Earth and Planetary Science

convener:Yasuyuki Kano(Earthquake Research Institute, The University of Tokyo), Kei Yoshimura(Institute of Industrial Science, The University of Tokyo), Hiroaki Isobe(Faculty of Fine Arts, Kyoto City University of Arts), kiyomi iwahashi(National Institute of Japanese Literature), Chairperson:Yasuyuki Kano(東京大学 地震研究所), Kiyomi Iwahashi, Hiroaki Isobe, Kei Yoshimura, Harufumi Tamazawa

9:05 AM - 9:30 AM JST | 12:05 AM - 12:30 AM UTC

[MIS17-01] Document based reconstruction of environment of forests in the Edo period

★Invited Papers

*SATOSHI SHIROUZU[1] (1.Chuogakuin University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[MIS17-02] Studies of Babylonian Astronomical Diaries: Today and the Future

*Yasuyuki Mitsuma[1] (1.The University of Tokyo)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[MIS17-03] Characteristics of the Sunspots that Produce Large Solar Flares and the Possibility to Investigate these Events Utilizing Historical Observational Records

*Shin Toriumi[1] (1.National Astronomical Observatory of Japan)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[MIS17-04] An Approach of Environmental History to the "14th Century Crisis"

*Isahaya Yoichi[1] (1.Slavic-Eurasian Research Center, Hokkaido University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[MIS17-05] Recovery of the Asian monsoon variations since the late 19th century by the data rescue activities in ACRE-Japan

*Jun Matsumoto[1,2], Tomoshige Inoue[1], Fumiaki Fujibe[1], Jun-Ichi Hamada[1], Taiichi Hayashi[3], Toru Terao[4], Fumie Murata[5], Hisayuki Kubota[6], Ikumi Akasaka[7], Hirotaka Kamahori[8], Nobuhiko Endo[9], Haruhiko Yamamoto[10], Shigeru Kobayashi[11], Yoshitaka Muraji[12] (1.Deaprtment of Geography, Tokyo Metropolitan University, 2.Department of Coupled Ocean-Atmosphere-Land Processes Research, 3.Kyoto University, 4.Kagawa University, 5.Kochi University, 6.Hokkaido University, 7.Senshu University, 8.Meteorological Research Institute, 9.NARO/NIAES, 10.Yamaguchi University, 11.Osaka University, 12.EScoT)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 201B 2F

[M-IS17] History X Earth and Planetary Science

convener:Yasuyuki Kano(Earthquake Research Institute, The University of Tokyo), Kei Yoshimura(Institute of Industrial Science, The University of Tokyo), Hiroaki Isobe(Faculty of Fine Arts, Kyoto City University of Arts), kiyomi iwahashi(National Institute of Japanese Literature), Chairperson:Hiroaki Isobe, Kei Yoshimura, Kiyomi Iwahashi, Yasuyuki Kano(東京大学 地震研究所), Harufumi Tamazawa

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[MIS17-06] Historical big data: integrated analysis of the past world by the workflow that bridges data structuring gaps

*Asanobu Kitamoto[1,2,3], Mika Ichino[1,2] (1.National Institute of Informatics, 2.ROIS-DS Center for Open Data in the Humanities, 3.SOKENDAI)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[MIS17-07] Felt earthquakes in Tokyo (Edo) based on historical daily records and seismic intensity data

*Kenji Satake[1] (1.Earthquake Research Institute, University of Tokyo)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[MIS17-08] Climate and social changes in ancient Japan construed by use of high resolution reconstruction of the Climate in Historical Time

*Katsunori IMAZU[1], Takeshi Nakatsuka[2] (1.OKAYAMA University Graduate School of Humanities and Social Sciences, 2.Research Institute for Humanity and Nature)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[MIS17-09] Absolute ages for huge eruptions of Towada Caldera and Baitoushan volcano in the 10th century as seen from dendrochronological studies and historical documents

*Masataka Hakozaki[1], Fusa Miyake[2], Masaki Sano[3], Katsuhiko Kimura[4], Toshio Nakamura[2], Mitsuru Okuno[5], Minoru Sakamoto[1], Takeshi Nakatsuka[6,2] (1.National Museum of Japanese History, 2.Nagoya University, 3.Waseda University, 4.Fukushima University, 5.Fukuoka University, 6.Research Institute for Humanity and Nature)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[MIS17-10] How can we activate collaborations with history and archaeology? – Lesson from Historical Climate Adaptation project

★Invited Papers

*Takeshi Nakatsuka[1,2] (1.Research Institute for Humanity and Nature, 2.Graduate School of Environmental Studies, Nagoya University)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 301A 3F

[M-IS18] Geophysical fluid dynamics-Transfield approach to geoscience

convener:Keita Iga(Atmosphere and Ocean Research Institute, The University of Tokyo), Shigeo Yoshida(Department of Earth and Planetary Sciences, Faculty of Sciences, Kyushu University), Takatoshi Yanagisawa(Department of Deep Earth Structure and Dynamics Research, Japan Agency for Marine-Earth Science and Technology), Hidenori AIKI(Nagoya University), Chairperson:Kensuke Nakajima

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[MIS18-01] Axisymmetric disturbance on an axisymmetric shallow water vortex

*Toshihisa Itano[1] (1.National Defense Academy)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[MIS18-02] Numerical studies on the classification of flow regimes of the 3-D thermal convection of rotating fluids

*Masanori Kameyama[1,2] (1.Geodynamics Research Center, Ehime University, 2.Japan Agency for Marine-Earth Science and Technology)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[MIS18-03] Diffusive behavior of columnar vortices in rotating thermal convection

*Daisuke Noto[1], Yuji Tasaka[2], Takatoshi Yanagisawa[3], Yuichi Murai[2] (1.Graduate School of Engineering, Hokkaido University, 2.Faculty of Engineering, Hokkaido University, 3.Japan Agency for Marine-Earth Science and Technology)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[MIS18-04] Liquid metal flows driven by a rotating magnetic field

*Koki Sawada[1], Vladimir Galindo[2], Tobias Vogt[2], Sven Eckert[2], Yuji Tasaka[3], Yuichi Murai[3] (1.Graduate School of Engineering, Hokkaido University , 2.Helmholtz-Zentrum Dresden-Rossendorf, 3.Faculty of Engineering, Hokkaido University,)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[MIS18-05] A symmetry-breaking self-regulating dynamo generating Mercury’s anomalous magnetic field

*Futoshi Takahashi[1], Hisayoshi Shimizu[2], Hideo Tsunakawa[3] (1.Faculty of Sciences, Kyushu University, 2.Earthquake Research Institute, University of Tokyo , 3.Department of Earth and Planetary Sciences, School of Science, Tokyo Institute of Technology)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 103 1F

[M-IS20] Mountain Science

convener:Keisuke Suzuki(Department of Environmental Sciences, Faculty of Science, Shinshu University), Yoshihiko Kariya(Department of Environmental Geography, Senshu University), Akihiko SASAKI(Department of Geography and Environmental Studies, Kokushikan University), Chiyuki Narama(Niigata University, Department of Science), Chairperson:Yoshihiko Kariya(専修大学)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[MIS20-01] Early Holocene landslide deposits found from Mount Honita, the upper Tama River basin, west of Tokyo

*Yoshihiko Kariya[1], Koichiro Sawabe[2] (1.Department of Environmental Geography, Senshu University, 2.Japan Conservation Engineers)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[MIS20-02] The effect of understanding of mountainous terrain using 3D maps and solid model

*Jiro Komori[1] (1.Teikyo Heisei University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[MIS20-03] Development process of Lake Naganuma in a large-scale landslide on Hachimantai Volcano

*Natsuki Sasaki[1], Toshihiko Sugai[1] (1.Graduate School of Frontier Science, the University of Tokyo)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[MIS20-04] Air and ground temperature conditions on alpine and sub-apline zone of Norikura Volcano, Northern Japanese Alps

*Akihiko SASAKI[1], Motoshi NISHIMURA[2], Keisuke Suzuki[3] (1.Department of Geography and Environmental Studies, Kokushikan University, 2.Interdisciplinary Graduate school of Science and Technology, Shinshu University, 3.Faculty of Science, Shinshu University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[MIS20-05] Initiation and flow characteristics of debris flows on a sediment deposition zone in a mountain area

★Invited Papers

*Fumitoshi Imaizumi[1], Yuichi S. Hayakawa[2], Haruka Tsunetaka[3], Norifumi Hotta[4] (1.Faculty of Agriculture, Shizuoka University, 2.Faculty of Environmental Earth Sciences, 3.Forestry and Forest Products Research Institute, 4.Graduate School of Agricultural and Life Sciences)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[MIS20-06] Relationships between annual landform changes of the riverbed and vegetation dynamics during recent 10 years in the upper Asusa River in Kamikochi valley in the Japan Alps

★Invited Papers

*Hiroshi Shimazu[1] (1.Department of Geography, Faculty of Geo-Environmental Science, Rissho University)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 103 1F

[M-IS20] Mountain Science

convener:Keisuke Suzuki(Department of Environmental Sciences, Faculty of Science, Shinshu University), Yoshihiko Kariya(Department of Environmental Geography, Senshu University), Akihiko SASAKI(Department of Geography and Environmental Studies, Kokushikan University), Chiyuki Narama(Niigata University, Department of Science), Chairperson:Akihiko SASAKI

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[MIS20-07] Age dating of groundwater using tritium and CFCs in headwater catchments, Fukushima after the Fukushima Dai-ichi Nuclear Power Plant accident

*Koichi Sakakibara[1], Sho Iwagami[2], Maki Tsujimura[3], Yutaka Abe[4], Manami Hada[5], Ishwar Pun[6], Yuichi Onda[3,7] (1.Faculty of Science, Shinshu University, 2.Department of Disaster Prevention, Meteorology and Hydrology, Forestry and Forest Products Research Institute, 3.Faculty of Life and Environmental Sciences, University of Tsukuba, 4.Natural Environment Conservation Center, Kanagawa, 5.Graduate School of Life and Environmental Sciences, University of Tsukuba, 6.Organization for the Strategic Coordination of Research and Intellectual Property, Meiji University, 7.Center for Research in Isotopes and Environmental Dynamics, University of Tsukuba)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[MIS20-08] Hydraulic adaptation for tree height growth in tall tree species

★Invited Papers

*Wakana Azuma[1] (1.Kyoto University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[MIS20-09] **The molecular phylogenetic structure and biogeographic history of a alpine gravel environment specific plant *Dicentra peregrina* (Papaveraceae) in Japan**

*Takahisa Ozaki[1], Hirokazu Matsuda, Koji Tojo[2] (1.Graduate School of Science and Technology, Shinshu University, 2.Biology Department, Faculty of Science, Shinshu University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[MIS20-10] Formation process of small stands of *Abies mariesii* forest in pseudo-alpine zone on Mt. Akita-komagatake, northern Japan

*Asaka Konno[1] (1.International Research Institute of Disaster Science, Tohoku University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[MIS20-11] Distribution of the pinas forests including a Cryptomeria japonica and its environmental factors in Echigo mountain range.

*Masatsugu YASUDA[1] (1.Asia Air Survey Co., Ltd.)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[MIS20-12] Roles of glacier microbes in alpine ecosystems of Asian high mountains: effect of cryoconite outflow on soil development in glacier forefields

★Invited Papers

*Nozomu Takeuchi[1], Masato Shiomuki[1] (1.Chiba University)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 103 1F

[M-IS20] Mountain Science

convener:Keisuke Suzuki(Department of Environmental Sciences, Faculty of Science, Shinshu University), Yoshihiko Kariya(Department of Environmental Geography, Senshu University), Akihiko SASAKI(Department of Geography and Environmental Studies, Kokushikan University), Chiyuki Narama(Niigata University, Department of Science), Chairperson:Chiyuki Narama(新潟大学)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[MIS20-13] Comparison of surface energy balance of seasonal snowcover for three sites in Japanese alpine region

*Motoshi NISHIMURA[1], Akihiko SASAKI[2], Keisuke Suzuki[3] (1.Interdisciplinary Graduate school of Science and Technology, Shinshu University, 2.Department of Geography and environmental Studies, Kokushikan University, 3.Faculty of Science, Shinshu University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[MIS20-14] The influence of snow for the local wind system on the east slope of Mt.Norikura

*Genki Uehara[1], Keisuke Suzuki[2] (1.Graduate School of Science and Technology, Shinshu University, 2.Department of Environmental Science, Faculty of Science, Shinshu University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[MIS20-15] Mass balance of "Avalanche-accumulation type"glaciers and perennial snow patches in Hida mountain range.

*Kenshiro Arie[1], Chiyuki Narama[2], Kotaro FUKUI[3], Hajime IIDA[3] (1.Graduate School of Science and Technology, Niigata University, 2.Faculty of Science, Niigata University, 3.Tateyama Caldera Sabo Museum)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[MIS20-16] Pattern of occurrence of sea of clouds and waterfall cloud near Mt.Nishihotakadake

★Invited Papers

*Toru Awazawa[1] (1.Faculty of Science, Shinshu University National University, Shinshu University Faculty of Science)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[MIS20-17] Review and prospect of strong local wind “Matsubori-kaze” blowing at the western foot of Mt. Aso.

★Invited Papers

*Hiroshi Matsuyama[1] (1.Graduate School of Urban Environmental Sciences, Tokyo Metropolitan University)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[MIS20-18] **Two decades of mountain climate monitoring and research: lessons learned and future challenges.**

*Luis Duran[1,2,3], Irene Rodríguez-Muñoz[1] (1.interMET Sistemas y Redes S.L.U. Madrid. Spain, 2.Centro de Investigación, Seguimiento y Evaluación del Parque Nacional Sierra de Guadarrama. Madrid. Spain, 3.Departamento de Física de la Tierra y Astrofísica. Facultad de Ciencias Físicas. Universidad Complutense de Madrid. Spain)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 106 1F

[M-IS23] Planetary Volcanology

convener:Rina Noguchi(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Tomokatsu Morota(Graduate School of Environmental Studies, Nagoya University), Kyoko S. Kataoka(Research Institute for Natural Hazards and Disaster Recovery, Niigata University), Shizuka Otsuki(Research Institute of Earthquake and Volcano Geology, Geological Survey of Japan, Advanced Industrial Science and Technology), Chairperson:Rina Noguchi(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Nobuo Geshi(GSJ/AIST)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[MIS23-01] Growth and evolution of isolated volcanic island, Nishinoshima, Ogasawara

★Invited Papers

*Fukashi Maeno[1] (1.Earthquake Research Institute, University of Tokyo)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[MIS23-02] The style of magmatism on terrestrial planets of various sizes predicted from numerical models of mantle dynamics

*Masaki Ogawa[1] (1.Division of General Systems Studies, Graduate School of Arts and Sciences, University of Tokyo)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[MIS23-03] Lunar and Matian lava tubes and explorations to them through their skylight holes

*Junichi Haruyama[1], Takahiro Iwata[1], Yukio Yamamoto[1], Tetsuya Kaku[2,1], Wataru Miyake[2], Atsushi Kumamoto[3], Ken Ishiyama[1], yokota yasuhiro[4], Takumi Ono[2,1] (1.Japan Aerospace Exploration Agency, 2.Tokai University, 3.Tohoku University, 4.Kochi University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[MIS23-04] Volcanic activity on Io, formation of the atmosphere, and escape of atmosphere to the magnetosphere

*Fuminori Tsuchiya[1], Ryoichi Koga[1], Mizuki Yoneda[2], Masato Kagitani[1], Kazuo Yoshioka[4], Reina Hikida[4], Go Murakami[3], Tomoki Kimura[1], Atsushi Yamazaki[3], Hajime Kita[3], Ichiro Yoshikawa[4] (1.Tohoku University, 2.Tadano, 3.ISAS/JAXA, 4.The University of Tokyo)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[MIS23-05] Cryovolcanism, a critical review

*Kei Kurita[1] (1.Earthquake Research Inst.,The University of Tokyo)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[MIS23-06] Cryovolcanisms on Solar System bodies: Observations, importance, and future perspectives

★Invited Papers

*Yasuhito Sekine[1] (1.Earth-Life Science Insitute, Tokyo Institute of Technology)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 201B 2F

[M-IS28] Fluid-sediment migration and geo-bio interaction

convener:Robert Jenkins(School of Geosciences and Civil Engineering, College of Science and Engineering, Kanazawa University), Tomohiro Toki(Faculty of Science, University of the Ryukyus), Akira Ijiri(Japan Agency for Marine-Earth Science and Technology), Takami Nobuhara(Science Education (Geology), Faculty of Education, Shizuoka University), Hiromi Kayama WATANABE(Japan Agency for Marine-Earth Science and Technology), Miho Asada(Japan Agency for Marine-Earth Science and Technology), Chairperson:Tomohiro Toki, Robert Jenkins(Kanazawa University)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[MIS28-01] Upper Pliocene large lucinid communities with cold-seep carbonates from the Shimajiri Group in the Miyagi-jima Island off the central part of Okinawa-jima Island, Japan

*Takami Nobuhara[1], Robert Jenkins[2], Shin-ichi Nomura[3] (1.Science Education (Geology), Faculty of Education, Shizuoka University, 2.School of Natural System, College of Science and Engineering, Kanazawa University, 3.Chiba Prefectural Kisarazu High School)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[MIS28-02] Chemosynthetic fossil community in Early Cretaceous methane seep from Yubari City, Hokkaido

*Nanami Shimazu[1], Robert Jenkins[1] (1.Kanazawa University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[MIS28-03] Marine Snow Hypothesis: What is controling faunal composition of the methane-seep since Mesozoic?

*Robert Jenkins[1] (1.School of Geosciences and Civil Engineering, College of Science and Engineering, Kanazawa University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[MIS28-04] *In situ* Sr isotope analysis of methane-seep carbonates: insight into ancient subseafloor fluid circulation

★Invited Papers

*Yusuke Miyajima[1], Michał Jakubowicz[2,3], Takafumi Hirata[1] (1.Geochemical Research Center, Graduate School of Science, The University of Tokyo, 2.Institute of Geoecology and Geoinformation, Adam Mickiewicz University, Poland, 3.Isotope Laboratory, Adam Mickiewicz University, Poland)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[MIS28-05] Monitoring CH_4 amounts deep inside deep-water mud volcanoes

★Invited Papers

*A. Kioka[1], T. Tsuji[2], H. Otsuka[3], J. Ashi[3] (1.Universität Innsbruck, Austria, 2.Kyushu University, Japan, 3.The University of Tokyo, Japan)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[MIS28-06] Discussion

*Robert Jenkins[1] (1.School of Natural System, College of Science and Engineering, Kanazawa University)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-GI General Geosciences, Information Geosciences & Simulations

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[M-GI33] Data-driven geosciences

convener:Tatsu Kuwatani(Japan Agency for Marine-Earth Science and Technology), Hiromichi Nagao(Earthquake Research Institute, The University of Tokyo), Kenta Ueki(Japan Agency for Marine-Earth Science and Technology), Masayuki Kano(Graduate school of science, Tohoku University), Chairperson:Kenta Ueki, Masayuki Kano(東北大学大学院理学研究科 地球物理学専攻)

10:45 AM - 11:15 AM JST | 1:45 AM - 2:15 AM UTC

[MGI33-01] Forecasting volcanic eruption sequence based on field data and physical models

★Invited Papers

*Takehiro Koyaguchi[1], Kensuke Ishii[2], Kyle R. Anderson[3], Tomofumi Kozono[4] (1.Earthquake Research Institute, University of Tokyo, 2.Meteorological Research Institute, 3.US Geological Survey, 4.Graduate School of Science, Tohoku University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[MGI33-02] Sparse modeling based feature selection of magmatic tectonic settings

*Kenta Ueki[1], Hideitsu Hino[2], Tatsu Kuwatani[1,3] (1.Japan Agency for Marine-Earth Science and Technology, 2.The Institute of Statistical Mathematics, 3.Japan Science and Technology Agency)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[MGI33-03] Automatic Detection of Stationary Gravity Waves in the Venus' Atmosphere Using Deep Generative Models

*Minori Narita[1], Daiki Kimura[2], Atsushi Yamazaki[3], Takeshi Imamura[1] (1.The University of Tokyo, 2.IBM Research AI, 3.ISAS/JAXA)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[MGI33-04] Fracture and mineral distribution analysis using hyper-resolution DEM and hyperspectral satellite imagery for detecting geothermal fluids paths

*Taiki Kubo[1], Hiroaki Gonnokami[1], Arie Naftali Hawu Hede[2], Mohamad Nur Heriawan[2], Irwan Iskandar[2], Katsuaki Koike[1], Sudarto Notosiswoyo[2] (1.Graduate School of Engineering, Kyoto University, 2.Bandung Institute of Technology)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[MGI33-05] **Geochemical characterization of deep-sea sediments in the western North Pacific Ocean by an integrated multivariate statistical technique**

*Kazutaka Yasukawa[1,2], Kentaro Nakamura[1], Koichiro Fujinaga[2,1], Hikaru Iwamori[3,4], Yasuhiro Kato[1,2] (1.School of Engineering, The University of Tokyo, 2.Ocean Resources Research Center for Next Generation, Chiba Institute of Technology, 3.Earthquake Research Institute, The University of Tokyo, 4.Department of Earth and Planetary Sciences, Tokyo Institute of Technology)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-GI General Geosciences, Information Geosciences & Simulations

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[M-GI33] Data-driven geosciences

convener:Tatsu Kuwatani(Japan Agency for Marine-Earth Science and Technology), Hiromichi Nagao(Earthquake Research Institute, The University of Tokyo), Kenta Ueki(Japan Agency for Marine-Earth Science and Technology), Masayuki Kano(Graduate school of science, Tohoku University), Chairperson:Tatsu Kuwatani(JAMSTEC), Suguru Yabe(JAMSTEC)

3:30 PM - 4:00 PM JST | 6:30 AM - 7:00 AM UTC

[MGI33-06] Markov Chain Monte Carlo: algorithms for multimodal distribution and their applications

★Invited Papers

*Yukito iba[1] (1.The Institute of Statistical Mathematics)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[MGI33-07] **Specifying rate constants and reaction path on the water-rock chemical reaction based on exchange Monte Carlo method and sparse modeling**

*Ryosuke Oyanagi[1], Tatsu Kuwatani[1], Omori Toshiaki[2] (1.Japan Agency for Marine-Earth Science and Technology, 2.Kobe University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[MGI33-08] Superresolution of X-ray CT images of core samples for understanding the multi-scale structures of water-rock interaction

*Toshiaki Omori[1], Atsushi Okamoto[2], Katsuyoshi Michibayashi[3], Oman Drilling Project Phase 2 Science Party (1.Kobe Univ., 2.Tohoku Univ., 3.Nagoya Univ.)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[MGI33-09] 3-dimensional Fracture Network Analysis by Persistent Homology

*Miyuki Miyazawa[1], Anna Suzuki[2], Atsushi Okamoto[1], Hiroyuki Shimizu[3], Ippei Obayashi[4], Yasuaki Hiraoka[4,5], Takatoshi Ito[2] (1.Graduate School of Environmental Studies, Tohoku University, 2.Institute of Fluid Science, Tohoku University, 3.Kajima Corporation, 4.The Advanced Institute for Materials Research, Tohoku University, 5.Kyoto University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[MGI33-10] Characteristic patterns and minimal dynamics of correlated seismicity in Japanese island region

*mitsuhiro toriumi[1] (1.Japan agency of marine science and technology)

Tue. May 28, 2019

[J] Oral | U (Union)：Union

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 101 1F

[U-03] Future of Scientific Publishing in Geosciences

convener:Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Hirokuni Oda(Institute of Geology and Geoinformation, Geological Survey of Japan, AIST), Chairperson:Hirokuni Oda, Hodaka Kawahata

9:00 AM - 9:30 AM JST | 12:00 AM - 12:30 AM UTC

[U03-01] Game-change of scholarly communication based on papers and the role of learned society and peer-review

★Invited Papers

*Kazuhiro Hayashi[1] (1.National Institute of Science and Technology Policy)

9:30 AM - 10:00 AM JST | 12:30 AM - 1:00 AM UTC

[U03-02] The future of the journal metrics and new trend of the scholarly publishing

★Invited Papers

*Yoshiko Tanahashi[1] (1.Clarivate Analytics)

10:00 AM - 10:30 AM JST | 1:00 AM - 1:30 AM UTC

[U03-03] Underlying Issues and Problems in Publishing International Scientific Journals in Japan. “DNA Research” As A Case Study.

★Invited Papers

*Michio Oishi[1] (1.Kazusa DNA Research Institute)

[J] Oral | U (Union)：Union

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 101 1F

[U-03] Future of Scientific Publishing in Geosciences

convener:Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Hirokuni Oda(Institute of Geology and Geoinformation, Geological Survey of Japan, AIST), Chairperson:Hirokuni Oda, Hodaka Kawahata

10:45 AM - 11:05 AM JST | 1:45 AM - 2:05 AM UTC

[U03-04] Review of editorial work for PEPS in 2018-2019 and new strategy for 2019–2020

★Invited Papers

*Yasufumi Iryu[1] (1.Institute of Geology and Paleontology Graduate School of Science Tohoku University)

11:05 AM - 11:25 AM JST | 2:05 AM - 2:25 AM UTC

[U03-05] "Earth, Planets and Space" An Open Access Journal: Past, Present and and Future

★Invited Papers

*Yasuo Ogawa[1], Kiyoshi Baba[2] (1.Volcanic Fluid Research Center, School of Science, Tokyo Institute of Technology, 2.Earthquake Research Institute, University of Tokyo)

11:25 AM - 11:55 AM JST | 2:25 AM - 2:55 AM UTC

[U03-06] Scientific Research Output and Publication: research article, data, and digital transformation

★Invited Papers

*Yasuhiro Murayama[1] (1.Strategic Program Produce Office, National Institute of Information and Communications Technology)

11:55 AM - 12:15 PM JST | 2:55 AM - 3:15 AM UTC

[U03-07] **Enhancing dissemination of research activities to international communities by Japanese Geoscience Union**

★Invited Papers

*Hodaka Kawahata[1] (1.Atmosphere Ocean Research Institute, the University of Tokyo)

[J] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A01 TOKYO BAY MAKUHARI HALL

[P-PS06] Planetary Sciences

convener:Kenji Kurosaki(Department of Physics, Nagoya University), Yusuke Nakauchi(Japan Aerospace Exploration Agency), Chairperson:Ryo Suetsugu(University of Occupational and Environmental Health, Japan), Keisuke Sugiura(Nagoya University)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[PPS06-25] Tensile Strength of Porous Dust Aggregates Measured with Dust N-body Simulations

*Misako Tatsuuma[1,2], Akimasa Kataoka[2], Hidekazu Tanaka[3] (1.The University of Tokyo, 2.National Astronomical Observatory of Japan, 3.Tohoku University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[PPS06-26] **Filling factor dependence of the thermal conductivity understood from the graph structure of dust aggregates**

*Sota ARAKAWA[1], Masaki TAKEMOTO[1], Taishi NAKAMOTO[1] (1.Tokyo Institute of Technology)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[PPS06-27] Collisional disruption of planetesimals: dependence of material strength

*Ryo Suetsugu[1], Hidekazu Tanaka[2], Hiroshi Kobayashi[3], Hidenori Genda[4] (1.University of Occupational and Environmental Health, 2.Tohoku University, 3.Nagoya University, 4.Tokyo Institute of Technology)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[PPS06-28] Size and cooling rate of chondrules formed thorough collision between planetesimals containing volatile materials

*Sin-iti Sirono[1] (1.Department of Earth and Planetary Sciences, Nagoya University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[PPS06-29] From Dust to Planet via collisional growth

*Hiroshi Kobayashi[1], Hidekazu Tanaka[2] (1.Department of Physics, Nagoya University, 2.Tohoku University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[PPS06-30] Impact Conditions for the Formation of the Extremely Elongated Shape of 1I/'Oumuamua

*Keisuke Sugiura[1], Hiroshi Kobayashi[1], Shu-ichiro Inutsuka[1] (1.NAGOYA UNIVERSITY Graduate School of Science)

[J] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[P-CG25] Planetary Magnetosphere, Ionosphere, and Atmosphere

convener:Kanako Seki(Graduate School of Science, University of Tokyo), Takeshi Imamura(Graduate School of Frontier Sciences, The University of Tokyo), Hiroyuki Maezawa(Department of Physical Science Osaka Prefecture University), Naoki Terada(Graduate School of Science, Tohoku University), Chairperson:Masaki Nishino(名古屋大学宇宙地球環境研究所), Hiroyuki Maezawa(大阪府立大学大学院理学系研究科)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[PCG25-01] On the observational constraint on time and spatial variation of Titan's atmospheric trace gases driven with the ALMA solar system big-data

*Takahiro IINO[1,2], Hideo Sagawa[3], Takashi Tsukagoshi[4] (1.The University of Tokyo, 2.Tokyo Univ. of Agr. and Tech., 3.Kyoto Sangyo University, 4.NAOJ)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[PCG25-02] Transport and energization of planetary ions in the magnetospheric flanks of Mercury

*Sae Aizawa[1], Dominique Delcourt[2], Naoki Terada[1] (1.Graduate School of Science,Tohoku University, 2.LPC2E, CNRS)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[PCG25-03] Exploring the real-time prediction of Mercury's magnetosphere

*Manabu Yagi[1], Kanako Seki[2], Yosuke Matsumoto[3], Dominique C. Delcourt[4], Francois Leblanc[4] (1.RIKEN Center for Computational Science, 2.Graduate School of Science, University of Tokyo, 3.Graduate School of Science, Chiba University, 4.The National Center for Scientific Research)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[PCG25-04] Model study on the contribution of various physical processes for generation and dissipation of Mercury's exosphere

*Yudai Suzuki[1], Kazuo Yoshioka[1] (1.University of Tokyo)

[J] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[P-CG25] Planetary Magnetosphere, Ionosphere, and Atmosphere

convener:Kanako Seki(Graduate School of Science, University of Tokyo), Takeshi Imamura(Graduate School of Frontier Sciences, The University of Tokyo), Hiroyuki Maezawa(Department of Physical Science Osaka Prefecture University), Naoki Terada(Graduate School of Science, Tohoku University), Chairperson:Hiromu Nakagawa(Planetary Atmosphere Physics Laboratory, Department of Geophysics, Graduate School of Science, Tohoku University), Kanako Seki(Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo,)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[PCG25-05] Updated status and science goals of the BepiColombo mission

*Go Murakami[1], Hajime Hayakawa[1], Masaki Fujimoto[1], BepiColombo Project Team (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[PCG25-06] A Novel High-Moment Multifluid Model for Mercury: From the Planetary Conducting Core to the Dynamic Magnetosphere

*Chuanfei Dong[1], Liang Wang[1], Ammar Hakim[1], Amitava Bhattacharjee[1], James A Slavin[2], Gina A DiBraccio[3], Kai Germaschewski[4] (1.Princeton University, 2.University of Michigan, Ann Arbor, 3.NASA Goddard Space Flight Center, 4.University of New Hampshire)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[PCG25-07] DSMC simulation of slow hydrodynamic escape from terrestrial planets

Kaori Terada[1], *Naoki Terada[1], Hitoshi Fujiwara[2] (1.Graduate School of Science, Tohoku University, 2.Faculty of Science and Technology, Seikei University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[PCG25-08] The influence of Martian crustal magnetic fields on atmospheric escape

*Dave A Brain[1,2], Robin Ramstad[1], Yaxue Dong[1], Tristan Weber[1], Shogo Inui[2], Kanako Seki[2], Andrew Poppe[3], Riku Jarvinen[4], Jim McFadden[3], Jasper Halekas[5], Jared Espley[6], David Mitchell[3], Laila Andersson[1], Bruce Jakosky[1] (1.University of Colorado, 2.University of Tokyo, 3.University of California Berkeley, 4.Finnish Meteorological Institute, 5.University of Iowa, 6.NASA Goddard Space Flight Center)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[PCG25-09] Effects of the IMF direction on atmospheric escape under a weak intrinsic magnetic field at Mars

*Shotaro Sakai[1], Kanako Seki[1], Naoki Terada[2], Hiroyuki Shinagawa[3], Ryoya Sakata[1], Takashi Tanaka[3,4], Yusuke Ebihara[5] (1.Graduate School of Science, The University of Tokyo, 2.Graduate School of Science, Tohoku University, 3.National Institute of Information and Communications Technology, 4.International Center for Space Weather Science and Education, Kyushu University, 5.Research Institute for Sustainable Humanosphere, Kyoto University)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[PCG25-10] Simulating solar energetic electron precipitation and drift at Mars

*Rebecca Jolitz[1], Chuanfei Dong[2], Dave A Brain[1], Steve Bougher[3], Christina Lee[4], Rob Lillis[4], Shannon Curry[4], Bruce Jakosky[1] (1.Univ. of Colorado Boulder, 2.Princeton Univ., 3.Univ. of Michigan, 4.Univ. of California Berkeley)

[J] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[P-CG25] Planetary Magnetosphere, Ionosphere, and Atmosphere

convener:Kanako Seki(Graduate School of Science, University of Tokyo), Takeshi Imamura(Graduate School of Frontier Sciences, The University of Tokyo), Hiroyuki Maezawa(Department of Physical Science Osaka Prefecture University), Naoki Terada(Graduate School of Science, Tohoku University), Chairperson:Takeshi Imamura(Graduate School of Frontier Sciences, University of Tokyo), Naoki Terada(School of Science, Tohoku University)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[PCG25-11] Effects of the intrinsic magnetic field on the ion loss from ancient Mars

*Ryoya Sakata[1], Kanako Seki[1], Shotaro Sakai[1], Naoki Terada[2], Hiroyuki Shinagawa[3], Takashi Tanaka[3,4] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 2.Graduate School of Science, Tohoku University, 3.National Institute of Information and Communications Technology, 4.International Center for Space Weather Science and Education, Kyushu University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[PCG25-12] Global characterization of wave perturbations in the middle atmosphere on Mars

*Hiromu Nakagawa[1], Naoki Terada[1], Hannes Groller[7], Roger Yelle[7], Montmessin Franck[8], Schneider M Nicholas[4], England Scott[5], Kanako Seki[6], Takeshi Kuroda[3], Hitoshi Fujiwara[2], Takeshi Imamura[6], Kaori Terada[1], Nao Yoshida[1], Justin I Deighan[4], Sonal K Jain[4], Bruce M Jakosky[4] (1.Planetary Atmosphere Physics Laboratory, Department of Geophysics, Graduate School of Science, Tohoku University, 2.Seikei University, 3.National Institute of Information and Communications Technology, 4.Laboratory for Atmospheric and Space Physics, University of Colorado, 5.Aerospace and Ocean Engineering, Virginia Tech, 6.Department of Earth and Planetary Science, University of Tokyo, 7.Lunar and Planetary Laboratory Science, University of Arizona, 8.LATMOS, UVSQ/CNES/IPSL)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[PCG25-13] Seasonal variation of the dayside N_2/CO_2 at 140 km altitude derived from MAVEN/IUVS

*Nao Yoshida[1], Hiromu Nakagawa[1], Naoki Terada[1], Nicholas Schnider[2], Scott Evans[3], Sonal Jain[2], Hitoshi Fujiwara[4], Takeshi Imamura[5], Justin Deighan[2], Ian Stewart[2], Michael Stivens[6], Roger Yelle[7] (1.Dep. Geophysics Graduate School of Science Tohoku University, 2.Laboratory for Atmospheric and Space Physics, Boulder, USA, 3.Computational Physics, Inc., Springfield, Virginia, USA, 4.Faculty of Science and Technology, Seikei University, 5.Department of Complexity Science and Engineering, Graduate School of Frontier Sciences, The University of Tokyo, 6.Naval Research Laboratory, Washington, USA, 7.Department of Planetary Sciences, University of Arizona)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[PCG25-14] Automated segmentation of Martian dust storms in MGS/MOC images using a deep learning technique

*Kazunori Ogohara[1], Ryusei Gichu[2] (1.School of Engineering, University of Shiga Prefecture, 2.Graduate School of Engineering, University of Shiga Prefecture)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[PCG25-15] Investigation of variation mechanisms of the Jovian radiation belt using ALMA

*Hajime Kita[1], Hideo Sagawa[2], Takahiro Iino[3], Chihiro Tao[4], Takeshi Kuroda[4], Fuminori Tsuchiya[5], Hiroaki Misawa[5], Yasumasa Kasaba[5], Masaki Fujimoto[1] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency , 2.Faculty of Science, Kyoto Sangyo University, 3.Nature and Science Museum, Tokyo University of Agriculture and Technology, 4.National Institute of Information and Communications Technology, 5.Tohoku University)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[PCG25-16] Jupiter's radio Riddle arcs observed by LWA and Juno

*Kazumasa Imai[1], Charles A. Higgins[2], Masafumi Imai[3], Tracy Clarke[4] (1.Department of Social Design Engineering, National Institute of Technology, Kochi College, 2.Middle Tennessee State University, 3.University of Iowa, 4.Naval Research Laboratory)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 106 1F

[A-OS17] Kuroshio Large Meander

convener:Toru Miyama(Japan Agency for Marine-Earth Science and Technology, Application Laboratory), Norihisa Usui(Meteorological Research Institute), Takashi Setou(National Research Institute of Fisheries Science, Fisheries Research and Education Agency), Chairperson:Toru Miyama, Takashi Setou, Norihisa Usui

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[AOS17-01] The progress of the Kuroshio large meander in and after 2017

★Invited Papers

*Toshiyuki Sakurai[1], Mikitoshi Hirabara[1], Yoshikazu Fukuda[1], Mika Kimura[1], Kotaro Mine[1], Masaomi Takahashi[1], Kensaku Kobayashi[1], Yuka Okunaka[1], Hiromu Kobayashi[1] (1.Japan Meteorological Agency)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[AOS17-02] Influences of the Kuroshio path variation south of Honshu on summer surface air temperature in Kanto district, Japan

*Shusaku Sugimoto[1] (1.Graduate School of Science, Tohoku University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[AOS17-03] Bio-chemilcal difference between the large meander and the non case of the Kuroshio current

*Takashi Setou[1], Tuneo Ono[2], Kiyotaka Hidaka[1], Yugo Shimizu[1], Atsushi Nishimoto[1], Sayaka Sogawa[1], Akira Kusaka[1], Daisuke Ambe[1], Daiki Itoh[1], Takashiko Kameda[1], Yutaka Hiroe[3] (1.National Research Institute of Fisheries Science, Fisheries Research and Education Agency , 2.National Research Institute of Far Seas Fisheires,Fisheries Research and Education Agency , 3.National Research Institute of Far Seas Fisheires,Seikai National Fisheries Research Institute)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[AOS17-04] The late arrival of 2017-18 Japanese eel recruitment and its links to ocean circulation

*Yu-Lin Eda Chang[1], Yasumasa Miyazawa[1], Michael Miller[2], Katsumi Tsukamoto[2] (1.Application Laboratory, Japan Agency for Marine-Earth Science and Technology, 2.Department of Aquatic Bioscience, The University of Tokyo)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[AOS17-05] A probabilistic forecast of the Kuroshio current path variability using an 80-member ensemble simulation.

*Kunihiro Aoki[1], Yasumasa Miyazawa[1], Tsutomu Hihara[1] (1.JAMSTEC)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[AOS17-06] Long-term forecast of the Kuroshio large meander in 2017

*Norihisa Usui[1], Nariaki Hirose[1], Kei Sakamoto[1], Yosuke Fujii[1], Nadao Kohno[1] (1.Meteorological Research Institute)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 106 1F

[A-OS18] Physical Oceanography (General)

convener:Yoshimi Kawai(Research and Development Center for Global Change, Japan Agency for Marine-Earth Science and Technology), Tomoki Tozuka(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Kitade Yujiro(Tokyo University of Marine Science and Technology), Chairperson:Yoshimi Kawai(Japan Agency for Marine-Earth Science and Technology), Tomoki Tozuka(The University of Tokyo)

1:50 PM - 2:05 PM JST | 4:50 AM - 5:05 AM UTC

[AOS18-01] **Real-Time Subsurface Moorings as a Promising Component of Global Ocean Monitoring System**

*Jianing Wang[1], Fan Wang[1] (1.Institute of Oceanology, Chinese Academy of Sciences)

2:05 PM - 2:20 PM JST | 5:05 AM - 5:20 AM UTC

[AOS18-02] Seasonal Variation of the Mixed Layer Depth at 60°S and its governing dynamics

*Matheus Ferreira Azevedo[1], Yujiro Kitade[1], Shigeru Aoki[2] (1.Tokyo University of Marine Science and Technology, 2.Institute of Low Temperature Science, Hokkaido University)

2:20 PM - 2:40 PM JST | 5:20 AM - 5:40 AM UTC

[AOS18-03] **21st-Century Flood Hazards along the U.S. Atlantic Coast: Impacts of Sea Level Rise and Tropical Cyclone Climatology Change**

★Invited Papers

*Reza Marsooli[1], Ning Lin[2], Kerry Emanuel[3] (1.Stevens Institute of Technology, 2.Princeton University, 3.Massachusetts Institute of Technology)

2:40 PM - 3:00 PM JST | 5:40 AM - 6:00 AM UTC

[AOS18-04] **The Effect of Ocean Waves on an Explosive Cyclone Development: Investigation with a Coupled Model**

★Invited Papers

*Yuki Kita[1], Takuji Waseda[1] (1.University of Tokyo)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 106 1F

[A-OS20] Global ocean observing systems, obtained results and system optimization: toward OceanObs19

convener:Shigeki Hosoda(Japan Marine-Earth Science and Technology), Shuhei Masuda(Japan Agency for Marine-Earth Science and Technology), Yosuke Fujii(Meteorological Research Institute, Japan Meteorological Agency), Fujiki Tetsuichi(Japan Agency for Marine-Earth Science and Technology), Chairperson:Shigeki Hosoda(Japan Agency for Marine-Earth Science and Technology)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[AOS20-01] Global Ocean Observing System: The Past, the Present and the Future

★Invited Papers

*Toshio Suga[1,2] (1.Graduate School of Science, Tohoku University, 2.JAMSTEC)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[AOS20-02] Observed long-term change and variability in the global upper-ocean stratification

*Ryohei Yamaguchi[1], Toshio Suga[1,2] (1.Graduate School of Science, Tohoku University, 2.Japan Agency for Marine-Earth Science and Technology)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[AOS20-03] Estimation of changes in salinity and dissolved oxygen based on observational networks

★Invited Papers

*Shinya Kouketsu[1] (1.JAMSTEC Japan Agency for Marine-Earth Science and Technology)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[AOS20-04] Remotely forced decadal physical and biogeochemical variability of North Pacific Subtropical Mode Water over the last 40 years

*Daisuke Sasano[1], Eitarou Oka[2], Yudai Yamada[2], Enyo Kazutaka[1], Toshiya Nakano[1], Masao Ishii[3] (1.Japan Meteorological Agency, 2.Atmosphere and Ocean Research Institute, The University of Tokyo, 3.Meteorological Research Institute)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[AOS20-05] Asessing the impact of the global ocean observing system using ocean data assimilation systems

*Yosuke Fujii[1] (1.Meteorological Research Institute, Japan Meteorological Agency)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[AOS20-06] **Global ocean state estimation with new float observations**

*Shuhei Masuda[1], Satoshi Osafune[1], Tadashi Hemmi[1] (1.Japan Agency for Marine-Earth Science and Technology)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CC Cryospheric Sciences & Cold District Environment

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 201B 2F

[A-CC26] Ice cores and paleoenvironmental modeling

convener:Ryu Uemura(University of the Ryukyus), Kenji Kawamura(National Institute of Polar Research, Research Organization of Information and Systems), Ayako Abe-Ouchi(Atmosphere and Ocean Research Institute, The University of Tokyo), Nozomu Takeuchi(Chiba University), Chairperson:Ryu Uemura(University of the Ryukyus), Ikumi Oyabu(National Institute of Polar Research)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[ACC26-01] Aerosols and climate change in the Arctic in the historical experiments using the MRI Earth System Model

★Invited Papers

*Naga Oshima[1], Taichu Y Tanaka[1], Tsuyoshi Koshiro[1], Makoto Deushi[1], Takuro Aizawa[1], Masahiro Hosaka[1], Hideaki Kawai[1], Seiji Yukimoto[1], Iizuka Yoshinori[2], Kumiko Goto-Azuma[3], Teruo Aoki[4] (1.Meteorological Research Institute, 2.Institute of Low Temperature Science, Hokkaido University, 3.National Institute of Polar Research, 4.Okayama University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[ACC26-02] Particles in ice layers of SIGMA-A ice core, northwestern Greenland

*Kaoru Kawakami[1,2], Yoshinori Iizuka[2], Sumito Matoba[2], Teruo Aoki[3], Shin Sugiyama[2], Takuto Ando[4] (1.Graduate School of Environmental Science, Hokkaido University, 2.Institute of Low Temperature Science, Hokkaido University, 3.Graduate School of Natural Science and Technology, Okayama University, 4.Arctic Research Center, Hokkaido University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[ACC26-03] Snow modification due to climate change in southeastern high-accumulation area of Greenland over the last 60 years evaluated by physical properties of firn core.

*Takuto Ando[1], Iizuka Yoshinori[2,3], Mai Shibata[2,3], Sumito Matoba[2,3], Shin Sugiyama[2,3], Satoru Adachi[4], Satoru Yamaguchi[4], Koji Fujita[5], Akira Hori[6], Teruo Aoki[7], Shuji Fujita[8] (1.Arctic Research Center, Hokkaido University, 2.Institute of Low Temperature Science, Hokkaido University, 3.Graduate School of Environmental Science, Hokkaido University, 4.National Research Institute for Earth Science and Disaster Resilience, 5.Graduate School of Environmental Studies, Nagoya University, 6.Department of Civil and Environmental Engineering, Kitami Institute of Technology, 7.Graduate School of Natural Science and Technology, Okayama University, 8. National Institute of Polar Research)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[ACC26-04] **Temporal variations of concentrations, size distributions, and seasonal variations of anthropogenic and natural black carbon in Greenland**

*Kumiko Goto-Azuma[1,2], Yoshimi Ogawa-Tsukagawa[1], Yutaka Kondo[1], Remi Dallmayr[1,10], Motohiro Hirabayashi[1], Jun Ogata[1], Kyotaro Kitamura[1], Kenji Kawamura[1,2], Hideaki Motoyama[1,2], Sumito Matoba[3], Teruo Aoki[4], Nobuhiro Moteki[5], Sho Ohata[5], Tatsuhiro Mori[6], Makoto Koike[5], Yuki Komuro[7], Akane Tsushima[8,9], Naoko Nagatsuka[1], Wataru Shigeyama[1,2], Koji Fujita[9] (1.National Institute of Polar Research, 2.SOKENDAI, 3.Hokkaido University, 4.Okayama University, 5.University of Tokyo, 6.University of Science, 7.Yamagata University, 8.Research Institute for Humanity and Nature, 9.Nagoya University, 10.AWI)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[ACC26-05] Mineral composition of dust layers in a shallow ice core drilled in Pamir Alay Mountains of Central Asia

*Shunsuke Takeuchi[1], Nozomu Takeuchi[1], Koji Fujita[2], Kenji Kawamura[3], Akane Tsushima[2], Vladimir Aizen[4] (1.Chiba University, 2.Nagoya University, 3.National Institute of Polar Research, 4.Idaho University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[ACC26-06] Estimation of snow surface patterns from the coast to the inland, Dome-Fuji Station, of Antarctica, using camera images

*Konosuke Sugiura[1], Kengo Watanabe[1], Naohiko Hirasawa[2], Kenji Kawamura[2], Fumio Nakazawa[2], Hiroshi Ohno[3], Shuji Fujita[2], Ikumi Oyabu[2], Takashi Yamanouchi[2], Hideaki Motoyama[2] (1.University of Toyama, 2.National Institute of Polar Research, 3.Kitami Institute of Technology)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CC Cryospheric Sciences & Cold District Environment

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 201B 2F

[A-CC26] Ice cores and paleoenvironmental modeling

convener:Ryu Uemura(University of the Ryukyus), Kenji Kawamura(National Institute of Polar Research, Research Organization of Information and Systems), Ayako Abe-Ouchi(Atmosphere and Ocean Research Institute, The University of Tokyo), Nozomu Takeuchi(Chiba University), Chairperson:Nozomu Takeuchi(千葉大学), Kenji Kawamura(国立極地研究所)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[ACC26-07] Isolation of living fungi from Antarctic ice cores

★Invited Papers

*Masaharu Tsuji[1] (1.National Institute of Polar Research)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[ACC26-08] **Study of ancient fungi resting in the polar ice cores and its future prospects**

*Fumio Nakazawa[1,2], Masaharu Tsuji[1], Satoshi Imura[1,2] (1.National Institute of Polar Research, 2.SOKENDAI (The Graduate University of Advanced Studies))

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[ACC26-09] **Flux, provenance and modification of terrestrial dust and sea salt in the Dome C and Dome Fuji ice cores from Last Glacial Maximum to early Holocene by ice-sublimation and single-particle measurement of soluble and insoluble particles**

*Ikumi Oyabu[1,2], Iizuka Yoshinori[3], Kenji Kawamura[1,4,5], Eric Wolff[6], Mirko Severi[7], Margareta Hansson[8] (1.National Institute of Polar Research, Research Organization of Information and Systems, 2.Japan Society for the Promotion of Science, 3.Institute of Low Temperature Science, Hokkaido University, 4.SOKENDAI (The Graduate University of Advanced Studies), 5.Japan Agency for Marine Science and Technology (JAMSTEC), 6.Department of Earth Sciences, University of Cambridge, 7.Department of Chemistry “Ugo Schiff”, University of Florence, 8.Department of Physical Geography, Stockholm University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[ACC26-10] Spatial variation of surface mass balance over the last few millennia in the Dome Fuji area from the analyses of shallow ice cores

*Kenji Kawamura[1], Ikumi Oyabu[1], Fumio Nakazawa[1,2], Shuji Fujita[1,2], Kyohei Yamada[1], Naoyuki Kurita[4], Shun Tsutaki[5], Hiroshi Ohno[6], Konosuke Sugiura[7], Kumiko Goto-Azuma[1,2], Hideaki Motoyama[1,2], Ayako Abe-Ouchi[5,3] (1.National Institute of Polar Research, Research Organization of Information and Systems, 2.SOKENDAI (The Graduate University of Advanced Studies), 3.JAMSTEC, 4.Nagoya University, 5.University of Tokyo, 6.Kitami Institute of Technology, 7.University of Toyama)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[ACC26-11] Sensitivity of global nonhydrostatic atmospheric model to changes in orbital forcing for the early Holocene

*Minoru Chikira[1], Ayako Abe-Ouchi[1], Masaki Satoh[1] (1.Atmosphere and Ocean Research Institute, The University of Tokyo)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[ACC26-12] **Roles of sea ice–surface wind feedback in maintaining contrasting modes of glacial Atlantic meridional overturning circulation and climate**

*Sam Sherriff-Tadano[1], Ayako Abe-Ouchi[1] (1.Atmosphere and Ocean Research Institute, the University of Tokyo)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CC Cryospheric Sciences & Cold District Environment

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 201B 2F

[A-CC26] Ice cores and paleoenvironmental modeling

convener:Ryu Uemura(University of the Ryukyus), Kenji Kawamura(National Institute of Polar Research, Research Organization of Information and Systems), Ayako Abe-Ouchi(Atmosphere and Ocean Research Institute, The University of Tokyo), Nozomu Takeuchi(Chiba University), Chairperson:Ayako Abe-Ouchi(東京大学大気海洋研究所), Sam Sherriff-Tadano(University of Tokyo)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[ACC26-13] Simulated Dansgaard-Oeschger like oscillations and abrupt climate changes

*Ayako Abe-Ouchi[1,2,3], Wing-Le Chan[1], Sam Sherriff-Tadano[1], Takashi Obase[1], Masakazu Yoshimori[1], Akira Oka[1], Kenji Kawamura[3], Rumi Ohgaito[2] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.JAMSTEC, 3.National Institute of Polar Research)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[ACC26-14] **Reproduction of the increasing amplitude and period in the glacial cycles using a model incorporating diatomaceous activity.**

*Tasuku Akagi[1], Takahiro Hasegawa[2] (1.Department of Earth and Planetary Sciences, Faculty of Science, Kyushu University, 2.Graduate School of Science, Kyushu University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[ACC26-15] Development of an Ice Sheet Model coupled General Circulation Model and application of Energy Balance Model on the estimation of Ice Sheet mass balance

*Ryouta O'ishi[1], Ayako Abe-Ouchi[2,1], Fuyuki SAITO[2], Takashi Obase[1] (1.Atmosphere and Ocean Research Institute, the Universitoy of Tokyo, 2.JAMSTEC)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[ACC26-16] An ice-flow modeling study for evaluation of sites for and oldest ice core around Dome Fuji, Antarctica

★Invited Papers

*Takashi Obase[1], Ayako Abe-Ouchi[1,2], Fuyuki SAITO[2], Shun Tsutaki[1], Shuji Fujita[3], Kenny Matsuoka[4], Kenji Kawamura[3,5,2], Ralf Greve[6] (1.Atmosphere and Ocean Research Institute, the University of Tokyo, 2.Japan Agency for Marine-Earth Science and Technology, 3.National Institute of Polar Research, Research Organization of Information and Systems, 4.Norwegian Polar Institute, 5.SOKENDAI (The Graduate University of Advanced Studies), 6.Institute of Low Temperature Science, Hokkaido University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[ACC26-17] International studies of ice sheet and bedrock at Dome Fuji, East Antarctica

*Shuji Fujita[1,2], Kenji Kawamura[1,2,10], Prasad Gogineni[3], Ayako Abe-Ouchi[4], David Braaten[5], Jean-Charles Gallet[6], Elisabeth Isaksson[6], Brice van Liefferinge[6], Kenny Matsuoka[6], Charles O'Neill[3], John Paden[5], Fernando Rodriguez-Morales[5], Ryan A. Taylor[3], Shun Tsutaki[4], Jie-Bang Yan[3], Kumiko Goto-Azuma[1,2], Ralf Greve[7], Stephen Hudson[6], Jack Kohler[6], Shriniwas Kolpuke[3], Linfeng Li[3], Geir Moholdt[6], Hideaki Motoyama[1,2], Fumio Nakazawa[1], Takashi Obase[4], Hiroshi Ohno[8], Ikumi Oyabu[9,1], Fuyuki Saito[10], Konosuke Sugiura[11] (1.National Institute of Polar Research, Research Organization of Information and Systems(ROIS), 2.Department of Polar Science, The Graduate University for Advanced Studies (SOKENDAI), Japan, 3.The University of Alabama, USA, 4.Atmosphere and Ocean Research Institute, The University of Tokyo, Japan, 5.CReSIS, University of Kansas, USA, 6.Norwegian Polar Institute, Norway, 7.Institute of Low Temperature Science, Hokkaido University, Japan, 8.Kitami Institute of Technology, Japan, 9.JSPS, Japan, 10.Japan Agency for Marine-Earth Science and Technology (JAMSTEC), Japan, 11.University of Toyama, Japan)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[ACC26-18] Possible cause for rapid deformation of ice from glacial periods, investigated from laboratory-based deformation experiments and microstructural observations

*Tomotaka Saruya[1], Morimasa Takata[1], Tomoyuki Homma[1], Nobuhiko Azuma[1], Kumiko Goto-Azuma[2,3] (1.Nagaoka University of Technology, 2.National Institute of Polar Research, 3.SOKENDAI (The Graduate University for Advaced Research))

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-GE Geological & Soil Environment

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 202 2F

[A-GE30] Conservation and Restoration of Soil Environment at Terrestrial Surface

convener:Yasushi Mori(Graduate School of Environmental and Life Science, Okayama University), Chairperson:Yasushi Mori(Okayama University)

1:50 PM - 2:05 PM JST | 4:50 AM - 5:05 AM UTC

[AGE30-01] Soil Organic Cabon Contents Estimation using Neural Network System

Ikumi Kaida[1], *Yasushi Mori[1], Takayuki Shuku[1] (1.Graduate School of Environmental and Life Science, Okayama University)

2:05 PM - 2:25 PM JST | 5:05 AM - 5:25 AM UTC

[AGE30-02] Methane emission from rice paddies and its response to climate change

★Invited Papers

*Takeshi Tokida[1] (1.Institute for Agro-Environmental Sciences, National Agriculture and Food Research Organization)

2:25 PM - 2:40 PM JST | 5:25 AM - 5:40 AM UTC

[AGE30-03] **Relationship between degradation of rice grain quality due to chalky kernels and available nutrients in soil**

*Shingo Matsumoto[1], Junko Kasuga[1] (1.Shimane University)

2:40 PM - 2:55 PM JST | 5:40 AM - 5:55 AM UTC

[AGE30-04] The effects of trenching and insertion of crop residue on infiltration and soil erosion in a farmland

*Kazutoshi Osawa[1], Yasushi Mori[2], Akira Hoshikawa (1.Utsunomiya University, 2.Graduate school of Environmental and Life Science, Okayama University)

2:55 PM - 3:15 PM JST | 5:55 AM - 6:15 AM UTC

[AGE30-05] Measuring wide-range soil water content using GPS signals

★Invited Papers

*Kosuke Noborio[1], Natsumi Naganuma[1] (1.Meiji University)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-GE Geological & Soil Environment

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 202 2F

[A-GE31] New Roles of Soil Science for Extraterrestrials

convener:Kosuke Noborio(Meiji University), Masaru Mizoguchi(Graduate school of Agricultural and Life Sciences, The University of Tokyo), Chairperson:Naoto Sato

3:30 PM - 4:00 PM JST | 6:30 AM - 7:00 AM UTC

[AGE31-01] Life search on Mars by Life Detection Microscope (LDM)

★Invited Papers

*Yoshitaka Yoshimura[1] (1.College of Agriculture, Tamagawa University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[AGE31-02] **Moisture movement in sand during evaporation under reduced pressure**

*Masaru Mizoguchi[1] (1.Graduate school of Agricultural and Life Sciences, The University of Tokyo)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[AGE31-03] Gravity effects on liquid behavior in porous media of uniform glass beads.

*Naoto Sato[1], Natsumi Naganuma[2], Kento Nogawa[2], Yuichi Maruo[2], Kosuke Noborio[1] (1.School of Agriculture, Meiji University, 2.Graduate School of Agriculture, Meiji University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[AGE31-04] Effects of changes in viscosity under low gravity on infiltration rate

*Kento Nogawa[1], Naoto Sato[2], Yuichi Maruo[1], Natsumi Naganuma[1], Kosuke Noborio[2] (1.Graduate School of Agriculture, Meiji University, 2.School of Agriculture, Meiji University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[AGE31-05] Differences in infiltration process on the planets under different gravity.

*Yasushi Mori[1] (1.Graduate School of Environmental and Life Science, Okayama University)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 104 1F

[A-CG38] Multi-scale ocean-atmosphere interaction in the tropical Indo-Pacific region

convener:Ayako Seiki(Japan Agency for Marine-Earth Science and Technology), Tomoki Tozuka(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Motoki Nagura(Japan Agency for Marine-Earth Science and Technology), Youichi Kamae(Faculty of Life and Environmental Sciences, University of Tsukuba), Chairperson:Ayako Seiki(Japan Agency for Marine-Earth Science and Technology), Motoki Nagura(Japan Agency for Marine-Earth Science and Technology)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[ACG38-01] Various aspects of climate system variability associated with ENSO

★Invited Papers

*Shuhei Maeda[1] (1.Climate Prediction Division, Japan Meteorological Agency)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[ACG38-02] Influence and mechanism of the tropical Pacific variability on the Arctic and its seasonality

*Tsubasa Takigawa[1], Yu Kosaka[1], Bunmei Taguchi[1], Lea Svendsen[2] (1.Research Center for Advanced Science and Technology, University of Tokyo, 2.Bjerknes Centre for Climate Research, University of Bergen)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[ACG38-03] Subsurface nonlinear dynamical heating and ENSO asymmetry in CMIP5: Implications for anthropogenic tropical-warming uncertainties

★Invited Papers

*Michiya Hayashi[1], Fei-Fei Jin[1] (1.Department of Atmospheric Sciences, University of Hawaii at Manoa)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[ACG38-04] **Uncertainty in the projections of ENSO amplitude change under global warming: Role of the response of atmospheric circulation to SST anomalies**

*Jun Ying[1] (1.Second institute of Oceanography, Ministry of Natural Resources)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[ACG38-05] Impact of atmospheric variability on Indian Ocean Dipole mode

*Yuya Baba[1] (1.JAMSTEC Japan Agency for Marine-Earth Science and Technology)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[ACG38-06] Do salinity anomalies matter for the evolution of the IOD? –Experimental assessments using a regional ocean model-

*Shoichiro Kido[1], Tomoki Tozuka[1], Weiqing Han[2] (1.Graduate School of Science, The University of Tokyo, 2.Department of Atmospheric and Oceanic Sciences, University of Colorado Boulder)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 104 1F

[A-CG38] Multi-scale ocean-atmosphere interaction in the tropical Indo-Pacific region

convener:Ayako Seiki(Japan Agency for Marine-Earth Science and Technology), Tomoki Tozuka(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Motoki Nagura(Japan Agency for Marine-Earth Science and Technology), Youichi Kamae(Faculty of Life and Environmental Sciences, University of Tsukuba), Chairperson:Tomoki Tozuka(The University of Tokyo), Youichi Kamae(University of Tsukuba)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[ACG38-07] Mechanisms of future changes in equatorial upwelling: CMIP5 inter-model analysis

★Invited Papers

*Shoshiro Minobe[1,2], Mio Terada[2], Curtis Deutsch[3] (1.Earth and Planetary Sciences, Faculty of Science, Hokkaido University, 2.Graduate School of Science, Hokkaido University, 3.School of Oceanography, University of Washington)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[ACG38-08] The Indo-Pacific cross-basin interaction of the decadal climate variability under the progress of the global warming

*Yuma Miyaji[1], Youichi Tanimoto[2] (1.Hokkaido University, Graduate School of Environmental Science, 2.Hokkaido University, Faculty of Environmental Earth Science)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[ACG38-09] Air-sea flux observation by unmanned autonomous sea surface vehicle in the Tropics - Application of the Wave Glider -

★Invited Papers

*Iwao Ueki[1] (1.JAMSTEC Japan Agency for Marine-Earth Science and Technology)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[ACG38-10] **Radar-derived Fresh water flux and its possible impact to the oceanic stratification observed during the Years of the Maritime Continent (YMC)**

*Masaki Katsumata[1], Biao Geng[1], Satoru Yokoi[1], Shuichi Mori[1], Iwao Ueki[1] (1.Japan Agency for Marine-Earth Science and Technology)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[ACG38-11] **Driving Mechanism of Inter-Annual Precipitation Variability during Monsoon Season over the Northern Part of Sumatra Island, Indonesia**

*Yahya Darmawan[1,2,3], Huang-Hsiung Hsu[2] (1.Taiwan International Graduation Program, Academia Sinica, 2.Research Center for Environmental Changes, Academia Sinica, 3.Indonesian Agency for Meteorology, Climatology and Geophysics (BMKG))

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[ACG38-12] The impact of diurnal precipitation over the maritime continent on synoptic disturbances and its relation to the MJO

*Ayako Seiki[1], Satoru Yokoi[1], Masaki Katsumata[1], Kunio Yoneyama[1] (1.Japan Agency for Marine-Earth Science and Technology)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 301A 3F

[A-CG39] Biogeochemical cycles in Land Ecosystem

convener:Tomomichi Kato(Research Faculty of Agriculture, Hokkaido University), Kazuhito Ichii(Chiba University), Takeshi Ise(FSERC, Kyoto University), Munemasa Teramoto(National Institute for Environmental Studies), Chairperson:Tomomichi Kato(Hokkaido University)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[ACG39-01] Laboratory examination of combined effects of temperature rising and increased water fluctuation on CO_2 release from volcanic ash soils

*Hirohiko Nagano[1], Mariko Atarashi-Andoh[1], Jun Koarashi[1] (1.Japan Atomic Energy Agency)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[ACG39-02] Field observation of GHGs emission from pome palm oil mill effluent (POME) treatment ponds in an oil palm plantation in tropical peatland.

*Yoshiyuki Takahashi[1], Takashi Onodera[2], Ryuichi Hirata[1], Kazuya Nishina[2], Joseph Wenceslaus Waili[3], Kevin Kemudang Musin[3], Edward Baran Aeries[3], Frankie Kiew[3], Guan Xhuan Wong[3], Zufaqar Sa'adi[3], Lulie Melling[3] (1.Center for Global Environmental Research, National Institute for Environmental Studies, 2.Center for Regional Environmental Research, National Institute for Environmental Studies, 3.Sarawak Tropical Peat Research Institute)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[ACG39-03] Soil CO_2 efflux dynamics with land-use changes in Southeast Asia

*HAJIME TOMIMATSU[1], NAISHEN LIANG[1], MUNEMASA TERAMOTO[1], JIYE ZENG[1], ZHAO XIN[1] (1.National Institute for Environmental Studies)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[ACG39-04] Individual-based analyses of the carry-over effects from recent climatic conditions on the interannual variability of LAI of an evergreen conifer stand

*Akihiro Sumida[1], Tsutomu Watanabe[1], Tomiyasu Miyaura[2] (1.Institute of Low Temperature Science, Hokkaido University, 2.Faculty of Science and Technology, Ryukoku University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[ACG39-05] Carbon dioxide balance of an oil palm plantation on tropical peat

*Takashi Hirano[1], Frankie Kiew[2], Ryuichi Hirata[3], Guan Xhuan Wong[2], Edward Baran Aries[2], Kevin Kemudang[2], Joseph Wenceslaus[2], Lo Kim San[2], Lulie Melling[2] (1.Research Faculty of Agriculture, Hokkaido University, 2.Sarawak Tropical Peat Research Institute, 3.CGER, National Institute for Environmental Studies)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[ACG39-06] The effect of heat wave in the summer of 2018 on carbon and water fluxes in an open black spruce forest in an interior Alaska

*Hideki Kobayashi[1], Robert Busey[2], Yongwon Kim[2], Sigrid Dengel[3], Stephen Chan[3] (1.Japan Agency for Marine-Earch Science and Technology, 2.International Arctic Research Center, University of Alaska, Fairbanks, 3.Lawrence Berkeley National Laboratory)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 301A 3F

[A-CG39] Biogeochemical cycles in Land Ecosystem

convener:Tomomichi Kato(Research Faculty of Agriculture, Hokkaido University), Kazuhito Ichii(Chiba University), Takeshi Ise(FSERC, Kyoto University), Munemasa Teramoto(National Institute for Environmental Studies), Chairperson:Tomomichi Kato(Hokkaido University)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[ACG39-07] Evaluation of feasibility of continental vegetation monitoring using Himawari-8.

*Kodai Hayashi[1], Kazuhito Ichii[1], Hiroki Yoshioka[2], Kazutaka Murakami[3], Reiko Ide[3], Kenlo Nasahara[4], Tomoko Akitsu[4], Tomoaki Miura[5] (1.Chiba Univ., 2.Aichi Prefectural Univ., 3.NIES, 4.Tsukuba Univ., 5.Univ. Hawaii)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[ACG39-08] Estimation of global carbon dioxide emissions by fires

*Tomohiro Shiraishi[1], Ryuichi Hirata[1] (1.National Institute for Environmental Studies)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[ACG39-09] Interactions between topography, permafrost, and vegetation in Siberian larch forest: a simulation study

*Hisashi Sato[1] (1.Institute of Arctic Climate and Environment Research, Japan Agency for Marine-Earth Science and Technology (JAMSTEC))

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[ACG39-10] Data assimilation experiments with MODIS LAI observation and the dynamic global vegetation model SEIB-DGVM in Japan

*Hazuki Arakida[1], Shunji Kotsuki[1], Shigenori Otsuka[1], Takemasa Miyoshi[1] (1.RIKEN Center for Computational Science)

11:45 AM - 12:15 PM JST | 2:45 AM - 3:15 AM UTC

[ACG39-11] Studying ecosystem dynamics with deep neural networks

★Invited Papers

*Takeshi Ise[1], Masanori Onishi[2] (1.FSERC, Kyoto University, 2.Grad. School of Agriculture, Kyoto University)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 102 1F

[A-CG40] Coastal Ecosystems - 1. Water Cycle and Land-Ocean Interactions

convener:Masahiko Fujii(Faculty of Environmental Earth Science), Makoto Yamada(Faculty of Economics, Ryukoku University), Jun Shoji(The University of Tokyo), Ryo Sugimoto(Faculty of Marine Biosciences, Fukui Prefectural University), Chairperson:Masahiko Fujii, Makoto Yamada

9:05 AM - 9:20 AM JST | 12:05 AM - 12:20 AM UTC

[ACG40-01] Submarine groundwater discharge from Mt. Fuji in Suruga Bay(VI)

*Yasuhide Muranaka[1], Takafumi Kamitani[1], Noriaki Fushimi[1], Tomoya Oka[1], Masahiko Ono[2], Atsunao Marui[2] (1.Shizuoka Institute of Environment and Hygiene, 2.National Institute of Advanced Industrial Science and Technology)

9:20 AM - 9:35 AM JST | 12:20 AM - 12:35 AM UTC

[ACG40-02] Relationship between the distribution of freshwater groundwater under the seabed at Obama Bay and the surrounding terrain of the land

*Makoto Yamada[1], Ryo Sugimoto[2], Toshimi Nakajima[3] (1.Faculty of Economics, Ryukoku University, 2.Fuculty of Marine Biosciences, Fukui Prefectural University, 3.Fukui Prefectural University)

9:35 AM - 9:50 AM JST | 12:35 AM - 12:50 AM UTC

[ACG40-03] Influence of recirculated submarine groundwater discharge on phytoplankton dynamics in Moune Bay, Kesennuma

*Toshimi Nakajima[1], Takahiro Kusunoki[1], Yoshitake Takao[1], Ryo Sugimoto[1] (1.Fukui Prefectural University)

9:50 AM - 10:05 AM JST | 12:50 AM - 1:05 AM UTC

[ACG40-04] Estimation of contribution rate of Submarine Groundwater Discharge to *Ulva pertusa* using nitrogen stable isotope ratio analysis

*Tatsuhiro Ishida[1], Masaru Takeuchi[1], Toshimi Nakajima[1], Ryo Sugimoto[1], Shiho Kobayashi[2], Keisuke Koba[3], Keitaro Fukushima[3], Osamu Tominaga[1] (1.Fukui Prefectural University, 2.Kyoto University, 3.Center for Ecological Research,Kyoto Univrsity)

10:05 AM - 10:20 AM JST | 1:05 AM - 1:20 AM UTC

[ACG40-05] Evaluation of the environmental condition of Submarine Groundwater Discharge (SGD) using carbon and oxygen stable isotope ratio of the sessile bivalve *Crassostrea nippona* shell

*Osamu Tominaga[1], Takeuchi Masaru[1], Ryo Sugimoto[1], Ishida Tatsuhiro[1], Takeru Hirai[1], Toshimi Nakajima[1], Jun Shoji[2], Hisami Honda[4], Makoto Taniguchi[3] (1.Fukui Prefectural University, 2.Tokyo Univ. AORI, 3.RIHN, 4.Fukui Pref Gov)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 102 1F

[A-CG40] Coastal Ecosystems - 1. Water Cycle and Land-Ocean Interactions

convener:Masahiko Fujii(Faculty of Environmental Earth Science), Makoto Yamada(Faculty of Economics, Ryukoku University), Jun Shoji(The University of Tokyo), Ryo Sugimoto(Faculty of Marine Biosciences, Fukui Prefectural University), Chairperson:Masahiko Fujii, Makoto Yamada

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[ACG40-06] Influence of climate change on river and submarine groundwater discharge for three decades and the change of nutrient fluxes from the land to the coastal area

*Saki KATAZAKAI[1], Jing ZHANG[2], Kota NOJIMA[3] (1.Graduate School of Science and Engineer, University of Toyama, 2.Graduate School of Science and Engineering for Science, University of Toyama, 3.University of Toyama)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[ACG40-07] The assessment of human impacts on the distribution patterns of mangroves: a comparative study between the Rewa and Ba delta, Fiji

*Masahiko Fujii[1], Jone Ravuci Sassen[2] (1.Faculty of Environmental Earth Science, 2.Graduate School of Environmental Science)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[ACG40-08] Landscape factors affect persistence and accumulation of organic carbon in sediment of secondary mangrove forests: A preliminary study

*Toshihiro Miyajima[1], Rempei Suwa[2], Keith Limuel C. Bejasa[3], Rene N. Rollon[3], Maria Lourdes San Diego-McGlone[3], Caroline M.B. Jaraula[3], Fernando P. Siringan[3], Kenji Ono[4], Yasmin H. Primavera Tirol[5], Yosuke Miyairi[1], Yusuke Yokoyama[1] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Japan International Research Center for Agricultural Sciences, 3.Marine Science Institute, University of the Philippines, 4.Forestry and Forest Products Research Institute, 5.Aklan State University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[ACG40-09] Multiple benefits of blue carbon ecosystems in promoting blue economy and reinforcing resilience in coastal communities

*Atsushi Watanabe[1] (1.The ocean policy research institute, The Sasakawa peace foundation)

11:45 AM - 12:05 PM JST | 2:45 AM - 3:05 AM UTC

[ACG40-10] Significant storage of organic carbon in mineral matrix in both land and ocean and the role of Fe

★Invited Papers

*Rota Wagai[1] (1.NARO, Institute for Agro-Environmental Sciences)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 201B 2F

[A-CG41] Promotion of Application and Utilization of Aircrafts for Earth sciences

convener:Nobuhiro Takahashi(Institute for Space-Earth Environmental Research, Nagoya University), Makoto Koike(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Toshinobu Machida(National Institute for Environmental Studies), Taro Shinoda(Institute for Space-Earth Environmental Research, Nagoya University), Chairperson:Nobuhiro Takahashi(Institute for Space-Earth Environmental Research, Nagoya University)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[ACG41-01] In situ observation of typhoon central pressure using dropsondes

*Kazuhisa Tsuboki[1], Hiroyuki Yamada[2], Yukihiro Takahashi[3], Taro Shinoda[1], Tadayasu Ohigashi[4], Munehiko Yamaguchi[5], Hisayuki Kubota[3], Tetsuo Nakazawa[5], Norio Nagahama[6], Kensaku Shimizu[6], Masaya Kato[1], Sachie Kanada[1], Mayumi Yoshioka[1], Nobuhiro Takahashi[1] (1. Institute for Space-Earth Environmental Research, Nagoya University, 2.University of the Ryukyus, 3.Hokkaido University, 4.National Research Institute for Earth Science and Disaster Resilience, 5.Meteorological Research Institute, Japan Meteorological Agency, 6.Meisei Electric Co. Ltd.)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[ACG41-02] New observation strategies for typhoon intensity over the western North Pacific

*Hiroyuki Yamada[1], Kazuhisa Tsuboki[2], Taro Shinoda[2], Hisayuki Kubota[3], Yukihiro Takahashi[3], Norio Nagahama[4], Kensaku Shimizu[4], Tadayasu Ohigashi[5], Kosuke Ito[1], Munehiko Yamaguchi[6], Tetsuo Nakazawa[6] (1.University of the Ryukyus, 2.Nagoya University, 3.Hokkaido University, 4.Meisei Electric, 5.National Research Institute for Earth Science and Disaster Resilience, 6.Meteorological Research Institute, Japan Meteorological Agency)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[ACG41-03] Observing System Experiment for Typhoon Trami (2018) using T-PARCII dropsondes and JMA Global Forecasting System

*Munehiko Yamaguchi[1], Toshiyuki Ishibashi[1], Tetsuo Nakazawa[1], Kosuke Ito[2], Hiroyuki Yamada[2], Tadayasu Ohigashi[3], Norio Nagahama[4], Kensaku Shimizu[4], Hisayuki Kubota[5], Yukihiro Takahashi[5], Masaya Kato[6], Sachie Kanada[6], Mayumi Yoshioka[6], Taro Shinoda[6], Nobuhiro Takahashi[6], Kazuhisa Tsuboki[6] (1.Meteorological Research Institute, Japan Meteorological Agency, 2.Faculty of Science, University of the Ryukyus, 3.National Research Institute for Earth Science and Disaster Resilience, 4.Meisei Electric, 5.Graduate School of Science, Hokkaido University, 6.Institute for Space-Earth Environmental Research, Nagoya University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[ACG41-04] Fundamental characteristics of black carbon and iron oxide aerosols in the troposphere revealed from the aircraft measurements

*Nobuhiro Moteki[1], Makoto Koike[1], Sho Ohata[2], Yutaka Kondo[3], Nobuyuki Takegawa[5], Kouji Adachi[4], Naga Oshima[4], Hitoshi Matsui[2], Kazuyuki Kita[6], Tatsuhiro Mori[7], Atsushi Yoshida[1] (1.The Univerisity of Tokyo, 2.Nagoya University, 3.National Institute for Polar Research, 4.Meteorological Research Institute, 5.Tokyo Metropolitan University, 6.Ibaraki University, 7.Tokyo University of Science)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[ACG41-05] Aerosol measurements around the ridge of East Antarctica using a Rogallo wing UAV

*Ryohei Haraguchi[1], Masahiko Hayashi[1], Keiichiro Hara[1], Naohiko Hirasawa[2], Koki Nakata[3], Kei-ichi Ozuka[4,1] (1.Fukuoka University, 2.National Institute of Polar Research, 3.kkt Inovate Co., Ltd, 4.Nippon Tungsten Co., Ltd)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[ACG41-06] Wind Mesurements Based on In-situ Data -Direct Vector Calculation and Hodograph Analyses-

*Masahiko Hayashi[1], Tomoyuki Onohara[1], Ryohei Haraguchi[1,3], Kei-ichi Ozuka[2,4], Kazuo Okabe[3] (1.Faculty of Science, Fukuoka University, 2.Nippon Tungsten Co.,Ltd, 3.SkyRemote Co.,Ltd, 4.FIT-EH, Fukuoka University)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 102 1F

[A-CG44] Coastal Ecosystems 2 Coral reefs, seagrass and macroalgal beds, and mangrove

convener:Yu Umezawa(Tokyo University of Agriculture and Technology), Toshihiro Miyajima(Marine Biogeochemistry Group, Division of Ocean-Earth System Science, Atmosphere and Ocean Research Institute, The University of Tokyo), Atsushi Watanabe(The ocean policy research institute, The Sasakawa peace foundation), Tomihiko Higuchi(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:Yu Umezawa(Tokyo University of Agriculture and Technology), Toshihiro Miyajima(The University of Tokyo), Tomihiko Higuchi(Atmosphere and Ocean Research Institute, The University of Tokyo), Atsushi Watanabe(Tokyo Institute of Technology)

1:50 PM - 2:10 PM JST | 4:50 AM - 5:10 AM UTC

[ACG44-01] Evaluation of mangrove ecosystems as a dissolved iron supplying system to tropical coastal waters

★Invited Papers

*Yasuhiro Nakanishi[1], Ko Hinokidani[1] (1.Tokyo University of Agriculture)

2:10 PM - 2:25 PM JST | 5:10 AM - 5:25 AM UTC

[ACG44-02] Dissolved organic carbon and optical properties in tropical and subtropical mangrove environments

*Raghab Ray[1], Toshihiro Miyajima[1], Charissa M Ferrera[2], Chia-Jung Lu[1], M.L San Diego-McGlone[2], Hiroshi Ogawa[1], Kazuo Nadaoka[3] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Marine Science Institute, University of the Philippines, Diliman, 3.School of Environment and Society, Tokyo Institute of Technology)

2:25 PM - 2:45 PM JST | 5:25 AM - 5:45 AM UTC

[ACG44-03] Modeling coral polyp-scale bleaching phenomenon and upscaling to reef-scale

★Invited Papers

*Takashi Nakamura[1], Tomihiko Higuchi[2], Toshihiro Miyajima[2], Lawrence Patrick Cases Bernardo[1], Kazuo Nadaoka[1], Atsushi Watanabe[1,3], Hiroyuki Fujimura[4] (1.School of Environment and Society, Tokyo Institute of Technology, 2.AORI, The University of Tokyo, 3.The ocean policy research institute, The Sasakawa peace foundation, 4.University of the Ryukyus)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[ACG44-04] Reversal of surface ocean acidification and recovery potential of calcification: ecology of proton concentration control

*Kazuhiko Ichikawa[1] (1.(post) Graduate School of Environmental Earth Science, Hokkaido University)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[ACG44-05] Revisit of massive *Porites* coral growth under the outbreak of crown-of-thorns starfish and thermal stress in Sekisei Lagoon, Japan

*Kohki Sowa[1] (1.Japan Agency for Marine-Earth Science and Technology)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 102 1F

[A-CG44] Coastal Ecosystems 2 Coral reefs, seagrass and macroalgal beds, and mangrove

convener:Yu Umezawa(Tokyo University of Agriculture and Technology), Toshihiro Miyajima(Marine Biogeochemistry Group, Division of Ocean-Earth System Science, Atmosphere and Ocean Research Institute, The University of Tokyo), Atsushi Watanabe(The ocean policy research institute, The Sasakawa peace foundation), Tomihiko Higuchi(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:Yu Umezawa(Tokyo University of Agriculture and Technology), Toshihiro Miyajima(The University of Tokyo), Atsushi Watanabe(Tokyo Institute of Technology), Tomihiko Higuchi(Atmosphere and Ocean Research Institute, The University of Tokyo)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[ACG44-06] Reconstructing sedimentation process of lagoon sediment in the Eastern Kume Island, Ryukyus

*Wataru Sano[1], Shoko Hirabayashi[2], Yusuke Yokoyama[3], Yosuke Miyairi[3], Kazuhiko Fujita[4], Hironobu Kan[2], Lauren T. Toth[5], Richard B. Aronson[6] (1.Graduate School of Integrated Sciences for Global Society, Kyushu University, 2.Graduate School of Social and Cultural Studies, Kyushu University, 3.Atmosphere and Ocean Research Institute, University of Tokyo, 4.Department of Physics and Earth Sciences, University of the Ryukyus, 5.United States Geological Survey, 6.Florida Institute of Technology)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[ACG44-07] Addressing challenges in long-term coral reef monitoring: Statistical tools to address the effect of new methods

*Iwao Fujii[1,2], Jennifer Selgrath[3,2], Amanda Vincent[2] (1.The Ocean Policy Research Institute of the Sasakawa Peace Foundation, 2.Project Seahorse, Institute of the Oceans and Fisheries, The University of British Columbia, 3.Hopkins Marine Station, Stanford University)

4:00 PM - 4:20 PM JST | 7:00 AM - 7:20 AM UTC

[ACG44-08] Ocean currents and herbivory drive macroalgae-to-coral community shift under climate warming

★Invited Papers

*Naoki H. Kumagai[1], Jorge García Molinos[2], Hiroya Yamano[1], Shintaro Takao[1], Masahiko Fujii[2], Yasuhiro Yamanaka[2] (1.National Institute for Environmental Studies, 2.Hokkaido University)

4:20 PM - 4:35 PM JST | 7:20 AM - 7:35 AM UTC

[ACG44-09] Estimation of temperature of seaweed bed vegetation boundary in the Western Seto Inland Sea using satellite SST

*Naoki Yoshie[1], Anri Kabe[1], Hiromori Shimabukuro[2], Goro Yoshida[2] (1.Center for Marine Environmental Studies, Ehime University, 2.Japan Fisheries Research and Education Agency)

4:35 PM - 4:55 PM JST | 7:35 AM - 7:55 AM UTC

[ACG44-10] Fate of macroalgal organic matter and its effects on in and outside of algal bed

★Invited Papers

*Shigeki Wada[1], Yuko Omori[1], Takeo Hama[1,2] (1.University of Tsukuba, 2.Dokkyo University)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 103 1F

[A-CG45] Visible Remote Sensing of Hydrospheric Science and Its Application

convener:Joji Ishizaka(Institute for Space-Earth Environmental Research, Nagoya University), Mitsuhiro Toratani(School of Engineering, Tokai University), Yuji Sakuno(Graduate School of Engineering, Hiroshima University), Toru Hirawake(Faculty of Fisheries Sciences, Hokkaido University), Chairperson:Yuji Sakuno(広島大学大学院工学研究科)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[ACG45-01] Further information in the coastal areas from 250-m resolution multiple bands of GCOM-C “SHIKISAI”

★Invited Papers

*Hiroshi Murakami[1], Manabu Shimizu[2], Goh Onizuka[3] (1.Earth Observation Research Center, Japan Aerospace Exploration Agency, 2.Japan Fisheries Research and Education Agency, 3.National Research Institute of Fisheries and Environment of Inland Sea, Japan Fisheries Research and Education Agency)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[ACG45-02] Features of GCOM-C/SGLI standard atmospheric correction scheme and its processing results

*Mitsuhiro Toratani[1], Kazunori Ogata[2], Hajime Fukushima[3] (1.School of Engineering, Tokai University, 2.Japan Aerospace Exploration Agency/Earth Observation Research Center, 3.Tokai University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[ACG45-03] Verification of GCOM-C/SGLI-derived chlorophyll *a* data in the western North Pacific during May 2018 aboard the R/V *Shinsei Maru*

*Koji Suzuki[1], Stanford B. Hooker[2], Tomonori Isada[1], Kazunori Ogata[3], Mitsuhiro Toratani[4], Hiroshi Murakami[3] (1.Hokkaido University, 2.NASA, 3.JAXA, 4.Tokai University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[ACG45-04] **Toward a global retrieval of in-water optical properties using Deep Neural Network**

*Salem Ibrahim Salem[1], Hiroto Higa[2], Kazuo Oki[1], Taikan Oki[1] (1.The University of Tokyo, 2.Yokohama National University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[ACG45-05] Development of atmosphere and in-water combining algorithm using GCOM-C/SGLI in Tokyo Bay

*Taiga Nakayama[1], HIROTO HIGA[1], Kazuki Ogata[2] (1.Yokohama National University, 2.Japan Aerospace eXploration Agency)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[ACG45-06] Analysis of the uncertainty of backscattering coefficient by radiative transfer simulation in coastal areas and lakes

*Hidehito Taki[1], Hiroto Higa[1], Yoshiyuki Nakamura[1], Takayuki Suzuki[1] (1.Graduate School of Urban Innovation, Yokohama National University)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 103 1F

[A-CG45] Visible Remote Sensing of Hydrospheric Science and Its Application

convener:Joji Ishizaka(Institute for Space-Earth Environmental Research, Nagoya University), Mitsuhiro Toratani(School of Engineering, Tokai University), Yuji Sakuno(Graduate School of Engineering, Hiroshima University), Toru Hirawake(Faculty of Fisheries Sciences, Hokkaido University), Chairperson:Joji Ishizaka(名古屋大学宇宙地球環境研究所)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[ACG45-07] Development of a blue tide estimation method based on the optical properties of sulfur colloid particles by geostationary ocean color satellite

*HIROTO HIGA[1], WATARU NAKAMURA[1] (1.Yokohama National University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[ACG45-08] Characteristics of water quality and red tide distribution in the Seto Inland Sea immediately after heavy rain in the western Japan by GCOM-C SGLI data

*Yuji Sakuno[1], Hiroto Higa[2], Hiroshi Kobayashi[3], Mitsuhiro Toratani[4] (1.Hiroshima University, 2.Yokohama National University, 3.Yamanashi University, 4.Tokai University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[ACG45-09] Application of Satellite Remote Sensing to Monitor Eutrophication Status of Inland Lakes

*Wei Yang[1], Bunkei Matsushita[2] (1.Chiba University, 2.University of Tsukuba)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[ACG45-10] **Exploring the Potentials of Google Earth Engine for Global Assessment of Coastal Eutrophication Based on Chlorophyll-*a* concentration**

*Eligio de Raus Maure[1], Genki Terauchi[1], Joji Ishizaka[2] (1.Northwest Pacific Region Environmental Cooperation Center, 2.Institute for Space-Earth Environmental Research, Nagoya University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[ACG45-11] Seasonal and interannual variability of seagrass distribution detected by Landsat TM, ETM+ and OLI images in western Nanao Bay

*Genki Terauchi[1] (1.Northwest Pacific Region Environmental Cooperation Center)

[J] Oral | H (Human Geosciences)：H-DS Disaster geosciences

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Convention Hall B 2F

[H-DS13] Tsunami and Tsunami Forecast

convener:Naotaka YAMAMOTO CHIKASADA(National Research Institute for Earth Science and Disaster Resilience), Hiroaki Tsushima(Japan Meteorological Agency), Tatsuya Kubota(National Research Institute for Earth Science and Disaster Resilience), Chairperson:Osamu Sandanbata, Tatsuya Kubota

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[HDS13-01] Sensibility analysis for the inundation tsunami height due to 2018 Sulawesi earthquake and tsunami

★Invited Papers

*Taro Arikawa[1], Abdul Muhari[3], Shota Takeda[1], Anawat Suppasri[2], Fumihiko Imamura[2] (1.Chuo University, 2.IRIDES, Tohoku University, 3.Ministry of Marine Affairs and Fisheries, Indonesia)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[HDS13-02] Tsunami Source of the 2018 Sulawesi Earthquake Estimated from Tsunami and InSAR Data

*Tungcheng Ho[1], Kenji Satake[1], Shingo Watada[1], Ray Y Chuang[2], Chih-Heng Lu[2] (1.Earthquake Research Institute,The University of Tokyo, 2.Department of Geography, National Taiwan University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[HDS13-03] **Source Models of the Two September and December 2018 Indonesia Tsunamis Based on Spectral Analyses and Numerical Modeling**

*Mohammad Heidarzadeh[1], Abdul Muhari[2], Tomoya HARADA[3], Takeo Ishibe[4], Antonius Wijanarto[5] (1.Brunel University London, 2.Ministry of Marine Affairs and Fisheries, Jakarta 10110, Indonesia, 3.Earthquake Research Institute, The University of Tokyo, Japan, 4.Association for the Development of Earthquake Prediction, Tokyo, 101-0064, Japan, 5.Badan Informasi Geospasial, Cibinong, Indonesia)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[HDS13-04] Abrupt Large Uplift Caused by Volcanic Tsunami Earthquakes near the Kermadec Islands, New Zealand

*Osamu Sandanbata[1], Shingo Watada[1], Kenji Satake[1] (1.Earthquake Research Institute, the University of Tokyo)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[HDS13-05] **Adaptive tsunami waveform inversion for estimating coseismic vertical displacements and slip distribution**

*Iyan E. Mulia[1], Aditya Riadi Gusman[2], M. Jakir Hossen[3], Kenji Satake[1] (1.Earthquake Research Institute, The University of Tokyo, 2.GNS Science, 3.BRAC University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[HDS13-06] Real-time tsunami prediction in a coastal zone, using a superposition of Green’s function

*Seiji Tsuno[1], Norihiko Hashimoto[2] (1.Railway Technical Research Institute, 2.ITOCHU Techno-Solutions Corporation)

[J] Oral | H (Human Geosciences)：H-RE Resource and Engineering Geology

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 301B 3F

[H-RE17] Application of earth science data towards the renewable energy field

convener:Hideaki Ohtake(National Institute of Advanced Industrial Science and Technology), Fumichika Uno(National Institute of Advanced Industrial Science and Technology), Teruhisa Shimada(Graduate School of Science and Technology, Hirosaki University), Daisuke Nohara(Central Research Institute of Electric Power Industry), Chairperson:Hideaki Ohtake(National Institute of Advanced Industrial Science and Technology (AIST))

3:30 PM - 3:55 PM JST | 6:30 AM - 6:55 AM UTC

[HRE17-01] Application of geological dara to ground source heat pump systems with special reference to thermal conductivity of geological materials

★Invited Papers

*Masakatsu SASADA[1] (1.Geo-Heat Promotion Association of Japan)

3:55 PM - 4:10 PM JST | 6:55 AM - 7:10 AM UTC

[HRE17-02] Use of groundwater in the Nishi-Osaka Area and its activities.

*Naoko Kitada[1], Hiroko Ito[1], Tomoo Echigo[1], Teruyuki Fujiwara[1], Makoto Nishigaki[2] (1.Geo-Research Institute, 2.Okayama University)

4:10 PM - 4:25 PM JST | 7:10 AM - 7:25 AM UTC

[HRE17-03] Improvement of prediction of wind power ramp by using monitoring data

*Shinji Kadokura[1], Daisuke Nohara[1], Masamichi Ohba[1], Atsushi Hashimoto[1], Keisuke Nakao[1], Yasuo Hattori[1], Takeshi Watanabe[1], Hiromaru Hirakuchi[1] (1.Central Research Institute of Electric Power Industry)

4:25 PM - 4:40 PM JST | 7:25 AM - 7:40 AM UTC

[HRE17-04] **A study of the use of meteorological data for energy management**

*Hideaki Ohtake[1], Takashi Oozeki[1], Junichi Imura[2] (1.National Institute of Advanced Industrial Science and Technology, 2.Tokyo institute of technology)

[J] Oral | H (Human Geosciences)：H-TT Technology & Techniques

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 301B 3F

[H-TT22] New Developments in Shallow Geophysics

convener:Kyosuke Onishi(Public Works Research Institute), Kunio Aoike(Oyo corporation), Keisuke Inoue(National Agriculture and Food Research Organization), Tishiyuki Yokota(National Institute of Advanced Industrial Science and Technology), Chairperson:Toshiyuki Yokota, Keisuke Inoue

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[HTT22-01] High-frequency seismic reflection measurements for imaging internal structure of a sabo dam damaged by a huge debris flow

*Tomio INAZAKI[1], Hiroshi Kisanuki[2], Takanori Ogahara[1], Takeshi Shimizu[1], Naoki Fujimura[1] (1.Public Works Research Institute, Tsukuba Central Institute, 2.PWRI (Present address: OYO Corporation))

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[HTT22-02] Development and applications of 3D ambient noise tomography

*Chisato Konishi[1], Koichi Hayashi[1] (1.OYO Corporation)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[HTT22-03] An Attempt to Estimate the Level of Non-confind Groundwater by Earthing Resistance (I) - Outline of Theory -

*Kunihiro Ryoki[1] (1.Polytechnic University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[HTT22-04] Experimental and Theoretical Studies for Seafloor Survey by Ground Penetrating Radar

*Jun Sonoda[1], Tomoyuki Kimoto[2] (1.National Institute of Technology, Sendai College, 2.National Institute of Technology, Oita College)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[HTT22-05] Evaluation of the 3-D Distribution of Fractures in a Rock Mass using Directional Borehole Radar Data from a Horizontal Borehole

*Kazuhiko Masumoto[1], Tomoaki Matsushita[2], Suguru Shirasagi[1], Takashi Ueki[3], Shinsuke Karasawa[3], Daiki Makino[3], Kazushige Wada[4] (1.Kajima Technical Research Institute, 2.Kajima Corporation, 3.Matsunaga Geo-Survey Co., Ltd., 4.Mitsui Mineral Development Engineering Co., Ltd.)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[HTT22-06] Automatic Detection of Deteriorated Concrete Bridge Deck using 2 GHz Horn Antennae

*Kunio Aoike[1], Shogo Tanaka[2], Naoto Takase[1], Akio Matsuyama[1], Masaya Yamauchi[1], Yoshinori Uno[1] (1.OYO Corporation, 2.Professor Emeritus of Yamaguchi Univ.)

[J] Oral | S (Solid Earth Sciences)：S-GD Geodesy

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 303 3F

[S-GD01] Gravity and Geoid

convener:Tokuro Kodama(Geospatial Information Authority of Japan), Daisuke Oka(Geological Survey of Hokkaido, Environmental and Geological Research Department, Local Independent Administrative Agency, Hokkaido Research Organization), Chairperson:Toshiyuki Tanaka, Takahito Kazama

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SGD01-01] Seasonal variation of gravity values at the Ishioka Geodetic Observing Station

*Akira Tomiyama[1], Tokuro Kodama[1], Shuichi Oomori[1], Yoshifumi Hiraoka[1], Toshihiro Yahagi[1] (1.GSI of Japan)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SGD01-02] Installation of the First Gravity Station in the Mount Fuji Research Institute, and the Phase-Free gravity measurement

*Ryo Honda[1], Yuichi Imanishi[2], Kazunari Nawa[3], Toshiyuki Tanaka[4], Tokuro Kodama[5], Akira Tomiyama[5] (1.MFRI, Yamanashi Prefectural Government, 2.ERI, University of Tokyo, 3.GSJ, AIST, 4.TRIES, ADEP, 5.GSI)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SGD01-03] Absolute gravity and GNSS measurements on bedrock outcrops in Dronning Maud Land, East Antarctica

*Takahito Kazama[1], Yuichi Aoyama[2], Yoichi Fukuda[1], Koichiro Doi[2] (1.Graduate School of Science, Kyoto University, 2.National Institute of Polar Research)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SGD01-04] **Capability of ICA Method for separating GIA and Ice Mass Signals in Antarctica**

*SHI TIANYAN[1], Yoichi Fukuda[1] (1.Graduate School of Science, Kyoto University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SGD01-05] Preliminary result of continuous observation with an iGrav superconducting gravimeter at the Teshikaga observatory, eastern Hokkaido, Japan

*Kazunari Nawa[1], Hiroaki Takahashi[2], Mako Ohzono[2], Kazumi Okada[2], Teruhiro Yamaguchi[2], Daisuke Oka[3], Noritoshi Okazaki[3], Ryo Honda[4], Hiroshi Ikeda[5] (1.National Institute of Advanced Industrial Science and Technology, 2.Hokkaido University, 3.Geological Survey of Hokkaido, 4.Mount Fuji Research Institute, 5.University of Tsukuba)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SGD01-06] On the anomalous temporal gravity change between VERA and F-net stations at Ishigakijima, Japan

*Kazunari Nawa[1], Yuichi Imanishi[2], Yoshiaki Tamura[3], Hiroshi Ikeda[4], Takeshi Kimura[5] (1.National Institute of Advanced Industrial Science and Technology, 2.Earthquake Research Institute, The University of Tokyo, 3.National Astronomical Observatory of Japan, 4.University of Tsukuba, 5.National Research Institute for Earth Science and Disaster Resilience)

[J] Oral | S (Solid Earth Sciences)：S-GD Geodesy

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 303 3F

[S-GD01] Gravity and Geoid

convener:Tokuro Kodama(Geospatial Information Authority of Japan), Daisuke Oka(Geological Survey of Hokkaido, Environmental and Geological Research Department, Local Independent Administrative Agency, Hokkaido Research Organization), Chairperson:Kazunari Nawa, Ryo Honda(山梨県富士山科学研究所)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SGD01-07] **Absolute gravity signals at the Sakurajima volcano since 2009 through 2018**

*Shuhei Okubo[1], Keigo Yamamoto[2], Masato Iguchi[2], Yoshiyuki Tanaka[3], Yuichi Imanishi[1], Ryuichi Nishiyama[1], Miwako Ando[1], Atsushi Watanabe[1] (1.Earthquake Research Institute, The University of Tokyo, 2.Disaster Prevention Research Institute, Kyoto University, 3.Graduate School of Science, The University of Tokyo)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SGD01-08] Detection of Earthquake-induced Prompt Gravity Signals in Multi-channel Data

*Masaya Kimura[1], Nobuki Kame[1], Shingo Watada[1], Makiko Ohtani[2], Akito Araya[1], Yuichi Imanishi[1], Masaki Ando[3], Takashi Kunugi[4] (1.Earthquake Research Institute,The University of Tokyo, 2.National Institute of Advanced Industrial Science and Technology, 3.Department of Physics, The University of Tokyo, 4.National Research Institute for Earth Science and Disaster Resilience)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SGD01-09] Evaluation of atmospheric attraction effect using local-scale objective analysis (LANAL)

*Toshiyuki Tanaka[1] (1.Tono Research Institute of Earthquake Science, Association for the Development of Earthquake Prediction)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SGD01-10] Airborne gravity survey for establishment of a new precise gravimetric geoid model

*Tokuro Kodama[1], Akira Tomiyama[1], Shuichi Oomori[1], Erika Wada[1], Toshihiro Yahagi[1], Yoshifumi Hiraoka[1], Hiroshi Kawawa[1] (1.GSI of Japan)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SGD01-11] Gravimetric geoid modeling using airborne gravity data : a case study in Colorado, U.S.A.

*Koji Matsuo[1], Rene Forsberg[2] (1.GSI of Japan, 2.Denmark Technical University)

[J] Oral | S (Solid Earth Sciences)：S-GD Geodesy

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 105 1F

[S-GD02] Engineering Application of Space Geodesy

convener:Seiichi Shimada(Graduate School of Frontier Sciences, University of Tokyo Nippo Co. Ltd.), Shuichi Rokugawa(The University of Tokyo), Basara Miyahara(GSI of Japan), Toshiaki Tsujii(Department of Aerospace Engineering, Osaka Prefecture University), Chairperson:Masaatsu Aichi, Kazuki Sakai

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SGD02-01] Future vision of the society for utilizing highly precise three dimensional positioning data by applying crustal deformation and precise gravimetric geoid model

*Toshihiro Yahagi[1], Kensuke Kokado[1], Kenji Yoshida[1], Takashi Toyofuku[1], Masao Iwata[1], Basara Miyahara[1] (1.GSI of Japan)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SGD02-02] Preliminary study on the application of satelite-based monitoring for land surface displacement to inverse analyses of groundater flow/land subsidence modeling

*Masaatsu Aichi[1] (1.Graduate School of Frontier Sciences, The University of Tokyo)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SGD02-03] Monitoring of ground deformation all over Japan by InSAR and utilizing 2.5-D analysis

*Kazuki Sakai[1], Kyonosuke Hayahsi[1], Masaki Kuwahara[1], Tatsuya Yamashita[1], Masaki Honda[1], Hiroshi Munekane[1] (1.GSI of Japan)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SGD02-04] Resource Exploration using Interferometric Synthetic Aperture Radar Measurement Technology

*Shuichi Rokugawa[1], Takako Nakamura[1] (1.The University of Tokyo)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SGD02-05] The application example of GNSS for natural gas development together with PDCA Management Method

★Invited Papers

*Yoshiyuki Muramoto[1], Susumu Hayatsu[1], Michiharu Hiyama[1], Daisuke Murai[1], Shoji Kunisue[1] (1.KANTO NATURAL GAS DEVELOPMENT CO., LTD)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SGD02-06] New threats and countermeasures in the aviation field where the use of GNSS satellite navigation expands

★Invited Papers

*Takeshi Fujiwara[1], Toshiaki Tsujii[2] (1.Japan Aerospace Exploration Agency, 2.Osaka Prefecture University)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A10 TOKYO BAY MAKUHARI HALL

[S-SS10] Seismicity

convener:Kei Katsumata(Institute of Seismology and Volcanology, Hokkaido University), Chairperson:Aitaro Kato(Earthquake Research Institute, University of Tokyo), Shinji Toda(東北大学)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SSS10-01] Seasonal variations in crustal seismicity in San-in district, southwest Japan

*Taku Ueda[1], Aitaro Kato[1] (1.Earthquake Research Institute, the University of Tokyo)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SSS10-02] **Source fault model of the 2018 M_W 5.6 northern Osaka earthquake, Japan, inferred from the aftershock sequence**

*Aitaro Kato[1], Taku Ueda[1] (1.Earthquake Research Institute, the University of Tokyo)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SSS10-03] The 2018 Hokkaido Eastern Iburi earthquake (M_{JMA} = 6.7) was triggered by a strike-slip faulting in a stepover segment: Insights from the aftershock distribution and the focal mechanism solution of the mainshock

*Kei Katsumata[1], Mako Ohzono[1], Hiroshi Aoyama[1], Ryo Tanaka[1], Masamitsu Takada[1], Masayoshi Ichiyanagi[1], Teruhiro Yamaguchi[1], Kazumi Okada[1], Hiroaki Takahashi[1], Shin'ichi Sakai[2], Satoshi Matsumoto[3], Tomomi Okada[4], Toru Matsuzawa[4], Shuichiro Hirano[5], Toshiko Terakawa[6], Shinichiro Horikawa[6], Masahiro Kosuga[7], Hiroshi Katao[8], Yoshihisa Iio[8], Airi Nagaoka[8], Noriko Tsumura[9], Tomotake Ueno[10], the Group for the Aftershock Observations of the 2018 Hokkaido Eastern Iburi Earthquake (1.Institute of Seismology and Volcanology, Faculty of Science, Hokkaido University, 2.Earthquake Research Institute, University of Tokyo, 3.Institute of Seismology and Volcanology, Faculty of Science, Kyushu University, 4.Research Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University, 5.Nansei-Toko Observatory for Earthquakes and Volcanoes, Graduate School of Science and Engineering, Kagoshima University, 6.Earthquake and Volcano Research Center, Graduate School of Environmental Studies, Nagoya University, 7.Graduate School of Science and Technology, Hirosaki University, 8.Research Center for Earthquake Prediction, Disaster Prevention Research Institute, Kyoto University, 9.Graduate School of Science, Chiba University, 10.National Research Institute for Earth Science and Disaster Prevention)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SSS10-04] Layered structure of the upper mantle and the crust revealed in the time series analyses of the aftershocks of the 2018 Hokkaido Eastern Iburi Earthquake

*Takayuki Kawabe[1] (1.Faculty of Education, Arts and Sciences, Yamagata University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SSS10-05] Aftershock sequence of the 1847 Zenkoji earthquake: Temporal decay presented in four historical materials and best fit values of paramaters for Omori-Utsu law

*Kentaro Hattori[1], Ichiro Nakanishi[1] (1.Kyoto Univ.)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SSS10-06] The aseismic islands, Amakusa-Kamishima and Shimoshima, Kumamoto Prefecture, southwest Japan: What persistently shuts off regional seismicity

*Shinji Toda[1] (1.International Research Institute of Disaster Science, Tohoku University)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A10 TOKYO BAY MAKUHARI HALL

[S-SS10] Seismicity

convener:Kei Katsumata(Institute of Seismology and Volcanology, Hokkaido University), Chairperson:Akio Katsumata(気象研究所地震津波研究部第一研究室), Yasushi Harada(東海大学)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SSS10-07] Seismicity in the matle wedge around Ogasawara Islands and Lesser Antilles

*Akio Katsumata[1], Kenji Nakata[1], Akio Kobayashi[1], Fuyuki Hirose[1], Takahito Nishimiya[1] (1.Meteorological Research Institute, Japan Meteorological Agency)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SSS10-08] Improvement of the accuracy of the unified Japan Earthquake Catalog using ocean bottom seismographs

*Hiroshi UENO[1], Mitsuharu Ueda[1], Hiromi Misu[1], Hirofumi Yokoyama[1], Yuriko Iwasaki[1], Iwakiri Kazuhiro[1] (1.Seismology and Volcanology Department, Japan Meteorological Agency)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SSS10-09] Spatial distribution of seismic activity and stress field in the source region after the 2011 Tohoku-Oki earthquake

Tomoya Nishimori[1], *Ryota Hino[1], Masanao Shinohara[2] (1.Graduate School of Science, Tohoku University, 2.Earthquake Research Institute, The University of Tokyo)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SSS10-10] Assessment for a large earthquake occurrence on the northern side of the focal region of the 2011 off-Tohoku mega-thrust earthquake

*Kazuyoshi Nanjo[1], Kazuki Miyaoka[2], Akio Yoshida[3] (1.University of Shizuoka, 2.Japan Meteorological Agency, 3.Shizuoka University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SSS10-11] Spatial and temporal distributions of *b*-values related to long-term slow-slip and low-frequency earthquakes in the Bungo Channel and Hyuga-nada regions, Japan

*Keita Chiba[1] (1.Institute of Seismology and Volcanology, Faculty of Science, Kyushu University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[SSS10-12] 4D b-Value Mapping for Japan

*Yasushi Harada[1], Yuichi Akamine[1], Masayoshi Anzai[1] (1.School of Marine Science and Technology, Tokai University)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A09 TOKYO BAY MAKUHARI HALL

[S-SS11] Seismic wave propagation: Theory and Application

convener:Kiwamu Nishida(Earthquake Research Institute, University of Tokyo), Kazuya Shiraishi(Japan Agency for Marine-Earth Science and Technology), Takao Nibe(JAPEX), Kaoru Sawazaki(National Research Institute for Earth Science and Disaster Resilience), Chairperson:Shunsuke Takemura(防災科研)

9:01 AM - 9:23 AM JST | 12:01 AM - 12:23 AM UTC

[SSS11-13] Fluid flows inferred from microseismic events associated with injection test in Okuaizu Geothermal Field

★Invited Papers

*Kyosuke Okamoto[1], Li Yi[2], Hiroshi Asanuma[1], Takashi Okabe[3], Yasuyuki Abe[4], Masatoshi Tsuzuki[5] (1.National Institute of Advanced Industrial Science and Technology, 2.Osaka University, 3.Geothermal Energy Research and Development Co., Ltd., 4.Okuaizu Geothermal Co., Ltd., 5.Japan Oil, Gas and Metals National Corporation)

9:23 AM - 9:45 AM JST | 12:23 AM - 12:45 AM UTC

[SSS11-14] 3D distribution of intrinsic attenuation factors and random velocity fluctuations in southwestern Japan inferred from seismogram envelopes

★Invited Papers

*Masashi Ogiso[1] (1.Meteorological Research Institute, Japan Meteorological Agency)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SSS11-15] Regional to teleseismic strong ground motions from a 610 km deep 24 May 2013 Sea of Okhotsk earthquake

*Takashi Furumura[1], Brian LN Kennett[2] (1.Earthquake Research Institute The University of Tokyo, 2.Research School of Earth Sciences, The Australian National University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SSS11-16] Trial estimation of eclogitization depths within subducting oceanic crust of the Philippine Sea slab inferred from head wave propagating along the oceanic Moho

*Shunsuke Takemura[1], Takashi Tonegawa[2], Junichi Nakajima[3], Katsuhiko Shiomi[1] (1.National Research Institute for Earth Science and Disaster Resilience, 2.Japan Agency for Marine-Earth Science and Technology , 3.Tokyo Institute of Technology)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SSS11-17] **Transient gravity perturbations due to a buried gravitational source in a homogeneous elastic half space**

*Aditya Nitin Deshmukh[1], Pratik Laxman Borate[1], Abhishek Venkatesh Chitgopkar[1], Nobuki Kame[2], Ranjith Kunnath[1] (1.Mahindra Ecole Centrale, Hyderabad, India , 2.Division of Theoretical Geoscience, Earthquake Research Institute, University of Tokyo, Japan)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-SS14] Fault Rheology and Earthquake Physics

convener:Keishi Okazaki(Japan Agency for Marine-Earth Science and Technology), Hideki Mukoyoshi(Department of Geoscience Interdisciplinary Graduate School of Science and Engineering, Shimane University), Hiroyuki Noda(Kyoto University, Disaster Prevention Research Institute), Keisuke Yoshida(Tohoku University), Chairperson:Keisuke Yoshida(東北大学大学院理学研究科 地球物理学専攻), Keishi Okazaki(JAMSTEC)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SSS14-01] **Spatio-temporal Evolution of Micro-Earthquakes illuminated by “0.1 manten” Hyper Dense Seismic Observation: Implication of Fault Growth**

*Aitaro Kato[1], Shin'ichi Sakai[1], Satoshi Matsumoto[2], Yoshihisa Iio[3] (1.Earthquake Research Institute, the University of Tokyo, 2.Kyushu University, 3.Kyoto University)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SSS14-02] Estimation of fault model of the 2017 Pohang, South Korea earthquake using seismic and geodetic analyses

*Sun-Cheon Park[1], Won-Jin Lee[2], Geunyoung Song[1], Duk Kee Lee[1] (1.Korea Meteorological Administration, 2.National Institute of Environmental Research)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SSS14-03] Estimation of rupture directivity, fault plane, and stress drop of small earthquakes in inland areas of Japan

*Keisuke Yoshida[1], Tatsuhiko Saito[2], Kentaro Emoto[1], Yumi Urata[2] (1.Tohoku University, 2.NIED)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SSS14-04] **Possible aseismic phenomena causing the hypocenter migration in the precursory activity and aftershocks of the 2017 M 5.3 Kagoshima Bay earthquake, Kyusyu, SW Japan**

*Yoshiaki Matsumoto[1], Keisuke Yoshida[1], Toru Matsuzawa[1], Akira Hasegawa[1] (1.Research Center for Prediction of Earthquakes and Volcanic Eruptions, Tohoku University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SSS14-05] Stress and pore fluid pressure changes in fault zone preceding the earthquake occurrence

*Teruo Yamashita

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[SSS14-06] Micromechanical model of fluid-induced seismicity to reproduce observed spatiotemporal changes in source parameters and on-fault fluid diffusion

*Daisuke Sato[1], Keisuke Yoshida[2] (1.Disaster Prevention Research Institute, Kyoto University, 2.Tohoku University)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A02 TOKYO BAY MAKUHARI HALL

[S-SS15] Active faults and paleoseismology

convener:Mamoru Koarai(Earth Science course, College of Science, Ibaraki University), Takashi OGAMI(National Institute of Advanced Industrial Science and Technology), Ryosuke Doke(Hot Springs Research Institute of Kanagawa Prefecture), Hisao Kondo(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Chairperson:Mamoru KOARAI(Ibaraki University), Taku Komatsubara(産業技術総合研究所)

3:30 PM - 4:00 PM JST | 6:30 AM - 7:00 AM UTC

[SSS15-01] Historical documents and oral transmissions on historical tsunamis in the Paciffic coast of Tohoku

★Invited Papers

*ebina yuichi[1] (1.International Research Institute of Disaster Science)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SSS15-02] Co-seismic crustal movements along reverse faults which subsidence component is larger than uplifting component

*Taku Komatsubara[1] (1.Institute of Geology and Geoinformation, Advanced Industrial Science and Technology)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SSS15-03] The Iyo-Bungo, southwest Japan, earthquake on September 1st, 1596 as deduced from contemporary historical records

*Katsuhiko Ishibashi[1] (1.Emeritus Professor, Kobe University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SSS15-04] Geologically recorded historical and prehistoric tsunamis in the Tonankai region

*Shigehiro Fujino[1], Haruo Kimura[2], Junko Komatsubara[3], Dan Matsumoto[3], Yuichi Namegaya[3], Yuki Sawai[3], Masanobu Shishikura[3] (1.Faculty of Life and Environmental Sciences, University of Tsukuba, 2.Civil Engineering Research Laboratory, Central Research Institute of Electric Power Industry, 3.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST))

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | IC 2F

[S-VC38] Active Volcanism

convener:Yuta Maeda(Nagoya University), Takahiro Miwa(National research institute for earth science and disaster prevention), Takeshi Nishimura(Department of Geophysics, Graduate School of Science, Tohoku University), Chairperson:Fukashi Maeno, Yosuke Aoki

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SVC38-06] A sequence of volcanic flank collapse and tsunami event on 22 December 2018 at Anak Krakatau volcano, Indonesia

*Fukashi Maeno[1], Takayuki Kaneko[1] (1.Earthquake Research Institute, University of Tokyo)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SVC38-07] The 2018 eddifice collapse event of Anak Krakatau, Indonesia: Telseismic waveform analysis and tsunami simulation

*Shingo Watada[1], Iyan E. Mulia[1], Masumi Yamada[2], Dimas Sianipar[3] (1.Earthquake Research Institute, University of Tokyo, 2.Disaster Prevention Research Institute, Kyoto University, 3.TIGP-ESS Academia Sinica, National Central University, Taiwan)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SVC38-08] The 2018 edifice collapse event of Anak Krakatau, Indonesia: Landslide movement history estimated from seismic waveforms

*Masumi Yamada[1], Shingo Watada[2], Haruhisa Nakamichi[1], Iyan Mulia[2], Karyono Dr.[3] (1.Disaster Prevention Research Institute, Kyoto University, 2.Earthquake Research Institute, University of Tokyo, 3.Center for Earthquake and Tsunami, BMKG)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SVC38-09] Intense Swarm Activity in the Vicinity of Yake-dake Volcano, Central Japan, Started in November 2018

*Shiro Ohmi[1] (1.Earthquake Hazards Division, Disaster Prevention Research Institute, Kyoto University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SVC38-10] Change of the volcanic activity at Kuju volcano.

*Mori Takehiko[1], Muga Yaguchi[1], Yasushi Kawamura[2], Hideyuki Hiramatsu[3], Keiji Ikeda[2], Sugai Akira[2], Michitomo Sugahara[2], Kenichi Takata[2], Kyo Matsumoto[2], Fukuoka Regional Headquarters Japan Meteorological Agency, Oita Meteorological Office Japan Meteorological Agency (1. Meteorological Research Institute, Japan Meteorological Agency, 2.Fukuoka Regional Headquarters, Japan Meteorological Agency, 3.Oita Meteorological Office, Japan Meteorological Agency)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SVC38-11] Posteruptive Thermoelastic Deflation of Intruded Magma in Usu Volcano, Japan, 1992–2017

*Yosuke Aoki[1], Xiaowen Wang[1] (1.Earthquake Research Institute, University of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | IC 2F

[S-VC38] Active Volcanism

convener:Yuta Maeda(Nagoya University), Takahiro Miwa(National research institute for earth science and disaster prevention), Takeshi Nishimura(Department of Geophysics, Graduate School of Science, Tohoku University), Chairperson:Jun Oikawa, Takeshi Tameguri

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SVC38-12] Volcanic tremors and ash fall volumes associated with the 2018 vulcanian eruptions of Shinmoe-dake

*Jun Oikawa[1], Yasuhisa Tajima[2] (1.Earthquake Research Institute, University of Tokyo, 2.NIPPON KOEI CO.,LTD.)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SVC38-13] Crustal deformation around the Kirishima Volcano Group detected by GNSS and SAR observation after 2018 eruption.

*Hiroshi Yarai[1], Tomokazu Kobayashi[1], Satoshi Fujiwara[1], Tomokazu Kobayashi[1], Hiroshi Munekane[1], Masaki Honda[1], Kyonosuke Hayahsi[1], Satoshi Kawamoto[1], Atsuko Oowaki[1] (1.GSI of Japan)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SVC38-14] Harmonic tremor during 2011 eruption at Shinmoedake, Japan

*Minoru Takeo[1] (1.Earthquake Research Institute, University of Tokyo)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SVC38-15] Forecasting Volcanic Eruption of Sakurajima Volcano Based on Magma Intrusion Rate

*Masato Iguchi[1], Takeshi Tameguri[1], Jun-ichi Hirabayashi, Haruhisa Nakamichi[1] (1.Sakurajima Volcano Research Center, Disaster Prevention Research Institute, Kyoto University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SVC38-16] Tilt and strain change before and after the explosion at Minami-dake, Sakurajima, in 2017

*Kohei Hotta[1], Masato Iguchi[2] (1.University of Toyama, 2.Disaster Prevention Research Institute, Kyoto University)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SVC38-17] Pyroclastic Flow Accompanied with an Eruption on June 16, 2018 at Sakurajima Volcano

*Takeshi Tameguri[1], Masato Iguchi[1], Masayuki Maki[2], Haruhisa Nakamichi[1], Daisuke Miki[1] (1.Sakurajima Volcano Research Center,Disaster Prevention Research Institute, Kyoto University, 2.Research Field in Integrated Studies,Kagoshima University)

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | IC 2F

[S-VC38] Active Volcanism

convener:Yuta Maeda(Nagoya University), Takahiro Miwa(National research institute for earth science and disaster prevention), Takeshi Nishimura(Department of Geophysics, Graduate School of Science, Tohoku University), Chairperson:Hiroshi Aoyama, Satoshi Miura

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SVC38-18] Ground deformation observed at the crater area of Tokachidake volcano

*Hiroshi Aoyama[1], Takeshi Hashimoto[1], Ryo Tanaka[1], Hiromitsu Oshima[1], Koichiro Saito[2], Tsuyoshi Michishita[2], Satoshi Okuyama[2], Volcanic Observation and Warning Center Sapporo Regional Headquarters[2] (1.Institute of Seismology and Volcanology, Faculty of Science, Hokkaido University, 2.Japan Meteorological Agency)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SVC38-19] Moment tensor inversion of very-long-period seismicity at Stromboli volcano based on a very-near-field observation

*Shunsuke Sugimura[1,2], Maurizio Ripepe[2], Giorgio Lacanna[2], Denis Legrand[3], Sébastien Valade[4], Takeshi Nishimura[1] (1.Department of Geophysics, Graduate School of Science, Tohoku University, 2.Department of Earth Sciences, University of Florence, Italy, 3.UNAM University, Mexico, 4.GFZ-German Research Centre for Geosciences, Potsdam, Germany)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SVC38-20] Pressure source estimation of tilt changes associated with small explosions at Stromboli volcano

*Ayumu Ishikawa[1], Takeshi Nishimura[1], Hiroshi Aoyama[2], Ryohei Kawaguchi[3], Eisuke Fujita[4], Takahiro Miwa[4], Taishi Yamada[4], Maurizio Ripepe[5], Riccardo Genco[5] (1.Graduate school of science, Tohoku university, 2.Faculty of science, Hokkaido university, 3.Meteorological Research Institute, 4.National Research Institute for Earth Science and Disaster Resilience, 5.University of Florence)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SVC38-21] Seismic and acoustic waves excited by volcanic explosion: analyses of energy ratio and source spectra

*Mohammad Hasib[1], Takeshi Nishimura[1], Hisashi Nakahara[1] (1.Department of Geophysics, Graduate School of Science, Tohoku University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SVC38-22] Field survey report on Zao Volcano (2012–2018)

*Akio Goto[1], Noriyoshi Tsuchiya[2], Nobuo Hirano[2], Miwa Kuri[3], Tetsuya Matsunaka[4], Kengo Sawayama[2] (1.Center for Northeast Asian Studies, Tohoku University, 2.Graduate School of Environmental Studies, Tohoku University, 3.International Research Institute of Disaster Science, Tohoku University, 4.Institute of Nature and Environmental Technology, Kanazawa University)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SVC38-23] Inflation Event of Zao Volcano in 2015

*Satoshi Miura[1], Mare Yamamoto[1], Masahiro Ichiki[1], Tomotsugu Demachi[1] (1.Graduate School of Science, Tohoku University)

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | IC 2F

[S-VC38] Active Volcanism

convener:Yuta Maeda(Nagoya University), Takahiro Miwa(National research institute for earth science and disaster prevention), Takeshi Nishimura(Department of Geophysics, Graduate School of Science, Tohoku University), Chairperson:Mare Yamamoto, Yuta Maeda(Nagoya University)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SVC38-24] A machine-learning-based estimation of large amplitude regions for monitoring volcano seismicity

*Yuta Maeda[1] (1.Nagoya University)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SVC38-25] Development of a technique for automatic determination of volcanic earthquakes with unclear onsets - Application to Mt. Asama -

*Takao Ohminato[1], Shigeki Horiuchi[2] (1.Earthquake Research Institute, Tokyo University, 2.Home Seismometer Corporation)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SVC38-26] Amplitude source location method with depth-dependent scattering and attenuation structures for volcano-seismic signals

*Hiroyuki Kumagai[1], John Makario Lonodno[2], Alvaro Esteban Acevedo Rivas[2], Yuta Maeda[1] (1.Graduate School of Environmental Studies, Nagoya University, 2.Colombian Geological Survey)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SVC38-27] Seismic interferometry at active volcanoes in Japan: Analyses of seismic records of JMA for the period from 2012 to 2018

*Takeshi Nishimura[1], Tomoya Takano[1], Takashi Hirose[1], Hisashi Nakahara[1] (1.Department of Geophysics, Graduate School of Science, Tohoku University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SVC38-28] Empirical relation for *Q* factors of crack resonances and its use to estimate source properties of volcanic LP events

*Kimiko Taguchi[1], Hiroyuki Kumagai[1], Yuta Maeda[1], Roberto Torres[2] (1.Nagoya University Environmental Studies, 2.Colombian Geological Survey)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[SVC38-29] A study on the radiation pattern for resonating fluid-filled crack

*Mare Yamamoto[1] (1.Research Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A09 TOKYO BAY MAKUHARI HALL

[S-CG54] Rheology, fracture and friction in Earth and planetary sciences

convener:Miki Tasaka(Shimane University), Osamu Kuwano(Japan Agency for Marine-Earth Science and Technology), Ichiko Shimizu(Division of Earth and Planetary Sciences, Graduate School of Science, Kyoto University), Hidemi Ishibashi(Faculty of Science, Shizuoka University), Chairperson:Osamu Kuwano(Japan Agency for Marine-Earth Science and Technology (JAMSTEC)), Ichiko Shimizu

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SCG54-01] Rheology of granular materials near the jamming transition under oscillatory shear

★Invited Papers

*Michio Otsuki[1], Hisao Hayakawa[2] (1.Graduate School of Engineering Science, Osaka University, 2.Yukawa Institute for Theoretical Physics, Kyoto University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SCG54-02] The real-scale numerical sandbox experiments for understanding stress state in accretionary prisms

*Mikito Furuichi[1], Arthur Bauville[1], Daisuke Nishiura[1], Takane Hori[1], Osamu Kuwano[1] (1.Japan Agency for Marine-Earth Science and Technology)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SCG54-03] Numerical analysis on the fracture of Maxwell fluid by phase field models

*Masaharu Kameda[1], Keita Yamanishi[1], Akinori Yamanaka[1], Mie Ichihara[2] (1.Department of Mechanical Systems Engineering, Tokyo University of Agriculture and Technology, 2.Earthquake Research Institute, The University of Tokyo)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SCG54-04] Diagenesis- and earthquake-driven transformations of carbonaceous materials and their implication for frictional strength and earthquake rupture dynamics in carbon-bearing plate-subduction faults

*Shunya Kaneki[1], Tetsuro Hirono[1] (1.Graduate School of Science, Osaka University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SCG54-05] Viscous behavior of chert during frictional melting

*Ginta Motohashi[1], Kiyokazu Oohashi[2], Kohtaro Ujiie[1] (1.University of Tsukuba, 2.Yamaguchi University)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SCG54-06] Effect of friction and comminution on the optically-stimulated luminescence of quartz grains

*Kiyokazu Oohashi[1], Koji Akasegawa[2], Yuki Minomo[1], Noriko Hasebe[3], Kazumasa Miura[4] (1.Graduate School of Sciences and Technology for Innovation, Yamaguchi University, 2.Daiwa Exploration & Consulting Co., Ltd., 3.Institute of Nature and Environmental Technology, Kanazawa University, 4.Graduate School of Natural Science & Technology, Kanazawa University)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A09 TOKYO BAY MAKUHARI HALL

[S-CG54] Rheology, fracture and friction in Earth and planetary sciences

convener:Miki Tasaka(Shimane University), Osamu Kuwano(Japan Agency for Marine-Earth Science and Technology), Ichiko Shimizu(Division of Earth and Planetary Sciences, Graduate School of Science, Kyoto University), Hidemi Ishibashi(Faculty of Science, Shizuoka University), Chairperson:Miki Tasaka(島根大学), Hidemi Ishibashi(Shizuoka University)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SCG54-07] Frictional behaviors of smectite clay: constraints for the mobility of slow-moving landslides in the cold season

★Invited Papers

*Tatsuya Shibasaki[1], Sumio Matsuura[2] (1.Japan Conservation Engineers and Co., Ltd, 2.DPRI, Kyoto University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SCG54-08] Strength of a deep fault zone along the Median Tectonic Line: Influence of chrolite friction

*Ichiko Shimizu[1], Ayumi S. Okamoto, Andre R. Niemeijer[2], Christopher J. Spiers[2], Shun Arai[3], Toru Takeshita[4] (1.Division of Earth and Planetary Sciences, Graduate School of Science, Kyoto University, 2.Faculty of Geosciences, Utrecht University, 3.Tohoku University, 4.Hokkaido University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SCG54-09] Changes in seismic wave velocity during brittle deformation of gabbro and peridotite

*Yuya Akamatsu[1], Ikuo Katayama[1] (1.Hiroshima University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SCG54-10] Dislocation textures in shock-compressed MgO and their formation mechanisms

*Kiyoshi Fujino[1], Xun Liu[2], Tsutomu Mashimo[2] (1.Geodynamics Research Center, Ehime University, 2.Institute of Pulsed Power Science, Kumamoto University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SCG54-11] Development of rotational diamond anvil cell and large strain deformation experiments of lower-mantle materials

★Invited Papers

*Shintaro Azuma[1,2], Ryuichi Nomura[3,4], Kentaro Uesugi[5], Yu Nishihara[4], Doi Shunta[4], Takeshi Arimoto[4], Tetsuo Irifune[4] (1.Tokyo Tech., 2.Kyushu Univ., 3.Kyoto Univ., 4.Ehime Univ., 5.Japan Synchrotron Radiation Research Institute (JASRI))

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SCG54-12] Rheology of hcp-iron

*Yu Nishihara[1], Doi Shunta[1], Noriyoshi Tsujino[2], Daisuke Yamazaki[2], Yuji Higo[3] (1.Geodynamics Research Center, Ehime University, 2.Institute of Planetary Materials, Okayama University, 3.Japan Synchrotron Radiation Research Institute)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | Convention Hall A 2F

[S-CG61] Dynamics in mobile belts

convener:Yukitoshi Fukahata(Disaster Prevention Research Institute, Kyoto University), Toru Takeshita(Department of Natural History Sciences, Graduate School of Science, Hokkaido University), Hikaru Iwamori(Geochemical Evolution Research Program, Japan Agency for Marine-Earth Science and Technology), Chairperson:Keisuke Yoshida(東北大学大学院理学研究科 地球物理学専攻), Masaoki Uno(東北大学)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SCG61-13] Deciphering dynamics of thermal events at lithosphere-asthenosphere boundary from peridotite xenoliths of Ichinomegata maar, NE Japan

*Yuto Sato[1], Kazuhito Ozawa[1] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SCG61-14] **Experimental investigation of reaction-induced stress and permeability evolution in MgO–H_2O system**

*Masaoki Uno[1], Hisamu Kasahara[1], Atsushi Okamoto[1], Noriyoshi Tsuchiya[1] (1.Graduate School of Environmental Studies, Tohoku University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SCG61-15] Fluid-Flow, Resistivity and Elastic Wave Velocity Simulation of Digital Rock Fracture and Comparison with Experimental Data

*Kazuki Sawayama[1], Fei Jiang[2], Takuya ISHIBASHI[3], Takeshi Tsuji[4], Yasuhiro Fujimitsu[4] (1.Department of Earth Resources Engineering, Graduate school of engineering, Kyushu University, 2.Department of Mechanical Engineering, Faculty of Engineering, Yamaguchi University, 3.Fukushima Renewable Energy Institute, National Institute of Advanced Industrial Science and Technology, 4.Department of Earth Resources Engineering, Faculty of engineering, Kyushu University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SCG61-16] Fluid distribution in the crust – inference from seismic velocity and electrical conductivity

*Tohru Watanabe[1], Kenta Yoshida[2] (1.Gradudate School of Science and Engineering, University of Toyama, 2.Research and Development Center for Ocean Drilling Science, Japan Agency for Marine-earth Science and Technology)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SCG61-17] The seismological structure about fault zone extending to the lower crust in the northern Kinki district, southwestern Japan

*Shinya Kato[1], Yoshihisa Iio[1], Takuo Shibutani[1], Hiroshi Katao[1], Masayo Sawada[1], Kazuhide Tomisaka[1] (1.Disater Prevention Research Institute, Kyoto University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SCG61-18] Inland repeating earthquakes in the vicinity of low frequency earthquakes around Hakodate, Hokkaido

*Keisuke Yoshida[1], Akira Hasegawa[1], Shinako Noguchi[2], Keiji Kasahara[2] (1.Tohoku University, 2. Association for the Development of Earthquake Prediction)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | Convention Hall A 2F

[S-CG61] Dynamics in mobile belts

convener:Yukitoshi Fukahata(Disaster Prevention Research Institute, Kyoto University), Toru Takeshita(Department of Natural History Sciences, Graduate School of Science, Hokkaido University), Hikaru Iwamori(Geochemical Evolution Research Program, Japan Agency for Marine-Earth Science and Technology), Chairperson:Bunichiro Shibazaki, Daisuke Sato

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SCG61-19] Modeling strain concentration and mountain building processes in central Japan considering heterogeneous rheological structure

*Bunichiro Shibazaki[1] (1.International Institute of Seismology and Earthquake Engineering, Building Research Institute)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SCG61-20] Inelastic strain rate and deviatoric stress field of the seismic gap in west part of Kyushu, Japan, estimated from seismic and geodetic data

*Yuhei Yuasa[1], Satoshi Matsumoto[2], Shigeru Nakao[3], Takeshi Matsushima[2], Takahiro Ohkura[4] (1.Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University, 2.Institute of Seismology and Volcanology, Faculty of Sciences, Kyushu University, 3.Department of Earth and Environmental Sciences, Graduate School of Science and Engineering, Kagoshima University, 4.Aso Volcanological Laboratory, Institute for Geothermal Sciences, Graduate School of Science, Kyoto University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SCG61-21] Persistent and time-dependent crustal deformation in northern Fossa Magna and its tectonic implications

*Takeshi Sagiya[1], Koki Kumagai[2], Angela Meneses-Gutierrez[3], Nobuhisa Matsuta[4], Daisuke Hirouchi[5], Kenjiro Matsuhiro[2], Takashi OKUDA[2] (1.Disaster Mitigation Research Center, Nagoya University, 2.Graduate School of Environmental Studies, Nagoya University, 3.Disaster Prevention Research Institute, Kyoto University, 4.Graduate School of Education, Okayama University, 5.Faculty of Education, Shinshu University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SCG61-22] Unexpected relationship between ΔCFF and the strain-rate paradox: separation of plastic strain from inelastic strain

*Yukitoshi Fukahata[1], Angela Meneses-Gutierrez[1], Takeshi Sagiya[2] (1.Disaster Prevention Research Institute, Kyoto University, 2.Disaster Mitigation Research Center, Nagoya University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SCG61-23] Active period of inland earthquakes based on numerical simulation of megathrust earthquake cycle incorporating viscoelasticity

*Tsukasa MITOGAWA[1], Takuya NISHIMURA[2] (1.Graduate School of Science, Kyoto University, 2.Disaster Prevention Research Institute, Kyoto University)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SCG61-24] Influence of viscoelastic relaxation on estimated interplate coupling along the Nankai Trough, southwest Japan

*Takuya NISHIMURA[1], Fred F Pollitz[2] (1.Disaster Prevention Research Institute, Kyoto University, 2.U.S. Geological Survey)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | Convention Hall A 2F

[S-CG61] Dynamics in mobile belts

convener:Yukitoshi Fukahata(Disaster Prevention Research Institute, Kyoto University), Toru Takeshita(Department of Natural History Sciences, Graduate School of Science, Hokkaido University), Hikaru Iwamori(Geochemical Evolution Research Program, Japan Agency for Marine-Earth Science and Technology), Chairperson:Naoki Uchida, Takeshi Iinuma

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SCG61-25] Revisiting the Forearc Sliver Scenario Along the Southern Kurile Trench to Reconcile Interdisciplinary Observations

*Yuji ITOH[1], Kelin WANG[2], Takuya NISHIMURA[3] (1.Graduate School of Science, Kyoto University, 2.Pacific Geoscience Centre, Geological Survey of Canada, 3.Disaster Prevention Research Institute, Kyoto University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SCG61-26] Segmentation of crustal deformation area within the Sanriku coast, northeast Japan, on the basis of spatial distribution of millennial-scale crustal movements

*Yuichi Niwa[1] (1.Faculty of Science and Engineering, Chuo University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SCG61-27] Shear wave splitting east off NE Japan based on the S-net data

*Naoki Uchida[1], Junichi Nakajima[2], Ryota Takagi[1], Keisuke Yoshida[1], Takashi NAKAYAMA[1], Ryota Hino[1], Tomomi Okada[1], Youichi Asano[3], Sachiko Tanaka[3] (1.Research Center for Prediction of Earthquakes and Volcanic Eruptions Graduate School of Science, Tohoku University, 2.Department of Earth and Planetary Sciences, Graduate School of Science and Engineering, Tokyo Institute of Technology, Tokyo, 3.National Research Institute for Earth Science and Disaster Resilience)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SCG61-28] Gravity anomaly due to active faults and crustal rheology in the northeastern Japan arc inferred by fault dislocation model

*Mitsuhiro Hirano[1], Hiroyuki Nagahama[1], Jun Muto[1] (1.tohoku university)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SCG61-29] On the temporal decay of the localized strain rate in the Tohoku region after the Tohoku-Oki earthquake

*Youichiro Takada[1], Tomomi Inamatsu[2] (1.Faculty of Science, Hokkaido University, 2.Dept. Natural History Sciences, Hokkaido University)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SCG61-30] Revisiting the Coseismic Slip Distribution of the 2011 Tohoku-oki Earthquake Considering Early Postseismic Deformation, Non-linear Viscoelasticity, and Heterogeneous Structure

*Takeshi Iinuma[1], Ryoichiro Agata[1], Yusaku Ohta[2], Ryota Hino[2], Takane Hori[1] (1.Japan Agency for Marine-Earth Science and Technology (JAMSTEC), 2.Graduate School of Science, Tohoku University)

[J] Oral | B (Biogeosciences) : B-BC Biogeochemistry

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 201A 2F

[B-BC03] Interrelation between Life, Water, Mineral, and Atmosphere

convener:Takeshi Kakegawa(Graduate School of Science, Tohoku University), Tadashi Yokoyama(Graduate School of Integrated Arts and Sciences, Hiroshima University), Keisuke Fukushi(Institute of Nature & Environmental Technology, Kanazawa University), Fumito Shiraishi(Department of Earth and Planetary Systems Science, Graduate School of Science, Hiroshima University), Chairperson:Tadashi Yokoyama, Keisuke Fukushi

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[BBC03-01] Chemical speciation analysis of the brown and black precipitates observed in the gill chamber of the vent shrimp *Rimicaris kairei*

*Masanari Hikosaka[1], Yoshio Takahashi[2], Chong Chen[3], Robert Jenkins[1] (1.Kanazawa University, 2.Tokyo University, 3.Japan Agency for Marine-Earth Science and Technology)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[BBC03-02] Experimental study on hydrogen generation during low temperature serpentinization by using natural samples

*Shunta Higashino[1], Ryohei Kawakita[1], Tsubasa Otake[2], Tsutomu Sato[2] (1.Graduate School of Engineering, Hokkaido University, 2.Faculty of Engineering, Hokkaido University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[BBC03-03] **Constraint on the origin of methane from Hakuba Happo serpentinite-hosted hot spring by using $^{14}CH_4$ and noble gas isotope**

*Konomi Suda[1], Takahiro AZE[2], Yosuke Miyairi[2], Yusuke Yokoyama[2], Yohei Matsui[3,2], Hisahiro Ueda[3], Takuya Saito[3], Tomohiko Sato[4], Yusuke Sawaki[2], Ryosuke Nakai[1], Hideyuki Tamaki[1], Hiroshi A Takahashi[1], Noritoshi Morikawa[1] (1.National Institute of Advanced Industrial Science and Technology, 2.The University of Tokyo, 3.Japan Agency for Marine-Earth Science and Technology, 4.Tokyo Institute of Technology)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[BBC03-04] Inhibition of calcium silicate hydrate formation by lignosulfonate and lignin

*Kanako Toda[1], Tsubasa Otake[1], Tsutomu Sato[1] (1.Laboratory of Environmental Geology, Faculty of Engineering, Hokkaido University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[BBC03-05] Calcium carbonate formation processes on cyanobacterial surface

*Fumito Shiraishi[1], Takeru Omori[1], Naotaka Tomioka[2], Satoko Motai[2], Hiroki Suga[3], Yoshio Takahashi[3] (1.Hiroshima University, 2.JAMSTEC, 3.The University of Tokyo)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[BBC03-06] Mineralogical and geochemical study on sedimentary rock containing microfossils from 1.9 billion years ago(Ga) Gunflint Formation, Canada

*kouhei Sasaki[1], Akizumi Ishida[1], Takeshi Kakegawa[1] (1.Graduate School of Science, Tohoku University)

[J] Oral | B (Biogeosciences) : B-BC Biogeochemistry

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 201A 2F

[B-BC03] Interrelation between Life, Water, Mineral, and Atmosphere

convener:Takeshi Kakegawa(Graduate School of Science, Tohoku University), Tadashi Yokoyama(Graduate School of Integrated Arts and Sciences, Hiroshima University), Keisuke Fukushi(Institute of Nature & Environmental Technology, Kanazawa University), Fumito Shiraishi(Department of Earth and Planetary Systems Science, Graduate School of Science, Hiroshima University), Chairperson:Takeshi Kakegawa, Fumito Shiraishi(Hiroshima Univ.)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[BBC03-07] Secular variation of multiple sulfur isotopic compositions of sulfate and sulfide during long term incubation of *Desulfovibrio desulfuricans*

*Fumihiro Matsuura[1], Hiroko Makita[2], Ken Takai[3], Yuichiro Ueno[1,3] (1.Tokyo Institute of Technology, 2.Tokyo University of Marine Science and Technology, 3.Japan Agency for Marine-Earth Science & Technology (JAMSTEC))

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[BBC03-08] **Origins of volcanic SO_2 on Earth**

*Hiroshi Ohmoto[1] (1.The Pennsylvania State University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[BBC03-09] **Volcanism, sedimentation, and development of life in a Mesoarchaean intracratonic setting: the Dominion Group, South Africa**

*Andrea Agangi[1,2], Axel Hofmann[2], Dora Paprika[2], Andrey Bekker[2,3], Frantz Ossa-Ossa[2,4] (1.Akita University, 2.University of Johannesburg, 3.University of California, 4.University of Tuebingen)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[BBC03-10] New microbial ecology results from genome centered metagenomics studies of iron carbonate and sulfidic hot springs

*Shawn E McGlynn[1], Lewis Ward[2], Takeshi Kakegawa[3], Yuichiro Ueno[1], Mayuko Nakagawa[1] (1.Earth-Life Science Institute, Tokyo Institute of Technology, 2.Harvard University, 3.Tohoku University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[BBC03-11] Superhabitability in ultradeep rocky environments

*Yohey Suzuki[1] (1.Graduate School of Science, The University of Tokyo)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[BBC03-12] Exploring planetary habitability beneath the oceans

★Invited Papers

*Fumio Inagaki[1] (1.Japan Agency for Marine-Earth Science and Technology)

[J] Oral | B (Biogeosciences)：B-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 105 1F

[B-CG08] Phanerozoic biodiversity change: Extinction and diversification

convener:Yukio Isozaki(Department of Earth Science and Astronomy, Multi-disciplinary Sciences - General Systems Studies, Graduate School of Arts and Sciences, The University of Tokyo), Yusuke Sawaki(The University of Tokyo), Chairperson:Yukio Isozaki(Department of Earth Science and Astronomy, The University of Tokyo), Yusuke Sawaki(The University of Tokyo)

10:50 AM - 11:10 AM JST | 1:50 AM - 2:10 AM UTC

[BCG08-01] **The Ediacaran-Cambrian transition of North China**

★Invited Papers

*Xingliang Zhang[1] (1.State Key Laboratory of Continental Dynamics, Shaanxi Key Laboratory of Early Life and Environments, and Department of Geology, Northwest University)

11:10 AM - 11:30 AM JST | 2:10 AM - 2:30 AM UTC

[BCG08-02] The Qingjiang biota – An extraordinary new Burgess Shale-type fossil Lagerstätte from the early Cambrian of South China

★Invited Papers

*Dongjing Fu[1], Xingliang Zhang[1], Robert R. Gains[2] (1.State Key Laboratory of the Continental Dynamics, Shaanxi Key Laboratory of Early Life and Environment, Department of Geology, Northwest University, Xi'an 710069, PR China, 2.Department of Geology, Pomona College, Claremont, CA 91711, USA)

11:30 AM - 11:50 AM JST | 2:30 AM - 2:50 AM UTC

[BCG08-03] Enhanced flux of extraterrestrial ^{3}He across the Permian–Triassic boundary

★Invited Papers

*Tetsuji Onoue[1], Naoto Takahata[2], Honami Sato[4], Akira Ishikawa[3], Katsuhito Soda[1], Yuji Sano[2], Yukio Isozaki[2] (1.Kumamoto Univ., 2.Univ. Tokyo, 3.Tokyo Inst. Tech., 4.Chiba Inst. Tech.)

11:50 AM - 12:10 PM JST | 2:50 AM - 3:10 AM UTC

[BCG08-04] **End-Triassic Mass Extinction: Causes and Consequences**

★Invited Papers

*Wataru Fujisaki[1] (1.Japan Agency for Marine-Earth Science and Technology)

[J] Oral | B (Biogeosciences) : B-CG Complex & General

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 105 1F

[B-CG08] Phanerozoic biodiversity change: Extinction and diversification

convener:Yukio Isozaki(Department of Earth Science and Astronomy, Multi-disciplinary Sciences - General Systems Studies, Graduate School of Arts and Sciences, The University of Tokyo), Yusuke Sawaki(The University of Tokyo), Chairperson:Wataru Fujisaki(Japan Agency for Marine-Earth Science and Technology)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[BCG08-05] Transition of biodiversity in mobile populations and the small world in local subpopulations

*Kota Imaoka[1], Kazuhito Yamasaki[1] (1.Kobe University Graduate school of Science)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[BCG08-06] Rivision of the lowermost Cambrian SSF stratigraphy

*KONO SENA[1], Yukio Isozaki[1], Tomohiko Sato[2], Xingliang Zhang[3], Wei Liu[3] (1.The University of Tokyo School of Arts &Sciences, 2.Earth-Life Science Institute, Tokyo Institute of Technology, 3.Northwest university, China)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[BCG08-07] δ^{88}Sr and^{87}Sr/^{86}Srrecords of the Middle-Late Permian seawater: mass extinction-relevant change in ocean Sr budget

*Tomomi Kani[1], Yukio Isozaki[2], Keiji Misawa[3], Akira Ishikawa[4], Shigekazu Yoneda[5] (1.Kumamoto University, 2.The University of Tokyo, 3.National Institute of Polar Research, 4.Tokyo Tech, School of Science, 5.National Museum of Nature and Science)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[BCG08-08] Formation of stratiform manganese deposits during the Carnian (Late Triassic) “pluvial event” in the pelagic Panthalassa

*Yuki Tomimatsu[1], Tetsuji Onoue[2], Daisuke Yamashita[3], Tatsuo Nozaki[4,5,6,7], Yutaro Takaya[8] (1.Graduate school of Science and Technology, Kumamoto University, 2.Faculty of Advanced Science and Technology, Kumamoto University , 3.Satsumasendai City Office, 4.Research and Development Center for Submarine Resources, Japan Agency for Marine-Earth Science and Technology, 5.Frontier Research Center for Energy and Resources (FRC- ER), Graduate School of Engineering, Tokyo University, 6.Department of Planetology, Graduate School of Science, Kobe University, 7.Ocean Resources Research Center for Next Generation, Chiba Institute of Technology, 8.Department of Resources and Environmental Engineering School of Creative Science and Enginerring, Waseda University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[BCG08-09] Enrichment of chalcophile elements in Cretaceous–Paleogene boundary clays

*Teruyuki Maruoka[1], Yoshiro Nishio[2] (1.Faculty of Life and Environmental Sciences, University of Tsukuba, 2.Research and Education Faculty, Kochi University)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[BCG08-10] Mass extinctions: hierarchy of causes and cosmoclimatological perspective

*Yukio Isozaki[1] (1.Department of Earth Science and Astronomy, Multi-disciplinary Sciences - General Systems Studies, Graduate School of Arts and Sciences, The University of Tokyo)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 303 3F

[M-IS10] Interface- and nano-phenomena on crystal growth and dissolution

convener:Yuki Kimura(Institute of Low Temperature Science, Hokkaido University), Hitoshi Miura(Graduate School of Natural Sciences, Department of Information and Basic Science, Nagoya City University), Hisao Satoh(Naka Energy Research Laboratory, Mitsubishi Materials Corporation), Katsuo Tsukamoto(Graduate School of Engineering, Osaka University), Chairperson:Yuki Kimura (Institute of Low Temperature Science, Hokkaido University)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[MIS10-01] Fabrication of octacalcium phosphate block through a dissolutionprecipitation reaction and its biological evaluation

*Yuki Sugiura[1], Munar L Melvin[2], Kunio Ishikawa[2] (1.National Institute of Advanced Industrial Science and Technology, 2.Kyushu University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[MIS10-02] Development of optimized incineration process of fisheries waste for synthesizing a functional heat storage material

*Hidekazu Kobatake[1], SHinji Kirihara[1] (1.Hirosaki University Institute of Regional Innovation)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[MIS10-03] “Manipulated” Organic Crystallization and Two-step Dissolution Process Attained by Plasmonic Optical Tweezers

*Hiromasa Niinomi[1], Teruki Sugiyama[2,3,4], Miho Tagawa[5], Toru Ujihara[5], Katsuhiko Miyamoto[6,7], Takashige Omatsu[6,7], Jun Nozawa[1], Junpei Okada[1], Satoshi Uda[1] (1.Institute for Materials Research, Tohoku University, 2.Department of Applied Chemistry, National Chiao Tung University, 3.Center for Emergent Functional Matter Science, National Chiao Tung University, 4.Division of Materials Science, Nara Institute of Science and Technology, 5.Institute of Materials and Systems for Sustainability (IMaSS), Nagoya University, 6.Molecular Chirality Research Center (MCRC), Chiba University, 7.Graduate School of Engineering, Chiba University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[MIS10-04] Investigation of liquid cell transmission electron microscopy combined with antisolvent crystallization

*Tomoya Yamazaki[1], Yuki Kimura[1] (1.Institute of Low Temperature Science Hokkkaido University)

10:00 AM - 10:30 AM JST | 1:00 AM - 1:30 AM UTC

[MIS10-05] DNA-guided crystallization of nanoparticles: optimization of crystallization conditions and structure analysis

★Invited Papers

*Miho Tagawa[1], Shoko Kojima[1], Hayato Sumi[1], Arisa Nishibu[1], Takumi Isogai[1], Maasa Yokomori[2], Shunta Harada[1], Toru Ujihara[1], Katsuo Tsukamoto[1] (1.Nagoya University, 2.The University of Tokyo)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 303 3F

[M-IS10] Interface- and nano-phenomena on crystal growth and dissolution

convener:Yuki Kimura(Institute of Low Temperature Science, Hokkaido University), Hitoshi Miura(Graduate School of Natural Sciences, Department of Information and Basic Science, Nagoya City University), Hisao Satoh(Naka Energy Research Laboratory, Mitsubishi Materials Corporation), Katsuo Tsukamoto(Graduate School of Engineering, Osaka University), Chairperson:Hisao Satoh

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[MIS10-06] Growth mechanism of binary colloidal crystals

*Jun Nozawa[1], Suxia Guo[1], Hiromasa Niinomi[1], Junpei Okada[1], Satoshi Uda[1] (1.Tohoku University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[MIS10-07] Solution-Mediated-Transformation Kinetics of Norsethite

*Harutoshi Asakawa[1], Hiroshi Uneda[1], Itaru Echigo[1], Ryuichi Komatsu[1] (1.Graduate School of Sciences and Technology for Innovation Yamaguchi University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[MIS10-08] Formation of low-crystalline magnesium silicate in natural alkaline environment and flow-through experiments

*Yuto Nishiki[1], Misato Shimbashi[1], Tsutomu Sato[2], Tsubasa Otake[2] (1.Graduate School of Engineering, Hokkaido University, 2.Faculty of Engineering, Hokkaido University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[MIS10-09] Homogeneous Nucleation from Vapor in Al-O Binary System

*Shinnosuke Ishizuka[1], Jun Kawano[2], Tomoya Yamazaki[3], Tetsuya Hama[3], Yuki Kimura[3] (1.National Institute for Environmental Studies, 2.Faculty of Science, Hokkaido University, 3.Institute of Low Temperature Science, Hokkaido University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[MIS10-10] Crystal growth hysteresis in birth-and-spread mechanism

*Hitoshi Miura[1] (1.Graduate School of Natural Sciences, Department of Information and Basic Science, Nagoya City University)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A02 TOKYO BAY MAKUHARI HALL

[M-IS11] Aqua planetology

convener:Yasuhito Sekine(Earth-Life Science Insitute, Tokyo Institute of Technology), Tomohiro Usui(Earth-Life Science Institute, Tokyo Institute of Technology), Keisuke Fukushi(Institute of Nature & Environmental Technology, Kanazawa University), Takazo Shibuya(Japan Agency for Marine-Earth Science and Technology), Chairperson:Yasuhito Sekine(Dept. Earth & Planetary Sci., University of Tokyo), Takazo Shibuya(JAMSTEC), Tomohiro Usui

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[MIS11-13] A forward modeling of infrared reflectance spectra of asteroids

*Hiroyuki Kurokawa[1], Takazo Shibuya[2], Yasuhito Sekine[1], Bethany L Ehlmann[3,4] (1.ELSI, Tokyo Tech, 2.JAMSTEC, 3.Caltech, 4.JPL)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[MIS11-14] Estimation of formation mechanism and morphological condition in calcite concretion

*Takayuki Ihara[1], Sin-iti Sirono[1] (1.Nagoya University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[MIS11-15] Reconstructing groundwater hydrology and water-rock reactions around Gale Crater on early Mars

*Natsumi Noda[1,2], Yasuhito Sekine[1], Shuya Tan[1,2], Takazo Shibuya[3], Hidenori Genda[1] (1.Earth-Life Science Institute, Tokyo Institute of Technology, 2.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 3.Department of Subsurface Geobiological Analysis and Research, Japan Agency for Marine-Earth Science and Technology)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[MIS11-16] Habitable zone for a land planet

*Takanori Kodama[1], Hidenori Genda[2], Ryouta O'ishi[3], Ayako Abe-Ouchi[3] (1.University of Bordeaux, 2.Earth-Life Science Institute, Tokyo Institute of Technology, 3.Atmosphere and Ocean Research Institute, University of Tokyo)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[MIS11-17] A study on the dependence of ocean planet climate on solar constant: influence of oceanic heat transport in the case of large absorption coefficients of gray atmosphere

*Yuta Kawai[1,2], Yoshiyuki O. Takahashi[1], Masaki Ishiwatari[5], Kensuke Nakajima[3], Shin-ichi Takehiro[4], Hiroki Kashimura[1,6], Seiya Nishizawa[2], Hirofumi Tomita[2], Yoshi-Yuki Hayashi[1,6] (1.Kobe University, 2.RIKEN Center for Computational Science, 3.Kyusyu University, 4.Kyoto University , 5.Hokkaido University, 6.Center for Planetary Science)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[MIS11-18] Water cycle and its evolution: High-speed H_2O transport to upper atmosphere on Mars

★Invited Papers

*Hiromu Nakagawa[1], Shohei Aoki[1], Nao Yoshida[1], Naoki Terada[1], Takeshi Imamura[2], Kazunori Ogohara[3], Toru Kouyama[4], Hiroki Ando[6], Katsuyuki Noguchi[5], Akiho Miyamoto[1], Kosuke Takami[1], Isao Murata[1], Yasumasa Kasaba[1], IUVS team MAVEN (1.Planetary Atmosphere Physics Laboratory, Department of Geophysics, Graduate School of Science, Tohoku University, 2.Graduate school of Frontier sciences, University of Tokyo, 3.University of Shiga prefecture, 4.The National Institute of Advanced Industrial Science and Technology, 5.Nara Women's university, 6.Kyoto Sangyo university)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A02 TOKYO BAY MAKUHARI HALL

[M-IS21] Gas hydrate in environmental-resource sciences

convener:Hitoshi Tomaru(Department of Earth Sciences, Chiba University), Akihiro Hachikubo(Kitami Institute of Technology), Atsushi Tani(Graduate School of Human Development and Environment, Kobe University), Shusaku Goto(Institute for Geo-Resources and Environment National Institute of Advanced Industrial Science and Technology), Chairperson:Naoto Ishida, 戸丸 仁

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[MIS21-01] Equilibrium pressure of clathrate hydrates encaged $^{13}CH_4$

*Yuki Kikuchi[1], Akihiro Hachikubo[1], Takahiro Ozeki[1], Satoshi Takeya[2] (1.Kitami Institute of Technology, 2.National Institute of Advanced Industrial Science and Technology (AIST))

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[MIS21-02] Hydrogen isotopic fractionation of ethane encaged in different crystallographic structure

*Jumpei Matsuda[1], Akihiro Hachikubo[1], Satoshi Takeya[2] (1.Kitami Institute of Technology, 2.National Institute of Advanced Industrial Science and Technology (AIST))

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[MIS21-03] Trend of effect of temperature on C–H symmetric stretching vibrational frequencies of hydrocarbon molecules in 12, 14 and 16-hedra cages of gas hydrates

*Go Fuseya[1], Satoshi Takeya[2], Akihiro Hachikubo[1] (1.Kitami Institute of Technology, 2.National Institute of Advanced Industrial Science and Technology (AIST))

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[MIS21-04] The study on relations of the methane plume and atmospheric methane concentration

*Chiharu Aoyama[1] (1.Tokyo University of Marine Science and Technology)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[MIS21-05] Sampling of Methane Bubble Plumes and Solid Gas Hydrate on the Cascadia Margin, Pacific Northwest

*John E Lupton[1], Tamara Baumberger[1], Robert W. Embley[1], Susan G. Merle[1], Camilla Wilkinson[1], Conrad Young[2] (1.NOAA Pacific Marine Environmental Laboratory, Newport, Oregon, USA, 2.Young Engineering, Ramona, CA. USA)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A02 TOKYO BAY MAKUHARI HALL

[M-IS21] Gas hydrate in environmental-resource sciences

convener:Hitoshi Tomaru(Department of Earth Sciences, Chiba University), Akihiro Hachikubo(Kitami Institute of Technology), Atsushi Tani(Graduate School of Human Development and Environment, Kobe University), Shusaku Goto(Institute for Geo-Resources and Environment National Institute of Advanced Industrial Science and Technology), Chairperson:八久保 晶弘(北見工業大学), 戸丸 仁

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[MIS21-06] The distribution of atmospheric CH_4 concentration and gas plume location in the sea around Japanese islands.

*Shinsuke Aoki[1], Shujiro Komiya[2], Kosuke Noborio[3], Ryo Matsumoto[4] (1.Graduate School of Agriculture, Meiji Universiy, 2.Max Planck Institute, 3.School of Agriculture, Meiji Universiy, 4.Gas Hydrate Laboratory - Meiji University Organization for the Strategic Coordination of Research and Intellectual Property)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[MIS21-07] Reaction/fixation/migration of methane within the gas chimney on the Umitaka Spur, eastern margin of the Japan Sea

*Hitoshi Tomaru[1], Ryo Matsumoto[2] (1.Department of Earth Sciences, Chiba University, 2.Gas Hydrate Research Laboratory, Meiji University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[MIS21-08] Slope failures induced by methane hydrate dissociation: a case of submarine slide in the southwestern Oki Trough, Japan Sea

*Naoto Ishida[1], Shota Morihita[2], Takao Ebinuma[1], Hitoshi Tomaru[3], Ryo Matsumoto[4] (1.Social Systems and Civil Engineering, Graduate School of Engineering, Tottori University, 2.Department of Social Systems and Civil Engineering, Faculty of Engineering, Tottori University, 3.Department of Earth Sciences, Faculty of Science, Chiba University, 4.Gas Hydrate Research Laboratory, Organization for the Strategic Coordination of Research and Intellectual Properties, Meiji University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[MIS21-09] Origin and evolution of H_2S-bearing methane hydrate in the Sea of Japan

*Ryo Matsumoto[1], Tomoko Fukazawa[2], Akihiro Hiruta[1], Glen Snyder[1] (1.Organization for the Strategic Laboratory of Research and Intellectual Properties, Meiji University, 2.Department of Applied Chemistry, School of Science and Technoloty, Meiji University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[MIS21-10] Discovery of gas hydrate at the new point off Abashiri, the Sea of Okhotsk

*Akihiro Hachikubo[1], Jumpei Matsuda[1], Satoshi Yamashita[1], Hirotoshi Sakagami[1], Masaaki Konishi[1], Hirotsugu Minami[1], Kenji Nishina[2], Kenji Sakaguchi[3] (1.Kitami Institute of Technology, 2.Geological Survey of Hokkaido, Hokkaido Research Organization, 3.Kushiro Fisheries Research Institute, Hokkaido Research Organization)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[MIS21-11] All about gas hydrates and heat flow offshore Chile

*LUCIA ALEJANDRA VILLAR MUNOZ[1], IVAN VARGAS-CORDERO[2], JOAQUIM P. BENTO[3], JAN BEHRMANN[1], UMBERTA TINIVELLA[4], MICHELA GIUSTINIANI[4] (1.Helmholtz Centre for Ocean Research, 2.Universidad Andres Bello , 3.Pontificia Universidad Catolica de Valparaiso, 4.Istituto Nazionale di Oceanografia e di Geofisica Sperimentale)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 202 2F

[M-IS27] Atmospheric electricity: Applications toward natural disaster mitigation

convener:Yasuhide Hobara(Graduate School of Information and Engineering Department of Communication Engineering and Informatics, The University of Electro-Communications), Masashi Kamogawa(Department of Physics, Tokyo Gakugei University), Chairperson:Takeshi Morimoto

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[MIS27-01] Advantage and Disadvantage of the Phased Array Weather Radar

*Tomoo Ushio[1], Tomoaki Mega[1], Hiroshi Kikuchi[2], Eiichi Yoshikawa[3] (1.Tokyo Metropolitan University, 2.University of Electro-Communications, 3.JAXA)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[MIS27-02] Initial Observations with X-band Dual Polarimetric Phased Array Weather Radar in Tokyo

*Hiroshi Kikuchi[1], Taku Suezawa[2], Yasuhide Hobara[1], Tomoo Ushio[2] (1.The University of Electro-Communications, 2.Tokyo Metropolitan University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[MIS27-03] Three-dimensional total lightning characteristics of convective cells observed by the Tokyo LMA in the summer season in Tokyo Metropolitan area

*Namiko Sakurai[1], Paul R. Krehbiel[2], William Rison[2], Ronald J. Thomas[2], Daniel Rodeheffer[2], Shingo Shimizu[1], Koyuru Iwanami[1], Takeshi Maesaka[1], Kaori Kieda[1], Yasushi Uji[1] (1.National Research Institute For Earth Science and Disaster Resilience, 2.New Mexico Tech.)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[MIS27-04] Estimating rainfall in heavy rain events using lightning data in Japan

*Ogawa Tetsuya[1], Yasuhide Hobara[1], Hiroyuki IWASAKI[2], Stan Heckman[3], Michael Stock[3] (1.University of Electro-Communications, 2.Gunma University, 3.EarthNetworks)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[MIS27-05] The Effect of Lightning Phenomena on Lightning Protection for Objects on the Ground

★Invited Papers

*Yokoyama Shigeru[1] (1.Shizuoka University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[MIS27-06] Lightning charge moment changes deduced from highly sensitive ELF magnetic field observations in Southeast Asia

*Yasuhide Hobara[1], Amir Izzani Mohamed[2], Chandima Gomes[3], Wan Ismail Bin Ibrahim[2], Zulkurnain Abdul-Malek[4], Syahrun Nizam[5], Michael Stock[6], Kazuo Shiokawa[7], Hiroshi Kikuchi[1], Takuo T. Tsuda[1] (1.Graduate School of Information and Engineering Department of Communication Engineering and Informatics, The University of Electro-Communications, 2.University of Malaysia Pahang Pekan, Malaysia, 3.University of the Witwatersrand Johannesburg, South Africa, 4.Universiti Teknologi Malaysia Johor Bahru, Malaysia, 5.University Malaysia Perlis Perlis, Malaysia, 6.EarthNetworks, Inc. Germantown, USA, 7.Nagoya University, Nagoya, Japan)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 202 2F

[M-IS27] Atmospheric electricity: Applications toward natural disaster mitigation

convener:Yasuhide Hobara(Graduate School of Information and Engineering Department of Communication Engineering and Informatics, The University of Electro-Communications), Masashi Kamogawa(Department of Physics, Tokyo Gakugei University), Chairperson:Yasuhide Hobara

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[MIS27-07] Earthquake precursory electromagnetic phenoma : Summary and prospective

★Invited Papers

*Masashi Hayakawa[1] (1.Hayakawa Institute of Seismo Electromagnetics.Co. LTD. University of Electro-Communications venture company)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[MIS27-08] Detection of lower ionospheric anomaly preceding earthquake using nonlinear autoregressive neural network

*Kakeru Matsuki[1], Hayato Iibuchi[1], Hendy Santosa[3], Yasuhide Hobara[1], Michael A Balikhin[2] (1.The University of Electro-Communications , 2.University of Sheffield, 3.University of Bengkulu)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[MIS27-09] Analysis of multipoint measurements of plasma turbulence

*Michael A Balikhin[1], Simon N Walker[1] (1.University of Sheffield)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[MIS27-10] Progress of Observation Project for High-energy Phenomena in Winter Thunderstorms

*Yuuki Wada[1,2], Teruaki Enoto[3], Takahiro Matsumoto[1], Kazuhiro Nakazawa[4], Yoshihiro Furuta[5], Takayuki Yuasa, Harufumi Tsuchiya[5], Daisuke Yonetoku[6], Tatsuya Sawano[6], Kazuo Makishima[1,2], Masashi Kamogawa[7], Yoshitaka Nakamura[8], Takeshi Morimoto[9], Mitsuteru Sato[10], Hideo Sakai[11], Hidehito Nanto[12], Tomoo Ushio[13] (1.The University of Tokyo, 2.RIKEN, 3.Kyoto University, 4.Nagoya University, 5.Japan Atomic Energy Agency, 6.Kanazawa University, 7.Tokyo Gakugei University, 8.Kobe City College of Technology, 9.Kindai University, 10.Hokkaido University, 11.University of Toyama, 12.Kanazawa Institute of Technology, 13.Tokyo Metropolitan University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[MIS27-11] Electromagnetic and stroke current observations on rocket-triggered lightning

*Takeshi Morimoto[1], Shinya Kurokawa[1], Yoshitaka Nakamura[2], Kazuo Yamamoto[3] (1.Kindai University, 2.Kobe City College of Technology, 3.Chubu University)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-GI General Geosciences, Information Geosciences & Simulations

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A09 TOKYO BAY MAKUHARI HALL

[M-GI34] Marine Manganese Minerals

convener:Akira Usui(Marine Core Research Center, Kochi University), Yoshio Takahashi(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Katsuhiko Suzuki(Research and Development Center for Submarine Resources, Japan Agency for Marine-Earth Science and Technology), Takashi Ito(Faculty of Education, Ibaraki University), Chairperson:takashi ito(Ibaraki Univ.), Yoshio Takahashi(東京大学), Katsuhiko Suzuki(JAMSTEC)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[MGI34-01] Challenges in microstratigraphy on the hydrogenetic ferromanganese crusts: Depositional processes and environments recorded as secular variations in microstructure, chemical and mineralogical compositions.

*Akira Usui[1], Anna Nagaoka[2], Go-Ichiro Uramoto[1], Masafumi MURAYAMA[3] (1.Marine Core Research Center, Kochi University, 2.Graduate School of Science, Kochi University, 3.Fac. Agriculture and Marine Sciences, Kochi University)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[MGI34-02] Abundant ferromanganese microparticles in oxic pelagic sediments

*Go-Ichiro Uramoto[1,2], Yuki Morono[2], Naotaka Tomioka[2], Shigeyuki Wakaki[2], Ryoichi Nakada[2], Rota Wagai[3], Kentaro Uesugi[4], Akihisa Takeuchi[4], Masato Hoshino[4], Yoshio Suzuki[4,5], Satoshi Mitsunobu[6], Fumito Shiraishi[7], Hiroki Suga[5], Yasuo Takeichi[8], Yoshio Takahashi[5], Fumio Inagaki[2] (1.Kochi University, 2.Japan Agency for Marine-Earth Science and Technology, 3.National Agriculture and Food Research Organization, 4.Japan Synchrotron Radiation Research Institute, 5.University of Tokyo, 6.Ehime University, 7.Hiroshima University, 8.High Energy Accelerator Research Organization)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[MGI34-03] Fractionation of Zirconium-Hafnium in ferromanganese crusts

*Aya Sakaguchi[1], Junpei Inagaki[1], Minami Inoue[2], Akira Usui[3], Hiromitsu Haba[4], Masashi Kaneko[5], Shinya Yamasaki[1], Keisuke Sueki[1], Yoshio Takahashi[6] (1.Faculty of Pure and Applied Science, 2.Graduate School of Science, Hiroshima University, 3.Center for Advanced Marine Core Research , Kochi University, 4.Nishina Center, Riken, 5.Nuclear Science and Engineering Center, Japan Atomic Energy Agency, 6.Graduate School of Science, The University of Tokyo)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[MGI34-04] Isotope fractionation of Mo-like elements during adsorption to ferromanganese oxides

*Masato Tanaka[1], Yoshio Takahashi[1] (1.Graduate School of Science, The University of Tokyo)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[MGI34-05] **Distinct distribution trends of arsenate and molybdate in marine ferromanganese nodules**

*Shitong Yang[1], Soichiro Uesugi[1], Haibo Qin[1], Akira Usui[2], Yoshio Takahashi[1] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 2.Geology Department, Kochi University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[MGI34-06] Mineralogical and geochemical characteristics of ferromanganese nodules in the Minamitorishima EEZ

*Kentaro Nakamura[1], Koichi Horinouchi[1], Ryo Shimomura[1], Shiki Machida[2], Kazutaka Yasukawa[1,2], Koichiro Fujinaga[1,2], Yasuhiro Kato[1,2] (1.Department of Systems Innovation, School of Engineering, University of Tokyo, 2.ORCeNG, Chiba Institute of Technology)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-GI General Geosciences, Information Geosciences & Simulations

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 301B 3F

[M-GI35] Development of computational sciences on planetary formation, evolution and surface environment

convener:Yoshi-Yuki Hayashi(Department of Planetology/CPS, Graduate School of Science, Kobe University), Masaki Ogawa(Division of General Systems Studies, Graduate School of Arts and Sciences, University of Tokyo), Shigeru Ida(Earth-Life Science Institute, Tokyo Institute of Technology), Kanya Kusano(Institute for Space-Earth Environmental Research, Nagoya University), Chairperson:Hiroki Kashimura

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[MGI35-01] Simulation Studies of Solar Activities as a Cause of Solar-Terrestrial Environment Variation

*Kanya Kusano[1], Hideyuki Hotta[2] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.Faculty of Science and Engineering, Chiba University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[MGI35-02] Development of a global non-hydrostatic Martian atmospheric model and its high-resolution simulation

*Hiroki Kashimura[1], Hisashi Yashiro[2], Seiya Nishizawa[2], Hirofumi Tomita[2], Kensuke Nakajima[3], Masaki Ishiwatari[4], Yoshiyuki O. Takahashi[1], Yoshi-Yuki Hayashi[1] (1.Kobe University/Center for Planetary Science, 2.RIKEN Center for Computational Science, 3.Kyushu University, 4.Hokkaido University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[MGI35-03] Numerical simulations on the collision, adhesion, and growth of dust particles in turbulent gas in a protoplanetary disk

*Takashi Ishihara[1], Kohei Hamabata[2], Yoshiki Sakurai[2], Masayuki Umemura[3] (1.Graduate School of Environmental and Life Science, Okayama University, 2.Graduate School of Engineering, Nagoya University, 3.Center for Computational Sciences, University of Tsukuba)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[MGI35-04] Development of N-body Simulation Code for Planetary System Formation With Particle-Particle Particle-Tree Scheme

*Yota Ishigaki[1,4], Junko Kominami[2], Junichiro Makino[3], Masaki Fujimoto[4] (1.University of Tokyo, 2.Tokyo Institute of Technology, 3.RIKEN AICS, 4.Institite of Space and Astronautical Science, Japan Aerospace Exploration Agency)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[MGI35-05] Current status of post-K Exploratory Challenge, computational planetary science

*Junichiro Makino[1,2] (1.Kobe Univ, 2. RIKEN R-CCS)

Wed. May 29, 2019

[J] Oral | U (Union)：Union

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 103 1F

[U-04] Capture the fast process in Earth and planetary science

convener:Takashi Yoshino(Institute for Planetary Materials, Okayama University), Yoshinori Tange(Japan Synchrotron Radiation Research Institute), Chairperson:Takashi Yoshino(Okayama University), Yoshio Kono(愛媛大学地球深部ダイナミクスセンター), Yoshinori Tange

1:48 PM - 2:00 PM JST | 4:48 AM - 5:00 AM UTC

[U04-01] Toward organization of a new field on fast process in Earth and planetary science

★Invited Papers

*Takashi Yoshino[1] (1.Institute for Planetary Materials, Okayama University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[U04-02] Fractal particle size distribution of pulverized fault rocks and dynamic fragmentation of rocks

★Invited Papers

*Jun Muto[1], Osamu Nishikawa[2], Hiroyuki Nagahama[1] (1.Department of Earth Sciences, Tohoku University, 2.Graduate School of Engineering and Resource Sciences, Akita University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[U04-03] Universal aspects of acceleration process toward unstable fast rupture

★Invited Papers

*Takahiro Hatano[1] (1.Earthquake Research Institute, University of Tokyo)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[U04-04] Semi-brittle flow in dunite and harzburgite at upper mantle pressures

★Invited Papers

*Tomohiro Ohuchi[1], Xinglin Lei[2], Yuji Higo[3], Yoshinori Tange[3] (1.Geodynamics Research Center, Ehime University, 2.National Institute of Advanced Industrial Science and Technology, 3.Japan Synchrotron Radiation Research Institute)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[U04-05] A mechanism of magma fracturing revealed by in-situ X-ray imaging and diffraction

★Invited Papers

*Satoshi Okumura[1], Kentaro Uesugi[2], Tatsuya Sakamaki[1], Akio Goto[3] (1.Division of Earth and Planetary Materials Science, Department of Earth Science, Graduate School of Science, Tohoku University, 2.SPring-8/JASRI, 3.Center for Northeast Asian Studies, Tohoku University)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[U04-06] Estimation of physical parameters of volcanic eruptions based on analysis of eruptive products –Toward understanding of eruption dynamics–

★Invited Papers

*Fukashi Maeno[1] (1.Earthquake Research Institute, University of Tokyo)

[J] Oral | U (Union)：Union

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 103 1F

[U-04] Capture the fast process in Earth and planetary science

convener:Takashi Yoshino(Institute for Planetary Materials, Okayama University), Yoshinori Tange(Japan Synchrotron Radiation Research Institute), Chairperson:Takashi Yoshino(Okayama University), Yoshio Kono(愛媛大学地球深部ダイナミクスセンター), Yoshinori Tange

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[U04-07] Chemical reaction processes bridge between asteroid Ryugu and early evolution of Earth

★Invited Papers

*Seiji Sugita[1,3], Hideharu Kuwahara[2], Kosuke Kurosawa[3] (1.Department of Earth and Planetary Science, Graduate School of Science Sciece, The University of Tokyo, 2.Ehime University, 3.Chiba Institute of Technology)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[U04-08] Time-resolved synchrotron X-ray observations of mineral transformations under static pressures: applications to non-equilibrium behaviors in shocked meteorites

★Invited Papers

*Tomoaki Kubo[1], Masaaki Miyahara[2] (1.Kyushu University, 2.Hiroshima University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[U04-09] Ultrafast pump-probe experiemnts for planetary materials using high-power lasers and XFEL

★Invited Papers

*Norimasa Ozaki[1] (1.Osaka University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[U04-10] Tracking dynamical phenomena with X-ray free-electron lasers

★Invited Papers

*Tetsuo Katayama[1] (1.Japan Synchrotron Radiation Research Institute)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[U04-11] High speed measurement with synchrotron radiation X-ray.

★Invited Papers

*Kentaro Uesugi[1] (1.Japan Synchrotron Radiation Research Institute)

4:45 PM - 4:58 PM JST | 7:45 AM - 7:58 AM UTC

[U04-12] Recent advances in high-pressure synchrotron X-ray experiments on magmas under pressure at the beamline 16-BM-B in Advanced Photon Source

★Invited Papers

*Yoshio Kono[1] (1.Geodynamics Research Center, Ehime University)

[J] Oral | U (Union)：Union

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | Convention Hall A 2F

[U-07] How JpGU will manage environment and disaster from the impacts of unforeseen geo-hazards

convener:Koji Okumura(Graduate School of Letters, Hiroshima University), Jun Matsumoto(Deaprtment of Geography, Tokyo Metropolitan University), Daisaku Kawabata(Institute of Geology and Geoinformation, Geological Survey of Japan, AIST), Masaki Matsushima(Department of Earth and Planetary Sciences, School of Science, Tokyo Institute of Technology), Chairperson:Daisaku Kawabata, Koji Okumura(Hiroshima University)

10:45 AM - 10:55 AM JST | 1:45 AM - 1:55 AM UTC

[U07-01] Seismotectonic environments and landscape as keys to mitigate the impacts from unexpected hazards

*Koji Okumura[1] (1.Graduate School of Letters, Hiroshima University)

10:55 AM - 11:10 AM JST | 1:55 AM - 2:10 AM UTC

[U07-02] Activities related with the eruption at Kusatsu-Shiranesan (Motoshiranesan) volcano on 23 Jan,2018 - Focusing on JMA's activities -

*Junichi Miyamura[1] (1.Japan Meteorological Agency)

11:10 AM - 11:25 AM JST | 2:10 AM - 2:25 AM UTC

[U07-03] Correspondences to society events at emergency disaster – In case of the Annual Meeting of the Geological Society of Japan -

*Matsuda Hiroki[1,2] (1.Kumamoto University, 2.the Geological Society of Japan)

11:25 AM - 11:40 AM JST | 2:25 AM - 2:40 AM UTC

[U07-04] Aftershock and microtremor array observation around the source area of the 2018 Hokkaido Eastern Iburi earthquake

*Masayuki Yoshimi[1], Kahori Iiyama[2], Hitoshi Morikawa[2], Hiroyuki Goto[3] (1.Geological Survey of Japan, AIST, 2.Tokyo Institute of Technology, 3.DPRI, Kyoto Univ.)

11:40 AM - 11:55 AM JST | 2:40 AM - 2:55 AM UTC

[U07-05] Effect of non-linear site response on earthquake hazard map

*Takao Kagawa[1] (1.Tottori University Graduate School of Engineering)

11:55 AM - 12:10 PM JST | 2:55 AM - 3:10 AM UTC

[U07-06] Evolution of catastrofic landslides due to rapid valley incision and filling since Last Glacial Age in central Nepal Himalayas

★Invited Papers

*Hiroshi YAGI[1] (1.Faculty of Art, Science and Education, Yamagata University)

[J] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A03 TOKYO BAY MAKUHARI HALL

[P-EM16] Physics and Chemistry in the Atmosphere and Ionosphere

convener:Yuichi Otsuka(Institute for Space-Earth Environmental Research, Nagoya University), Takuya Tsugawa(National Institute of Information and Communications Technology), Seiji Kawamura(National Institute of Information and Communications Technology), Chairperson:Mitsumu Ejiri(国立極地研究所), Yuichi Otsuka

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[PEM16-01] The model study of ionospheric variations during the solar eclipse event by assimulating the GNSS TEC observations

*Chia-Hung Chen[1], Charles Lin[1], Tomoko Matsuo[2] (1.Department of Earth Sciences, National Cheng Kung University, 2.Department of Aerospace Engineering Sciences, University of Colorado at Boulder, CO)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[PEM16-02] Characteristics of mesoscale thermospheric-ionospheric dynamics associated with heating in the auroral region

*Tomokazu Oigawa[1], Hiroyuki Shinagawa[2], Satoshi Taguchi[1] (1.Department of Geophysics, Graduate School of Science, Kyoto University, 2.National Institute of Information and Communications Technology)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[PEM16-03] Spatial distribution of the polar thermospheric wind acceleration and importance of the 2D measurement

*Shin-ichiro Oyama[1,2,3], Anita Aikio[2], Mark G Conde[4], Heikki Vanhamaki[2], Ilkka Virtanen[2], Thomas Ulich[5], Urban Brandstrom[6], Pekka Verronen[7], Monika Andersson[7], Niilo Kalakoski[7], Lassi Roininen[8], Sari Lasanen[8], Abiyot Workayehu[2], Kazuo Shiokawa[1], Heqiucen XU[1], Mamoru Ishii[9], Masafumi Hirahara[1], Takeshi Sakanoi[10], Masato Kagitani[10], Juha Sorri[5], Tomi Teppo[5], Yoshimasa Tanaka[3], Christopher Fallen[4], Brenton J Watkins[4], Mikko Orispaa[5], Yasunobu Ogawa[3], Lei Cai[11], Esa Turunen[5], Kirsti Kauristie[7], Takuo T. Tsuda[12], Junichi Kurihara[13] (1.Institute for Space-Earth Environmental Research, Nagoya University, Japan, 2.University of Oulu, Finland, 3.National Institute of Polar Research, Japan, 4.Geophysical Institute, University of Alaska Fairbanks, US, 5.Sodankyla Geophysical Observatory, University of Oulu, Finland, 6.The Swedish Institute of Space Physics (IRF), Sweden, 7.Finnish Meteorological Institute, Finland, 8.Lappeenranta-Lahti University of Technology, Finland, 9.National Institute of Information and Communications Technology, Japan, 10.Tohoku University, Japan, 11.KTH Royal Institute of Technology, Sweden, 12.The University of Electro-Communications, 13.Hokkaido University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[PEM16-04] Analysis of the thermospheric neutral wind vector using observed images of *Trimethylaluminium* (*C6H18Al2*) released from sounding rocket in the upper atmosphere

*Yuki Otsuka[1], Masa-yuki Yamamoto[1], Hiroaki Saito[1] (1.Kochi University of Technology)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[PEM16-05] Establishment of real-time analysis method in a new HRO interferometer system and operation test of comprehensive meteor observation

*Takumi Sato[1], Seiya Takeda[2], Masa-yuki Yamamoto[1] (1.KOCHI UNIVERSITY OF TECHNOLOGY, 2.Inc.Bascule)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[PEM16-06] Solar flare effects of the D-region ionosphere using daytime tweek atmospherics

*Kodai Yamanobe[1], Hiroyo Ohya[2], Hiroyuki Nakata[2], Toshiaki Takano[2], Kazuo Shiokawa[3] (1.Graduate School of Science and Engineering, Chiba University , 2.Graduate School of Science and Engineering, Chiba University, 3.Institute for Space-Earth Environmental Research, Nagoya University)

[J] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A03 TOKYO BAY MAKUHARI HALL

[P-EM16] Physics and Chemistry in the Atmosphere and Ionosphere

convener:Yuichi Otsuka(Institute for Space-Earth Environmental Research, Nagoya University), Takuya Tsugawa(National Institute of Information and Communications Technology), Seiji Kawamura(National Institute of Information and Communications Technology), Chairperson:Yuichi Otsuka, Mitsumu Ejiri(国立極地研究所)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[PEM16-07] Toward a detection of sporadic-E episodes by ALOS2 ScaSAR InSAR

*Masato Furuya[1], Jun Maeda[2], Kosuke Heki[1] (1.Department of Earth and Planetary Sciences Hokkaido University, 2.Hokkaido University Library)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[PEM16-08] Vertical fine structure and time evolution of plasma irregularities in the E_s layer, observed by a high resolution Ca^+ lidar

*Mitsumu K. Ejiri[1,2], Takuji Nakamura[1,2], Takuo T. Tsuda[3], Takanori Nishiyama[1,2], Makoto Abo[4], Toru Takahashi[1], Katsuhiko Tsuno[5], Takuya Kawahara[6], Takayo Ogawa[5], Satoshi Wada[5] (1.National Institute of Polar Research, 2.SOKENDAI (Department of Polar Science, The Graduate University for Advanced Studies), 3.The University of Electro-Communications, 4.Tokyo Metropolitan University, 5.RIKEN, RAP, 6.Shinshu University Faculty of Engineering)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[PEM16-09] Study of Effects of Stratospheric Sudden Warming on Medium-Scale Traveling Ionospheric Disturbances Using Total Electron Content Data Obtained from World-Wide GPS Receiver Networks

*Yuichi Otsuka[1], Atsuki Shinbori[1], Prayitno Abadi[2], Takuya Tsugawa[3], Michi Nishioka[3] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.LAPAN, 3.National Institute of Information and Communications Technology)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[PEM16-10] Tsunami-generated ionospheric currents inferred from geomagnetic observations at ground level: Case for the 2011 Tohoku Earthquake

*Takuto Minami[1], Masashi Kamogawa[2], Tsutomu Ogawa[1], Makoto Uyeshima[1], Toru Mogi[3], Hiroshi Ichihara[4] (1.Earthquake Research Institute,The University of Tokyo, 2.Department of Physics, Tokyo Gakugei University, 3.Graduate School of Engineering, Hokkaido University, 4.Graduate School of Environmental Studies, Nagoya University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[PEM16-11] Relationship between the magnitude of Sakurajima eruptions and the disturbance of GPS-TEC

*Kiyoto Shoji[1], Hiroyuki Nakata[1], Toshiaki Takano[1], Hiroyo Ohya[1], Takuya Tsugawa[2], Michi Nishioka[2] (1.Graduate School of Science and Engineering, Chiba University, 2.National Institute of Information and Communications Technology)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[PEM16-12] Water vapor estimation using digital terrestriall broadcasting waves - Simultaneous observation with microwave radiometer -

*Hiroshi HANADO[1], Seiji Kawamura[1], Hironori Iwai[1], Shinsuke Satoh[1], Katsuhiro Nakagawa[1], Takuya Tajiri[2], Narihiro Orikasa[2], Yoshinori Shoji[2], Kentaro Araki[2], Hiromu Seko[2] (1.National Institute of Information and Communications Technology, 2.Meteorological Research Institute)

[J] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 201A 2F

[P-EM18] Heliosphere and Interplanetary Space

convener:Ken Tsubouchi(University of Electro-Communications), Masaki N Nishino(Japan Aerospace Exploration Agency, Institute of Space and Astronautical Science), Yasuhiro Nariyuki(Faculty of Human Development, University of Toyama), Kazumasa Iwai(Institute for Space?Earth Environmental Research (ISEE), Nagoya University), Chairperson:Yasuhiro Nariyuki, Kazumasa Iwai

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[PEM18-01] Problems in determining structures of interplanetary magnetic flux ropes

*Katsuhide Marubashi[1], Yuki Kubo[1], Nobuhiko Nishimura[2], Munetoshi Tokumaru[2], Nada Al-Haddad[3] (1.National Institute of Information and Communications Technology , 2.ISEE, Nagoya University, 3.IACS, Catholic University of America)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[PEM18-02] Validation of estimated interplanetary flux rope axial direction using internal plasma motions: benchmark test

*Nobuhiko Nishimura[1], Munetoshi Tokumaru[1], Katsuhide Marubashi[2] (1.Institute for Space Earth Environmental Research, 2.National Institute of Information and Communications Technology)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[PEM18-03] Effect of line-of-sight integration on locations of coronal mass ejection in the sky projection map of interplanetary scintillation observations

*Munetoshi Tokumaru[1], Ken'ichi Fujiki[1], Kazumasa Iwai[1] (1.Institute for Space-Earth Environmental Research, Nagoya University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[PEM18-04] Estimation of spatial structure of whistler mode wave packets in Earth’s bow shock by multiple spacecraft analysis

*Chika Umegaki[1], Takanobu Amano[1], Naritoshi Kitamura[1] (1.The university of tokyo)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[PEM18-05] Experimental Test for Stochastic Shock Drift Acceleration Theory

*Takanobu Amano[1], Takuma Katou[1], Naritoshi Kitamura[1], Mitsuo Oka[2], Yosuke Matsumoto[3], Masahiro Hoshino[1] (1.Department of Earth and Planetary Science, University of Tokyo, 2.Space Sciences Laboratory, University of California, Berkeley, 3.Department of Physics, Chiba University)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[PEM18-06] Radial structure of heliospheric boundary region

*Shuichi Matsukiyo[1], Gary P. Zank[2], Haruichi Washimi[3], Tohru Hada[1] (1.Faculty of Engineering Sciences, Kyushu University, 2.The Center for Space Plasma and Aeronomic Research, University of Alabama in Huntsville, 3.International Center for Space Weather Science and Education, Kyushu University)

[J] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 105 1F

[P-CG24] New Developments of Planetary Sciences with ALMA

convener:Takayuki Muto(Division of Liberal Arts, Kogakuin University), Munetake Momose(The College of Science, Ibaraki University), Hideo Sagawa(Faculty of Science, Kyoto Sangyo University), Masumi Shimojo(National Astronomical Observatory of Japan), Chairperson:Takayuki Muto

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[PCG24-01] Understanding solar atmosphere by ALMA observations

★Invited Papers

*Tomoko Kawate[1], Takenori J Okamoto[2], Kazumasa Iwai[3], Satoshi Masuda[3], Masumi Shimojo[2] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2.National Astronomical Observatory of Japan, 3.Nagoya University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[PCG24-02] **Multi-thermal structures in a spicule observed with ALMA, IRIS, and AIA/SDO**

*Masumi Shimojo[1], Tomoko Kawate[2], Takenori Okamoto[1], Takaaki Yokoyama[3] (1.National Astronomical Observatory of Japan, 2. Institute of Space and Astronautical Science , 3.University of Tokyo)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[PCG24-03] Observing the 2018 global dust storm on Mars with ALMA

Shohei Aoki[2], *Hideo Sagawa[1], Kazi Rigl[3], Geronimo L. Villanueva[4], Bill Dent[5], Hiroyuki Maezawa[6], Severine Robert[2], Hiromu Nakagawa[7], Frank Daerden[2], Takeshi Kuroda[8], Marco Giuranna[10], Kazuya Saigo[9], Michael J. Mumma[4], Yasumasa Kasaba[7], Ann Carine Vandaele[2] (1.Kyoto Sangyo University, 2.Royal Belgian Institute for Space Aeronomy, 3.Italian ALMA Regional Centre, INAF-Istituto di Radioastronomia, 4.NASA Goddard Space Flight Center, USA, 5.ESO ALMA, Chile, 6.Osaka Prefecture University, 7.Tohoku University, 8.NICT Big Data Integration Research Center, 9.NAOJ Chile Observatory, 10.Istituto di Astrofisica e Planetologia Spaziali, Italy)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[PCG24-04] Atmospheric observation of submillimeter wave and the thermal evolution of ice giants

★Invited Papers

*Kenji Kurosaki[1], Masahiro Ikoma[2] (1.Department of Physics, Nagoya University , 2.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo)

10:00 AM - 10:30 AM JST | 1:00 AM - 1:30 AM UTC

[PCG24-05] Planetary-system formation revealed with ALMA

★Invited Papers

*Misato Fukagawa[1] (1.National Astronomical Observatory of Japan)

[J] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 105 1F

[P-CG24] New Developments of Planetary Sciences with ALMA

convener:Takayuki Muto(Division of Liberal Arts, Kogakuin University), Munetake Momose(The College of Science, Ibaraki University), Hideo Sagawa(Faculty of Science, Kyoto Sangyo University), Masumi Shimojo(National Astronomical Observatory of Japan), Chairperson:Munetake MOMOSE(Ibaraki University)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[PCG24-06] Probing dust aggregate structure in protoplanetary disks by millimeter-wave polarization

*Ryo Tazaki[1], Hidekazu Tanaka[1], Takayuki Muto[2], Akimasa Kataoka[3], Satoshi Okuzumi[4] (1.Tohoku University, 2.Kogakuin University, 3.NAOJ, 4.Tokyo Institute of Technology)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[PCG24-07] A CONSTRAINT ON THE AMOUNT OF HYDROGEN FROM THE CO CHEMISTRY IN DEBRIS DISKS

*Hiroshi Kobayashi[1], Kazunari Iwasaki[2,4], Aya Higuchi[3] (1.Department of Physics, Nagoya University, 2.NAOJ, 3.RIKEN, 4.Osaka University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[PCG24-08] Structure of the protoplanetary disk around V1094 Sco obtained from dust continuum emission and SED

*Sanemichi Takahashi[1,2], Takayuki Muto[1], Takashi Tsukagoshi[2], Jun Hashimoto[2] (1.Kogakuin University, 2.NAOJ)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[PCG24-09] The Synthetic ALMA Multiband Analysis of the Dust Properties of the TW Hya Protoplanetary Disk

*Seongjoong Kim[1], Hideko Nomura[1], Takashi Tsukagoshi[2], Ryohei Kawabe[2,3,4], Takayuki Muto[5] (1.Department of Earth and Planetary Sciences, Tokyo Institute of Technology, 2.National Astronomical Observatory of Japan, 3.The Graduate University for Advanced Studies (SOKENDAI), 4.Department of Astronomy, School of Science, University of Tokyo, 5.Division of Liberal Arts, Kogakuin University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[PCG24-10] Dust evolution in the protoplanetary disk around TW Hya

*Takayuki Matsuura[1], Satoshi Okuzumi[1] (1.Tokyo Institute of Technology)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[PCG24-11] Discovery of a localized excess in the millimeter emission of the protoplanetary disk around TW Hya

*Takashi Tsukagoshi[1], Takayuki Muto[2], Hideko Nomura[3], Ryohei Kawabe[1,4,5], Kazuhiro Kanagawa[9], Satoshi Okuzumi[3], Shigeru Ida[10], Catherine Walsh[6], Tom J Millar[7], Sanemichi Takahashi[2,1], Jun Hashimoto[8], Taichi Uyama[5], Motohide Tamura[5,8] (1.Division of Radio Astronomy, National Astronomical Observatory of Japan, 2.Division of Liberal Arts, Kogakuin University, 3.Department of Earth and Planetary Sciences, Tokyo Institute of Technology, 4.The Graduate University for Adnvanced Studies, 5.School of Science, University of Tokyo, 6.School of Physics and Astronomy, University of Leeds, 7.Astrophysics Research Centre, Queen's University Belfast, 8.Astrobiology Center, National Institutes of Natural Sciences, 9.Research Center for the Early Universe, University of Tokyo, 10.Earth-Life Science Institute, Tokyo Institute of Technology)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 102 1F

[A-AS04] Atmospheric Chemistry

convener:Tomoki Nakayama(Graduate School of Fisheries and Environmental Sciences, Nagasaki University), Yoko Iwamoto(Graduate School of Biosphere Science, Hiroshima University), Sakae Toyoda(Department of Chemical Science and Engineering, Tokyo Institute of Technology), Nawo Eguchi(Kyushu University), Chairperson:Fumiko Nakagawa(名古屋大学)

9:00 AM - 9:30 AM JST | 12:00 AM - 12:30 AM UTC

[AAS04-01] Reconstruction and fluctuation mechanism of past aerosols preserved in ice cores

★Invited Papers

*Iizuka Yoshinori[1], Ryu Uemura[2], Koji Fujita[3], Shohei Hattori[4], Osamu Seki[1], Naga Oshima[5], Hiroshi Ohno[6], Sumito Matoba[1] (1.Institite of Low Temperature Science, Hokkaido University, 2.Department of Chemistry, Biology, and Marine Science, Faculty of Science, University of the Ryukyus, 3.Graduate School of Environmental Studies, Nagoya University, 4.Department of Chemical Science and Engineering, School of Materials and Chemical Technology, Tokyo Institute of Technology,, 5.Meteorological Research Institute, 6.Kitami Institute of Technology)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[AAS04-02] The 60 years history of atmospheric formation pathways responsible for sulfate based on triple oxygen isotopic composition of sulfate preserved in SE-Dome ice core

*Shohei Hattori[1], Iizuka Yoshinori[2], Koji Fujita[3], Ryu Uemura[4], Sakiko Ishino[1], Naga Oshima[5], Nozomi Suzuki[1], Sumito Matoba[2], Asuka Tsuruta[1], Joel Savarino[6], Naohiro Yoshida[1] (1.Department of Chemical Science and Engineering, School of Materials and Chemical Technology, Tokyo Institute of Technology, 2.Institute of Low Temperature Science, Hokkaido University, 3.Graduate School of Environmental Studies, Nagoya University, Nagoya, Japan., 4.Department of Chemistry, Biology, and Marine Science, Faculty of Science, University of the Ryukyus, 5.Meteorological Research Institute, 6.Institut des Geoscience de l'Environnement, Universite Grenoble Alpes/CNRS)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[AAS04-03] Estimation of high sulfate aerosol sources in 2012 spring at Cape Hedo, Okinawa

*Syuichi Itahashi[1], Shiro Hatakeyama[2], Kojiro Shimada[3], Akinori Takami[4] (1.Central Research Institute of Electric Power Industry, 2.Center for Environmental Science in SaitamaCenter for Environmental Science in Saitama, 3.School of Creative Science and Engineering, Waseda University, 4.National Institute for Environmental Studies)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[AAS04-04] Isotopic constrains on sources and formation pathways of atmospheric nitrate in Mt. Everest

*Kun Wang[1,2,4], Shohei Hattori[2], Shichang Kang[1,3,4], Mang Lin[2], Naohiro Yoshida[2,5] (1.Northwest Institute of Eco-Environment and Resources, Chinese Academy of Sciences , 2.Department of Chemical Science and Engineering, School of Materials and Chemical Technology, Tokyo Institute of Technology, 3.CAS Center for Excellence in Tibetan Plateau Earth Sciences, 4.University of Chinese Academy of Sciences, 5. Earth-Life Science Institute, Tokyo Institute of Technology)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[AAS04-05] Development of a large volume sampling system for measuring stable isotope analysis of carbonyl sulfide and field observation

*Kazuki Kamezaki[1], Shohei Hattori[1], Naohiro Yoshida[1,2] (1.Department of Chemical Science and Engineering, School of Materials and Chemical Technology, Tokyo Institute of Technology, 4259 Nagatsuta-cho, Midori-ku, Yokohama, Kanagawa 226-8502, Japan, 2.Earth-Life Science Institute, Tokyo Institute of Technology, 2-12-1-IE-1 Ookayama, Meguro-ku, Tokyo 152-8550, Japan)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 102 1F

[A-AS04] Atmospheric Chemistry

convener:Tomoki Nakayama(Graduate School of Fisheries and Environmental Sciences, Nagasaki University), Yoko Iwamoto(Graduate School of Biosphere Science, Hiroshima University), Sakae Toyoda(Department of Chemical Science and Engineering, Tokyo Institute of Technology), Nawo Eguchi(Kyushu University), Chairperson:Takashi Maki(気象研究所)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[AAS04-06] Observations of aerosol optical properties by sky radiometers at SKYNET Southeast and South Asian sites

*Al Mashroor Fatmi[1], Hitoshi Irie[1], Hossain Mohammed Syedul Hoque[1], Alessandro Damiani[1], Pradeep Khatri[2], Tamio Takamura[1], Thanawat Jurupongsaku[3], Govindan Pandithurai[4] (1.Center for Environmental Remote Sensing Chiba University , 2.Tohoku University, 3.Chulalongkorn University, 4.Indian Institute of Tropical Metereology)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[AAS04-07] Analysis of factors causing variations in the absorption Ångström exponent of aerosols in Japan using skyradiometers

*Kodai Yamaguchi[1], Hitoshi Irie[1], Pradeep Khatri[2], Toshihiko Takemura[3], Hirokazu Yamamoto[4] (1.Chiba University, 2.Tohoku University, 3.Kyushu University, 4.National Institute of Advanced Industrial Science and Technology)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[AAS04-08] Sources of atmospheric black carbon and related carbonaceous components at Rishiri Island, Japan

*Chunmao Zhu[1], Yugo Kanaya[1], Hisayuki Yoshikawa[2], Tomohisa Irino[2], Osamu Seki[2], Yasunori Tohjima[3] (1.Japan Agency for Marine-Earth Science and Technology, 2.Hokkaido University, 3.National Institute for Environmental Studies)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[AAS04-09] Black Carbon and Inorganic Aerosols in Snowpack over the Arctic

*Tatsuhiro Mori[1], Kumiko Goto-Azuma[2,3], Yutaka Kondo[2], Yoshimi Ogawa-Tsukagawa[2], Kazuhiko Miura[1], Motohiro Hirabayashi[2], Naga Oshima[4], Makoto Koike[5], Kaarle Kupiainen[6], Nobuhiro Moteki[5], Sho Ohata[7], Sinha Puna Ram[8], Konosuke Sugiura[9], Teruo Aoki[10], Martin Schneebeli[11], Konrad Steffen[11], Atsushi Sato[12], Akane Tsushima[13], Vladimir Makarov[14], Satoshi Omiya[15,16], Atsuko Sugimoto[17], Shinya Takano[17] (1.Tokyo University of Science, 2.National Institute of Polar Research, 3.The Graduate University for Advanced Studies, 4.Meteorological Research Institute, 5.Depertment of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 6.Environmental Protection Department Ministry of the Environment, 7.Institute for Space–Earth Environmental Research (ISEE), Nagoya University, 8.Department of Space Indian Space Research Organization, 9.University of Toyama, 10.Okayama University, 11.WSL Institute for Snow and Avalanche Research, 12.former Snow and Ice Research Center, 13.Reserach Institute for Humanity and Nature, 14.Melnikov's Permafrost Institute, 15.Institute of Low Temperature Science, Hokkaido University, 16.Civil Engineering Research Institute for Cold Region, 17.Graduate School of Environmental Science, Hokkaido University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[AAS04-10] The single-particle extinction and scattering method for online characterization of submicron particles: Principles and applications to aerosol research

*Nobuhiro Moteki[1] (1.The Univerisity of Tokyo)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[AAS04-11] High spatial resolution vehicular emissions inventory for China using VEIN model

*Sergio Ibarra Espinosa[1], Xuelei Zhang[1], Aijun Xiu[1], Edmilson Dias de Freitas[2] (1.Research Group of Regional Atmospheric Environment, Northeast Institute of Geography and Agroecology, Chinese Academy of Sciences, P. R. China, 2.Department of Atmospheric Sciences, University of São Paulo, Brazil.)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 102 1F

[A-AS04] Atmospheric Chemistry

convener:Tomoki Nakayama(Graduate School of Fisheries and Environmental Sciences, Nagasaki University), Yoko Iwamoto(Graduate School of Biosphere Science, Hiroshima University), Sakae Toyoda(Department of Chemical Science and Engineering, Tokyo Institute of Technology), Nawo Eguchi(Kyushu University), Chairperson:Kentaro Ishijima(気象研究所)

3:30 PM - 4:00 PM JST | 6:30 AM - 7:00 AM UTC

[AAS04-12] Effect of land use change on GHG fluxes of tropical peat forests in Borneo island

★Invited Papers

*Ryuichi Hirata[1], Habura Borjigin[1], Tomohiro Shiraishi[1], Takashi Hirano[2], Lulie Melling[3] (1.National Institute for Environmental Studies, 2.Hokkaido University, 3.Sarawak Tropical Peat Research Institute)

4:00 PM - 4:30 PM JST | 7:00 AM - 7:30 AM UTC

[AAS04-13] Remote sensing of carbon assimilation function of terrestrial ecosystem by Earth-observation satellite

★Invited Papers

*Hibiki M Noda[1], Yukio Yoshida[1], Haruki Oshio[1], Tomoki Kiyono[1], Tatsuya Miyauchi[1], Tsuneo Matsunaga[1] (1.NIES National Institute of Environmental Studies)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[AAS04-14] Analysis of the carbon dioxide in the upper troposphere and lower stratosphere by the data from GOSAT TANSO-FTS TIR

*Nawo Eguchi[1], Akihiro Honda[1], Naoko Saitoh[2], Yosuke Niwa[3] (1.Kyushu University, 2.Chiba University, 3.National Institute for Environmental Studies)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[AAS04-15] Seasonal and interannual variations of the Atmospheric Potential Oxygen over the Western North Pacific observed by using a cargo aircraft C-130H

*Shigeyuki Ishidoya[1], Kazuhiro Tsuboi[2], Yosuke Niwa[3], Shohei Murayama[1], Hidekazu Matsueda[2], Yousuke Sawa[2], Nobuyuki Aoki[1], Kentaro Ishijima[2], Kentaro Kozumi[4], Genta Umezawa[4], Kazuya Yukita[4], Shigeharu Nishida[4], Megumi Yamamoto[4] (1.National Institute of Advanced Industrial Science and Technology (AIST), 2.Meteorological Research Institute, 3.National Institute for Environmental Studies, 4.Japan Meteorological Agency)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 201B 2F

[A-AS05] Stratosphere-troposphere Processes And their Role in Climate

convener:Yoshio Kawatani(Japan Agency for Marine-Earth Science and Technology), Shingo Watanabe(Japan Agency for Marine-Earth Science and Technology), Takashi Sekiya(Japan Agency for Marine-Earth Science and Technology), Kaoru Sato(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Chairperson:Watanabe Shingo(海洋研究開発機構)

9:10 AM - 9:40 AM JST | 12:10 AM - 12:40 AM UTC

[AAS05-01] Turbulent kinetic energy dissipation rates depending on the polar vortex and on synoptic-scale disturbances in the UTLS region in the Antarctic

★Invited Papers

*Masashi Kohma[1], Kaoru Sato[1], Koji Nishimura[2], Masaki Tsutsumi[2] (1.Department of Earth and Planet Science, Graduate School of Science, The University of Tokyo, 2.National Institute of Polar Research and The Graduate University for Advanced Studies (SOKENDAI))

9:40 AM - 9:55 AM JST | 12:40 AM - 12:55 AM UTC

[AAS05-02] Momentum budget of semiannual oscillation around the tropical stratopause

*Yoshihiro Tomikawa[1,2], V. Lynn Harvey[3], John A. Knox[4], Masatomo Fujiwara[5] (1.National Institute of Polar Research, 2.SOKENDAI, 3.University of Colorado Boulder, 4.University of Georgia, 5.Hokkaido University)

9:55 AM - 10:10 AM JST | 12:55 AM - 1:10 AM UTC

[AAS05-03] A study on sources of gravity waves that reach the summer stratosphere and mesosphere based on high-resolution radiosonde data

*Haruka Okui[1], Masashi Kohma[1], Kaoru Sato[1] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo)

10:10 AM - 10:25 AM JST | 1:10 AM - 1:25 AM UTC

[AAS05-04] Stratospheric initial conditions provide seasonal predictability of the North Atlantic and Arctic Oscillations

*Yu Nie[1], Adam Scaife[2,3], Hong-Li Ren[1,4], Ruth Comer[2], Martin Andrews[2] (1.Laboratory for Climate Studies, National Climate Center, China Meteorological Administration, Beijing, China, 2.Met Office Hadley Centre, Exeter, UK, 3.College of Engineering, Mathematics and Physical Sciences, University of Exeter, Exeter, UK, 4.Department of Atmospheric Science, School of Environmental Studies, China University of Geoscience, Wuhan, China)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 201B 2F

[A-AS05] Stratosphere-troposphere Processes And their Role in Climate

convener:Yoshio Kawatani(Japan Agency for Marine-Earth Science and Technology), Shingo Watanabe(Japan Agency for Marine-Earth Science and Technology), Takashi Sekiya(Japan Agency for Marine-Earth Science and Technology), Kaoru Sato(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Chairperson:Takashi Sekiya

10:45 AM - 11:15 AM JST | 1:45 AM - 2:15 AM UTC

[AAS05-05] Transport of trace gases into the extratropical upper troposphere/lower stratosphere

★Invited Papers

*Yoichi Inai[1], Ryo Fujita[2,1], Toshinobu Machida[3], Hidekazu Matsueda[4], Yousuke Sawa[4], Kazuhiro Tsuboi[4], Keiichi Katsumata[3,5], Shinji Morimoto[1], Shuji Aoki[1], Takakiyo Nakazawa[1] (1.Tohoku Univ., 2.Imperial College London, 3.NIES, 4.MRI, 5.Takachiho Chem. Industrial)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[AAS05-06] Possible impacts of stratospheric ozone on circulation changes in the tropical troppposphere following a stratospheric sudden warming event

*Makoto Deushi[1] (1.Department of Atmospheric Environment and Applied Meteorology, Meteorological Research Institute)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[AAS05-07] **Stratosphere-troposphere exchange of ozone and carbon monoxide over the northern Pacific Ocean in northern winter using two chemical reanalysis data sets**

*Haosen Xi[1], Masatomo Fujiwara[1], Kazuyuki Miyazaki[2] (1.Graduate School of Environmental Science, Hokkaido University, 2.NASA Jet Propulsion Laboratory, California Institute of Technology, USA)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[AAS05-08] **Inter-comparison of Upper Air Temperature in China between Satellite MSU and Radiosonde Datasts**

*Yanjun GUO[1], Cheng-zhi Zou[2], Panmao Zhai[3], Guofu Wang[1] (1.National Climate Center(NCC), China Meteorological Administration(CMA) , 2.Center for Satellite Applications and Research, NOAA/NESDIS, 3.Chinese Academy of Meteorolgical Sciences (CAMS), China Meteorological Administration (CMA))

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[AAS05-09] Environmental Characterization of the Atmosphere Using WACCM-X

*Rose Tseng[1], Michelle Kanipe[1], Brian Urbancic[1], Robert Tournay[1], Omar Nava[1], Daniel Emmons[1], Robert Loper[1], Charlton Lewis[1] (1.Air Force Institute of Technology)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 201B 2F

[A-AS05] Stratosphere-troposphere Processes And their Role in Climate

convener:Yoshio Kawatani(Japan Agency for Marine-Earth Science and Technology), Shingo Watanabe(Japan Agency for Marine-Earth Science and Technology), Takashi Sekiya(Japan Agency for Marine-Earth Science and Technology), Kaoru Sato(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Chairperson:Yoshio Kawatani

1:45 PM - 2:15 PM JST | 4:45 AM - 5:15 AM UTC

[AAS05-10] Diagnostics of a WN2-type major sudden stratospheric warming event in February 2018 using a new three-dimensional wave activity flux

★Invited Papers

*Yayoi Harada[1], Kaoru Sato[2], Takenari Kinoshita[3], Ryosuke Yasui[2], Toshihiko Hirooka[4], Hiroaki Naoe[1] (1.Meteorological Research Institute, 2.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 3.Japan Agency for Marine-Earth Science and Technology, 4.Department of Earth and Planetary Sciences, Kyushu University)

2:15 PM - 2:45 PM JST | 5:15 AM - 5:45 AM UTC

[AAS05-11] Response of the Southern Hemisphere atmosphere to the QBO from winter to early summer

★Invited Papers

*Yousuke Yamashita[1], Hiroaki Naoe[2], Makoto Inoue[3], Masaaki Takahashi[4] (1.Japan Agency for Marine-Earth Science and Technology, 2.Meteorological Research Institute, 3.Akita Prefectural University, 4.National Institute for Environmental Studies)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[AAS05-12] Influence of QBO-like Oscillation on Tropical Convective Systems in a Three-Dimensional Minimal Model Framework of the Stratosphere-Troposphere Coupled System

*Shigeo Yoden[1], Hai Bui[2], Takahiro Banno[1] (1.Division of Earth and Planetary Sciences, Graduate School of Science, Kyoto University, 2.Geophysical Institute, University of Bergen)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[AAS05-13] Downward Propagation of Planetary Wave Packets from the Stratosphere to the Troposphere During Northern Hemisphere Winter

*Matsuyama Yuya[1], Toshihiko Hirooka[2] (1.Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University, 2.Department of Earth and Planetary Sciences, Faculty of Science, Kyushu University)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 301A 3F

[A-OS14] Coastal physical processes associated with mixing, eddies, internal waves

convener:Eiji Masunaga(Ibaraki University), Taira Nagai(Graduate School of Science, The University of Tokyo), TSUTSUMI EISUKE(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:Eiji Masunaga, Eisuke Tsutsumi

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[AOS14-01] The cooling of sea surface temperature in the southern Indonesian Seas due to a combination of the Ekman transport and tidal mixing in narrow straits

*Taira Nagai[1], Toshiyuki Hibiya[1] (1.Graduate School of Science, The University of Tokyo)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[AOS14-02] A reanalysis of regional circulations in the Southern South China Sea using a HYCOM-ROMS downscaling ocean model

*Naru Takaura[1], Yusuke Uchiyama[1], Nizamani Zafarullah[2], Akihiko Nakayama[2] (1.Kobe Univ, 2.Tunku Abdul Rahman University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[AOS14-03] Nutrient and phytoplankton dynamics in the continental slope region of the East China Sea associated with the Kuroshio frontal eddy

*Naoki Yoshie[1], Anri Kabe[1], Kazuki Ohgi[1], Eisuke Tsutsumi[2], Shigenobu Takeda[3], Joji Ishizaka[4], Xinyu Guo[1] (1.Center for Marine Environmental Studies, Ehime University, 2.Research Institute for Applied Mechanics, Kyushu University, 3.Faculty of Fisheries, Nagasaki University, 4.Institute for Space-Earth Environmental Research, Nagoya University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[AOS14-04] Dissipation and transport due to internal tides generated by multiple submarine canyons

*Qiang Li[1], Xianzhong Mao[1], Ran Liao[1] (1.Tsinghua University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[AOS14-05] Measurement of Physical structure in Kasumigaura using high resolution tow-yo instrument

*Daiki Asaoka[1], Eiji Masunaga[1], Shunsuke Komuro[2], Shunichi Matsumoto[2], Masahiko Ono[3], Hiroaki Banba[3] (1.Ibaraki University, 2.Ibaraki Kasumigaura Environmental Science Center, 3.Ministry of Land, Infrastructure, Transport and Tourism)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[AOS14-06] Mixing and baroclinic structure in a stratified shallow lake, Lake Kasumigaura, Japan

*Eiji Masunaga[1], Daiki Asaoka[1], Shunsuke Komuro[2], Shunichi Matsumoto[2], Masahiko Ono[3], Hiroaki Banba[3] (1.Ibaraki University, 2.Ibaraki Kasumigaura Environmental Science Center, 3.Ministry of Land, Infrastructure, Transport and Tourism)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 301A 3F

[A-OS14] Coastal physical processes associated with mixing, eddies, internal waves

convener:Eiji Masunaga(Ibaraki University), Taira Nagai(Graduate School of Science, The University of Tokyo), TSUTSUMI EISUKE(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:Eiji Masunaga, Taira Nagai

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[AOS14-07] Turbulent mixing and vertical nitrate flux in the Bungo Channel, Japan

*TSUTSUMI EISUKE[1], Naoki Yoshie[2], Takashi Mano[3], Kanda Taisei[3], Naoki Fujii[4], Xinyu Guo[2] (1.Research Institute for Applied Mechanics, Kyushu University, 2.Center for Marine Environmental Studies, Ehime Univeristy, 3.Graduate School for Science and Engineering, Ehime University, 4.Faculty of Agriculture, Saga Univerisity)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[AOS14-08] Numerical Analysis of Submerged Turbulent Buoyant Jet in River Mouth

*Yen-Chen Mou[1], Gene You[1], Chih-Chieh Young[2] (1.National Taiwan University, 2.National Taiwan Ocean University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[AOS14-09] Implementing regional downscaling capability in the STEAMER radionuclide dispersion prediction system based on multi-nested ROMS model

*Kamidaira Yuki[1], Hideyuki Kawamura[1], Takuya Kobayashi[1], Yusuke Uchiyama[2] (1.Japan Atomic Energy Agency, 2.Kobe University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[AOS14-10] Transport processes around the Izu-chain islands investigated with a Lagrangian particle tracking model

*Waku Kimura[1], Eiji Masunaga[1], Taichi Kosako[2], Yusuke Uchiyama[3] (1.Ibaraki University, 2.Port and Airport Research Institute, 3.Kobe University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[AOS14-11] Fates and dynamical roles of pinch-off mesoscale eddies originated from the Kuroshio Extension Jet

*Yusuke Uchiyama[1], Nobue Okada[1], Changming Dong[2] (1.Graduate School of Engineering, Kobe University, 2.Nanjing University of Information Science & Technology)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CC Cryospheric Sciences & Cold District Environment

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 303 3F

[A-CC27] Glaciology

convener:Takayuki Nuimura(Tokyo Denki University), Ishikawa Mamoru(Hokkaido University), Kzutaka Tateyama(National University Corporation Kitami Institute of Technology), Hiroto Nagai(Waseda Univ., School of Education), Chairperson:Hiroto Nagai(Japan Aerospace Exploration Agency)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[ACC27-01] The early validation results of the GCOM-C/SGLI cryosphere standard product

★Invited Papers

*Rigen Shimada[1], Masahiro Hori[1], Teruo Aoki[2,3], Tomonori Tanikawa[2], Sumito Matoba[4], Masashi Niwano[2], Knut Stamnes[5], Wei Li[5], Nan Chen[5] (1.Japan Aerospace Exploration Agency, 2.Meteorological Research Institute, 3.Okayama University, 4.Institute of Low Temperature Science, Hokkaido University, 5.Stevens Institute of Technology)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[ACC27-02] Overview of the cryospheric variables derived from GCOM-C/SGLI observations: The first-year results

★Invited Papers

*Masahiro Hori[1], Teruo Aoki[2,4], Knut Stamnes[3], Wei Li[3], Nan Chen[3], Rigen Shimada[1], Tomonori Tanikawa[4], Masashi Niwano[4] (1.Earth Observation Reseacrh Center, Japan Aerospace Exploration Agency, 2.Okayama University, 3.Stevens Institute of Technology, 4.Meteorological Research Institute)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[ACC27-03] Relationships between PASAR-2 backscatter amplitude changes and snow depths

*Hiroto Nagai[1], Satoru Yamaguchi[2], Katsuya Yamashita[2], Mayumi Kashima[3] (1.Waseda University, School of Education, 2. National Research Institute for Earth Science and Disaster Resilience, 3.Esri Japan Corporation)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[ACC27-04] Breaking-off of hanging glaciers at Mt. Langtang-Lirung in Nepal

Honami Watanabe[2], *Chiyuki Narama[1], Yoshitaka Mori[2], Katsuhisa Kawashima[3] (1.Niigata University, Program of Field Research in the Environmental Sciences, 2.Graduate School of Science and Technology, Niigata University, 3.Research Institute for Natural Hazards & Disaster Recovery, Niigata University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[ACC27-05] Spatial distribution of ice cliff in the Trakarding glacier, Nepal Himalaya

*Yota Sato[1], Koji Fujita[1], Hiroshi Inoue[2], Sojiro Sunako[1], Akiko Sakai[1], Akane Tsushima[1], Evgeny Podolskiy[3,4], Etienne Berthier[5], Rijan Kayastha[6] (1.Graduate School of Environmental Studies, Nagoya University, 2.National Research Institute for Earth Science and Disaster Resilience, 3.Arctic Research Center, Hokkaido University, 4.Global Station for Arctic Research, Global Institution for Collaborative Research and Education, Hokkaido University, 5.Centre National de la Recherche Scientifique, 6.School of Science, Kathmandu University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[ACC27-06] Quantify the range of projections of future changes in glacier mass caused by differences among observed past climate datasets

*Megumi Watanabe[1], Aki Yanagawa[2], Yukiko Hirabayashi[3], Satoshi Watanabe[4], Shinjiro Kanae[1] (1.Tokyo Institute of Technology, 2.Meisei University, 3.Shibaura Institute of Technology, 4.The University of Tokyo)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CC Cryospheric Sciences & Cold District Environment

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 303 3F

[A-CC27] Glaciology

convener:Takayuki Nuimura(Tokyo Denki University), Ishikawa Mamoru(Hokkaido University), Kzutaka Tateyama(National University Corporation Kitami Institute of Technology), Hiroto Nagai(Waseda Univ., School of Education), Chairperson:Takayuki Nuimura(Chiba Institute of Science)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[ACC27-07] Preliminary analysis result of the Handheld Integrating Sphere Snow Grain Sizer (HISSGraS)

*Teruo Aoki[1,2,3], Masashi Niwano[2], Satoru Yamaguchi[4], Sumito Matoba[5], Tomonori Tanikawa[2], Masahiro Hori[6], Rigen Shimada[6], Akihiro Hachikubo[7] (1.The Graduate School of Natural Science and Technology, Okayama University, 2.Meteorological Research Institute, Japan Meteorological Agency, 3.National Institute of Polar Research, 4.National Research Institute for Earth Science and Disaster Resilience, 5.Institute of Low Temperature Sciences, Hokkaido University, 6.Earth Observation Research Center, Japan Aerospace Exploration Agency, 7.Kitami Institute of Technology)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[ACC27-08] Experimental study on compaction process of highly porous ice: Implications for density change of icy regolith layer on icy bodies

Minami Yabe[1], *Minami Yasui[1], Masahiko Arakawa[1] (1.Department of Planetology, Graduate School of Science, Kobe University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[ACC27-09] **Effect of snow impurities on the radiation budget and snow melting observed at Sapporo during 10 winter seasons**

*Yoichiro Hirozawa[1], Teruo Aoki[1,2], Masashi Niwano[2], Sumito Matoba[3], Yuji Kodama[4], Tomonori Tanikawa[2] (1.Okayama University, Graduate School of Natural Science and Technology, 2.Meteorological Research Institute, 3.Institute of Low Temperature Science, Hokkaido University, 4.National Institute of Polar Research)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 102 1F

[A-CG42] Biogeochemical linkages between the surface ocean and atmosphere

convener:Yuzo Miyazaki(Institute of Low Temperature Science, Hokkaido University), Jun Nishioka(Hokkaido University, Institute of low temperature sciences), Koji Suzuki(Hokkaido University), Yoko Iwamoto(Graduate School of Biosphere Science, Hiroshima University), Chairperson:Yuzo Miyazaki(Institute of low temperature science, Hokkaido University), Jun Nishioka(Institute of low temperature science, Hokkaido University)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[ACG42-01] Production of bromoform in sea ice and emission to the atmosphere

*Daiki Nomura[1], Atsushi Ooki[1], Ellen Damm[2], Gerhard Dieckmann[2], Bruno Delille[3], Markus Frey[4], Mats Granskog[5], Klaus Meiners[6,7], Anna Silyakova[8], Takeshi Tamura[9], Jean-Louis Tison[10], Youhei Yamashita[11] (1.Faculty of Fisheries Sciences, Hokkaido University, 2.Alfred Wegener Institute for Polar and Marine Research, Bremerhaven, Germany, 3.Université de Liège, Liège, Belgium., 4.British Antarctic Survey, Cambridge, United Kingdom., 5.Norwegian Polar Institute, Tromsø, Norway., 6.Antarctic Climate andEcosystems Cooperative Research Centre, University of Tasmania, Hobart, Australia., 7.Australian Antarctic Division, Kingston, Australia., 8.Centre for Arctic Gas Hydrate, Environment and Climate, Tromsø, Norway., 9.National Institute of Polar Research, Tokyo, Japan., 10.Université Libre de Bruxelles, Bruxelles, Belgium., 11.Graduate School of Environmental Sceince, Hokkaido University, Sapporo, Japan.)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[ACG42-02] Accumulation processes of trace metals into arctic sea ice: distribution of Fe, Mn and Cd associated with ice structure

*La Kenya Evans[1], Jun Nishioka[1] (1.Institute of Low Temperature Sciences, Hokkaido University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[ACG42-03] Is halogen chemistry responsible for low ozone levels observed over western Pacific equatorial region? - From observations on R/V Mirai

*Yugo Kanaya[1], Kazuyuki Miyazaki[1], Fumikazu Taketani[1], Takuma Miyakawa[1], Hisahiro Takashima[1,2], Yuichi Komazaki[1], Xiaole PAN[3,1], Saki Kato[2], Kengo Sudo[4,1] (1.Research and Development Center for Global Change, Japan Agency for Marine-Earth Science and Technology, 2.Fukuoka University, 3.Institute of Atmospheric Physics, Chinese Academy of Sciences, China, 4.Nagoya University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[ACG42-04] Very low $\delta^{15}N$ of atmospheric nitrate found in the earstern equatorial Pacific and its implication to dynamic nitrogen recycle between ocean and lower atmosphere

*Shohei Hattori[1], Kazuki Kamezaki[1], Yoko Iwamoto[2], Sakiko Ishino[1], Mitsuo Uematsu[3], Kazuhiko Miura[4], Naohiro Yoshida[1] (1.Department of Chemical Science and Engineering, School of Materials and Chemical Technology, Tokyo Institute of Technology, 2.Hiroshima University, 3.University of Tokyo, 4.Tokyo University of Science)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[ACG42-05] Origin of water-soluble organic nitrogen in marine atmospheric aerosols in the subtropical North Pacific

*Tsukasa Dobashi[1,2], Yuzo Miyazaki[1], Eri Tachibana[1], Yoko Iwamoto[3], Kazutaka Takahashi[4], Sachiko Horii[4], Shu-Kuan Wong[5], Koji Hamasaki[5] (1.Institute of Low Temperature Science, Hokkaido Univ., 2.Graduate School of Env. Sci., Hokkaido Univ., 3.Graduate School of Biosphere Science, Hiroshima Univ., 4.Graduate School of Agricultural and Life Sciences, Univ. of Tokyo, 5.Atmosphere and Ocean Research Institute, Univ. of Tokyo)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[ACG42-06] Impacts of ammonia on gas-particle partition and AWC during the 2016 APHH-Beijing campaign: inducing effects of nitrate ammonium

*baozhu Ge[1], Xiaobin Xu[2], Zhiqiang Ma[3], Xiaole PAN[1], Zhe WANG[1,4], Weili Lin[5], Bin Ouyang[6], Danhui Xu[1], James Lee[7], Mei Zheng[8], Dongsheng Ji[1], Yele Sun[1], Huabin Dong[8], Freya Anne Squires[7], Pingqing Fu[1], Zifa Wang[1] (1.State Key Laboratory of Atmospheric Boundary Layer Physics and Atmospheric Chemistry, Institute of Atmospheric Physics, Chinese Academy of Sciences, Beijing 100029, China, 2.State Key Laboratory of Severe Weather & Key Laboratory for Atmospheric Chemistry of China Meteorological Administration, Chinese Academy of Meteorological Sciences, Beijing 100081, China, 3.Institute of Urban Meteorology, China Meteorological Administration, Beijing, China, 4.Research Institute for Applied Mechanics (RIAM), Kyushu University, Fukuoka, Japan, 5.College of Life and Environmental Sciences, Minzu University of China, Beijing 100081, China, 6.Lancaster Environment Centre,

Lancaster University, Lancaster, LA1 4YQ, UK, 7.National Centre for Atmospheric Science Department of Chemistry, University of York, York, YO10 5DD, UK, 8.State Key Joint Laboratory of Environmental Simulation and Pollution Control, College of Environmental Sciences and Engineering, Peking University, Beijing, 100871, China)

[J] Oral | H (Human Geosciences) : H-GM Geomorphology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 101 1F

[H-GM04] Geomorphology

convener:Tsuyoshi Hattanji(Faculty of Life and Environmental Sciences, University of Tsukuba), Masayuki Seto(Fukushima Future Center for Regional Revitalization, Fukushima University), Chairperson:Tsuyoshi Hattanji

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[HGM04-01] Salt weathering in humidity-change environments: a laboratory experiment

*Masato Sato[1], Tsuyoshi Hattanji[2] (1.Graduate School of Life and environmental Sciences, University of Tsukuba, 2.Faculty of Life and Environmental Sciences, University of Tsukuba)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[HGM04-02] Verification a new control device of blown sand transport rate by wind tunnel experiments

*Yoshinori Kodama[1], Riko Saikusa[2] (1.Faculty of Agriculture, 2.Faculty of Regional Sciences)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[HGM04-03] Bedrock landslides, river blockage, and barrier-lake outburst as general geomorphic processes in high-relief mountainous landscape: an example from the Marshyangdi River, central Nepal

*Yuki Matsushi[1], Hiroshi YAGI[2], Hiroyuki Matsuzaki[3] (1.Disaster Prevention Research Institute, Kyoto University, 2.Department of Education, Art and Science, Yamagata University, 3.icro Analysis Laboratory, Tandem Accelerator, The University of Tokyo)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[HGM04-04] Influence of lithology on production and transport of soils on hillslopes underlain by granite and hornfels

*Takuma Watakabe[1], Yuki Matsushi[2], Hiroyuki Matsuzaki[3] (1.Graduate School of Science, Kyoto University, 2.Disaster Prevention Research Institute, Kyoto University, 3.The University Museum, The University of Tokyo)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[HGM04-05] Characterization of the vertical unsaturated flow for an integrated prediction of the storm runoff response and landslide initiation on a hillslope

*Makoto Tani[1], Yuki Matsushi[2], Takahiro Sayama[2], Nagahiro Kojima[3] (1.University of Human Environments, 2.Disaster Prevention Research Institute, Kyoto University, 3.Lake Biwa Environmental Research Institute)

[J] Oral | H (Human Geosciences)：H-GM Geomorphology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 101 1F

[H-GM04] Geomorphology

convener:Tsuyoshi Hattanji(Faculty of Life and Environmental Sciences, University of Tsukuba), Masayuki Seto(Fukushima Future Center for Regional Revitalization, Fukushima University), Chairperson:Masayuki Seto, Hiroshi Shimazu

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[HGM04-06] The landform and flood characteristics of the Iron Gate on the ancient road from Samarkand to Bamian, south Uzbekistan

*Hiroshi Shimazu[1] (1.Department of Geography, Faculty of Geo-Environmental Science, Rissho University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[HGM04-07] OSL dating of sediment core in Olgoi lake, Mongolia

*Yudai Igarashi[1], Noriko Hasebe[1], Nagayoshi Katsuta[2], Hitoshi Hasegawa[3], Davaadorj Davaasuren[4], Yukiya Tanaka[5], Uyangaa Udaanjargal[1], Keisuke Fukushi[1], Ichinnorov Niiden[6] (1.Kanazawa University, 2.Gihu University, 3.Kochi University, 4.National University of Mongolia, 5.Kyunghee University, 6.Mongolian Academy of Science)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[HGM04-08] Paleo Lake level change in southern part of Mongolia

*Noriko Hasebe[1], Makoto Sambo[2], Uyangaa Udaanjargal[2,3], Shuukaaz Ganbat[3], Keisuke Fukushi[1], Yukiya Tanaka[4], Davaadorj Davaasuren[3] (1.Institute of Nature and Environmental Technology, Kanazawa University, 2.Department of Earth Sciences, Kanazawa University, 3.National University of Mongolia, 4.Kyunghee University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[HGM04-09] Numerical modeling of wave propagation on the coral reef based on high resolution 3D topography

*Kenta Minamidate[1], Kazuhisa Goto[2], Masashi Watanabe[3,4], Volker Roeber[5,6], Ken Toguchi[7], Masami Sannoh[8], Yosuke Nakashima[9], Hironobu Kan[10] (1.Graduate School of Science, Tohoku University, 2.International Research Institute of Disaster Science (IRIDeS), Tohoku University, 3.Graduate School of Engineering, Tohoku University, 4.Graduate School of Science and Engineering, Chuo University, 5.Hawaii University, 6.Université de Pau et des Pays de l'Adour, 7.Ryukyu University, 8.Mikuniya Corporation, 9.NIT, Ariake College, 10.Graduate School of Integrated Sciences for Global Society, Kyushu University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[HGM04-10] Coastal Seafloor Geomorphology: launching of a new field and perspectives

*Hironobu Kan[1], Nobuyuki Hori[2], Tatsuro Nakai[3], Yusuke Yokoyama[4], Kazuhiko Fujita[5], Hitoshi Hasegawa[3], Yosuke Nakashima[6], Kensaku Urata[1], Atsushi Suzuki[7], Masayuki Nagao[7], Kazuhisa Goto[8] (1.Graduate School of Integrated Sciences for Global Society, Kyushu University, 2.Emeritus Professor, Department of Geography, Tokyo Metropolitan University, 3.Department of Geography and Environmental Studies, Kokushikan University, 4.AORI, University of Tokyo, 5.Department of Physics and Earth Sciences, Faculty of Science, University of the Ryukyus, 6.National Institute of Technology, Ariake College, 7.Research Institute of Geology and Geoinformation, AIST, 8.IRIDeS, Tohoku University)

[J] Oral | H (Human Geosciences)：H-SC Social Earth Sciences & Civil/Urban System Sciences

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 301B 3F

[H-SC07] CCUS (Carbon Dioxide Capture, Utilization, and Storage) for Climate Mitigation

convener:Masao Sorai(Institute for Geo-Resources and Environment, National Institute of Advanced Industrial Science and Technology), Ziqiu Xue(Research Institute of Innovative Tech for the Earth), Masaatsu Aichi(Graduate School of Frontier Sciences, University of Tokyo), Chairperson:Masao Sorai(National Institute of Advanced Industrial Science and Technology)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[HSC07-01] Numerical simulation of variational pore pressure response to ocean tidal loading during CO2 injection

*Toshifumi Akaki[1], Hajime Yamamoto[1] (1.Taisei Corporation)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[HSC07-02] Relationship between rock deformation and permeability evolution during fracturing in rocks for CCUS technology

*Takashi Fujii[1], Xinglin Lei[1], Masao Sorai[1] (1.National Institute of Advanced Industrial Science and Technology)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[HSC07-03] Comparison of Optical Fiber Sensing Technique and Strain Gauge in a Measurement of Rock Deformation Caused by Chemical Osmosis

*Shogo Hirota[1], Tomochika Tokunaga[1], Ziqiu Xue[2], Hyuck Park[2] (1.Department of Environmental Systems, Graduate School of Frontier Science, the University of Tokyo, 2.Research Institute of Innovative Technology for the Earth)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[HSC07-04] Experiment of precipitation of salt for dry-out condition caused by CO_2 storage in saline aquifer

*Hayato Morigaki[1,2], Masaatsu Aichi[1] (1.University of Tokyo, 2.Toshiba Energy Systems & Solution Corporation)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[HSC07-05] Thermodynamic Approach to Wettability of CO_2/Brine/Mineral System by Augmented Young Laplace Equation

*Masashige Shiga[1,2], Masao Sorai[1], Masaatsu Aichi[2], Hiromi Honda[2] (1.AIST, 2.The University of Tokyo)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[HSC07-06] A proposal of CO2 underground storage using hydrate

*Takaomi Tobase[1] (1.Electric Power Development Co., Ltd.)

[J] Oral | H (Human Geosciences)：H-SC Social Earth Sciences & Civil/Urban System Sciences

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 301B 3F

[H-SC07] CCUS (Carbon Dioxide Capture, Utilization, and Storage) for Climate Mitigation

convener:Masao Sorai(Institute for Geo-Resources and Environment, National Institute of Advanced Industrial Science and Technology), Ziqiu Xue(Research Institute of Innovative Tech for the Earth), Masaatsu Aichi(Graduate School of Frontier Sciences, University of Tokyo), Chairperson:Ziqiu Xue(Research Institute of Innovative Technology for the Earth)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[HSC07-07] CO_2 behavior simulation using large scale geological model

*Yuuki Shigeoka[1], Haruki Nishiyama[1], Hiroshi Kinoto[1], Takaomi Tobase[2], Takahiro Nakajima[3], Ziqiu Xue[3] (1.JP Business Survice Corporation, 2.Electric Power Development Co., Ltd., 3.Research Institute of Innovative Technology for the Earth)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[HSC07-08] **Monitoring hydromechanical responses in aquifer by distributed fiber-optic strain sensing: From lab to field**

*Yi Zhang[1,2], Ziqiu Xue[1,2], Tsutomu Hashimoto[1,2], Hyuck Park[1,2] (1.Geological Carbon dioxide Storage Technology Research Association, 2.Research Institute of Innovative Tech for the Earth)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[HSC07-09] **Field Testing of Hybrid Brillouin-Rayleigh Distributed Sensing System for Subsurface Water Injection Monitoring**

*Yankun Sun[1,2], Ziqiu Xue[1,2], Tsutomu Hashimoto[1,2], Xinglin Lei[3], Yi Zhang[1,2] (1.Geological Carbon Dioxide Storage Technology Research Association, 2.Research Institute of Innovative Technology for the Earth, 3.National Institute of Advanced Industrial Science and Technology)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[HSC07-10] Gravity monitoring using superconducting gravimeters near the seashore at the Tomakomai CCS demonstration site

*Hiroki Goto[1,2], Mituhiko Sugihara[1,2], Hiroshi Ikeda[3], Yuji Nishi[1,2], Tsuneo Ishido[1,2], Masao Sorai[1,2] (1.Geological Carbon Dioxide Storage Technology Research Association, 2.National Institute of Advanced Industrial Science and Technology, 3.University of Tsukuba)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[HSC07-11] Pilot test for microbubble CO_2 injection to reservoir in oil field - Test planning and preparation -

*Kazunori Nakagawa[1], Ryo Ueda[1], Masanori Nakano[1], Ziqiu Xue[2] (1.Japan Petroleum Exploration Co., Ltd., 2.Research Institute of Innovative Technology for the Earth)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[HSC07-12] Mechanisms inducing anomalously high pCO_2 without CO_2 leakage in coastal environment

*Yuji Watanabe[1,2], Keisuke Uchimoto[1,2], Makoto Nishimura[1,2], Saeko Mito[1,2], Ziqiu Xue[1,2] (1.Geological CO2 Storage Technology Research Association, 2.RITE)

[J] Oral | H (Human Geosciences)：H-DS Disaster geosciences

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | Convention Hall B 2F

[H-DS13] Tsunami and Tsunami Forecast

convener:Naotaka YAMAMOTO CHIKASADA(National Research Institute for Earth Science and Disaster Resilience), Hiroaki Tsushima(Japan Meteorological Agency), Tatsuya Kubota(National Research Institute for Earth Science and Disaster Resilience), Chairperson:Masaaki Minami(気象研究所), Naotaka Chikasada(National Res. Inst. for Earth Science and Disaster Resilience)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[HDS13-07] Functions of Real-time Tsunami Inundation Forecast System Using S-net Pressure Data

*Wataru Suzuki[1], Naotaka YAMAMOTO CHIKASADA[1], Takayuki Miyoshi[1], Shin Aoi[1] (1.National Research Institute for Earth Science and Disaster Resilience)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[HDS13-08] Improvement of Real-time Tsunami Forecast System for Outer-rise Earthquake

*Naotaka YAMAMOTO CHIKASADA[1], Toshitaka Baba[2] (1.NIED, 2.Tokushima University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[HDS13-09] Maximum tsunami height prediction using Ocean-Bottom Pressure Values based on Gaussian Process Regression

*Kotaro Takahashi[1], Kenjiro Kashiwabara[1], Yasuhiko Igarashi[1,2], Toshitaka Baba[3], Takane Hori[4], Masato Okada[1] (1.Graduate School of Frontier Sciences, The University of Tokyo, 2.Japan Science and Technology Agency PRESTO, 3.Institute of Technology and Science, The University of Tokushima, 4.Research and Development Center for Earthquake and Tsunami, Japan Agency for Marine-Earth Science and Technology)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[HDS13-10] Improvement for Finite-Difference Formula of Non-Linear Longwave Equations to Express Tsunami Decay

*Masaaki MINAMI[1] (1.Meteorological Research Institute)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[HDS13-11] Real time tsunami inundation forecast method developed for Central America Region

*Yuichiro Tanioka[1], Ulbert Gleb Grillo[2], Greyving Jose Argrello[2], Amilcar Cabrera[2] (1.Hokkaido University, Institute of Seismology and Volcanology, 2.Nicaraguan Institute of Territorial Studies, Nicaragua)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[HDS13-12] Near-fault observations of an offshore earthquake by DONET: Comparison of ocean bottom pressure gauges and strong-motion accelerometers

*Ayumu Mizutani[1], Kiyoshi Yomogida[1] (1.Natural History Science, Graduate School of Science, Hokkaido University, Earth and Planetary Dynamics)

[J] Oral | H (Human Geosciences)：H-DS Disaster geosciences

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | Convention Hall B 2F

[H-DS13] Tsunami and Tsunami Forecast

convener:Naotaka YAMAMOTO CHIKASADA(National Research Institute for Earth Science and Disaster Resilience), Hiroaki Tsushima(Japan Meteorological Agency), Tatsuya Kubota(National Research Institute for Earth Science and Disaster Resilience), Chairperson:Kentaro Imai, Toshitaka Baba(Graduate School of Science and Technology, Tokushima University)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[HDS13-13] **Investigation of variation in multiple tsunami inundation modelling**

*Yoshinori Shigihara[1], Kentaro Imai[2], Hiroyuki Iwase[3], Koji Kawasaki[4], Makoto Nemoto[5], Toshitaka Baba[6], Naotaka YAMAMOTO CHIKASADA[7], Yu Chida[8], Taro Arikawa[9] (1.Department of Civil and Environmental Engineering, National Dedense Academy, 2.Japan Agency for Marine-Earth Science and Technology, 3.Ecoh Corporation, 4.Hydro Technology Institute, Co., Ltd., 5.OYO Corporation, 6.Graduate School of Science and Technology, Tokushima University, 7.National Research Institute for Earth Science and Disaster Resilience, 8.Port and Airport Research Institute, 9.Civil and Environmental Engineering, Faculty of Science and Engineering, Chuo University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[HDS13-14] **Numerical Modeling of Tsunami Inundation in Urban Area using Sub-Grid Scale Drag Force Model**

*Nobuki Fukui[1], Nobuhito Mori[2] (1.Graduate School of Engineering, Kyoto University, 2.Disaster Prevention Research Institute, Kyoto University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[HDS13-15] Numerical experiment of tsunami deposits related to fault parameters by sediment transport model

*Ako YAMAMOTO[1], Tomoyuki Takahashi[2], Kenji Harada[3] (1.Forest of Research and Management Organization Forestry and Forest Products Research Institute, 2.Kansai University, 3.Shizuoka University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[HDS13-16] Evaluation of potential impact of tsunami-induced sediment transport in Kochi Prefecture during the Nankai Trough megathrust earthquake and tsunami

*Kei Yamashita[1], Daisuke Sugawara[2], Shuji Seto[1], Taro Arikawa[3], Tomoyuki Takahashi[4], Fumihiko Imamura[1] (1.International Research Institute of Disaster Science, Tohoku University, 2.Museum of Natural and Environmental History, Shizuoka, 3.Faculty of Science and Engineering , Chuo University, 4.Faculty of Societal Safety Sciences, Kansai University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[HDS13-17] Tsunami damage of the Keicho Earthquake of February 3rd, 1605 on the coasts of Tokai, Shikoku, and Kyushu Districts

*Yoshinobu Tsuji[1], Kentaro Imai[2], Yuuichi Ebina[3], Hiroyuki Iwase[4], Ryoko Oobayashi[2] (1.Shimanto City, 2.JAMSTEC, 3.IRIDeS, 4.Ecoh co. LTD)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[HDS13-18] Re-examination of tsunami heights distribution during the 1854 Ansei Tokai Earthquake

*Kentaro Imai[1], ebina yuichi[2], Yoshinobu Tsuji[3], Hiroyuki Iwase[4], Takane Hori[1], Narumi Takahashi[1,5], Takashi Furumura[6] (1.Japan Agency for Marine-Earth Science and Technology, 2.International Research Institute of Disaster Science, 3.Shimanto City, 4.ECOH CORPORATION, 5.National Research Institute for Earth Science and Disaster Resilience, 6.Earthquake Research Institute The University of Tokyo)

[J] Oral | H (Human Geosciences)：H-RE Resource and Engineering Geology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 106 1F

[H-RE16] Resource Geology

convener:Tsubasa Otake(Division of Sustainable Resources Engineering, Faculty of Engineering, Hokkaido University), Daisuke Araoka(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Ryohei Takahashi(Graduate School of International Resource Sciences, Akita University), Tatsuo Nozaki(Research and Development Center for Submarine Resources, Japan Agency for Marine-Earth Science and Technology), Chairperson:Tsubasa Otake(Faculty of Engineering, Hokkaido University), Daisuke Araoka

10:45 AM - 11:15 AM JST | 1:45 AM - 2:15 AM UTC

[HRE16-01] The role of water in the concentration of Cr

★Invited Papers

*Shoji Arai[1] (1.Department of Earth Sciences, Faculty of Science, Kanazawa University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[HRE16-02] Mineralogical Features of Silver-Bearing Minerals in Chimney Ore from Myojinsho Caldera, Myojin Knoll and Bayonnaise Knoll Seafloor Hydrothermal Area, Izu-Bonin Arc

Shinji Kawaguchi[1], *Kotaro Yonezu[1], Thomas Tindell[1], Jun-ichiro Ishibashi[2], Tatsuo Nozaki[3], Yoko Ohtomo[4], Koichiro Watanabe[1] (1.Deaprtment of Earth Resources Engineering, Faculty of Engineering, Kyushu University, 2.Department of Earth and Planetary Sciences, Faculty of Sciences, Kyushu University, 3.Research and Development Center for Submarine Resources, Japan Agency for Marine-Earth Science and Technology, 4.Faculty of Engineering, Hokkaido University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[HRE16-03] Organic matters and acid-sulfate alteration in Itomuka Mine, Hokkaido, Japan: implications for the transportation and deposition mechanisms of mercury

*Takuya Echigo[1], Mitsuyoshi Kimata[2], Masahiro Shimizu[2] (1.Graduate School of International Resource Sciences, Akita University, 2.Graduate School of Life and Environmental Sciences, University of Tsukuba)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[HRE16-04] **Significances of 12 Ma manganese ores in the Hokuroku district, Akita: unique Mn accumulation and interaction with organic matter during submarine hydrothermal activities**

*Yuya Tsukamoto[1], Takeshi Kakegawa[1] (1.Tohoku Univ.)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[HRE16-05] Microbial communities around ca. 2.7 Ga submarine hydrothermal fields at the Potterdoal deposit in Abitibi Greenstone Belt, Canada

*Takeru Osato[1], Akizumi Ishida[1], Takeshi Kakegawa[1] (1.Tohoku University)

[J] Oral | H (Human Geosciences)：H-RE Resource and Engineering Geology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 106 1F

1:45 PM - 2:15 PM JST | 4:45 AM - 5:15 AM UTC

[HRE16-06] Development of nano-fabrication and high-resolution electron microscopy techniques: their possible applications to resource geology

★Invited Papers

*Naotaka Tomioka[1], Satoko Motai[1], Yu Kodama[2], Motoo Ito[1] (1.Kochi Institute for Core Sample Research, Japan Agency for Marine-Earth Science and Technology, 2.Marine Works Japan)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[HRE16-07] Microscopic study on rare earth elements in ion-adsorption type ore of China

*Hiroki Mukai[1], Yoshiaki Kon[1], Kenzo Sanematsu[1], Yoshio Takahashi[2], Motoo Ito[3] (1.National Institute of Advanced Industrial Science and Technology, 2.Graduate School of Science, the University of Tokyo, 3.Kochi Institute for Core Sample Research JAMSTEC)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[HRE16-08] Geochemical features of “invisible gold” in pyrites from the Akeshi and Kasuga deposits, Kagoshima, Japan

*Mizuki Ishida[1], Rurik Romeo[2,3], Mathieu Leisen[2,3], Junji Torimoto[4], Tatsuo Nozaki[4,5,6,7], Kazutaka Yasukawa[1,6], Koichiro Fujinaga[6,1], Kentaro Nakamura[1], Martin Reich[2,3], Yasuhiro Kato[1,6,5] (1.Department of Systems Innovation, School of Engineering, The University of Tokyo, 2.Department of Geology and Andean Geothermal Center of Excellence (CEGA), FCFM, 3.Millennium Nucleus for Metal Tracing Along Subduction, FCFM, Universidad de Chile, FCFM, 4.Japan Agency for Marine-Earth Science and Technology (JAMSTEC), 5.Frontier Research Center for Energy and Resources, School of Engineering, The University of Tokyo, 6.Ocean Resources Research Center for Next Generation, Chiba Institute of Technology, 7.Department of Planetology, Graduate School of Science, Kobe University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[HRE16-09] Hydrothermal Mineral Assemblage of the Southwest Prospect, in the Vicinity Sto. Tomas II (Philex) Porphyry Cu-Au Deposit, Baguio District, Philippines

*Avriel Venis Literal Cirineo[1], Akira Imai[2], Ryohei Takahashi[1], Noel C. Oliveros[3], Redempta P. Baluda[3], Victor B. Maglambayan[3], Roy Ronald C. Luis[3], Maria Lourdes M. Faustino[3] (1.Graduate School of International Resource Sciences, Akita University, 2.Faculty of Engineering, Kyushu University, 3.Philex Mining Corporation)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[HRE16-10] Characteristics and genesis of weathering REE deposits

★Invited Papers

*Kenzo Sanematsu[1] (1.Mineral Resource Research Group, Institute for Geo-Resources and Environment, Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-SS09] Earthquake prediction and forecast

convener:Masayuki Obayashi(Japan Agency for Marine-Earth Science and Technology), Toshitaka Baba(Graduate School of Science and Technology, Tokushima University), Chairperson:Sumio Yoshikawa(気象研究所), Mamoru Kato(Graduate School of Human and Environmental Studies Kyoto University)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SSS09-01] **Objective evaluationof precursory seismic quiescence and activation phenomenon in wide area**

*Sumio Yoshikawa[1] (1.Meteorological Research Institute)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SSS09-02] Long-term Probability of a Great Earthquake along the Kurile Trench, Hokkaido Japan (2)

*Masajiro Imoto[1], Morilkawa Nobuyuki[1], Fujiwara Hiroyuki[1] (1.National Research Institute for Earth Science and Disaster Resilience)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SSS09-03] Parallel and Focused Increase Trends in Time Series (M-T Diagram) of Earthquake Occurrences

*Satoshi Hashimoto[1] (1.none)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SSS09-04] Revisiting a simple method for short-term earthquake probabilities derived from past Seismicity

*Mamoru Kato[1] (1.Graduate School of Human and Environmental Studies Kyoto University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SSS09-05] Recent anomalous groundwater temperature and water level changes at the frontier land zone of Nanki region for impending great earthquakes at the Nankai trough

*Tameshige Tsukuda[1] (1.none)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[SSS09-06] What happen on the East Japan Megaquake; answer to sufferers

*Nobuaki Niitsuma[1] (1.Institute of Geosciences,Shizuoka University)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-SS14] Fault Rheology and Earthquake Physics

convener:Keishi Okazaki(Japan Agency for Marine-Earth Science and Technology), Hideki Mukoyoshi(Department of Geoscience Interdisciplinary Graduate School of Science and Engineering, Shimane University), Hiroyuki Noda(Kyoto University, Disaster Prevention Research Institute), Keisuke Yoshida(Tohoku University), Chairperson:Hideki Mukoyoshi, Shunya Kaneki(Osaka University)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SSS14-07] Effect of slickenside on the crustal strength

*Jun-ichi Ando[1], Takayoshi Nagaoka[1], Naotaka Tomioka[2], Hiroyuki Kagi[3], Kaushik Das[1] (1.Department of Earth and Planetary Systems Science, Hiroshima University, 2.Kochi Institute for core sample research, Japan Agency for Marine-Earth Science and Technology, 3.Geochemical Research Center, Graduate School of Science, University of Tokyo)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SSS14-08] Dehydroxylation kinetics of clay minerals and its application to friction heating along an imbricate thrust in an accretionary prism

★Invited Papers

*Hirokazu Masumoto[1], Jun Kameda[1] (1.Faculty of Science, Hokkaido University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SSS14-09] Origin of frictional melt in the Jurassic accretionary complex of the Mino Belt on the basis of trace element and isotope analysis

*Chizuru Ozawa[1], Tsuyoshi Ishikawa[2], Kohtaro Ujiie[1] (1.University of Tsukuba, 2.JAMSTEC)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SSS14-10] Geochemical constraint on the origin of albite-bearing black fault rocks in the Kodiak accretionary complex

*Tsuyoshi Ishikawa[1], Asuka Yamaguchi[2] (1.Kochi Institute for Core Sample Research, Japan Agency for Marine-Earth Science and Technology, 2.AORI, The University of Tokyo)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SSS14-11] Importance of initial maturity and reaction kinetics on maturation of carbonaceous material and its implications for thermal maturity as a proxy for temperature in estimation of coseismic slip parameters

*Shunya Kaneki[1], Ichiba Tatsuya[1], Shuhei Yamashita[1], Tetsuro Hirono[1] (1.Graduate School of Science, Osaka University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SSS14-12] Experimental investigation of cumulative effect on thermal maturation of carbonaceous material as a proxy for earthquake slip

*Tetsuro Hirono[1], Yuhtaro Shimamura[1], Shunya Kaneki[2] (1.Department of Earth and Space Science, Graduate School of Science, Osaka University, 2.Disaster Prevention Research Institute, Kyoto University)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-SS14] Fault Rheology and Earthquake Physics

convener:Keishi Okazaki(Japan Agency for Marine-Earth Science and Technology), Hideki Mukoyoshi(Department of Geoscience Interdisciplinary Graduate School of Science and Engineering, Shimane University), Hiroyuki Noda(Kyoto University, Disaster Prevention Research Institute), Keisuke Yoshida(Tohoku University), Chairperson:Hiroyuki Noda(DPRI, Kyoto University), Keishi Okazaki(JAMSTEC)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SSS14-13] **Fault rheology at the depth limits of the seismogenic zone**

★Invited Papers

*Berend Antonie Verberne[1] (1.Geological Survey of Japan, National Institute of Industrial Science and Technology)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SSS14-14] Fault models revisited based on friction to flow law

*Toshihiko Shimamoto[1] (1.State Key Laboratory of Earthquake Dynamics, Institute of Geology, China Earthquake Administration)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SSS14-15] Timing of Earthquakes on Intraplate Active Faults Subjected to Stress Perturbation by Megathrust Earthquakes: Insights from Earthquake Sequence Simulation

*Hiroyuki Noda[1] (1.Kyoto University, Disaster Prevention Research Institute)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SSS14-16] Physics of earthquake triggering: effect of stress perturbation to slip acceleration

★Invited Papers

*Takahiro Hatano[1] (1.Earthquake Research Institute, University of Tokyo)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SSS14-17] Foreshock activities controlled by slip rate on a 4-meter-long laboratory fault

*Futoshi Yamashita[1], Eiichi Fukuyama[1], Shiqing Xu[1] (1.National Research Institute for Earth Science and Disaster Resilience)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SSS14-18] Supersonic propagation of slow slip rupture during rock friction experiments

*Eiichi Fukuyama[1], Futoshi Yamashita[1], Shiqing Xu[1] (1.National Research Institute for Earth Science and Disaster Resilience)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-SS14] Fault Rheology and Earthquake Physics

convener:Keishi Okazaki(Japan Agency for Marine-Earth Science and Technology), Hideki Mukoyoshi(Department of Geoscience Interdisciplinary Graduate School of Science and Engineering, Shimane University), Hiroyuki Noda(Kyoto University, Disaster Prevention Research Institute), Keisuke Yoshida(Tohoku University), Chairperson:Hiroyuki Noda(DPRI, Kyoto University), Keisuke Yoshida(東北大学大学院理学研究科 地球物理学専攻)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SSS14-19] The role of fault damage zone in the supershear rupture of the 2018 Mw 7.5 Palu earthquake

*Lingsen Meng[1], Han Bao[1], Jean-Paul Ampuero[2], Eric Fielding[3], Cunren Liang[4], Christopher Milliner [3], Tian Feng[1], Hui Huang[1] (1.University of California Los Angeles, 2.Université Côte d'Azur and IRD, 3.Jet Propulsion Laboratory , 4.California Institute of Technology)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SSS14-20] The role of curvature in earthquake mechanics

*Pierre Romanet[1], Daisuke Sato[2], Ryosuke Ando[1] (1.Earth and Planetary Science Department, University of Tokyo, 2.Disaster Prevention Research Institute, Kyoto University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SSS14-21] **Heterogeneous source modelling by the fully dynamic simulations of earthquake cycles on a strike-slip fault and scaling relations.**

*Percy Galvez[1,5], Anatoly Petukhin[2], Paul Somerville[3], Ken Miyakoshi[2], Kojiro Irikura[4] (1.KAUST University, Saudi Arabia, 2.Geo-Research Institute, Osaka Japan, 3.AECOM, Los Angeles, USA., 4.Aichi Institute of Technology, Japan, 5.ETH Zurich, Switzerland)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SSS14-22] **Strain energy released by an earthquake: Contributions of random slip fluctuations**

*Tatsuhiko Saito[1], Akemi Noda[1] (1.National Research Institute for Earth Science and Disaster Resilience)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SSS14-23] The change in the elastic strain energy due to the 1992 Landers earthquake and triggering mechanisms of aftershock activity

*Toshiko Terakawa[1], Mitsuhiro Matsu'ura[2], Akemi Noda[3] (1.Graduate School of Environmental Studies, Nagoya University, 2.Institute of Statistical Mathematics, 3.National Research Institute for Earth Science and Disaster Resilience)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SSS14-24] Toward understanding generation mechanism of crustal earthquakes based on accumulation/release of elastic strain energy

★Invited Papers

*Akemi Noda[1] (1.National Research Institute for Earth Science and Disaster Resilience)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A02 TOKYO BAY MAKUHARI HALL

[S-SS15] Active faults and paleoseismology

convener:Mamoru Koarai(Earth Science course, College of Science, Ibaraki University), Takashi OGAMI(National Institute of Advanced Industrial Science and Technology), Ryosuke Doke(Hot Springs Research Institute of Kanagawa Prefecture), Hisao Kondo(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Chairperson:Takashi Azuma(AIST), Mamoru KOARAI(Ibaraki University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SSS15-05] Paleoseismological survey on the Shibetsu fault zone in the eastern part of Hokkaido, Japan

*Takashi Azuma[1], Daisuke Hirouchi[2], Koji Okumura[3], Kaoru Taniguchi[4], Masashi Omata[4], Yorihide Kohriya[4] (1.National Institute of Advanced Industrial Science and Technology, 2.Shinshu University, 3.Hiroshima University, 4.Pasco CORPORATION)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SSS15-06] Deformation of marine terrace surfaces associated with active Rokkasho fault in southern Shimokita peninsula, northern Japan

*Mitsuhisa Watanabe[1] (1.Faculty of Sociology, Toyo University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SSS15-07] **Vertical crustal movement during the past 600 years in the Kikai Island, deduced from the height distribution and ages of coral microatolls**

*Masanobu Shishikura[1], Hideaki Maemoku[2], Tomoo Echigo[3], Yuichi Namegaya[1], Tatsuya Ishiyama[4], Ryo Kinjo[2], Naoto Inoue[3] (1.Institute of Earthquake and Volcano Geology, National Institute of Advanced Industrial Science and Technology, 2.Hosei University, 3.Geo-Reserch Institute, 4.Earthquake Research Institute, University of Tokyo)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SSS15-08] Variation of coseismic fault displacements on multiple seismic cycles at a site: An example from the Kamishiro fault, Itoigawa-Shizuoka Tectonic Line active fault system, central Japan

*Naoya Takahashi[1], Shinji Toda[2] (1.Graduate school of Science, Department of Earth Science, Tohoku University, 2.International Research Institute of Disaster Science, Tohoku University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SSS15-09] High-resolution shear-wave seismic reflection surveys across the Kamishiro fault, Itoigawa-Shizuoka Tectonic Line active fault system, central Japan

*Naoki IKEGUCHI[1], Nobuhisa Matsuta[2], Kyoko Kagohara[3], Shinsuke Okada[4], Daisuke Hirouchi[5], Tatsuya Ishiyama[1], Katsuya Noda[6], Hiroshi Sato[1] (1.Earthquake Resarch Institute University of Tokyo, 2.Graduate School of Education, Okayama University, 3.Faculty of Education, Yamaguchi University, 4.Graduate school of Science, Tohoku University, 5.Faculty of Education, Shinshu University, 6.GEOSYS Inc.)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A02 TOKYO BAY MAKUHARI HALL

[S-SS15] Active faults and paleoseismology

convener:Mamoru Koarai(Earth Science course, College of Science, Ibaraki University), Takashi OGAMI(National Institute of Advanced Industrial Science and Technology), Ryosuke Doke(Hot Springs Research Institute of Kanagawa Prefecture), Hisao Kondo(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Chairperson:HISAO KONDO(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Nobuhiko Sugito(Hosei University)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SSS15-10] Paleoseismic investigations on the un-ruptured section during the 2014 earthquake along the Kamishiro fault, ISTL active fault zone, Central Japan

*Hisao Kondo[1], Hideki Kurosawa[2], Yoko Hirakura[2], Keita Takada[3], Kohei Abe[2], Miwako Ito[2], Atsuo Igarashi[3], Tetsuya Ikeda[3], Atsushi Miwa[2] (1.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology, 2.OYO Cooperation, 3.Fukken Co., Ltd)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SSS15-11] P-wave seismic reflection profiling across the northern central ISTL active fault system, central Japan

*Haruo Kimura[1], Hisao Kondo[2], Yasuhiko Akinaga[3], Shigeru Okamoto[3], Masaki Suehiro[3] (1.Central Research Institute of Electric Power Industry, 2.Geological Survey of Japan, AIST, 3.Hanshin Consultants Co., Ltd.)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SSS15-12] History of interplate earthquakes along the Sagami Trough from uplifted coasts in the Boso Peninsula

*Junki Komori[1], Masanobu Shishikura[2], Ryosuke Ando[1] (1.The University of Tokyo, 2.The National Institute of Advanced Industrial Science and Technology)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SSS15-13] Inferring location and activity of the Iriyamase fault, the Fujikawa-kako fault zone, based on boring core sample analyses and physical fault model

*Namiki Ryo[1], Ryosuke Ando[1], Masanobu Shishikura[2] (1.The University of Toyko, 2.National Institute of Advanced Industrial Science and Technology)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SSS15-14] **Coastal submergence events identified by fossil diatoms and plant macrofossils at Ukishima-ga-hara adjacent to the Suruga Trough (eastern Nankai Trough), central Japan**

*Yuki Sawai[1], Arata Momohara[2], DAN MATSUMOTO[1], Yumi Shimada[1,3] (1.Geological Survey of Japan, AIST, 2.Chiba University, 3.University of Tsukuba)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A02 TOKYO BAY MAKUHARI HALL

[S-SS15] Active faults and paleoseismology

convener:Mamoru Koarai(Earth Science course, College of Science, Ibaraki University), Takashi OGAMI(National Institute of Advanced Industrial Science and Technology), Ryosuke Doke(Hot Springs Research Institute of Kanagawa Prefecture), Hisao Kondo(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Chairperson:Takashi Ogami(AIST), Koji Okumura(Hiroshima University)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SSS15-15] Shallow structures and tectonic geomorphology of active blind thrusts imaged by new hi-resolution seismic reflection profiling, Hokkaido, Northern Japan

*Tatsuya Ishiyama[1], Naoko Kato[1], Hiroshi Sato[1], Taro Koike[2], Katsuya Noda[2] (1.Earthquake Research Institute, University of Tokyo, 2.Geosys, Inc.)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SSS15-16] Paleo-seismological survey on the Idenokuchi fault, Nishihara village, Kumamoto prefecture

*Daisuke Ishimura[1], Hiroyuki Tsutsumi[2], Naoya Takahashi[3], Ryuhei Oda[1], Jun Matsukaze[1], Heitaro Kaneda[4], Motoya Kobayashi[4], Yasuhiro Kumahara[5], Makoto Kobayashi[6], Toshihiko Ichihara[7] (1.Department of Geography, Tokyo Metropolitan University, 2.Department of Environmental Systems Science, Faculty of Science and Engineering, Doshisha University, 3.Department of EarthScience, Tohoku University, 4.Graduate School of Science, Chiba University, 5.Graduate School of Education, Hiroshima University, 6.Research Center for Volcanic Hazards and Their Mitigation, Tokyo Metropolitan University, 7.Sedimentary Environments Research)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SSS15-17] Paleoseismic investigations of the Hinagu fault zone, Kumamoto, Japan: Preliminary result of trenching survey at Yatsushiro city

*Yukari Miyashita[1], Takashi Azuma[1], Yusuke Komine[2], Masao Kametaka[2], Midori Kishiyama[2] (1.Institute of Earthquake and Volcano Geology, Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology, 2.Dia Consultants Co. Ltd.)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SSS15-18] Seismic trenching on offshore part of the Hinagu Fault Zone, Kyushu, Japan −3D structure and paleo-seismicity of offshore dextral strike-slip fault

*Takashi OGAMI[1], Shintaro Abe[2], Kenjiro Mukaiyama[3], Shigeyuki Suda[4] (1.Geological Survey of Japan, AIST, 2.ADEP, 3.Kawasaki Geological Engineering Co. Ltd., 4.JGI Inc.)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SSS15-19] Conductivity Structure models of large and small slip regions at the 2016 Kumamoto earthquake sequence

*Satoru Yamaguchi[1], Yuto Yamanaka[2], Akira Mimura[1], Kazuki Fkue[1], Daigo Furukawa[1], Tada-nori Goto[3], Hisatoshi Koji[3], Sota Kawaguchi[3], Koki Aizawa[4], Shinichi Takakura[5] (1.Department of Geosciences, Graduate School of Science, Osaka City University, 2.Faculty of Science, Osaka City University, 3.Department of Urban Management, Graduate School of Engineering, Kyoto University, 4.Institute of Seismology and Volcanology, Kyushu University, 5. Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SSS15-20] The Timing and Extent of the Last Surface Rupture Event on the Himalayan Frontal Thrust in Central Nepal around Butwal

*Koji Okumura[1], Soma Nath Sapkota[2], Prakash Pokhrel[2], Hisao Kondo[4], Takuya Furuhashi[3] (1.Graduate School of Letters, Hiroshima University, 2.Department of Mines and Geology, 3.Taiheiyo Cement Corporation, 4.Geological Survey of Japan, AIST)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A02 TOKYO BAY MAKUHARI HALL

[S-SS15] Active faults and paleoseismology

convener:Mamoru Koarai(Earth Science course, College of Science, Ibaraki University), Takashi OGAMI(National Institute of Advanced Industrial Science and Technology), Ryosuke Doke(Hot Springs Research Institute of Kanagawa Prefecture), Hisao Kondo(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Chairperson:Ryosuke Doke(Hot Springs Research Institute of Kanagawa Prefecture), Mamoru KOARAI(Ibaraki University)

3:30 PM - 4:00 PM JST | 6:30 AM - 7:00 AM UTC

[SSS15-21] Linear surface ruptures detected by SAR - - *the Kumamoto earthquake, the Northern Osaka earthquake and the Hokkaido Eastern Iburi earthquake*

★Invited Papers

*Satoshi Fujiwara[1], Hiroshi Une[1], Takayuki Nakano[1], Hiroshi Yarai[1], Tomokazu Kobayashi[1], Yu Morishita[1] (1.GSI of Japan)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SSS15-22] Acquisition of micro-landforms in the forest using small UAV-LiDAR: An example from surface rupture of the 2008 Iwate-Miyagi Nairiku, Japan, earthquake

*Asaka Konno[1], Taro Suzuki[2], Shinji Toda[1] (1.International Research Institute of Disaster Science, Tohoku University, 2.Waseda University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SSS15-23] **Bayesian Inference and Forecast on Renewal Processes for Recurrent Earthquakes with Uncertain Occurrence Times**

*Shunichi Nomura[1], Yosihiko Ogata[1] (1.The Institute of Statistical Mathematics)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SSS15-24] **Slip rate of the Chaman fault: estimates based on ^{10}Be exposure dating for offset geomorphic surfaces in Afghanistan**

*Zakeria Shnizai[1], Yuki Matsushi[2], Hiroyuki Tsutsumi[1] (1.Doshisha University, 2.Kyoto University)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[S-SS17] Seismic evidence of volcanic roots

convener:Naofumi Aso(Tokyo Institute of Technology), Yohei Yukutake(Hot Springs Research Institute of Kanagawa Prefecture), Chairperson:Naofumi Aso, Yohei Yukutake

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SSS17-01] Spectral characteristics of deep low frequency earthquakes at Mount Fuji

★Invited Papers

*Motoo Ukawa[1] (1.Nihon University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SSS17-02] Deep low-frequency earthquakes corresponding to the 2011 and 2018 eruptions in Kirishima volcano

*Ryo Kurihara[1], Kazushige Obara[1], Akiko Takeo[1], Yusaku Tanaka[1] (1.Earthquake Research Institute, The University of Tokyo)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SSS17-03] Origin of long-duration of deep low-frequency earthquakes and activity of shallow low-frequency earthquakes beneath northeastern Japan

*Masahiro Kosuga[1], Taichi Haruyama[1], Yuki Matsuno[2], Iori Narita[2], Takuto Maeda[1] (1.Graduate School of Science and Technology, Hirosaki University, 2.Faculty of Science and Technology, Hirosaki University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SSS17-04] Deep low-frequency earthquakes, tomography and magmatic system beneath active volcanoes

★Invited Papers

*Dapeng Zhao[1] (1.Department of Geophysics, Tohoku University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SSS17-05] Seismic imaging of deep structure beneath active volcanoes

*Junichi Nakajima[1] (1.Department of Earth and Planetary Sciences, Tokyo Institute of Technology)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SSS17-06] Deep low-frequency volcanic earthquakes and their implication for deep crustal processes in the magmatic arc

*Haruhisa Nakamichi[1] (1.Sakurajima Volcano Research Center, Disaster Prevention Research Institute, Kyoto University)

[J] Oral | S (Solid Earth Sciences)：S-MP Mineralogy & Petrology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[S-MP32] Deformed rocks, Metamorphic rocks and Tectonics

convener:Yumiko Harigane(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST)), Yoshihiro Nakamura(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Chairperson:Yoshihiro Nakamura(産総研), Yumiko Harigane(産総研)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SMP32-01] Argon release mechanism of deformed phengite

*Tetsumaru Itaya[1] (1.Engineering Geology Center, Hiruzen Institute for Geology and Chronology)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SMP32-02] Detrital zircons from a traverse along the Asemi River (Sanbagawa Metamorphic Belt, Shikoku, Japan): U-Pb geochronology and Hf isotopic composition

*Ulrich Knittel[1], Shigeyuki Suzuki[2], Monika Walia[3], Juan-Hsi Lee[4], Hao-Yang Lee[5] (1.RWTH Aachen University, 2.Okayama University, 3.Nat. Taiwan University , 4.Chung Cheng University, 5.Academia Sinica)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SMP32-03] Tectonic process of the Sanbagawa eclogite: zircon U–Pb and REE composition analyses

*Shogo Aoki[1], Kazumasa Aoki[2], Tatsuki Tsujimori[3], Yuta Tsuchiya[1], Daichi Kato[2] (1.Department of Biosphere-Geosphere Science, Okayama University of Science, 2.Department of Applied Science, Okayama University of Science, 3.Center for Northeast Asian Studies, Tohoku University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SMP32-04] Petrological implications of a new occurrence of retrogressed eclogite from the Sanbagawa belt of southwest Japan

*Tomoki Taguchi[1], Shunsuke Endo[2], Yohei Igami[1,3], Akira Miyake[1] (1.Graduate School of Science, Kyoto University, 2.Interdisciplinary Faculty of Science and Engineering, Shimane University, 3.Institute of Materials and Systems for Sustainability, Nagoya University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SMP32-05] *P-T* estimations of Kashio mylonite in Oshika, Nagano, Japan: Constraints on the amalgamation of Ryoke and Sambagawa belts

*Yoshihiro Nakamura[1], Yutaka Takahasi[1], Tohru Danhara[2], Hideki Iwano[2], Takehumi Hirata[3] (1.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology, 2.Kyoto Fission-Track Co., Ltd., 3.Geochemical Research Center, The University of Tokyo)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SMP32-06] **Static phenomena retained by garnet during exhumation of metamorphic rocks**

*Masaki Enami[1], Yui Kouketsu[2] (1.Institute for Space–Earth Environmental Research, Nagoya University, 2. Nagoya University)

[J] Oral | S (Solid Earth Sciences)：S-MP Mineralogy & Petrology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[S-MP32] Deformed rocks, Metamorphic rocks and Tectonics

convener:Yumiko Harigane(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST)), Yoshihiro Nakamura(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Chairperson:Tomoki Taguchi(京都大学　大学院理学研究科), Kenta Yoshida(JAMSTEC)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SMP32-07] Garnet zoning suggesting the correlation between the Higo and Abukuma metamorphic rocks

*Tadao Nishiyama[1], Yuto Wakida[1] (1.Department of Earth and Environmental Sciences, School of Science, Graduate School of Science and Technology, Kumamoto University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SMP32-08] $FeAlO_3$ phase at ultrahigh-temperature metamorphic conditions: Evidences from the sillimanite—Fe_2O_3 and sillimanite—Fe_3O_4 systems at 9 kbar and 1050 °C

*Toshisuke Kawasaki[1], Tatsuro Adachi[2], Hiroaki Ohfuji[1], Yasuhito Osanai[2] (1.Ehime University, 2.Kyushu University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SMP32-09] **Halogens in nanogranitoids entrapped during granulite facies to ultrahigh-temperature metamorphism in the lower crust**

*Fumiko Higashino[1], Tetsuo Kawakami[2] (1. Graduate School of Environmental Studies, Tohoku University, 2.Graduate School of Science, Kyoto University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SMP32-10] Significance of high-Ti biotite and anatectic conditions of paragneiss in the Oki-Dogo Island, Japan

Hiroshi Yoshida[1], *Shunsuke Endo[1], Mai Fujiwara[1], Atsushi Kamei[1] (1.Department of Earth Science, Interdisciplinary Faculty of Science and Engineering, Shimane University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SMP32-11] Eclogite-to-granulite transition in the Ufipa Complex (Tanzania): the time-lag between collision and the granulitization

*Morita Isamu[1], Tatsuki Tsujimori[1], Nelson Boniface[2], Shogo Aoki[3], Kazumasa Aoki[3] (1.Tohoku University, 2.University of Dar es Salaam, 3.Okayama University of Science)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SMP32-12] **Switching of metamorphic growth kinetics due to volume fraction of metamorphic fluid**

*Kazuhiro Miyazaki[1] (1.Orogenic Processes Research Group, Institute of Geology and Geoinformation, Geological Survey of Japan/National Institute of Advanced Industrial Science and Technology)

[J] Oral | S (Solid Earth Sciences)：S-MP Mineralogy & Petrology

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[S-MP32] Deformed rocks, Metamorphic rocks and Tectonics

convener:Yumiko Harigane(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST)), Yoshihiro Nakamura(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Chairperson:Shunsuke Endo(島根大学 総合理工学部 地球科学科), Ryosuke Oyanagi(国立研究開発法人 海洋研究開発機構 地球内部物質循環研究分野)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SMP32-13] Early Paleozoic subduction-zone metamorphism in Japan: A geochronological reappraisal of Kitomyo Schists

*Shota Matsunaga [1], Tatsuki Tsujimori[1], Atsushi MIYASHITA[2], Shogo Aoki[3], Kazumasa Aoki[3] (1.Tohoku University, 2.Seikei University, 3. Okayama University of Science)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SMP32-14] Dating a 'princess': U–Pb age determination of 'nunakawaite' (strontio-orthojoaquinite)

*Tatsuki Tsujimori[1], Tomomi Hara[1], Yuzuki Shinji[1], Tomohiro Ishizaka[1], Hiroshi Miyajima[2], Jun-Ichi Kimura[3], Shogo Aoki[4], Kazumasa Aoki[4] (1.Tohoku University, 2.Fossa Magna Museum, 3.JAMSTEC, 4.Okayama University of Science)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SMP32-15] Modeling of the progressive evolution of subducting slab composition by sparse modeling

*Kenta Yoshida[1], Tatsu Kuwatani[1,2], Kenta Ueki[1], Ryosuke Oyanagi[1], Shotaro Akaho[3] (1.Japan Agency for Marine-earth Science and Technology (JAMSTEC), 2.PRESTO, Japan Science and Technology Agency, 3.National Institute of Advanced Industrial Science and Technology (AIST))

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SMP32-16] Bayesian statistical evaluation method for detrital zircon geochronology: Applications

*Tan Furukawa[1], Tatsuki Tsujimori[2], Shogo Aoki[3], Kazumasa Aoki[4] (1.Tohoku University, Department of Earth Science, 2.Tohoku University, 3.Faculty of Biosphere-Geosphere Science, Okayama University of Science, 4.Department of Applied Science Okayama University of Science)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SMP32-17] 3D structural analysis using X-ray Computed Tomography technique: a case study for fault rocks from the Nojima Fault, southwest Japan

*Takafumi Nishiwaki[1], Aiming Lin[1], Bingcheng Liu[1] (1.Kyoto University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[SMP32-18] High- and low-stress subduction zones recognized in the rock record

*Kazuhiko Ishii[1], Simon Richard Wallis[2] (1.Department of Physical Science, Graduate School of Sciences, Osaka Prefecture University, 2.Department of Earth and Planetary Science, Faculty of Science, The University of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-MP Mineralogy & Petrology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A07 TOKYO BAY MAKUHARI HALL

[S-MP33] Physics and Chemistry of Minerals

convener:Seiji Kamada(Frontier Research Institute for Interdisciplinary Sciences, Tohoku University), Masahiro KAYAMA(Department of Earth and Planetary Material Sciences, Faculty of Science, Tohoku University), Chairperson:Seiji Kamada(FRIS, Tohoku Univ.)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SMP33-01] High-temperature Raman spectroscopic study of CO_2-containing melanophlogite

*Masami Kanzaki[1] (1.Institute for Planetary Matereials, Okayama University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SMP33-02] Synthesis of barium carbonate with calcite structure and rotational disorder of carbonate ions

*Hiroyuki Kagi[1], Ayaka Saito[1], Kazuki Komatsu[1], Jun Kawano[2] (1.Geochemical Research Center, Graduate School of Science, University of Tokyo, 2.Fuculty of Science, Hokkaido University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SMP33-03] In-situ Raman spectroscopy of ε-FeOOH under high pressures

*Osamu Ikeda[1], Tatsuya Sakamaki[1], Akio Suzuki[1] (1.Department of Earth Science, Graduate School of Science, Tohoku University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SMP33-04] **Strong hydrogen-bond generation in dense hydrous magnesium silicate phase E observed by single-crystal neutron diffraction**

*Narangoo Purevjav[1], Takuo Okuchi[1], Christina Hoffmann[2] (1.Institute for Planetary Materials, Okayama University, 2.Neutron Scattering Division, Neutron Sciences Directorate, Oak Ridge National Laboratory)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SMP33-05] **Water partitioning between upper mantle minerals and melts**

*Dmitry Bondar[1], Hongzhan Fei[1], Tony Withers[1], Tomoo Katsura[1] (1.Bayerisches Geoinstitut, University of Bayreuth, 95440 Bayreuth, Germany)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SMP33-06] Drop-solution enthalpy measurement of $MgSiO_3$ majorite

*Hiroshi Kojitani[1], Masamichi Noda[2], Toru Inoue[2,3], Masaki Akaogi[1] (1.Department of Chemistry, Faculty of Science, Gakushuin University, 2.GRC, Ehime University, 3.Dept. of Earth and Planetary systems Science, Hiroshima University)

[J] Oral | S (Solid Earth Sciences)：S-MP Mineralogy & Petrology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A07 TOKYO BAY MAKUHARI HALL

[S-MP33] Physics and Chemistry of Minerals

convener:Seiji Kamada(Frontier Research Institute for Interdisciplinary Sciences, Tohoku University), Masahiro KAYAMA(Department of Earth and Planetary Material Sciences, Faculty of Science, Tohoku University), Chairperson:Masahiro Kayama(東北大学)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SMP33-07] High-pressure phase transitions of minerals in the system MgO-TiO_2

*Masaki Akaogi[1], Tetsuya Fujimura[1], Shunto Arai[1], Masaki Okano[1], Hiroshi Kojitani[1] (1.Department of Chemistry, Faculty of Science, Gakushuin University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SMP33-08] Phase change process of iron sulfide nanoparticle from amorphous to crystalline with grain growth

*Yoshinari Sano[1], Atsushi Kyono[2], Yasuhiro Yoneda[3], Gen-ichiro Yamamoto[1] (1.Graduate School of Life and Environmental Sciences, University of Tsukuba, 2.Faculty of Life and Environmental Sciences, University of Tsukuba, 3.Japan Atomic Energy Agency)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SMP33-09] Texture formation in quenching of Fe-S-O micro melt spherules

*Hiroshi Isobe[1] (1.Department of Earth and Environmental Sciences, Faculty of Advanced Science and Technology, Kumamoto University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SMP33-10] Development of a software for electron diffraction simulation based on dynamical theory and its application to mineralogy

*Yusuke Seto[1], Masahiro Ohtuka[3], Akira Miyake[2] (1.Graduate School of Science, Kobe University, 2.Graduate School of Science, Kyoto University, 3.Graduate School of Technology, Nagoya University)

11:45 AM - 12:15 PM JST | 2:45 AM - 3:15 AM UTC

[SMP33-11] Site occupation analysis for cation in minerals by analytical electron microscopy: application of TEM-ALCHEMI for earth and planetary science

★Invited Papers

*Yohei Igami[1], Shunsuke Muto[1], Masahiro Ohtsuka[3], Akira Miyake[2], Takahiro Kuribayashi[4], Shoichi Toh[5] (1.Institute of Materials and Systems for Sustainability, Nagoya University, 2.Graduate School of Science, Kyoto University, 3.Graduate School of Engineering, Nagoya University, 4.Graduate School of Science, Tohoku University, 5.Faculty of Science, Fukuoka University)

[J] Oral | S (Solid Earth Sciences)：S-MP Mineralogy & Petrology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A07 TOKYO BAY MAKUHARI HALL

[S-MP33] Physics and Chemistry of Minerals

convener:Seiji Kamada(Frontier Research Institute for Interdisciplinary Sciences, Tohoku University), Masahiro KAYAMA(Department of Earth and Planetary Material Sciences, Faculty of Science, Tohoku University), Chairperson:Fumiya Noritake(Materials Science, Faculty of Engineering, Graduate Faculty of Interdisciplinary Research, UNIVERSITY OF YAMANASHI), Seiji Kamada(FRIS, Tohoku Univ.)

1:45 PM - 2:15 PM JST | 4:45 AM - 5:15 AM UTC

[SMP33-12] Molecular Dynamics Study of Soret Effect in Silicate Liquids

★Invited Papers

*Fumiya Noritake[1] (1.Graduate Faculty of interdisciplinary Research, University of Yamanashi)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SMP33-13] Seebeck coefficient of olivine: Implausible Mercury's thermoelectric dynamo

*Hitoshi Gomi[1], Takashi Yoshino[1], Akira Yoneda[1] (1.Okayama University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SMP33-14] Density measurement of liquid gallium using externally heated diamond anvil cell

*Ryo Tsuruoka[1], Hidenori Terasaki[1], Seiji Kamada[2], Iori Yamada[1], Fumiya Maeda[3], Tadashi Kondo[1], Satoru Urakawa[4], Naohisa Hirao[5], Akihiko Machida[6] (1.Department of Earth and Space Science, Graduate School of Science Osaka University, 2.Frontier Research Institute for Interdisciplinary Sciences, Tohoku University, 3.Department of Earth and Planetary Materials Science, Graduate School of Science, Tohoku University, 4.Department of Earth Science, Okayama University, 5.Japan Synchrotron Radiation Research Institute, 6.National Institutes for Quantum and Radiological Science and Technology)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SMP33-15] Density measurements of crystalline Fe and amorphous materials at high pressure

*Seiji Kamada[1,2], Hidenori Terasaki[3], Yusaku Takubo[3], Ryo Tsuruoka[3], Fumiya Maeda[2], Rui Yamada[1], Saori Kawaguchi[4], Naohisa Hirao[4], Akihiko Machida[5] (1.Frontier Research Institute for Interdisciplinary Sciences, Tohoku University, 2.Department of Earth Science, Graduate School of Science, Tohoku University, 3.Department of Earth and Space Science, Graduate School of Science, Osaka University, 4.JASRI, 5.QST)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SMP33-16] DAC-GHz ultrasonic P wave velocity measurement on KCl and natural olivine

*Akira Yoneda[1], Shinichiro Kobayashi[2], Seiji Kamada[3] (1.Institute for planetary materials, Okayama University, 2.Department of Earth Science, Graduate school of Science, Tohoku Univ., 3.Frontier Research Institute for Interdisciplinary Sciences, Tohoku Univ.)

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | IC 2F

[S-VC38] Active Volcanism

convener:Yuta Maeda(Nagoya University), Takahiro Miwa(National research institute for earth science and disaster prevention), Takeshi Nishimura(Department of Geophysics, Graduate School of Science, Tohoku University), Chairperson:Nobukazu Seama, Tetsuo Matsuno

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SVC38-30] Summary of Kikai submarine caldera researches conducted by KOBEC (Kobe Ocean-Bottom Exploration Center)

*Nobukazu Seama[1,2], Tetsuo Matsuno[2,1], Koji Kiyosugi[3,2], Satoshi Shimizu[2], Reina Nakaoka[2], Keiko Suzuki-Kamata[2,1], Yasutomo Seto[1], Mamoru Sano[2], Yuiko Morita[4], Hikaru Iwamaru[2], Haruhisa Morozumi[2], Misaki Horiuchi[1], Kimihiro Nishimura[1], Hiroshi Ichihara[5], Kazuki Hayashi[1], Toki Hirose[1], Katsuya Kaneko[1,2], Hiroto Yamaguchi[4], Yuki Okizono[4], Hiroko Sugioka[1,2], Kazuo Nakahigashi[6,2], Yojiro Yamamoto[7], Tatsuya KODA[2], Shuichi Kodaira[7,2], Yoshiyuki Tatsumi[2,1], Scientific party of T/S Fukae-maru Kikai caldera research cruises (1.Department of Planetology, Graduate School of Science, Kobe University, 2.Kobe Ocean Bottom Exploration Center, Kobe University, 3.Organization of Advanced Science and Technology, Kobe University, 4.Department of Planetology, Faculty of Science, Kobe University, 5.Graduate school of environmental studies, Nagoya University, 6.Tokyo University of Marine Science and Technology, 7.Japan Agency for Marine-Earth Science and Technology)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SVC38-31] Distribution of submarine pyroclastic-flow deposits of Akahoya eruption, Kikai caldera

*Satoshi Shimizu[1,2], Nobukazu Seama[3,1], Reina NAKAOKA[1], Tetsuo Matsuno[1,3], Koji Kiyosugi[5], Hikaru Iwamaru[1,2], Mamoru Sano[1,2], Kimihiro Nishimura[3], Keiko Suzuki-Kamata[1,3], Katsuya Kaneko[3], hiroto yamaguchi[4], Misaki Horiuchi[3], Toki Hirose[3], Kazuki Hayashi[3], Yoshiyuki Tatsumi[1,3] (1.Ocean Bottom Exploraiton Center, Kobe University, 2.Nippon Marine Enterprises, Ltd., 3.Department of Planetology, Graduate School of Science, Kobe University, 4.Department of Planetology, Faculty of Science, Kobe University, 5.Organization of Advanced Science and Technology, Kobe University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SVC38-32] Identification of submarine volcanic ash around the Kikai caldera with the Koya pyroclastic flow deposit inferred from glass composition

*Reina NAKAOKA[1], Keiko Suzuki-Kamata[1,2], Satoshi Shimizu[1], Yoshiyuki Tatsumi[1,2], Katsuya Kaneko[2,1], Koji Kiyosugi[3,1], Nobukazu Seama[2,1], Tetsuo Matsuno[1,2], Kimihiro Nishimura[2], Kazuki Hayashi[2] (1.Kobe Ocean-Bottom Exploration Center, Kobe University, 2.Department of Planetology, Graduate School ofScience, Kobe University, 3.Organization of Advanced Science and Technology, Kobe University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SVC38-33] Preliminary report of the sea floor survey by a remotely operated vehicle (ROV) at the Kikai caldera, SW Japan

*Koji Kiyosugi[1], Keiko Suzuki-Kamata[2], Haruhisa Morozumi[2,4], Yoshiyuki Tatsumi[2], Katsuya Kaneko[3], Reina NAKAOKA[2], Mamoru Sano[2], Satoshi Shimizu[2], Hikaru Iwamaru[2], Nobukazu Seama[3], Tetsuo Matsuno[2], Kimihiro Nishimura[3], Kazuki Hayashi[3], Misaki Horiuchi[3] (1.Organization for Advanced and Integrated Research, Kobe University, 2.Kobe Ocean-Bottom Exploration Center, Kobe University, 3.Department of Planetology, Graduate School of Science, Kobe University, 4.Japan Oil, Gas and Metals National Corporation)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SVC38-34] Seismic activity beneath Kikai Caldera by using Ocean Bottom Observation

*Yasutomo Seto[1], Hiroko Sugioka[2], Yojiro Yamamoto[3], Tsutomu Takahashi[4] (1.Department of Planetology, Graduate School of Science, Kobe University, 2.Department of Planetology, Kobe University, 3.Japan Agency for Marine-Earth Science and Technology, 4.Research and Developement Center for Earthquake and Tsunami, Japan Agency for Marine-Earth Science and Technology)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SVC38-35] An investigation of three-dimensional electrical resistivity structure under Kikai Caldera

*Tetsuo Matsuno[1,2], Toki Hirose[2], Yuuki Okizono[3], Nobukazu Seama[2,1], Hiroshi Ichihara[4], Hiroko Sugioka[2,1], Yoshiyuki Tatsumi[1,2] (1.Kobe Ocean Bottom Exploration Center, Kobe University, 2.Department of Planetology, Graduate School of Science, Kobe University, 3.Department of Planetology, Faculty of Science, Kobe University, 4.Graduate school of environmental studies, Nagoya University)

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | IC 2F

[S-VC38] Active Volcanism

convener:Yuta Maeda(Nagoya University), Takahiro Miwa(National research institute for earth science and disaster prevention), Takeshi Nishimura(Department of Geophysics, Graduate School of Science, Tohoku University), Chairperson:Takeshi Ohba, Akihiko Terada

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SVC38-36] Time variation in the chemical and isotopic composition of fumarolic gases at Hakone volcano Japan

*Takeshi Ohba[1], Muga Yaguchi[2], Kana NISHINO[1], Nozomi Numanami[1], Yasushi DAITA[3], Urumu Tsunogai[4], Masanori Ito[4], Chiho Sukigara[4] (1.Department of chemistry, School of Science, Tokia University, 2.Meteorological Research Institute, JMA, 3.Kanagawa Environmental Research Center, 4.Nagoya University Graduate School of Environmental Studies)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SVC38-37] Chemical and isotopic composition of volcanic gases at Mt Kirishima Iwoyama, Japan

*Takeshi Ohba[1], Muga Yaguchi[2], Kotaro Toyama[3], Hirochika Sumino[3], Urumu Tsunogai[4], Masanori Ito[4], Ryo Shingubara[4] (1.Department of chemistry, School of Science, Tokia University, 2.Meteorological Research Institute, 3.The University of Tokyo Graduate School of Arts and Sciences Department of Basic Science, 4.Nagoya University Graduate School of Environmental Studies)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SVC38-38] Temporal and spatial variations of helium isotope ratios in volcanic gases in Kirishima volcanic group, Japan

*Kotaro Toyama[1], Hirochika Sumino[1], Kaori Kawana[1], Takeshi Ohba[2], Muga Yaguchi[3], Yoshihide Akiyama[1], Koki Aizawa[4], Kaori Tsukamoto[4] (1.Department of Basic Science, Graduate School of Arts and Sciences, The University of Tokyo, 2.Department of chemistry, School of Science, Tokia University, 3.Meteorological Research Institute, 4.Institute of Seismology and Volcanology, Faculty of Science, Kyushu University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SVC38-39] Emission regions of gaseous elemental mercury around Yugama crater lake at Kusatsu-Shirane volcano, Japan

*Akihiko Terada[1], Noriaki Mizutani[1] (1.Volcanic Fluid Research Center, Faculty of Science, Tokyo Institute of Technology)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SVC38-40] Magnetotelluric images of Kusatsu-Shirane volcano, revisited by 3-D modeling with tetrahedral elements considered topography effect

*Kuo Hsuan Tseng[1], Yasuo Ogawa[1], Nurhassan .[2], Sabri Bulent Tank[3], Akihiko Terada[1], Wataru Kanda[1], Masato Fukai[1] (1.Tokyo Institute of Technology, 2.Bandung Institute of Technology, Indonesia, 3.Bogazici University, Turkey)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SVC38-41] Magma conduit and associated hydrothermal systems of Aso volcano as revealed by broadband magnetotelluric data

*Nobuo Matsushima[1], Mitsuru Utsugi[2], Shinichi Takakura[1], Tadashi Yamasaki[1], Maki Hata[3], Takeshi Hashimoto[4], Makoto Uyeshima[3] (1.Geological Survey of Japan,AIST, 2.Kyoto University, 3.The University of Tokyo, 4.Hokkaido University)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A09 TOKYO BAY MAKUHARI HALL

[S-CG57] Structure and evolution of Japanese islands - Formation of island arc systems and earthquake cycles

convener:Hiroshi Sato(Earthquake Prediction Research Center, Earthquake Research Institute, The University of Tokyo), Masanao Shinohara(Earthquake Research Institute, University of Tokyo), Masahiro Ishikawa(Graduate School of Environment and Information Sciences Yokohama National University), Makoto MATSUBARA(National Research Institute for Earth Science and Disaster Resilience), Chairperson:Masanao Shinohara(Earthquake Research Institute, The University of Tokyo), Tatsuya Ishiyama(Earthquake Research Institute, University of Tokyo)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SCG57-01] Recent Earthquake Activity in Northern Hokkaido, Japan

Cancelled

*Tetsuo Takanami[1,2] (1.Carnegie Institution for Science, 2.Hokkaido Research Center of Geology)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SCG57-02] Seismic constraints on the crustal structure off the southwestern coast of Hokkaido, Japan Sea

*Tetsuo No[1], Takeshi Sato[1], Shuichi Kodaira[1], Hiroshi Sato[2], Tatsuya Ishiyama[2] (1.JAMSTEC, 2.ERI, University of Tokyo)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SCG57-03] Deep seismic reflection profiling across the Oshima Peninsula, SW Hokkaido, Japan

*Hiroshi Sato[1], Tatsuya Ishiyama[1], Naoko Kato[1], Hidehiko Shimizu[2], Takeshi Sato[3], Shinji Kawasaki[2], Tetsuo No[3], Shuichi Kodaira[3], Seiichi Miura[3] (1.Earthquake Research Institute, The University of Tokyo, 2.JGI Inc, 3.Japan Agency for Marine-Earth Acience and Technology)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SCG57-04] Crustal deformation and stress accumulation on source faults around Hokkaido, Japan, due to coupling at the Kuril trench

*Akinori Hashima[1], Hiroshi Sato[1], Tatsuya Ishiyama[1], Andrew M. Freed[2] (1.Earthquake Research Institute, The University of Tokyo, 2.Purdue University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SCG57-05] Structural Heterogeneity in and around the Source Region of the 2018 Hokkaido Eastern Iburi Earthquake, Central Hokkaido, Japan

*Takaya Iwasaki[1], Noriko Tsumura[2], Tanio Ito[3], Kazunori Arita[4], Makoto Matsubara[5], Hiroshi Sato[1], Eiji Kurashimo[1], Naoshi Hirata[1], Susumu Abe[6], Katsuya Noda[7], Akira Fujiwara[8], Shinsuke Kikuchi[9], Kazuko Suzuki[10] (1.Eathquake Research Institute, the University of Tokyo, 2.Graduate School of Science, Chiba University, 3.Association for the Development of Earthquake Prediction, 4.Hokkaido Research Center of Geology, 5.National Research Institute for Earth Science and Disaster Resilience, 6.JAPEX, 7.GEOSYS Inc., 8.JOGMEC, 9.JGI Inc., 10.Schlumberger Ltd.)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SCG57-06] Electrical resistivity distribution around the middle axis of Hokkaido Island: constraint for tectonics of ultra-mafic rocks

*Hiroshi Ichihara[1], Toru Mogi[1], Yusuke Yamaya[2] (1.Earthquake and Volcano Research Center, Nagoya University, 2.AIST)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A09 TOKYO BAY MAKUHARI HALL

[S-CG57] Structure and evolution of Japanese islands - Formation of island arc systems and earthquake cycles

convener:Hiroshi Sato(Earthquake Prediction Research Center, Earthquake Research Institute, The University of Tokyo), Masanao Shinohara(Earthquake Research Institute, University of Tokyo), Masahiro Ishikawa(Graduate School of Environment and Information Sciences Yokohama National University), Makoto MATSUBARA(National Research Institute for Earth Science and Disaster Resilience), Chairperson:Hiroshi Sato(Earthquake Research Institute, Tokyo University), Masahiro Ishikawa(Yokohama National University)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SCG57-07] Three-dimensional seismic velocity structure beneath and around Japanese Islands including beneath the Pacific Ocean using NIED S-net data

*Makoto MATSUBARA[1], Hiroshi Sato[2], Kenji Uehira[1], Masashi Mochizuki[4], Toshihiko Kanazawa[5], Narumi Takahashi[1], Kensuke Suzuki[3], Shinichiro Kamiya[1] (1.National Research Institute for Earth Science and Disaster Resilience, 2.Earthquake Research Institute, the University of Tokyo, 3.Japan Agency for Marine-Earth Science and Technology, 4.Ministry of Education, Culture, Sports, Science and Technology, Japan , 5.Association for the Development of Earthquake Prediction)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SCG57-08] Spatio-temporal extent of Cretaceous fore-arc basin in Japan

*Yukio Isozaki[1], Ryo Hasegawa[1], Yukiyasu Tsutsumi[1] (1.Department of Earth Science and Astronomy, Multi-disciplinary Sciences - General Systems Studies, Graduate School of Arts and Sciences, The University of Tokyo)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SCG57-09] Geotectonic identities of dismembered ancient fore-arc clastics: U-Pb dating of detrital zircons in Cretaceous-Paleogene shallow marine/fluvial sandstones sporadically found in Kanto, central Japan

*Ryo Hasegawa[1], Yukio Isozaki[1], Yukiyasu Tsutsumi[2] (1.Department of Earth Science and Astronomy, The University of Tokyo, 2.Department of Geology and Paleontology, National Museum of Nature and Science)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SCG57-10] Laboratory Measurements of Vp, Vs and Vp/Vs for polycrystalline labradorite up to 800°C and 1GPa

*Satoko Honda[1], Masahiro Ishikawa[1] (1.Graduate School of Environment and Information Sciences, Yokohama National University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SCG57-11] Shallow to deeper structures of the Median Tectonic Line active fault system in Shikoku illuminated by new hi-resolution seismic reflection profiling, southwest Japan

*Tatsuya Ishiyama[1], Naoko Kato[1], Shin Koshiya[2], Hiroshi Sato[1], Makoto MATSUBARA[3], Tomoko Elizabeth Yano[3], Taro Koike[4], Katsuya Noda[4] (1.Earthquake Research Institute, University of Tokyo, 2.Department of Civil and Environmental Engineering, Faculty of Science and Engineering, Iwate University, 3.National Research Institute for Earth Science and Disaster Resilience, 4.Geosys, Inc.)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SCG57-12] **Cenozoic evolution of the Tsushima Strait and the Fukue Basin, southern Sea of Japan: an interplay of tectonics, palaeo-environment, and volcanism**

*Johan S. Claringbould[1], Hiroshi Sato[1], Tatsuya Ishiyama[1], Anne Van Horne[1,2], Shinji Kawasaki[3], Susume Abe[4] (1.Earthquake Research Institute, The University of Tokyo, 2.Department of Geology and Geophysics, University of Wyoming, 3.JGI, Inc., 4.JAPEX)

[J] Oral | B (Biogeosciences)：B-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 201A 2F

[B-CG07] Decoding the history of Earth: From Hadean to the present

convener:Tsuyoshi Komiya(Department of Earth Science & Astronomy Graduate School of Arts and Sciences The University of Tokyo), Yasuhiro Kato(Department of Systems Innovation, Graduate School of Engineering, University of Tokyo), Katsuhiko Suzuki(Research and Development Center for Submarine Resources, Japan Agency for Marine-Earth Science and Technology), Chairperson:Tomohiko Sato(Earth-Life Science Institute, Tokyo Institute of Technology)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[BCG07-01] Iron-oxidizing bacteria and stromatolites in the Ediacaran hydrothermal carbonate

*Akihiro Kano[1], Aya Miyazaki[1], Jumpei Yoshioka[1], Ibtissam Chraiki[2], Abdelhafed Barzouk[2], Nasrrddine Youbi[2,3], Hassan Admou[2], Moulay Ahmed Boumehdi[2,3], Lhou Maacha[4], Hsaine Baoutoul[4], Ismail Bouskri[4] (1.Graduate School of Science, The University of Tokyo, 2.Department of Geology, Faculty of Sciences-Semlalia, Cadi Ayyad University, 3.Instituto Dom Luiz, Faculdade de Ciências, Universidade de Lisboa, 4.Managem-ONA Group)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[BCG07-02] Carbonate carbon isotope stratigraphy of the Paleoproterozoic Francevillian Group in Gabon

★Invited Papers

*Tomohiko Sato[1], Yusuke Sawaki[2], Hisashi Asanuma[2], Hisahiro Ueda[1], Shigenori Maruyama[1] (1.Tokyo Institute of Technology, 2.The University of Tokyo)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[BCG07-03] The redox condition of late Paleoproterozoic shallow marine environment: The Cape Smith Belt, Canada

*Kento Motomura[1], Shoichi Kiyokawa[1], Minoru Ikehara[2], Takashi Sano[4], Kentaro Tanaka[3], Tsubasa Miki[3], Yuji Sano[3] (1.Kyushu University, 2.Kochi University, 3.University of Tokyo, 4.National Museum of Nature and Science)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[BCG07-04] Paleovegetation changes reconstructed by terrestrial plant biomarker analyses in the sediments deposited across the Cenomanian/Turonian boundary in the Tomamae area, Hokkaido, Japan

*Masashi A. Ikeda[1], Ken Sawada[2], Takuto Ando[3], Hideto Nakamura[4], Reishi Takashima[5], Hiroshi Nishi[5] (1.Graduate School of Science, Hokkaido University, 2.Department of Earth and Planetary Sciences, Faculty of Science, Hokkaido University, 3.Arctic Research Center, Hokkaido University, 4.Faculty of Science, Osaka City University, 5.The Center for Academic Resources and Archives, The Tohoku University Museum, Tohoku University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[BCG07-05] A general overview of the research progress on REY-rich mud

*Yasuhiro Kato[1,2], Kentaro Nakamura[1], Koichiro Fujinaga[2,1], Kazutaka Yasukawa[1,2], Yutaro Takaya[3,1,2], Junichiro Ohta[2,1], Erika Tanaka[1], Kazuhide Mimura[1], Koichi Iijima[4,1], Shiki Machida[2,1], Tatsuo Nozaki[4,1,2,5], Jun-Ichi Kimura[4], Hikaru Iwamori[1,4,6] (1.The University of Tokyo, 2.ORCeNG, Chiba Institute of Technology, 3.Waseda University, 4.JAMSTEC, 5.Kobe University, 6.Tokyo Institute of Technology)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[BCG07-06] A cold and alkaline Hadean ocean caused by impact ejecta weathering

*Shintaro Kadoya[1], David C Catling[1] (1.University of Washington)

[J] Oral | B (Biogeosciences) : B-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 201A 2F

[B-CG07] Decoding the history of Earth: From Hadean to the present

convener:Tsuyoshi Komiya(Department of Earth Science & Astronomy Graduate School of Arts and Sciences The University of Tokyo), Yasuhiro Kato(Department of Systems Innovation, Graduate School of Engineering, University of Tokyo), Katsuhiko Suzuki(Research and Development Center for Submarine Resources, Japan Agency for Marine-Earth Science and Technology), Chairperson:Satoshi Yoshida(Department of Earth Science & Astronomy, Graduate School of Arts and Sciences, The University of Tokyo)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[BCG07-07] **Impact-induced magmatism on early Earth**

*Hiroshi Ohmoto[1], Uschi M. Graham[2], Yuya Tsukamoto[3], Yumiko Watanabe[3], Takeshi Kakegawa[3], Hiroshi Hamasaki[4], Andrew Chorney[5], Katherine Crispin[1], Zi-Kui Liu[1] (1.The Pennsylvania State University, 2.Univ. of Kentucky, 3.Tohoku Univ., 4.Tokyo Gas, 5.Temple Univ.)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[BCG07-08] An evaluation of impact dating for shocked zircons with planar features (PFs) in the Vredefort dome by LA-ICP-MS multi-spot analysis

*Shinji Yamamoto[1], Taiga Kato[1] (1.Graduate School of Environment and Information Sciences, Yohohama National University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[BCG07-09] **Application of acid-washing to trace element and tungsten isotope analyses of Eoarchean rocks from the Isua Supracrustal Belt**

★Invited Papers

*Hatsuki Enomoto[1], Tsuyoshi Iizuka[1], Yoshitaka Homma[1] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[BCG07-10] Limited primary production in the early Archean oceans and its biogeochemical consequenses

★Invited Papers

*Kazumi Ozaki[1] (1.Toho University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[BCG07-11] Behaviors of carbon cycle system and inevitability of the hot climate in the Archean Earth

★Invited Papers

*Yasuto Watanabe[1], Eiichi Tajika[1], Kazumi Ozaki[2], Peng Hong[3] (1.The University of Tokyo, 2.Toho University, 3.Chiba Institute of Technology)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[BCG07-12] Occurrence and chemical composition of metamorphic carbonate rocks in the Isua supracrustal belt, West Greenland: Implications for the origin of carbonate rocks and compositions of the Eoarchean seawater.

*Yoshida Satoshi[1], Kazutaka Yasukawa[2], Yasuhiro Kato[2], Yusuke Sawaki[3], Tsuyoshi Komiya[3] (1.Department of Earth & Planetary Science, Graduate School of Science, The University of Tokyo, 2.Department of Systems Innovation, Graduate School of Engineering, University of Tokyo, 3.Department of Earth Science & Astronomy Graduate School of Arts and Sciences, The University of Tokyo)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 304 3F

[M-IS19] Paleoclimatology and paleoceanography

convener:Yusuke Okazaki(Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University), Akira Oka(Atmosphere and Ocean Research Institute, The University of Tokyo), Michinobu Kuwae(Center for Marine Environmental Studies), Hitoshi Hasegawa(Faculty of Science and Technology, Kochi University), Chairperson:Yusuke Okazaki

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[MIS19-01] Development of Longitudinal dunes under the Pangean atmospheric circulation

*Hiroki Shozaki[1], Hitoshi Hasegawa[2] (1.Faculty of Science, Kochi University, 2.Faculty of Science and Technology, Kochi University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[MIS19-02] Response of primary producers in the ocean anoxic events during the Cretaceous

*Haga Mayuko[1], Eiichi Tajika[1], Kazumi Ozaki[2] (1.The University of Tokyo, 2.Toho University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[MIS19-03] The linkage between desertification and tectonism inferred from the provenance change of the terrestrial sediments in the Tarim basin

*Aki Sakuma[1], Ryuji Tada[1], Tomohiro Yoshida[1], Hitoshi Hasegawa[2], Naomi Sugiura[1], Akinori Karasuda[1], Ke WANG[1], Hongbo Zheng[3] (1.Department of Earth and Planetary Science, School of Science, the University of Tokyo, 2.Faculty of Science and Technology, Kochi University, 3.School of Resource Environment and Earth Science, Yunnan University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[MIS19-04] Paleoceanographic reconstruction in the northwestern Pacific during MIS 19 using ultra-high temporal resolution oxygen isotope profiles and planktonic foraminiferal assemblage

*Yuki Haneda[1], Nanako Yokokawa[1], Makoto Okada[1], Hiroki Hayashi[2], Yoshimi Kubota[3], Yusuke Suganuma[4] (1.College of Science, Ibaraki University, 2.Interdisciplinary Factulty of Science and Engineering, Shimane University, 3.National Museum of Nature and Science, 4.National Institute of Polar Research)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[MIS19-05] Paleoclimate reconstruction using fossil pollen analyses from a sedimentary sequence around the Matuyama-Brunhes polarity transition in the Chiba composite section

*Makoto Okada[1], Hitomi Takizawa[1], Yuki Haneda[2], Yusuke Suganuma[3,4], Quentin Simon[5] (1.Department of Earth Sciences, College of Science, Ibaraki University, 2.Graduate school of Science and Technology, Ibaraki University, 3.National Institute of Polar Research, 4.Graduate University for Advanced Studies, 5.Aix-Marseille University)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[MIS19-06] Reconstruction of vertical thermal structure in the western Pacific warm pool over the last 1 Myr

*Fumito Mizuno[1], Takuya Sagawa[2], Keisuke Mukaida[3], Yoshimi Kubota[4], Toshitsugu Yamazaki[5], Junichiro Kuroda[5] (1.Graduate School of Natural Science and Technology. Kanazawa University, 2.Institute of Science & Engineering. Kanazawa University, 3.Collage of Science & Engineering. Kanazawa University, 4.National Museum of Nature & Science, 5.Atmosphere and Ocean Research Institute. The University of Tokyo)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 304 3F

[M-IS19] Paleoclimatology and paleoceanography

convener:Yusuke Okazaki(Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University), Akira Oka(Atmosphere and Ocean Research Institute, The University of Tokyo), Michinobu Kuwae(Center for Marine Environmental Studies), Hitoshi Hasegawa(Faculty of Science and Technology, Kochi University), Chairperson:Michinobu Kuwae(愛媛大学沿岸環境科学研究センター)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[MIS19-07] Future perspective on the response of marine calcifiers to “evil twins” of climate change due to increased PCO2

*Hodaka Kawahata[1] (1.Atmosphere Ocean Research Institute, the University of Tokyo)

2:00 PM - 2:22 PM JST | 5:00 AM - 5:22 AM UTC

[MIS19-08] Reconstruction of seawater pH and atmospheric CO_2 concentration based on boron isotopic composition of biogenic calcium carbonate

★Invited Papers

*Kaoru Kubota[1] (1.Kochi Institute for Core Sample Research, JAMSTEC)

2:22 PM - 2:37 PM JST | 5:22 AM - 5:37 AM UTC

[MIS19-09] A 70 years changes of the Java Sea surface condition based on geochemical analyses of a coral core

*Ai Genda[1], Atsushi Suzuki[2], Toyoho Ishimura[3], Minoru Ikehara[4], Mayuri Inoue[1] (1.Graduate School of National Science and Technology, Okayama University, 2.Geological Survey of Japan Natinal Institute of Advanced Industrial Science and Technology, 3.National Institute of Technology, Ibaraki College, 4.Center for Advanced Marine Core Research, Kochi University)

2:37 PM - 2:52 PM JST | 5:37 AM - 5:52 AM UTC

[MIS19-10] Reconstruction of paleoenvironments in the western Pacific for the last 220 years

Mutsumi Chihara[1], Ayaka Fukushima[2], Minoru Ikehara[3], Hodaka Kawahata[2], Atsushi Suzuki[4], *Mayuri Inoue[1] (1.Department of Earth Sciences, Okayama University, 2.Atmosphere and Ocean Research Institute, the University of Tokyo, 3.Center for Advanced Marine Core Research, Kochi University, 4.Geological Survey of Japan, AIST)

2:52 PM - 3:15 PM JST | 5:52 AM - 6:15 AM UTC

[MIS19-11] Ocean deoxygenation from the Last Glacial Maximum to the future global warming: inshight from model simulations

★Invited Papers

*Akitomo Yamamoto[1], Ayako Abe-Ouchi[2,1], Rumi Ohgaito[1], Akinori Ito[1], Masahito Shigemitsu[1], Yasuhiro Yamanaka[3], Akira Oka[2] (1.Japan Agency for Marine-Earth Science and TechnologyAtmosphere and Ocean Research Institute, 2.Atmosphere and Ocean Research Institute, The University of Tokyo, 3. Faculty of Environmental Earth Science, Hokkaido University)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 304 3F

[M-IS19] Paleoclimatology and paleoceanography

convener:Yusuke Okazaki(Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University), Akira Oka(Atmosphere and Ocean Research Institute, The University of Tokyo), Michinobu Kuwae(Center for Marine Environmental Studies), Hitoshi Hasegawa(Faculty of Science and Technology, Kochi University), Chairperson:Akira Oka

3:30 PM - 3:52 PM JST | 6:30 AM - 6:52 AM UTC

[MIS19-12] Extraction of high-quality ^{14}C data from terrestrial sediments containing pollen fossils

★Invited Papers

*Takayuki Omori[1], Keitaro Yamada[2], Ikuko Kitaba[2], Takeshi Nakagawa[2] (1.The University Museum, The University of Tokyo, 2.Research Centre for Palaeoclimatology, Ritsumeikan University)

3:52 PM - 4:07 PM JST | 6:52 AM - 7:07 AM UTC

[MIS19-13] Oxygen isotope fluctuations of pollen fossils from Lake Suigetsu, Japan

*Keitaro Yamada[1], Takayuki Omori[2], Ikuko Kitaba[1], Takeshi Nakagawa[1] (1.Research Organization of Science and Technology, Ritsumeikan University, 2.The University museum, The University of Tokyo)

4:07 PM - 4:22 PM JST | 7:07 AM - 7:22 AM UTC

[MIS19-14] Reconstruction of lake-level changes during the last glaciation based on fossil diatom record in Lake Biwa

*Takashi Suzuki[1], Yoshio Inouchi[2], Keisuke Otsuka[1], Kaoru Kawakami[3] (1.Graduate School of Human Science, Waseda University, 2.Faculty of Human Sciences, Waseda University, 3.Graduate School of Environmental Science, Hokkaido University)

4:22 PM - 4:45 PM JST | 7:22 AM - 7:45 AM UTC

[MIS19-15] An estimation of microplatcis sedimentation flux in a coastal sea

★Invited Papers

*Hirofumi Hinata[1], Michinobu Kuwae[1], Issei Masumoto[1], Hayato Kawamata[1] (1.Ehime University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[MIS19-16] Beppu Bay sediments: Potential palaeoenvironmental archives for a candidate auxiliary stratotype for Anthropocene-Holocene boundary

*Michinobu Kuwae[1], Yoshiaki Suzuki[2] (1.Center for Marine Environmental Studies, Ehime Univ., 2.Department of Eearth Scieces, Fuculty of Education and Integrated Arts and Sciences, Waseda Univ.)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A07 TOKYO BAY MAKUHARI HALL

[M-IS22] Electromagnetic phenomena associated with seismic and volcanic activities

convener:Tetsuya Kodama(Research Unit I, Research and Development Directorate, Japan Space Exploration Agency), Toshiyasu Nagao(Institute of Oceanic Research and development, Tokai University), Chairperson:Tetsuya Kodama, Toshiyasu Nagao

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[MIS22-01] Stress-induced charges in gabbro at high temperature

*Chihiro Yamanaka[1], Daiki Maezono[1] (1.Graduate School of Science, Osaka University)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[MIS22-02] Evaluation of ULF seismo-magnetic precursor phenomena at Kakioka, Japan over 1983 – 2018 by using SEA and Molchan's error diagram

*Katsumi Hattori[1], Kei Takahashi[2], Peng Han[3] (1.Department of Earth Sciences, Graduate School of Science, Chiba University, 2.Department of Earth Sciences, Faculty of Science, Chiba University, 3.Southern University of Science and Technology, China)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[MIS22-03] On the tsunami and electromagnetic pulses appeared abound 10min. after the 2011 Tohoku earthquake

*Yuji Enomoto[1], Tsuneaki Yamabe[1], Shigeki Sugiura[2], Hitoshi Kondo[2] (1.Shinshu Univeristy, Ueda Campus Fii, 2.Genesis Reserach Institute, Inc.)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[MIS22-04] Reinvestigation of correlation between groundwater anomalies and earthquakes carried out by an amateur network in Japan

*Yoshiaki Orihara[1], Masashi Kamogawa[2], Toshiyasu Nagao[1] (1.Institute of Oceanic Research and Development, Tokai University, 2.Dpt. of Phys., Tokyo Gakugei Univ.)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[MIS22-05] Participation Report of S-Booster 2018

*Tetsuya Kodama[1] (1.Research Unit I, Research and Development Directorate, Japan Space Exploration Agency)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[MIS22-06] The future direction of EMSEV, IUGG International Working Group

*Toshiyasu Nagao[1] (1.Institute of Oceanic Research and development, Tokai University)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-SD Space Development & Earth Observation from Space

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 302 3F

[M-SD44] Future Missions of Satellite Earth Observation

convener:Yoshiaki HONDA(Center for Environmental Remote Sensing, Chiba University), Yukari Takayabu(Atmosphere and Ocean Research Institute, the University of Tokyo), Shinichi Sobue(Japan Aerospace Exploration Agency), Yuki Kaneko(Japan Aerospace Exploration Agency), Chairperson:Yoshiaki Honda

9:05 AM - 9:20 AM JST | 12:05 AM - 12:20 AM UTC

[MSD44-01] Experimental platform for design and advance evaluation of frequent satellite observations to innovate weather, ocean and land surface predictions

*Takemasa Miyoshi[1], Shunji Kotsuki[1], Koji Terasaki[1], Shigenori Otsuka[1], Takumi Honda[1], Atsushi Okazaki[1], Kohei Takatama[1] (1.RIKEN)

9:20 AM - 9:35 AM JST | 12:20 AM - 12:35 AM UTC

[MSD44-02] Technology demonstration mission for next generation precipitation observation radars

*Tomoo Ushio[1], Toshio Iguchi[2], Kenji Nakamura[4], Kinji Furukawa[3], Riko Oki[3], Daisuke Jodoi[3] (1.Tokyo Metropolitan University, 2.NICT, 3.JAXA, 4.Dokkyo University)

9:35 AM - 9:50 AM JST | 12:35 AM - 12:50 AM UTC

[MSD44-03] Mission of creating base maps as public infrastructures for disaster and monitoring

*ISHITSUKA Naoki[1] (1.The Remote Sensing Society of Japan)

9:50 AM - 10:05 AM JST | 12:50 AM - 1:05 AM UTC

[MSD44-04] Aerosol monitoring, forecasting and estimate of its impacts with multispectral imager data

*Keiya Yumimoto[1,2], Takashi Maki[2], Taichu Y Tanaka[2], Thomas Sekiyama[2], Toshihiko Takemura[1] (1.Kyushu University, 2.Meteorological Research Institute)

10:05 AM - 10:20 AM JST | 1:05 AM - 1:20 AM UTC

[MSD44-05] Global aerosol and cloud observation by space-borne multi-wavelength polarization high-spectral-resolution lidar

*Tomoaki Nishizawa[1], Hajime Okamoto[2], Syoken Ishii[3], Yoshitaka Jin[1] (1.National Institute for Environmental Studies, 2.Kyushu University, 3.National Institute of Information and Communication Technology)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-SD Space Development & Earth Observation from Space

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 302 3F

[M-SD44] Future Missions of Satellite Earth Observation

convener:Yoshiaki HONDA(Center for Environmental Remote Sensing, Chiba University), Yukari Takayabu(Atmosphere and Ocean Research Institute, the University of Tokyo), Shinichi Sobue(Japan Aerospace Exploration Agency), Yuki Kaneko(Japan Aerospace Exploration Agency), Chairperson:Kazuhiro Asai(東北工業大学), Toshiyoshi Kimura(宇宙航空研究開発機構)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[MSD44-06] Dual-Doppler-velocity-mission using cloud radar and lidar

*Okamoto Hajime[1], Kentaroh Suzuki[2], Tomoaki Nishizawa[3], Shoken Ishii[4] (1.Kyushu University, 2.The university of Tokyo, 3.National Instuitute for Environmental Studies, 4.National Institute of Information and Communications Technology)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[MSD44-07] Global wind profiling with space-based Doppler wind lidar for improvement of numerical weather prediction

*Shoken Ishii[1], Kozo Okaoto[2,1], Takuji Kubota[3], Atsushi Sato[4,1], Daisuke Sakaizaw[3], Tomoaki Nishizawa[5], Ayako Matsumoto[6], Tetsuya Tugami[6], Toshiyuki Ishibashi[2], Taichu Y Tanaka[2], Philippe Baron[1], Makoto Aoki[1], Riko Oki[3], Masaki Satoh[7], Toshiki Iwasaki[8] (1.National Institute of Information and Communications Technology, 2.JMA/MRI, 3.JAXA, 4.TIT, 5.NIES, 6.ANA, 7.University of Tokyo, 8.Tohoku University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[MSD44-08] Technology demonstration of space-borne water vapor DIAL

*Makoto Abo[1], Chikao Nagasawa[1], Yasukuni Shibata[1], Osamu Uchino[2], Takashi Shibata[3] (1.Graduate School of System Design, Tokyo Metropolitan University, 2.National Institute for Environmental Studies, 3.Nagoya University)

11:30 AM - 12:00 PM JST | 2:30 AM - 3:00 AM UTC

[MSD44-09] Short presentation of poster session

*Yoshiaki HONDA[1] (1.Center for Environmental Remote Sensing, Chiba University)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-SD Space Development & Earth Observation from Space

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 302 3F

[M-SD44] Future Missions of Satellite Earth Observation

convener:Yoshiaki HONDA(Center for Environmental Remote Sensing, Chiba University), Yukari Takayabu(Atmosphere and Ocean Research Institute, the University of Tokyo), Shinichi Sobue(Japan Aerospace Exploration Agency), Yuki Kaneko(Japan Aerospace Exploration Agency), Chairperson:Riko Oki(宇宙航空研究開発機構)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[MSD44-10] **Himawari-8/9 follow-on satellites program**

*BESSHO Kotaro[1] (1.Japan Meteorological Agency)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[MSD44-11] Impact assessment of hyperspectral infrared sounders toward Himawari-8/9 follow-on satellites

*Kozo OKAMOTO[1], Hiromi Owada[2], Masahiro Kazumori[2], Michiko Otsuka[1], Yoshifumi Ota[2], Naotaka Uekiyo[1], Hiromu Seko[1], Akiyoshi Ando[2], Ryo Yoshida[2], Hiroshi Ishimoto[1], Masahiro Hayashi[1], Haruma Ishida[3], Yoshiaki Sato[2], Hiroshi Kunimatsu[2], Kotaro Bessho[2], Hironobu Yokota[2] (1.Meteorological Research Institute, 2.Japan Meteolological Agency, 3.Meteorological Satellite Center)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[MSD44-12] Observation system simulation experiments for a hyperspectral infrared sounder onboard geostationary satellite

*HIROMI OWADA[1], Kozo OKAMOTO[2], Masahiro Kazumori[1], NAOTAKA UEKIYO[2], Hiroshi Ishimoto[2], Masahiro Hayashi[2] (1.Japan Meteorological Agency, 2.Meteorological Research Institute)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[MSD44-13] Realization of pseudo high frequency high resolution observation by geostationary satellite and orbiting satellite combined observation

*Yoshiaki HONDA[1] (1.Center for Environmental Remote Sensing, Chiba University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[MSD44-14] **Geostationary Optical Earth Observation Satellite**

*Kazuo Oki[1], Toshiyoshi Kimura[2], Tadahito Mizutani[2], Takeo Tadono[2] (1.The University of Tokyo, 2.JAXA)

Thu. May 30, 2019

[J] Oral | U (Union)：Union

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | IC 2F

[U-06] Japan's contribution to IUGG celebrating 100th anniversary

convener:Setsuya Nakada(National Research Institute for Earth Science and Disaster Resilience), Kenji Satake(Earthquake Research Institute, University of Tokyo), Kumiko Goto-Azuma(National Institute of Polar Research), Chairperson:Kumiko Goto-Azuma(National Institute of Polar Research), Setsuya Nakada(NIED)

9:00 AM - 9:20 AM JST | 12:00 AM - 12:20 AM UTC

[U06-01] **Centennial of the International Cooperation in Earth and Space Sciences**

★Invited Papers

*Alik Ismail-Zadeh[1,2,3] (1.Karlsruhe Institute of Technology, 2.International Union of Geodesy and Geophysics, 3.International Science Council)

9:20 AM - 9:40 AM JST | 12:20 AM - 12:40 AM UTC

[U06-02] IUGG and Japan: the past, the present, and the way to go from now

★Invited Papers

*Masaru Kono[1] (1.Tokyo Institute of Technology)

9:40 AM - 9:55 AM JST | 12:40 AM - 12:55 AM UTC

[U06-03] **Contributions from the Science Council of Japan to international cooperation in the field of Earth and planetary science**

*Hisashi Nakamura[1] (1.Research Center for Advanced Science and Technology, University of Tokyo)

9:55 AM - 10:15 AM JST | 12:55 AM - 1:15 AM UTC

[U06-04] History and Japanese contribution to the International Association of Cryospheric Sciences IACS

★Invited Papers

*Ralf Greve[1] (1.Institute of Low Temperature Science, Hokkaido University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[U06-05] **Japan's Contributions to IAG**

*Yoichi Fukuda[1] (1.Department of Geophysics, Graduate School of Science, Kyoto University)

[J] Oral | U (Union)：Union

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | IC 2F

[U-06] Japan's contribution to IUGG celebrating 100th anniversary

convener:Setsuya Nakada(National Research Institute for Earth Science and Disaster Resilience), Kenji Satake(Earthquake Research Institute, University of Tokyo), Kumiko Goto-Azuma(National Institute of Polar Research), Chairperson:Kumiko Goto-Azuma(National Institute of Polar Research), Kenji Satake(Earthquake Research Institute, the University of Tokyo)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[U06-06] IAGA activities in the era of too many international conferences

*Toshihiko Iyemori[1] (1.Kyoto University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[U06-07] The role of IAHS in education, research, social issues concerning water and future perspective

*Maki Tsujimura[1] (1.Faculty of Life and Environmental Sciences, University of Tsukuba)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[U06-08] Centenary of the atmospheric sciences: Its progress and future issues

*Teruyuki Nakajima[1] (1.Japan Aerospace Exploration Agency)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[U06-09] Contributuins of Japan to IAPSO

*Yukio Masumoto[1] (1.Graduate School of Science, The University of Tokyo)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[U06-10] IASPEI- activities, history and Japan’s contribution

*Kenji Satake[1], Thorne Lay[2], Johannes Schweitzer[3] (1.Earthquake Research Institute, University of Tokyo, 2.IASPEI President , 3.IASPEI Secretary General)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[U06-11] Recent history of IAVCEI in Japan and young researchers’ response to IUGG and IAVCEI

*Setsuya Nakada[1] (1.National Research Institute for Earth Science and Disaster Resilience)

[J] Oral | U (Union)：Union

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 101 1F

[U-08] Opinions and recommendations from meeting participants to the future of the Japan Geoscience Union

convener:Yozo Hamano(KOBE Ocean-Bottom Exploration Center, Kobe University), Eiichi Tajika(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Koji Wada(Planetary Exploration Research Center, Chiba Institute of Technology), Ikuro Sumita(Geosciences and Civil Engineering, Institute of Science and Engineering, Kanazawa University), Chairperson:Koji Wada(Planetary Exploration Research Center, Chiba Institute of Technology), Ikuro Sumita

1:51 PM - 2:03 PM JST | 4:51 AM - 5:03 AM UTC

[U08-01] Request and proposal from the Committee on Earth and Planetary Sciences of the Science Council of Japan to JpGU

*Ryoichi Fujii[1] (1.Research Organization of Information and Systems)

2:03 PM - 2:15 PM JST | 5:03 AM - 5:15 AM UTC

[U08-02] Geography in JpGU: current status and future perspectives

*Takashi Oguchi[1], Ikuho Yamada[2], Yuichi S. Hayakawa[3], Daichi Kohmoto[4], Hitoshi Saito[5] (1.Center for Spatial Information Science, The University of Tokyo, 2.Faculty of Science and Engineering, Chuo University, 3.Graduate School of Env.Science, Hokkaido University , 4.Nara University of Education, 5.College of Economics, Kanto Gakuin University)

2:15 PM - 2:27 PM JST | 5:15 AM - 5:27 AM UTC

[U08-03] Biogeoscineces will connect everthing together

*Takeshi Kakegawa[1] (1.Graduate School of Science, Tohoku University)

2:27 PM - 2:39 PM JST | 5:27 AM - 5:39 AM UTC

[U08-04] Coverage of JpGU

*Yukihiro Takahashi[1] (1.Department of Cosmosciences, Graduate School of Science, Hokkaido University)

2:39 PM - 2:51 PM JST | 5:39 AM - 5:51 AM UTC

[U08-05] Is he a bit overkill for English?

*Yoshi-Yuki Hayashi[1] (1.Department of Planetology/CPS, Graduate School of Science, Kobe University)

2:51 PM - 3:03 PM JST | 5:51 AM - 6:03 AM UTC

[U08-06] Globalization of Japan Geoscience Union

*Hirokuni Oda[1] (1.Institute of Geology and Geoinformation, Geological Survey of Japan, AIST)

3:03 PM - 3:15 PM JST | 6:03 AM - 6:15 AM UTC

[U08-07] A proposal for JpGU based on the questionaires to SSJ members

*Koshun Yamaoka[1] (1.Earthquake and Volcano Research Center, Graduate School of Environmental Studies, Nagoya University)

[J] Oral | U (Union)：Union

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 101 1F

[U-08] Opinions and recommendations from meeting participants to the future of the Japan Geoscience Union

convener:Yozo Hamano(KOBE Ocean-Bottom Exploration Center, Kobe University), Eiichi Tajika(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Koji Wada(Planetary Exploration Research Center, Chiba Institute of Technology), Ikuro Sumita(Geosciences and Civil Engineering, Institute of Science and Engineering, Kanazawa University), Chairperson:Koji Wada(Planetary Exploration Research Center, Chiba Institute of Technology), Ikuro Sumita

3:30 PM - 3:42 PM JST | 6:30 AM - 6:42 AM UTC

[U08-08] Opinions and recommendations to the Japan Geoscience Union from Society of Geomagnetism and Earth, Planetary and Space Sciences

Yoshiharu Omura[2], Shigeto Watanabe[3], *Yuto Katoh[1], Takuya Tsugawa[4], Yuichi Otsuka[5], SGEPSS steering committee (1.Graduate School of Science, Tohoku University, 2.Research Institute for Sustainable Humanosphere, Kyoto University, 3.Hokkaido Information University, 4.National Institute of Information and Communications Technology, 5.Institute for Space–Earth Environmental Research, Nagoya University)

3:42 PM - 3:54 PM JST | 6:42 AM - 6:54 AM UTC

[U08-09] Collaboration between Earth & Planetary Science and Information Science ~A trial of mutual benefit in the interdisciplinary field~

*Hirohide Demura[1] (1.The University of Aizu)

3:54 PM - 4:06 PM JST | 6:54 AM - 7:06 AM UTC

[U08-10] Comments from young planetary scientists

*Shunichi Kamata[1], Keiko Hamano[2], Go Murakami[3], Ryuki Hyodo[2], Yusuke Nakauchi[3] (1.Hokkaido University, 2.Tokyo Institute of Technology, 3.JAXA/ISAS)

4:06 PM - 4:18 PM JST | 7:06 AM - 7:18 AM UTC

[U08-11] Japan Geoscience Union should operate based on the perspective of individual academic society and fulfill accountability

*Naoji Koizumi[1] (1.School of Environmental Science,the University of Shiga Prefecture)

4:18 PM - 4:30 PM JST | 7:18 AM - 7:30 AM UTC

[U08-12] A proposal from a representative of General Geoscience Sector on a possible direction to future JpGU: actions for domestic activities could be weighted

*Hidenori Kumagai[1] (1.Japan Agency for Marine-Earth Science and Technology)

4:30 PM - 4:42 PM JST | 7:30 AM - 7:42 AM UTC

[U08-13] Fifteen years of Japan Geoscience Letters and its future

*Shogo Tachibana[1], Eiichi Tajika[2] (1.UTokyo Organization for Planetary and Space Science, University of Tokyo , 2.Dept. Earth and Planetary Science, University of Tokyo)

[J] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 103 1F

[P-PS08] Lunar science and exploration

convener:Hiroshi Nagaoka(Japan Aerospace Exploration Agency), Masahiro KAYAMA(Department of Earth and Planetary Material Sciences, Faculty of Science, Tohoku University), Masaki N Nishino(Japan Aerospace Exploration Agency, Institute of Space and Astronautical Science), Tomokatsu Morota(Graduate School of Environmental Studies, Nagoya University), Chairperson:Satoshi Tanaka, Masaki Nishino(名古屋大学宇宙地球環境研究所)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[PPS08-01] Observing simulations of impact-induced moonquakes combined with the lunar impact flash observation data for future lunar seismic explorations

*Keisuke Onodera[1,2], Taichi Kawamura[3], Satoshi Tanaka[2], Yoshiaki Ishihara[4], Takuto Maeda[5], Masahisa Yanagisawa[6], Yuki Uchida[6], Shinsuke Abe[7], Ryuhei Yamada[8], Takaya Okamoto[2] (1.SOKENDAI (The Graduate University for Advanced Studies), 2.Institute of Space and Astronautical Science / Japan Aerospace Exploration Agency, 3.Insitut de Physique du Globe de Paris, 4.National Institute for Environmental Studies, 5.Hirosaki University, 6.The University of Electro-Communications, 7.Nihon University, 8.University of Aizu)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[PPS08-02] New Results from Restored Apollo Magnetic Field Records

*Peter J Chi[1] (1.University of California Los Angeles)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[PPS08-03] Analysis of the High Latitude Region of the Moon with Spectral Profiler Data: Possible Presence of Water Ice

Haramitsu Kyoda[3], *Satoshi Tanaka[1], Makiko Ohtake[1], Hiroshi Nagaoka[2], Yusuke Nakauchi[2], Keisuke Onodera[4] (1.Department of Solid Planetary Sciences Institute of Space and Astronautical Science, 2.Japan Aerospace Exploration Agency, 3.Department of Complexity Science and Enginnering, the University of Tokyo, 4.Department of Space and Astronautical Science, SOKENDAI)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[PPS08-04] **Detection of Dark Regions on the Lunar Surface with Shadow Masked Multiband Imager Data**

*Riho Ito[1], Hiroka Inoue[2], Makiko Ohtake[2], Hisashi Otake[2], Ryosuke Nakamura[1] (1.National Institute of Advanced Industrial Science and Technology, 2.Japan Aerospace Exploration Agency)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[PPS08-05] Estimation of Moho depth under lunar basins by using only the GRAIL gravity data

*Gaku Nishiyama[1], Noriyuki Namiki[2] (1.Department of Earth and Planetary Science, The University of Tokyo, 2.RISE Project, National Astronomical Observatory of Japan)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[PPS08-06] Ejecta Thickness Distribution of Lunar Schrödinger Basin

*Luyuan Xu[1], Minggang Xie[1] (1.State Key Laboratory of Lunar and Planetary Sciences, Macau University of Science and Technology)

[J] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 103 1F

[P-PS08] Lunar science and exploration

convener:Hiroshi Nagaoka(Japan Aerospace Exploration Agency), Masahiro KAYAMA(Department of Earth and Planetary Material Sciences, Faculty of Science, Tohoku University), Masaki N Nishino(Japan Aerospace Exploration Agency, Institute of Space and Astronautical Science), Tomokatsu Morota(Graduate School of Environmental Studies, Nagoya University), Chairperson:Ko Hashizume, Hiroshi Nagaoka

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[PPS08-07] Possible evolution paths of the lunar orbit based on tidal response in the global ocean model of the early Earth

*Mai Motoyama[1], Hideo Tsunakawa[1], Futoshi Takahashi[2] (1.Department of Earth and Planetary Sciences, School of Science, Tokyo Institute of Technology, 2.Department of Earth and Planetary Sciences, Faculty of Science, Kyushu University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[PPS08-08] Geochemical and Petrological Investigations of Lunar Feldspathic Crust by Lunar Sample Studies and Remote Sensing Data

*Hiroshi Nagaoka[1], Yuzuru Karouji[1], Makiko Ohtake[1] (1.Japan Aerospace Exploration Agency)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[PPS08-09] Development of frosting system for lunar simulant and the detectability of ice growing on the simulant by NIR measurement

*Aoi Ogishima[1], Kazuto Saiki[1] (1.Department of Earth and Space Science, Graduate School of Science, Osaka University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[PPS08-10] Volatile studies on Moon - A review toward future exploration programs

*Ko Hashizume[1] (1.Faculty of Science, Ibaraki University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[PPS08-11] Scientific approach for the promotion of lunar polar exploration mission

*Masahiro KAYAMA[1], Ko Hashizume[2], Hiroshi Nagaoka[3], Kazuto Saiki[4], Chihiro Yamanaka[4], Makoto Hareyama[5], Makiko Ohtake[3] (1.Tohoku University, 2.Ibaraki University, 3.Japan Aerospace Exploration Agency, 4.Osaka University, 5.St. Marianna University School of Medicine)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[PPS08-12] Feasibility study of detection of the lunar subsurface ice with UHF-band GPR based on FDTD electromagnetic simulation

*Atsushi Kumamoto[1], Hideaki Miyamoto[2], Toshifumi Nishibori[3], Takafumi Niihara[2], Fuminori Tsuchiya[1], Ken Ishiyama[3] (1.Tohoku University, 2.University of Tokyo, 3.JAXA)

[J] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 103 1F

[P-PS08] Lunar science and exploration

convener:Hiroshi Nagaoka(Japan Aerospace Exploration Agency), Masahiro KAYAMA(Department of Earth and Planetary Material Sciences, Faculty of Science, Tohoku University), Masaki N Nishino(Japan Aerospace Exploration Agency, Institute of Space and Astronautical Science), Tomokatsu Morota(Graduate School of Environmental Studies, Nagoya University), Chairperson:Masahiro Kayama(東北大学), Yusuke Nakauchi(JAXA/ISAS)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[PPS08-13] **Geology of the SLIM landing site on the Moon**

★Invited Papers

*Makiko Ohtake[1], Kazuto Saiki[2], Yusuke Nakauchi[1], Hiroaki Shiraishi[1], Yoshiaki Ishihara[3], Hiroyuki Sato[1], Chikatoshi Honda[4] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2.Osaka University, 3.National Institute for Environmental Studies, 4.University of Aizu)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[PPS08-14] Observing scenario for the Multi-Band Camera onboard SLIM

*Kazuto Saiki[1], Yuya Igarashi[1], Yusuke Nakauchi[2], Chikatoshi Honda[3], Makiko Ohtake[2], Hiroaki Shiraishi[2], Hiroyuki Satoh[2], Yoshiaki Ishihara[4], Takao Maeda[5], Chihiro Yamanaka[1] (1.Osaka Univ., 2.JAXA, 3.Univ. Aizu, 4.National Institute for Environmental Studies, 5.Chuo Univ.)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[PPS08-15] **Current status of a Japanese lunar polar exploration mission**

*Takeshi Hoshino[1], Makiko Ohtake[1], Yuzuru Karouji[1], Hiroaki Shiraishi[1] (1.Japan Aerospace Exploration Agency)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[PPS08-16] HERACLES mission: Returning to the Moon by an ESA-JAXA-CSA Joint Study

*Yuzuru Karouji[1], Hiroshi Nagaoka[1], Yoshiaki Ishihara[2], Masahiro KAYAMA[3], Satoru Yamamoto[4], Nobuyuki Hasebe[5], Ko Hashizume[6], Yoshiko Ogawa[7], Toru Yada[1], Junichi Haruyama[1], Masanao Abe[1], Makiko Ohtake[1], HERACLES Science Working Group, HERACLES International Science Definition Team (1.Japan Aerospace Exploration Agency, 2.National Institute for Environmental Studies, 3.Faculty of Science, Tohoku University, 4.J-spacesystems, 5.Advanced Research Institute for Science and Engineering, Waseda University, 6.Faculty of Science, Ibaraki University, 7.The University of Aizu)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[PPS08-17] **Lunar Science for Landed Missions – High-Priority Landing Sites Visualized with NASA's Moon Trek**

*Brian Hamilton Day[1], Emily Law[2] (1.NASA Solar System Exploration Research Virtual Institute, NASA Ames Research Center, 2.NASA Jet Propulsion Laboratory, California Institute of Technology)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[PPS08-18] NASA SSERVI: Merging Science and Human Exploration

*Brad Eugene Bailey[1], Kristina Gibbs[1], Gregory Schmidt[1] (1.NASA)

[J] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A03 TOKYO BAY MAKUHARI HALL

[P-EM17] Space Plasma Physics: Theory and Simulation

convener:Takayuki Umeda(Institute for Space-Earth Environmental Research, Nagoya University), Takanobu Amano(Department of Earth and Planetary Science, University of Tokyo), Yasuhiro Nariyuki(Faculty of Human Development, University of Toyama), Tadas Nakamura(Fukui Prefectural University), Chairperson:Takayuki Umeda(Institute for Space-Earth Environmental Research, Nagoya University), Takanobu Amano(Department of Earth and Planetary Science, University of Tokyo)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[PEM17-01] Prediction of the high-resolution numerical flux by using a deep neural network

*Yosuke Matsumoto[1] (1.Graduate School of Science, Chiba University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[PEM17-02] Multiple Boris integrators for particle-in-cell simulation

*Seiji Zenitani[1], Tsunehiko N Kato[2] (1.Kyoto University, 2.National Astronomical Observatory of Japan)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[PEM17-03] Contour Dynamics for Vlasov–Poisson Plasma with the Periodic Boundary

*Hiroki Sato[1], Tomo-Hiko Watanabe[1], Shinya Maeyama[1] (1.Nagoya University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[PEM17-04] Simulation methods and visualization tools for MHD simulations in a sphere

*Akira Kageyama[1], Kumiko Hori[1], Naohisa Sakamoto[1] (1.Graduate School of System Informatics, Kobe University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[PEM17-05] Kármán Vortex Street, Strouhal Number, Hairpin Vortex in 3D global Magnetohydrodynamic MHD simulations in Northward IMF

*DongSheng CAI[1] (1.University of Tsukuba)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[PEM17-06] Correlations between plasma density and magnetic field strength in MHD turbulence in space

*Tohru Hada[1], Yasuhito Narita[2], Yasuhiro Nariyuki[3] (1.Interdisciplinary Graduate School of Engineering Sciences, Kyushu University, 2.Space Research Institute, Austrian Academy of Sciences, 3.Faculty of Human Development, University of Toyama)

[J] Oral | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A03 TOKYO BAY MAKUHARI HALL

[P-EM17] Space Plasma Physics: Theory and Simulation

convener:Takayuki Umeda(Institute for Space-Earth Environmental Research, Nagoya University), Takanobu Amano(Department of Earth and Planetary Science, University of Tokyo), Yasuhiro Nariyuki(Faculty of Human Development, University of Toyama), Tadas Nakamura(Fukui Prefectural University), Chairperson:Tadas Nakamura(Fukui Prefectural University), Yasuhiro Nariyuki

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[PEM17-07] Stochastic models of phase space diffusion via wave-particle interaction with parallel propagating electromagnetic waves

*Yasuhiro Nariyuki[1] (1.Faculty of Human Development, University of Toyama)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[PEM17-08] Electron beam instability in collisionless magnetic reconnection with a strong guide field

*Kazuya Shimomura[1], Tomo-Hiko Watanabe[1], Shinya Maeyama[1], Akihiro Ishizawa[2] (1.Nagoya Univertsity, 2.Kyoto University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[PEM17-09] Particle acceleration with precursor wave driven wakefield in relativistic shocks

*Masanori Iwamoto[1], Takanobu Amano[1], Masahiro Hoshino[1], Yosuke Matsumoto[2] (1.Graduate School of Science,The University of Tokyo, 2.Graduate School of Science, Chiba University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[PEM17-10] Stochastic Shock Drift Acceleration in the Shock Transition Region with Finite Pitch-Angle Anisotropy

*Takuma Katou[1], Takanobu Amano[1] (1.The University of Tokyo)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[PEM17-11] Near-fields and its Applications in Space Plasmas

*Tadas Nakamura[1] (1.Fukui Prefectural University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[PEM17-12] Problems of Gravitational Waves and Origin of Gravitational Fields Raised by Studies on Binary Black Hole

*Hiroshi Oya[1] (1.Department of Geophysics Graduate School for Science Tohoku University)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 102 1F

[A-AS04] Atmospheric Chemistry

convener:Tomoki Nakayama(Graduate School of Fisheries and Environmental Sciences, Nagasaki University), Yoko Iwamoto(Graduate School of Biosphere Science, Hiroshima University), Sakae Toyoda(Department of Chemical Science and Engineering, Tokyo Institute of Technology), Nawo Eguchi(Kyushu University), Chairperson:Hisahiro Takashima(福岡大学)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[AAS04-16] Toward the Reduction of Radiative Forcing of Methane and Tropospheric Ozone: Aiming at the Emission Control of CH_4, $NO_x$and NMVOC in Asia

*Hajime Akimoto[1], Tatsuya NNagashima[1], Hiroshi Tanimoto[1], Zig Klimont[2], Markus Amann[2] (1.National Institute for Environmental Studies, 2.International Institute for Applied Systems Analysis)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[AAS04-17] **Determination of atmospheric NO_2 column densities using a Pandora instrument measuring direct-sun spectra at Yokosuka, Japan: Improved validation of TROPOMI satellite observations**

*Yugo Kanaya[1], Hisahiro Takashima[2,1], Masato I. Nodzu[3], Takashi Sekiya[7], Kazuyuki Miyazaki[1], Henk Eskes[4], Gaia Pinardi[5], Daniel Santana Diaz[6], Moritz Müller[6], Alexander Cede[6] (1.Research and Development Center for Global Change, Japan Agency for Marine-Earth Science and Technology (JAMSTEC), 2.Fukuoka University, 3.Tokyo Metropolitan University, 4.KNMI, 5.BIRA-IASB, 6.LuftBlick, 7.Japan Agency for Marine-Earth Science and Technology (JAMSTEC))

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[AAS04-18] A high-resolution global data assimilation for air pollution analysis on megacity scale using multi-sensor satellite measurements including TROPOMI NO_2 data

*Takashi Sekiya[1], Kazuyuki Miyazaki[2,1], Henk Eskes[3], Folkert Boersma[3], Koji Ogochi[1], Kengo Sudo[4,1], Masayuki Takigawa[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.Jet Propulsion Laboratory/California Institute for Technology, 3.Royal Netherlands Meteorological Institute (KNMI), 4.Graduate School of Environmental Studies, Nagoya University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[AAS04-19] Recent trends of NO_2, VOC, and tropospheric ozone concentrations observed around Chiba, Japan in 2013-2018

*Daichi Yonekawa[1], Hitoshi Irie[2] (1.Chiba university Graduate school, 2.Chiba university)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[AAS04-20] Long-term seasonal changes in tropospheric ozone over Japan

*Natsumi Kawano[1], Tatsuya Nagashima[1], Seiji Sugata[1] (1.National Institute for Environmental Studies)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[AAS04-21] **Characteristics of Atmospheric Photochemical Pollution at a Comprehensive Site in Guangzhou, China**

*Yu Zou[1] (1.Institute of Tropical and Marine Meteorology, CMA,Guangzhou,China)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 102 1F

[A-AS04] Atmospheric Chemistry

convener:Tomoki Nakayama(Graduate School of Fisheries and Environmental Sciences, Nagasaki University), Yoko Iwamoto(Graduate School of Biosphere Science, Hiroshima University), Sakae Toyoda(Department of Chemical Science and Engineering, Tokyo Institute of Technology), Nawo Eguchi(Kyushu University), Chairperson:Fumikazu Taketani(海洋研究開発機構), Michihiro Mochida(名古屋大学)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[AAS04-22] LC/MS analysis of molecular markers present in biogenic secondary organic aerosols collected during year-round observations at a cool-temperature forest

*Kei Sato[1], Sathiyamurthi Ramasamy[1], Satoshi Inomata[1], Yuzo Miyazaki[2] (1.National Institute for Environmental Studies, 2.Hokkaido University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[AAS04-23] Surfactant Effects on Acid-Catalyzed Reactions at Aqueous Aerosol Surfaces

*Shinnosuke Ishizuka[1], Tetsuya Hama[2], Shinichi Enami[1] (1.National Institute for Environmental Studies, 2.Institute for Low Temperature Science, Hokkaido University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[AAS04-24] Roles of heterogeneous reactions in the tropospheric chemistry: a global modeling study

*Phuc Thi Minh Ha[1], Fumikazu Taketani[2], Yugo Kanaya[2], Kengo Sudo[1,2] (1.Graduate School of Environmental Studies, Nagoya University, 2.Research and Development Center for Global Change, JAMSTEC)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[AAS04-25] Sensitivity of regional deposition of inhaled atmospheric aerosols in human respiratory tract to their size distribution and hygroscopicity: A case study

*Minrui Wang[1], Toshiyuki Mihara[2,4], Mizuo Kajino[5], Kaori Kawana[2,6], Michihiro Mochida[1,2,3] (1.Institute for Space Earth Environmental Research, 2.Graduate School of Environmental Studies, Nagoya University, 3.Institute for Advanced Research, Nagoya University, 4.Now at Gifu Prefectural Industrial Research Institute, 5.Meteorological Research Institute, Japan Meteorological Agency, 6.Now at Research and Development Center for Global Change, JAMASTEC)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[AAS04-26] Biogeochemical cycle between atmosphere and ocean via particulate matters
-Award lecture for JpSAC Young Scientist Award-

★Invited Papers

*Yoko Iwamoto[1] (1.Graduate School of Biosphere Science, Hiroshima University)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[AAS04-27] Kinetic Studies for Quantitative Elucidation of Heterogeneous Halogen Chemistry in the Troposphere
-JpSAC Early Career Scientist Award Lecure-

★Invited Papers

*Yosuke Sakamoto[1,2] (1.Graduate School of Global Environmental Studies, Kyoto University , 2.Graduate School of Human and Environmental Studies, Kyoto University)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 103 1F

[A-AS04] Atmospheric Chemistry

convener:Tomoki Nakayama(Graduate School of Fisheries and Environmental Sciences, Nagasaki University), Yoko Iwamoto(Graduate School of Biosphere Science, Hiroshima University), Sakae Toyoda(Department of Chemical Science and Engineering, Tokyo Institute of Technology), Nawo Eguchi(Kyushu University), Chairperson:Hideaki Nakajima(国立環境研究所)

3:30 PM - 4:00 PM JST | 6:30 AM - 7:00 AM UTC

[AAS04-28] Planetary atmosphere - Mars and Venus -

★Invited Papers

*Hiroyuki Maezawa[1] (1.Department of Physical Science Osaka Prefecture University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[AAS04-29] Validation of methane profile observed with FTIR at Tsukuba

Yuki Dai[2], *Isao Murata[1], Hideaki Nakajima[3], Isamu Morino[3] (1.Graduate School of Environmental Studies, Tohoku University, 2.Graduate School of Science, Tohoku University, 3.National Institute for Environmental Studies)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[AAS04-30] **Retrieval of HFC-23 from FTIR observations at Syowa Station, Rikubetsu and Tsukuba**

*Masanori Takeda[1,2], Hideaki Nakajima[2,1], Isao Murata[1], Tomoo Nagahama[3], Isamu Morino[2] (1.Graduate School of Environmental Studies, Tohoku University, 2.Center for Global Environmental Research, National Institute for Environmental Studies, 3.Institute for Space-Earth Environmental Research, Nagoya University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[AAS04-31] Roles of cloud distribution in global atmospheric photochemistry

*Ryoki Matsuda[1], Kengo Sudo[1,2] (1.Graduate School of Environmental Studies, Nagoya University , 2.Japan Marine-Earth Science and Technology)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[AAS04-32] Evaluating global distribution and interannual variation of stratosphere-troposphere exchange of ozone: impacts of climate variabilities

*Kengo Sudo[1,2], Xin Li[1] (1.Graduate School of Environmental Studies, Nagoya University, 2.Research and Development Center for Global Change, JAMSTEC)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 106 1F

[A-CG36] Earth & Environmental Sciences and Artificial Intelligence

convener:Tomohiko Tomita(Faculty of Advanced Science and Technology, Kumamoto University), Ken-ichi Fukui(Osaka University), Daisuke Matsuoka(Japan Agency for Marine-Earth Science and Technology), Satoshi Ono(Kagoshima University), Chairperson:Tomohiko Tomita(Kumamoto University, Faculty of Advanced Science and Technology)

10:50 AM - 11:20 AM JST | 1:50 AM - 2:20 AM UTC

[ACG36-01] Recent Progress in Deep Neural Network Architectures and their Applications

★Invited Papers

*Shinichi Shirakawa[1] (1.Yokohama National University)

11:20 AM - 11:35 AM JST | 2:20 AM - 2:35 AM UTC

[ACG36-02] Improving performance of oxidant prediction using machine learning by optimizing input data based on atmospheric science knowledge

*Tomohiro Sato[1], Peijiang Zhao[1], Koji Zettsu[1] (1.National Institute of Information and Communications Technology)

11:35 AM - 11:50 AM JST | 2:35 AM - 2:50 AM UTC

[ACG36-03] Spatiotemporal Climate Forecasting with ConvLSTM

*Ekasit Phermphoonphiphat[1], Tomohiko Tomita[3], Masayuki Numao[2], Ken-ichi Fukui[2] (1.Graduate School of Information Science and Technology, Osaka University, 2.The Institute of Scientific and Industrial Research, Osaka University, 3.Faculty of Advanced Science and Technology, Kumamoto University)

11:50 AM - 12:05 PM JST | 2:50 AM - 3:05 AM UTC

[ACG36-04] Deep-Learning Based Short-Term Prediction Method for Sea Ice Concentration Using Explanatory Variables

*Issei Kawashima[1], Toru Kouyama[1], Ryu Sugimoto[1], Ryosuke Nakamura[1] (1.National Institute of Advanced Industrial Science and Technology)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 104 1F

[A-CG36] Earth & Environmental Sciences and Artificial Intelligence

convener:Tomohiko Tomita(Faculty of Advanced Science and Technology, Kumamoto University), Ken-ichi Fukui(Osaka University), Daisuke Matsuoka(Japan Agency for Marine-Earth Science and Technology), Satoshi Ono(Kagoshima University), Chairperson:Tomohiko Tomita(Kumamoto University, Faculty of Advanced Science and Technology)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[ACG36-05] **Remote sensing of cloud using the deep learning based on three-dimensional radiative transfer**

*Hironobu Iwabuchi[1], Ryosuke Masuda[1], K. Sebastian Schmidt[2,3], Alessandro Damiani[4], Rei Kudo[5] (1.Graduate School of Science, Tohoku University, 2.Department of Atmospheric and Oceanic Sciences, University of Colorado, 3.Laboratory for Atmospheric and Space Physics, University of Colorado, 4.Center for Environmental Remote Sensing, Chiba University, 5.Meteorological Research Institute, Japan Meteorological Agency)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[ACG36-06] Time series of cloud cover during the night derived from an omnidirectional camera

*Karin miyabe[1], Kazunori Ogohara[1] (1.University of Shiga Prefecture)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[ACG36-07] Time series prediction of cloud cover using whole-sky images and meteorological elements

*Kazunori Ogohara[1], Teppei Sonoda[2] (1.School of Engineering, University of Shiga Prefecture, 2.Graduate School of Engineering, University of Shiga Prefecture)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[ACG36-08] Fundamental investigation about the inductive prediction of precipitation based on the time series data

*Naoki Matsumoto[1], Tomohiko Tomita[1], Kenichi Fukui[2] (1.Kumamoto Univ., 2.Osaka Univ.)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[ACG36-09] Identification of ships image on SAR data using machine learning

*Takashi Sonoke[1], Hirohide Demura[1] (1.University of Aizu)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 303 3F

[A-CG37] Science in the Arctic Region

convener:NAOYA KANNA(Arctic Research Center, Hokkaido University), Masashi Niwano(Meteorological Research Institute), Tetsu Nakamura(Faculty of Environmental Earth Science, Hokkaido University), Shunsuke Tei(Arctic Research Center, Hokkaido University), Chairperson:Tetsu Nakamura(Faculty of Earth Environmental Science, Hokkaido University), Shunsuke Tei(Arctic Research Center, Hokkaido University)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[ACG37-01] **Arctic midlatitude linkage modulated by the QBO**

*Jinro Ukita[1], Kazuhiro Hoshi[1], Meiji Honda[1], Tetsu Nakamura[2], Koji Yamazaki[2] (1.Niigata University, 2.Hokkaido University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[ACG37-02] **Interhemispheric synchronization between the AO and the AAO**

*Yoshihiro Tachibana[1], Yusuke Inoue[1], Kensuke K komatsu[1], Tetsu Nakamura[2], Meiji Honda[3], Koto Ogata[1,4], Koji Yamazaki[2] (1.Mie University, 2.Hokkaido University, 3.Niigata University, 4.Japan Meteorological Agency)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[ACG37-03] Marginal ice zone sea ice observations in the refreezing Chukchi Sea

*Takehiko Nose[1], Tsubasa Kodaira[1], Takuji Waseda[1], Jun Inoue[2] (1.The university of Tokyo, 2.National Institute of Polar Research)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[ACG37-04] **Prediction of wildfire and air pollution with machine learning over the five domains of Eastern Eurasia**

*Teppei J Yasunari[1,2], Ichigaku Takigawa[3], Kyu-Myong Kim[4], Arlindo M da Silva[4] (1.Faculty of Engineering, Hokkaido University, 2.Arctic Research Center, Hokkaido University, 3.Graduate School of Information Science and Technology, Hokkaido University, 4.NASA Goddard Space Flight Center)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[ACG37-05] Hydrological Changes in the Four Largest Siberian Arctic River Basins

*Kazuyoshi Suzuki[1], Tetsuya Hiyama[2], Kazuhito Ichii[3], Yoshihiro Iijima[4], Koji Matsuo[5], Dai Yamazaki[6,1] (1.Japan Agency for Marine-Earth Science and Technology, 2.Institute for Space-Earth Environmental Research, Nagoya University, 3.Chiba University, 4.Graduate School of Bioresources, Mie University, 5.Geospatial Information Authority of Japan, 6.Institute of Industrial Sciences, The University of Tokyo)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[ACG37-06] Mapping thermokarst subsidence in Central Yakutia using L-band SAR interferometry

*Takahiro Abe[1], Go Iwahana[2,3], Takeo Tadono[1] (1.Earth Observation Research Center, Japan Aerospace Exploration Agency, 2.International Arctic Research Center, University of Alaska, Fairbanks, 3.Arctic Research Center, Hokkaido University)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 303 3F

[A-CG37] Science in the Arctic Region

convener:NAOYA KANNA(Arctic Research Center, Hokkaido University), Masashi Niwano(Meteorological Research Institute), Tetsu Nakamura(Faculty of Environmental Earth Science, Hokkaido University), Shunsuke Tei(Arctic Research Center, Hokkaido University), Chairperson:Shunsuke Tei(Arctic Research Center, Hokkaido University), Masashi Niwano(Meteorological Research Institute)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[ACG37-07] Spatiotemporal variation of thaw subsidence and frost heave of permafrost caused by wildfire around Batagay, East Siberia

*Kazuki Yanagiya[1], Masato Furuya[2] (1.Graduate School of Science, Hokkiado University, 2.Faculty of Science, Hokkaido University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[ACG37-08] Influence of recent climate change on permafrost coast dynamics in the Kara Sea, Russian Arctic Ocean

*A. Kioka[1,2], V. S. Isaev[2], A. V. Koshurnikov[2], A. Pogorelov[2], R. M. Amangurov[2], O. Podchasov[2], D. O. Sergeev[3], S. N. Buldovich[2], D. M. Aleksyutina[4], E. A. Grishakina[5] (1.Institut für Geologie, Leopold-Franzens-Universität Innsbruck, Austria, 2.Department of Geocryology, Lomonosov Moscow State University, Russia, 3.Sergeev Institute of Environmental Geoscience, Russian Academy of Science, Russia, 4.Research Laboratory of Geoecology of the Northern Territories, Lomonosov Moscow State University, Russia, 5.Vernadsky Institute of Geochemistry and Analytical Chemistry, Russian Academy of Science, Russia)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[ACG37-09] Ice front variations of Heilprin Glacier in northwestern Greenland controlled by the ocean and glacier bed geometries

*Izumi Asaji[1,2], Daiki Sakakibara[3], Takuto Ando[3], Shin Sugiyama[1] (1.Institute of Low Temperature Science, Hokkaido University, 2.Graduate School of Environmental Science, Hokkaido University, 3.Arctic Research Center, Hokkaido University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[ACG37-10] Meltwater discharge and flooding of the outlet stream of Qaanaaq Glacier, northwestern Greenland

*Ken Kondo[1,2], Daiki Sakakibara[3,2], Shungo Fukumoto[1,2], Shin Sugiyama[2] (1.Graduate School of Environmental Science, Hokkaido University, 2.Institute of Low Temperature Science, Hokkaido University, 3.Arctic Research Center, Hokkaido University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[ACG37-11] Occurrence frequency of lee-side downslope winds near Siorapaluk in northwest Greenland

*Akihiro Hashimoto[1], Tetsuhide Yamasaki[2], Teruo Aoki[3,1], Masashi Niwano[1], Satoru Yamaguchi[4] (1.Meteorological Research Institute, 2.Avangnaq, 3.The Graduate School of Natural Science and Technology, Okayama University, 4.Snow and Ice Research Center, National Research Institute for Earth Science and Disaster Resilience)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[ACG37-12] **Impacts of clouds on the Greenland ice sheet surface melt and mass balance**

*Masashi Niwano[1], Akihiro Hashimoto[1], Teruo Aoki[2] (1.Meteorological Research Institute, 2.Graduate School of Natural Science and Technology, Okayama University)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 303 3F

[A-CG37] Science in the Arctic Region

convener:NAOYA KANNA(Arctic Research Center, Hokkaido University), Masashi Niwano(Meteorological Research Institute), Tetsu Nakamura(Faculty of Environmental Earth Science, Hokkaido University), Shunsuke Tei(Arctic Research Center, Hokkaido University), Chairperson:Naoya Kanna(Arctic Research Center, Hokkaido University)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[ACG37-13] Introduction of the IASC project "T-MOSAiC"

Masaki Uchida[1], *Tetsuo Sueyoshi[1] (1.National Institute of Polar Research)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[ACG37-14] Estimation of ice thickness and volume in the Sea of Okhotsk using ICESat and CryoSat-2 data

*Sohey Nihashi[1], Nathan T. Kurtz[2], Takenobu Toyota[3] (1.National Institute of Technology, Tomakomai College, 2.NASA GSFC, 3.Institute of Low Temperature Science, Hokkaido University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[ACG37-15] Arctic Sea Ice Changes in the DAMIP experiments using the MRI Earth System Model

*Takuro Aizawa[1], Masayoshi Ishii[2], Naga Oshima[2], Seiji Yukimoto[2], Hiroyasu Hasumi[1] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Meteorological Reseaerch Institute)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[ACG37-16] **Oceanographic Observation in the Refreezing Warm Chukchi Sea during 2018 Mirai Cruise**

*Tsubasa Kodaira[1], Takehiko Nose[1], Takuji Waseda[1], Jun Inoue[2] (1.The University of Tokyo, 2.National Institute of Polar Research)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[ACG37-17] **Observed Waves in the refreezing eastern Chukchi Sea during 2018 Mirai Cruise**

*Takuji Waseda[1], Takehiko Nose[1], Tsubasa Kodaira[1], Alison Kohout[2], Johannes Gemmrich[3], Hui Shen[4], Jun Inoue[5] (1.The University of Tokyo, 2.National Institute of Water and Atmospheric Research, 3.University of Victoria, 4.Bedford Institute of Oceanography, 5.National Institute for Polar Research)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[ACG37-18] Mooring measurement near a marine-terminating glacier in Bowdoin Fjord in northwestern Greenland

*Yoshiki Fujishi[1,2], Yasushi Fukamachi[1,3], NAOYA KANNA[3], Shin Sugiyama[1,3] (1.Institute of Low Temperature Science, Hokkaido University, 2.Graduate School of Environmental Science, Hokkaido University , 3.Arctic Research Center, Hokkaido University)

[J] Oral | H (Human Geosciences)：H-DS Disaster geosciences

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 106 1F

[H-DS15] Human environment and disaster risk

convener:Tatsuto Aoki(School of Regional Development Studies, Kanazawa University), Hisao Kondo(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Chairperson:Tatsuto Aoki(金沢大学地域創造学類)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[HDS15-01] Influence of inhomogeneous structure in surficial reclaimed body traced by aerial photos and delineated by near surface geophysical survey at Makuhari-Kaihin Park liquefied by the 2011 off the Pacific coast of Tohoku earthquake.

*Tomio INAZAKI[1], Takanori Ogahara[1] (1.Public Works Research Institute, Tsukuba Central Institute)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[HDS15-02] Distribution morphology of deformed reclaimed valley associated with the 2018 Hokkaido Eastern Iburi Earthquake

*Takayuki Nakano[1], Satoshi Fujiwara[1], Hiroshi Une[1] (1.GSI of Japan)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[HDS15-03] Liquefaction risk evaluation using relative height data of natural levee

*Mamoru Koarai[1], Kouta Uchiyama[1], Takayuki Nakano[2] (1.Earth Science course, College of Science, Ibaraki University, 2.Geospatial Information Authority of Japan)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[HDS15-04] **Spatial Analysis of Social Vulnerability to large-scale flood: a case study on the Katsushika Ward, Tokyo**

*LIAN XIAO[1] (1.University of Tsukuba)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[HDS15-05] Importance and method of visualization of future occurrence possibilities of giant earthquakes along the Nankai trough

*Yo Fukushima[1] (1.International Research Institute of Disaster Science, Tohoku University)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[HDS15-06] Investigation of efficient tsunami evacuation using real-time disaster information

*Yusuke Oishi[1,2,3], Takashi Furumura[2], Fumihiko Imamura[3], Yoshiteru Mihara[4], Fumiyasu Makinoshima[3], Yamashita Kei[3], Takao Higashiyama[5], Tomonori Goto[5], Makoto Oomura[4], Mitsuyuki Nagayama[4] (1.Fujitsu Laboratories Ltd., 2.Earthquake Research Institute, the University of Tokyo, 3.IRIDeS, Tohoku University, 4.Kawasaki City, 5.Fujitsu Ltd.)

[J] Oral | H (Human Geosciences)：H-TT Technology & Techniques

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 301B 3F

[H-TT23] Geographic Information System and Cartography

convener:Mamoru Koarai(Earth Science course, College of Science, Ibaraki University), Kazunari Tanka(Department of Civil Engineering and Urban Design, Faculty of Engineering, Osaka Institute of Technology), Kazuhiko Nakamura(The University of Tokyo), Chairperson:Mamoru KOARAI(Ibaraki University), Kazunari Tanaka(大阪工業大学)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[HTT23-01] **An analysis of the year-round distribution of $PM_{2.5}$ and Oxidant by (Web)GIS and R**

★Invited Papers

*Junji Yamakawa[1] (1.Graduate School of Natural Science and Technology, Okayama University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[HTT23-02] Development Process and Spatial Structure of Urban Villages in Shenzhen City China

*YARONG LUAN

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[HTT23-03] An analysis on the location characteristic of alley spaces in Tokyo

*Ryo Taniguchi[1], Go Ishikawa[1], Mayumi Oka[2] (1.Tokyo Map Research Inc., 2.Research Organization of Information and Systems The Institute of Statistical Mathematics)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[HTT23-04] Image analysis of night scape using lyrics

*Hiroki Komai[1], Kazunari Tanaka[1] (1.Osaka Institute of Technology)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[HTT23-05] On the Method to Evaluate Signboards based on the Relationship with the Surrounding Space

*Akihiro Kishikawa[1], Kazunari Tanaka[1] (1.Osaka Institute of Technology)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[HTT23-06] ON THE LANDSCAPES ELEMENTS FROM A BIRD'S-EYE VIEW SCAPE

*Nobuaki Tanaka[1], kazunari Tanaka[1] (1.Osaka Institute of Technology)

[J] Oral | H (Human Geosciences)：H-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 101 1F

[H-CG31] Nuclear Energy and Geoscience

convener:Eiji Sasao(Tono Geoscience Center, Japan Atomic Energy Agency), Ryuta Hataya(Central Research Institute of Electric Power Industry), Shinji Takeuchi(Department of Earth and Environmental Sciences, College of Humanities & Sciences, Nihon University), Chairperson:Tadafumi Niizato

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[HCG31-01] **Uplift estimation in coastal sea area by extrapolation of the land area model and its uncertainty**

*Ryuta Hataya[1], Takaomi Hamada[1], Yohei Shimizu[1] (1.Central Research Institute of Electric Power Industry)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[HCG31-02] Deep groundwater mobility at costal area estimated by groundwater dating

*Takuma HASEGAWA[1], Kotaro NAKATA[1], Yuichi Tomioka[1], Tomoko Ota[1], Atsunao Marui[2], Isao Machida[2], Reo Ikawa[2], Masahiko Ono[2], Shinji Matsumoto[2] (1.Central Research Institute of Electric Power Industry, 2.The National Institute of Advanced Industrial Science and Technology)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[HCG31-03] Attempt to Estimate permeability of rock mass based on elasticity and resistivity measurement in underground tunnel

*Sota Kawaguchi[1], Tada-nori Goto[1], Koki Kashiwaya[1] (1.Graduate School of Engineering, Kyoto University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[HCG31-04] Study on relationship between pathway of groundwater and mass transport, and cooling process of granitic rock

*Eiji Sasao[1], Takashi Yuguchi[2], Masayuki Ishibashi[1] (1.Tono Geoscience Center, Japan Atomic Energy Agency, 2.Faculty of Science, Yamagata University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[HCG31-05] Fracture characterization in the accretionary complex from the view point of mass transfer

*Shinji Takeuchi[1], Chikara Kurata[1], Masakazu Niwa[2], Tadamasa Ueki[2] (1.Department of Earth and Environmental Sciences, College of Humanities & Sciences, Nihon University, 2.Japan Atomic Energy Agency)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[HCG31-06] Retardation of Cs and Sr leachings by geopolymer matrices with zeolte and titanate adsorbent

*Kazuma Kuroda[1], Soonthornwiphat Natatsawas[1], Chaerun Raudhatul Islam[1], Hnin Wint Wint Two[1], Kanako Toda[1], Yutaro Kobayashi[1], Tsutomu Sato[2], Tsubasa Otake[2] (1.Graduate school of Engineering, Hokkaido University, 2.Faculty of Engineering, Hokkaido University)

[J] Oral | H (Human Geosciences)：H-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 101 1F

[H-CG31] Nuclear Energy and Geoscience

convener:Eiji Sasao(Tono Geoscience Center, Japan Atomic Energy Agency), Ryuta Hataya(Central Research Institute of Electric Power Industry), Shinji Takeuchi(Department of Earth and Environmental Sciences, College of Humanities & Sciences, Nihon University), Chairperson:Shinji Takeuchi

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[HCG31-07] Focus points of post-closure monitoring in geological disposal

*Hiroaki Murakami[1], Yusuke Watanabe[1], Kenji Fukuda[1], Teruki Iwatsuki[1] (1.Japan Atomic Energy Agency)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[HCG31-08] 5 years monitoring results for the environmental dynamics of radiocesium in mountainous forest of the Abukuma Mountains, Fukushima

*Tadafumi Niizato[1], Takayoshi Watanabe[1], Yoshito Sasaki[1], Katsuaki Mitachi[2], Satomi Ito[1], Hironobu Abe[1] (1.Japan Atomic Energy Agency, 2.ATOM TRANSPORT SERVICE CO., LTD)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[HCG31-09] Problems of geological disposal based on the contaminated water issues at Fukushima Daiichi NPS

*Naoaki Shibasaki[1] (1.Fukushima University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[HCG31-10] Examination of "Nationalwide Map of Scientific Features" for HLRW geological disposal in case of Niigata Prefecture and fundamental problems in the fair discussion on this task

*Junji Akai[1], Ryuichiro Ohno (1.Emeritus Professor of Niigata University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[HCG31-11] Problems of the "Nationwide Map of Scientific Features for Geological Disposal" in Saitama prefecture and storage method of High-level Radioactive Waste (HLW)

*Kazuaki SEKINE[1], Kazuyuki SUENAGA[2], Tadao KOBAYASHI (1.Saitama Prefectural Chichibu High School, 2.SUENAGA Environmental Geology)

[J] Oral | H (Human Geosciences)：H-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 202 2F

[H-CG34] Education and research for rehabilitation of agriculture against harmful rumors in nuclear disaster areas

convener:Masaru Mizoguchi(Graduate school of Agricultural and Life Sciences, The University of Tokyo), Chairperson:Masaru Mizoguchi(The University of Tokyo), Kousuke Noborio(School of Agricultural Science, Meiji University)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[HCG34-01] Education and research for rehabilitation of agriculture against harmful rumors in nuclear disaster areas

*Masaru Mizoguchi[1] (1.Graduate school of Agricultural and Life Sciences, The University of Tokyo)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[HCG34-02] Towards the reborn of Iitate village 'Agriculture'

★Invited Papers

Makoto Sugisoka[2], *Masaru Mizoguchi[1] (1.Graduate school of Agricultural and Life Sciences, The University of Tokyo, 2.Division of Reconstruction Measures, Iitate Village)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[HCG34-03] Difference among crop species by radiocesium absorption from different soil fractions

*Nihei Naoto[1], Yoshimi Ohmae[1], Makoto Furukawa[1], Syuichiro Yoshida[1] (1.The University of Tokyo, Graduate School of Agricultural and Life Sciences)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[HCG34-04] Wild vegetables and mushrooms retrieving agriculter in Iitate Village, Fukushima Prefecture

*Kosuke Noborio[1], Yudai Fukuyama[2], Satoko Fujita[1], Hiroaki Sugino[2], Masaru Mizoguchi[2] (1.Meiji University, 2.the Univewrsity of Tokyo)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[HCG34-05] Effect of Study Tour toward Participants' Attachment on the Study Site - Case Study of University Student Tour to
Iitate Village, Fukushiima Prefecture -

*Natsumi Ebitani[1], Masaru Mizoguchi[1], Hiroaki Sugino[1] (1.Graduate school of Agricultural and Life Sciences, The University of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-SS12] Crustal Structure

convener:Kazuo Nakahigashi(Tokyo University of Marine Science and Technology), Chairperson:Yoshio Murai(Hokkaido University), Genti Toyokuni(東北大学)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SSS12-01] Shrinking and draining continental lower crust: its binary effects of stress and fluid on crustal activities

*Takehito Koyama[1] (1.Institute of Industrial Science, the University of Tokyo)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SSS12-02] Seismic velocity structure in southern Hokkaido deduced from ocean-bottom seismographic and land observations

*Yoshio Murai[1], Kei Katsumata[1], Tetsuo Takanami[2], Tomoki Watanabe[3], Tadashi Yamashina[4], Ikuo Cho[5], Masayuki Tanaka[6], Ryosuke Azuma[7] (1.Institute of Seismology and Volcanology, Faculty of Science, Hokkaido University, 2.Department of Terrestrial Magnetism, Carnegie Institution of Washington, 3.Marine Works Japan LTD, 4.Kochi University, 5.National Institute of Advanced Industrial Science and Technology, 6.Meteorological Research Institute, 7.Research Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SSS12-03] Structural Complexity Associated with Arc-Arc Collision in Hokkaido Island, Japan - Review on Controlled-Source Seismic Researches in Western and Central Hokkaido -

★Invited Papers

*Takaya Iwasaki[1], Noriko Tsumura[2], Tanio Ito[3], Kazunori Arita[4], Hiroshi Sato[1] (1.Eathquake Research Institute, the University of Tokyo, 2.Graduate School of Science, Chiba University, 3.Association for the Development of Earthquake Prediction, 4.Hokkaido Research Center of Geology)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SSS12-04] **Seismic imaging of the eastern Japan forearc region using S-net data**

*Genti Toyokuni[1], Dapeng Zhao[1], Naoki Uchida[1], Takashi NAKAYAMA[1] (1.RCPEVE, Tohoku Univ.)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SSS12-05] The relationship between the location of the mid crustal reflector and seismicity in Iwaki area, northeastern Japan

*Takashi Iidaka[1], Shin'ichi Sakai[1], Toshihiro Igarashi[1], Kazushige Obara[1], Aitaro Kato[1], Tetsuya Takeda[2], Shigeki Nakagawa[1] (1.Earthquake Research Institute, University of Tokyo, 2.National Research Institute for Earth Science and Disaster Resilience)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SSS12-06] Abnormal Seismic Anisotropy beneath the Tokyo Metropolitan Area (1) Mantle of the Philippine Sea Slab

*Motoko Ishise[1], Shin'ichi Sakai[1], Aitaro Kato[1], Shin Aoi[2], Makoto MATSUBARA[2] (1.Earthquake Reseach Institute, University of Tokyo, 2.National Research Institute for EarthScience and Disaster Resillience)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-SS12] Crustal Structure

convener:Kazuo Nakahigashi(Tokyo University of Marine Science and Technology), Chairperson:Tsuruga Kayoko(Tokyo University of Marine Science and Technology), Yojiro Yamamoto(Japan Agency for Marine-Earth Science and Technology)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SSS12-07] Deep seismic reflection profiling across the Suruga trough, Shizuoka, Japan

*Hiroshi Sato[1], Kayoko Tsuruga[2], Hisatoshi Baba[3], Tatsuya Ishiyama[1], Shinji Kawasaki[4], Yasuhisa Tanaka[4], Toshifumi Hayashi[2], Yoshihiro Sekino[2], Masanao Shinohara[1], Takaya Iwasaki[1], Makoto MATSUBARA[5], Naoshi Hirata[1,5] (1.Earthquake Research Institute, The University of Tokyo, 2.Tokyo University of Marine Science and Technology, 3.Tokai Univerisity, 4.JGI Inc., 5.National Research Institute for Earth Science and Disaster Resilience)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SSS12-08] Multi-channel seismic profiling in the northern part of Suruga bay using the Shiyomaru-vessel of Tokyo University of Marine Science and Technology (Preliminary report)

*Kayoko Tsuruga[1], Hiroshi Sato[2], Hisatoshi Baba[3], Yoshihiro Sekino[1], Toshifumi Hayashi[1], Hayato Kondotec[1], Chiharu Aoyama[1], Tetsutaro Aikawa[1], Tatsuya Ishiyama[2], Masanao Shinohara[2], Shinji Kawasaki[4], Yasuhisa Tanaka[4] (1.Tokyo University of Marine Science and Technology, 2.University of Tokyo, 3.Tokai University, 4.JGI, Inc.)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SSS12-09] Crustal structure refraction survey using Airgun-OBS in the northern part of Suruga Bay -Fujikawa fault zone- (Preliminary Report)

*Hisatoshi Baba[1], Kayoko Tsuruga[2], Hiroshi Sato[3], Tatsuya Ishiyama[3], Masanao Shinohara[3], Takahito Nishimiya[4], Shintaro Abe[5] (1.Department of Marine and Earth Science, Tokai University, 2.Tokyo University of Marine Science and Technology, 3.Earthquake Research Institute, University of Tokyo, 4.Meteorological Research Institute, Japan Meteorological Agency, 5.Association for the Development of Earthquake Prediction)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SSS12-10] 3D seismic attenuation profiling for imaging an active fault in Uchiura wan

*Tetsuro Tsuru[1], Shio Shimizu[1], Mayu Ogawa[1], Jin-Oh Park[2], Seishiro Furuyama[1], Kosaku Arai[3], Takahiko Inoue[3], Chen Guo[2] (1.Tokyo University of Marine Science and Technology, 2.Atmosphere and Ocean Research Institute, The University of Tokyo, 3.National Institute of Advanced Industrial Science and Technology)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SSS12-11] Gravity survey at the extension of the Takahama fault and the Yokosuka fault in Nishio City, Aichi Prefecture

*Tokunosuke Tatsuzawa[1,2], Tatsuya Sumita[2], Shinobu Ito[2], Tomoya Abe[2] (1.Department of Earth Sciences, Resources and Environmental Engineering, Creative Science and Engineering, Faculty of Science and Engineering, Waseda University, 2.National Institute of Advanced Industrial Science and Technology)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[SSS12-12] Subduction geometry and seismicity around northern Ryukyu subduction zone

*Yojiro Yamamoto[1], Tsutomu Takahashi[1], Yasushi Ishihara[1], Koichiro Obana[1], Seiichi Miura[1], Shuichi Kodaira[1], Yoshiyuki Kaneda[2] (1.Japan Agency for Marine-Earth Science and Technology (JAMSTEC), 2.Kagawa University)

[J] Oral | S (Solid Earth Sciences)：S-GL Geology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A10 TOKYO BAY MAKUHARI HALL

[S-GL27] Geochronology and Isotope Geology

convener:Takahiro Tagami(Graduate School of Science, Kyoto University), Yuji Sano(Division of Ocean and Earth Systems, Atmosphere and Ocean Research Institute, University of Tokyo), Chairperson:Takahiro Tagami, Yuji Sano

9:00 AM - 9:30 AM JST | 12:00 AM - 12:30 AM UTC

[SGL27-01] Terrestrial cosmogenic nuclides as a dating tool of landforms and near-surface materials: applicability and limitations

★Invited Papers

*Yuki Matsushi[1] (1.Disaster Prevention Research Institute, Kyoto University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SGL27-02] Dating of marine erosional terraces using cosmogenic nuclides: A case study of the Hyuga City, Miyazaki Prefecture, southwest Japan (preliminary results)

*Shigeru Sueoka[1], Tetsuya Komatsu[1], Yuki Matsushi[2], Yusuke Yonaga[1], Naomi Sano[1], Noriaki Hirao[1], Tadamasa Ueki[1], Natsuko Fujita[1], Yoko Kokubu[1], Masakazu Niwa[1] (1.Japan Atomic Energy Agency, 2.Disaster Prevention Research Institute, Kyoto University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SGL27-03] Estimation of thermal history of Toki granite over 0.1Myr timescale by Multi-OSL-thermochronometry

*Manabu Ogata[1], Georgina E King[2], Frédéric Herman[2], Shigeru Sueoka[1] (1.Tono Geoscience Center, Japan Atomic Energy Agency, 2.University of Lausanne)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SGL27-04] Depth condition under which OSL signal of quartz gouge experiences coseismic zeroing

*Yuki Minomo[1], Kiyokazu Oohashi[1], Noriko Hasebe[2], Kazumasa Miura[3] (1.Graduate School of science and Technology for Innovation, Yamaguchi University , 2.Institute of Nature and Environmental Technology, Kanazawa University, 3.Kanazawa University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SGL27-05] Result of age determination of samples from Hokuriku Group

*Noriko Hasebe[1], Ryo Kamiguchi[2] (1.Institute of Nature and Environmental Technology, Kanazawa University, 2.Department of Earth Sciences, Kanazawa University)

[J] Oral | S (Solid Earth Sciences)：S-GL Geology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A10 TOKYO BAY MAKUHARI HALL

[S-GL27] Geochronology and Isotope Geology

convener:Takahiro Tagami(Graduate School of Science, Kyoto University), Yuji Sano(Division of Ocean and Earth Systems, Atmosphere and Ocean Research Institute, University of Tokyo), Chairperson:Yuji Sano, Takahiro Tagami

10:45 AM - 11:15 AM JST | 1:45 AM - 2:15 AM UTC

[SGL27-06] **Geochemical origin/cycle analysis with isotopologues and isotopomers**

★Invited Papers

*Naohiro Yoshida[1] (1.Department of Chemical Science and Engineering, Earth-Life Science Institute, Tokyo Institute of Technology)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SGL27-07] Estimation of Paleoenvironment by sedimentary rocks in Labrador, Cacada

*katsutaka sudo[1], Yuji Sano[1], Tsuyoshi Komiya[1], Bakert David[2], Michael Broadley[2], Bernard Marty[2] (1.University of Tokyo, 2.CRPG-CNRS, Université de Lorraine)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SGL27-08] Hf-W dating of zircons from mesosiderites with high-pressure sintered sample

*Yuta Koyama[1], Naoto Takahata[1], Yuji Sano[1], Naoji Sugiura[1], Mizuho Koike[2], Makiko K. Haba[3], Sakata Shuhei[4], Hideharu Kuwahara[5], Tetsuo Irifune[5] (1.the University of Tokyo, 2.Japan Aerospace Exploration Agency, 3.Tokyo Institute of Technology, 4.Gakushuin University, 5.Geodynamics Research Center, Ehime University)

11:45 AM - 12:15 PM JST | 2:45 AM - 3:15 AM UTC

[SGL27-09] Radiometric ages *vs.* astrophysical ages -with regard to the numerical age in the International Stratigraphic Chart

★Invited Papers

*Ichiro Kaneoka[1] (1.Earthquake Research Institute, University of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-MP Mineralogy & Petrology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 301B 3F

[S-MP32] Deformed rocks, Metamorphic rocks and Tectonics

convener:Yumiko Harigane(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST)), Yoshihiro Nakamura(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Chairperson:Yoshihiro Nakamura(産総研), Yumiko Harigane(産総研)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SMP32-19] Thermal interaction of the lithosphere and asthenosphere revealed from internal variations of pressure-temperature history in orogenic peridotite complexes

*Kazuhito Ozawa[1], Carlos J. Garrido[2], Karoly Hidas[2], Jean-Louis Bodinier[3] (1.Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo, 2.Instituto Andaluz de Ciencias de la Tierra (IACT), CSIC – UGR, Armilla, Granada, Spain, 3.Geosciences Montpellier, Montpellier, France)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SMP32-20] **Hydration and Ca-metasomatism in Mantle Wedge: An evidence from the Alag Khadny Accretionary Wedge, Western Mongolia**

*OTGONBAYAR DANDAR[1], Atsushi Okamoto[1], Masaoki Uno[1], Noriyoshi Tsuchiya[1] (1.Graduate School of Environmental Studies, Tohoku University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SMP32-21] **Attenuated Total Reflection Infrared (ATR-IR) Spectroscopy of Antigorite, Chrysotile and Lizardite**

*Ilona Talvikki Sakaguchi[1] (1.Nagoya University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SMP32-22] Fabric and petrological characteristics of sheared peridotites in Marion transform fault, Southwest Indian Ridge

*Kakihata Yuki[1], Katsuyoshi Michibayashi[2], Henry Dick[3] (1.Shizuoka University Graduate School of Science, 2.Nagoya University Graduate School of Environmental Studies, 3.Woods Hole Oceanographic Institution)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SMP32-23] Structure and formation mechanism of lithosphere-asthenosphere boundary decoded from Ichinomegata peridotite xenoliths

*Yuto Sato[1], Kazuhito Ozawa[1] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SMP32-24] Metasomatic banding and deformation instability in the metamorphic rocks

*mitsuhiro toriumi[1] (1.Japan agency of marine science and technology)

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A07 TOKYO BAY MAKUHARI HALL

[S-VC37] Dynamics of volcanic eruptions and their physical and chemical processes

convener:Yujiro Suzuki(Earthquake Research Institute, The University of Tokyo), Chairperson:Yujiro Suzuki(Earthquake Research Institute, The University of Tokyo), Hiroyuki Shimizu(Earthquake Research Institute, The University of Tokyo)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SVC37-01] Volcanic activities triggered or inhibited by resonance of volcanic edifices to large earthquakes

*Atsuko Namiki[1], Eleonora Rivalta[2], Heiko Woith[2], Timothy Willey[2], Stefano Parolai[3], Thomas R Walter[2] (1.Graduate School of Integrated Arts and Sciences, Hiroshima University, 2.GFZ, 3.OGS)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SVC37-02] **Groundmass crystallization experiments of an andesitic pumice under low vapor pressure.**

*Yasukawa Hiroki[1], Mayumi Mujin[1], Michihiko Nakamura[1], Shizuka Otsuki[2] (1.Division of Earth and Planetary Materials Science, Department of Earth Science, Graduate School of Science, Tohoku University., 2.National Institute of Advanced Industrial Science and Technology)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SVC37-03] Decoding pre-eruptive magma evolution and water behavior from plagioclase phenocrysts: Application to the Hoei eruption of Mt. Fuji

*Tsuyoshi Iizuka[1], Chiyo Harada[1], Kenji Shimizu[2], Takayuki Ushikubo[2], Morihisa Hamada[2], Mitsuhiro Yoshimoto[3] (1.University of Tokyo, 2.JAMSTEC, 3.Mount Fuji Research Institute)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SVC37-04] Probing magmatic processes just prior to historic eruptions at Sakurajima volcano: Toward understanding “magma pre-charge”

*Naoki Araya[1], Michihiko Nakamura[1], Satoshi Okumura[1] (1.Division of Earth and Planetary Materials Science, Department of Earth Science, Graduate School of Science, Tohoku UniversityUniversity)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SVC37-05] Magmatic processes prior to the Vulcanian eruptions of Sakurajima volcano: A combined petrologic and geophysical approach

*Sakauchi Nono[2], Michihiko Nakamura[2], ATSUSHI YASUDA[1], Satoshi Okumura[2], Naoki Araya[2], Masato Iguchi[3], Daisuke Miki[3], Nobuo Geshi[4] (1.Earthquake Research Institute, University of Tokyo, 2.Division of Earth and Planetary Materials Science, Department of Earth Science, Graduate School of Science, Tohoku University, 3.Sakurajima Volcano Research Center, Disaster Prevention Research Institute, Kyoto University, 4.Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SVC37-06] Cyclic degassing behavior accompanying dome-forming lava effusion at Shinmoedake volcano in the 2018 eruption

★Invited Papers

*Taishi Yamada[1], Hideki Ueda[1], Toshiya Mori[2], Toshikazu Tanada[1] (1.National Research Institute for Earth Science and Disaster Resilience, 2.Geochemical Research Center, Graduate School of Science, The University of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A07 TOKYO BAY MAKUHARI HALL

[S-VC37] Dynamics of volcanic eruptions and their physical and chemical processes

convener:Yujiro Suzuki(Earthquake Research Institute, The University of Tokyo), Chairperson:Yujiro Suzuki(Earthquake Research Institute, The University of Tokyo), Taishi Yamada

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SVC37-07] Estimation of the amplitude of infrasoundsignal based on sound diffraction

*Kyoka Ishii[1], Akihiko Yokoo[1] (1.Graduate School of Science, Kyoto University)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SVC37-08] Mechanism and frequency change of pressure oscillation in the laboratory geyser system

*Noriko Teshima[1], Atsushi Toramaru[2] (1.Department of Earth and Planetary Sciences, Graduate School of Sciences, Kyushu University, 2.Department of Earth and Planetary Sciences, Faculty of Sciences, Kyushu University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SVC37-09] Effects of temperature on the run-out distance of large-scale pyroclastic density currents: Numerical simulation of a two-layer depth-averaged model

*Hiroyuki A. Shimizu[1], Takehiro Koyaguchi[1], Yujiro J. Suzuki[1] (1.Earthquake Research Institute, The University of Tokyo)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SVC37-10] **Total grain-size distribution of pumice fallout deposits (Kj-P1) from 54 ka plinian eruption at Kuju Volcano**

*Tomohiro Tsuji[1], Kishimoto Hiroshi[2], Fujita Kouji[2], Chisato Nakamura[3], Nagata Tomohiro[3], Kimura Kazunari[3], Michiharu Ikeda[1], Naoki Nishizaka[4], Kozo Onishi[4] (1.Shikoku Research Institute Inc., 2.Asia Air Survey Co. Ltd., 3.Naiba, 4.Shikoku Electric Power Co. Inc.)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SVC37-11] Estimating ashfall volumes for the 2018 Shinmoedake eruptions using the Ellipse Approximated Isopach (EAI) method - How to quantify ashfall volumes from limited ashfall observation locations

*Yasuhisa Tajima[1], Setsuya Nakada[2], Masashi NAGAI[2], Fukashi Maeno[3], Jun Oikawa[3], Teruki Oikawa[4], Yasuo Miyabuchi[5], Toshiaki Hasenaka[5], Masataka Kawaguchi[5] (1.NIPPON KOEI CO.,LTD., 2.NIED, 3.ERI, the Univ. Tokyo, 4.Geological Survey of Japan, AIST, 5.Kumamoto Univ.)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[SVC37-12] Optical disdrometer measurement of tephra fall: Constraints on radar parameters for eruption cloud observations

★Invited Papers

*Tomofumi Kozono[1], Masato Iguchi[2], Takahiro Miwa[3], Masayuki Maki[4], Takeshi Maesaka[3], Daisuke Miki[2], Takeshi Nishimura[1] (1.Department of Geophysics, Graduate School of Science, Tohoku University, 2.Sakurajima Volcano Research Center, Disaster Prevention Research Institute, Kyoto University, 3.National Research Institute for Earth Science and Disaster Resilience, 4.Research and Education Center for Natural Hazards, Kagoshima University)

[J] Oral | S (Solid Earth Sciences)：S-TT Technology & Techniques

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A11 TOKYO BAY MAKUHARI HALL

[S-TT43] seismic monitoring and processing system

convener:Takahiro Maeda(National Research Institute for Earth Science and Disaster Resilience),
Chairperson:Masanao Shinohara(Earthquake Research Institute, The University of Tokyo)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[STT43-01] Summary and Considerations about Characteristics of Borehole Stress Meter for Continuous Observation

*Hiroshi Ishii[1], Yasuhiro Asai[1] (1.Tono Research Institute of Earthquake Science, Association for the Development of Earthquake Prediction)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[STT43-02] Seismic monitoring by an autonomous robotic float equipped with a hydrophone: MERMAID

*Masayuki Obayashi[1], Hiroko Sugioka[2] (1.Japan Agency for Marine-Earth Science and Technology, 2.Department of Planetology, Kobe University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[STT43-03] Earthquake observation in a borehole over 250 °C using high temperature optical fiber and DAS technology

*Tsunehisa KIMURA[1] (1.Schlumberger)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[STT43-04] Distributed Acoustic Sensing measurement by using seafloor optical fiber cable system off Sanriku for dense seismic observation

*Masanao Shinohara[1], Tomoaki Yamada[1], Takeshi Akuhara[1], Kimihiro Mochizuki[1], Takeo Kasajima[2], Takahiro Arioka[2], Masayuki Hamakawa[3], Shunsuke Kubota[4] (1.Earthquake Research Institute, University of Tokyo, 2.Fujitsu Laboratories Ltd., 3.Fujitsu Limited, 4.YK Giken Co., Ltd.)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[S-CG52] Petrology, Mineralogy & Resource Geology

convener:Tatsuo Nozaki(Research and Development Center for Submarine Resources, Japan Agency for Marine-Earth Science and Technology), Satoshi SAITO(Graduate School of Science and Engineering, Ehime University), Koichi Momma(National Museum of Nature and Science), Nobutaka Tsuchiya(Department of Geology, Faculty of Education, Iwate University), Chairperson:Tatsuo Nozaki(JAMSTEC), Satoshi Saito

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SCG52-01] Coordinated sample preparation with cryo-FIB-SEM and X-ray CT: Applications to chemical analysis for fluid inclusions in minerals

*Yu Kodama[1], Naotaka Tomioka[2], Tatsuhiko Kawamoto[3], Junichiro Kuroda[4], Masafumi MURAYAMA[5], Motoo Ito[2] (1.Marine Works Japan Ltd., 2.Kochi Institute for Core Sample Research, JAMSTEC, 3.Department of Geoscience, Faculty of Science, Shizuoka University, 4.Atmosphere and Ocean Research Institute, the University of Tokyo, 5.Faculty of Agriculture and Marine Science, Kochi University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SCG52-02] Feasibility Study for Precise Particle Characterization of Fine Clay Particle Using An Automated Particle Image Analysis and Nanotrakcking Analysis.

*Daisuke Sasakura[1], Aiko Hayauchi[1], Sho Kimura[2] (1.MalvernPanalytical Japan ,Div of Spectris Co.Ltd,., 2.Faculty of Agriculture, University of the Ryukyu)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SCG52-03] Crystal structure and local structures of natural perovskite-type (Na,REE,Ca)(Ti, Nb)O_3 loparite by single crystal diffraction and XAFS analyses

*Ginga Kitahara[1], Akira Yoshiasa[1], Makoto Tokuda[1], Kazumasa Sugiyama[2] (1.Kumamoto University, 2.Tohoku University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SCG52-04] Crystal Size Distributions based on crystal habit of groundmass pyroxene crystals in the ejecta of the Shinmoedake 2011 eruption

*Shota Okumura[1], Mayumi Mujin[2], Akira Tsuchiyama[1], Norimasa Shimobayashi[1], Akira Miyake[1] (1.Department of Geology and Mineralogy, Graduate School of Science, Kyoto University, 2.Division of Earth and Planetary Materials Science, Department of Earth Science, Tohoku University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SCG52-05] Petrochemistry and zircon U-Pb age of ``lateritic'' metamorphic rocks from the Kitakami Mountains

*Nobutaka Tsuchiya[1], Yamato Kumagai[1], Tatsuro Adachi[2], Nobuhiko Nakano[2], Yasuhito Osanai[2] (1.Department of Geology, Faculty of Education, Iwate University, 2.Department of Earth Sciences, Faculty of Social and Cultural Studies, Kyushu University)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SCG52-06] How to make 'syn-plutonic dike' - - - Another story from the Ryoke granitic province, Southwest Japan

*Takashi Nakajima[1], Hiroyuki Kamiyama[2], Ian S. Williams[3] (1.Geological Survey of Japan, 2.Ueyama-Shisui, Co. Ltd., 3.Australian National University)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-CG53] Environment formed and maintained by active faults

convener:Naoji Koizumi(School of Environmental Science,the University of Shiga Prefecture), Makoto Yamano(Earthquake Research Institute, the University of Tokyo), Takafumi Kasaya(Japan Agency for Marine-Earth Science and Technology), Hideki Hamamoto(Center for Environmental Science in Saitama), Chairperson:NAOJI KOIZUMI, TADANORI GOTO(Graduate School of Engineering, Kyoto University)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SCG53-01] **Effect of the Hanaore fault and Biwako-seigan fault on the water quality of the Ado river in Shiga Prefecture**

*Naoji Koizumi[1], Masahiro Ueda[1], Shinsuke Minote[1], Tatsuya Tanaka[1], Masahiro Maruo[1], Kanto Mitani[2] (1.School of Environmental Science,the University of Shiga Prefecture, 2.Daikokuten Bussan Co., Ltd.)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SCG53-02] **Hydrothermal vents in the deep basin of Lake Biwa**

★Invited Papers

*Michio Kumagai[1] (1.Ritsumeikan University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SCG53-03] Heat flow anomalies observed on the seafloor in the vicinity of faults: indication of fluid flow

*Makoto Yamano[1], Shusaku Goto[2], Yoshifumi Kawada[3], Hideki Hamamoto[4] (1.Earthq. Res. Inst., Univ. Tokyo, 2.Geol. Surv. Japan, AIST, 3.IRIDeS, Tohoku Univ., 4.Center Environ. Sci. Saitama)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SCG53-04] How can we quantify the hydraulic permeability of fault based on geophysical survey?

*Tada-nori Goto[1], Sota Kawaguchi[1] (1.Graduate School of Engineering, Kyoto University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SCG53-05] Healing process of the Nojima Fault zone after 1995 Hyogo-ken Nanbu earthquake

*Hideki Murakami[1], Naoto Oshiman[2], Ryokei Yoshimura[2], Tsutomu Miura[2], Masato Kamo[2] (1.Research and Education Faculty,Kochi University, 2.Disaster Prevention Research Institute,Kyoto University)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SCG53-06] Discussion on the environment formed and maintained by active faults

*Naoji Koizumi[1] (1.School of Environmental Science,the University of Shiga Prefecture)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A11 TOKYO BAY MAKUHARI HALL

[S-CG55] Crustal fluids and deformation

convener:Yuichi Kitagawa(Tectono-Hydrology Research Group, Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Naoji Koizumi(School of Environmental Science,the University of Shiga Prefecture), Koji Umeda(Hirosaki University), Fumiaki Tsunomori(Geochemical Research Center, Graduate School of Science, University of Tokyo), Chairperson:Yuichi Kitagawa(産業技術総合研究所地質調査総合センター地震地下水研究グループ), Fumiaki Tsunomori(東京大学大学院理学系研究科地殻化学実験施設)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SCG55-01] Estimation of fault models of the short-term SSE using groundwater pressures at the Hokusei observation site

*Yuichi Kitagawa[1], Norio Matsumoto[1] (1.Tectono-Hydrology Research Group, Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology)

9:15 AM - 9:35 AM JST | 12:15 AM - 12:35 AM UTC

[SCG55-02] Groundwater level changes during the 2018 Hokkaido Eastern Iburi earthquake

★Invited Papers

*Tomo Shibata[1], Ryo Takahashi[2], Hiroaki Takahashi[3], Takanori Kagoshima[4], Yuji Sano[4], Daniele Pinti[5] (1.Graduate School of Science, Kyoto University, 2.Geological Survey of Hokkaido, Hokkaido Research Organization, 3.Graduate School of Science, Hokkaido University, 4.Atmosphere and Ocean Research Institute, The University of Tokyo, 5.GEOTOP, Université du Québec)

9:35 AM - 9:50 AM JST | 12:35 AM - 12:50 AM UTC

[SCG55-03] Postseismic streamflow changes after the 2016 Kumamoto earthquake

*Naoji Koizumi[1], Shinsuke Minote[1], Tatusya Tanaka[1] (1.School of Environmental Science,the University of Shiga Prefecture)

9:50 AM - 10:05 AM JST | 12:50 AM - 1:05 AM UTC

[SCG55-04] Development of Radium Concentration Monitoring System based on Gamma-Ray Spectroscopy

*Fumiaki Tsunomori[1], Shigekazu Nagai[2], Junji Yoshii[3], Yoshihide Kimura[4], Yoriyuki Kamakura[5], Yuki Inoue[5], Norihito Sato[6], Shiro Sakuragi[7], Ryuichi Shimizu[8], V N Gluchschenko[9] (1.Geochemical Research Center, Graduate School of Science, University of Tokyo, 2.Graduate School of Engineering, Mie University, 3.Advanced Clinical Research Center, Fukushima Medical University, 4.Graduate School of Engineering, Osaka University, 5.Faculty of Information Science and Technology, Osaka Institute of Technology, 6.Chiyoda Technol corp., 7.Union Material Inc., 8.Office for University-Industry Collaboration, Osaka University, 9.Institute of Nuclear Physics, Almaty, Republic of Kazakhstan)

10:05 AM - 10:25 AM JST | 1:05 AM - 1:25 AM UTC

[SCG55-05] ^{222}Rn concentration distribution in Yatsushiro Sea

★Invited Papers

*Kuniyo Kawabata[1], Fumiaki Tsunomori[2], Yujin Kitamura[1], Hakuho-Maru K18-3 scientists (1.Graduate School of Science and Engineering, KAGOSHIMA UNIVERSITY, 2.Geochemical Research Center, Graduate School of Science, University of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A09 TOKYO BAY MAKUHARI HALL

[S-CG58] Brittle-Ductile Transition and Supercritical Geofluids for Crustal Energy in Island Arc

convener:Noriyoshi Tsuchiya(Graduate School of Environmental Studies, Tohoku University), Hiroshi Asanuma(AIST), Yasuo Ogawa(Volcanic Fluid Research Center, School of Science, Tokyo Institute of Technology), Shigemi Naganawa(Akita University), Chairperson:Noriyoshi Tsuchiya, Atsushi Okamoto

1:45 PM - 1:55 PM JST | 4:45 AM - 4:55 AM UTC

[SCG58-01] Supercritical Geothermal Resources as a Function of Mass and Energy Transport in Subduction Zone

*Noriyoshi Tsuchiya[1] (1.Graduate School of Environmental Studies, Tohoku University)

1:55 PM - 2:05 PM JST | 4:55 AM - 5:05 AM UTC

[SCG58-02] Outline of NEDO Supercritical Geothermal Project

*Hiroshi Asanuma[1] (1.AIST)

2:05 PM - 2:30 PM JST | 5:05 AM - 5:30 AM UTC

[SCG58-03] Mineral precipitation/dissolution from water and brine with decreasing temperatures along hydrostatic pressures

★Invited Papers

*Kenichi Hoshino[1] (1.Department of Earth and Planetary Systems Science, Hiroshima University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SCG58-04] Thermodynamic data of aqueous species for supercritical water–rock interaction: dissolution experiments and density-based extrapolation

*Atsushi Okamoto[1], Hajime Ishii[1], Ryosuke Oyanagi[2], Noriyoshi Tsuchiya[1] (1.Graduate School of Environmental Studies, 2.JAMSTEC)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SCG58-05] Nitrogen isotope ratios of ammonium in hypersaline hot spring waters distributed along Arima-Takatsuki fault zone.

*Kazuhiro Amita[1], Takashi Nakamura[2], Shinji Ohsawa[3] (1.Faculty of Engineering Science, Akita University, 2.International Research Center for River Basin Environment, University of YAMANASHI, 3.Institute for Geothermal Sciences, Graduate School of Science, Kyoto University)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SCG58-06] **Crustal fluid pressure gradients and permeability estimated from fluid-rock reaction zones**

*Masaoki Uno[1], Diana Mindaleva[1], Noriyoshi Tsuchiya[1] (1.Graduate School of Environmental Studies, Tohoku University)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A09 TOKYO BAY MAKUHARI HALL

[S-CG58] Brittle-Ductile Transition and Supercritical Geofluids for Crustal Energy in Island Arc

convener:Noriyoshi Tsuchiya(Graduate School of Environmental Studies, Tohoku University), Hiroshi Asanuma(AIST), Yasuo Ogawa(Volcanic Fluid Research Center, School of Science, Tokyo Institute of Technology), Shigemi Naganawa(Akita University), Chairperson:Noriyoshi Tsuchiya

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SCG58-07] 3D S-wave velocity structure in volcanic region using surface-wave tomography

*Hiro Nimiya[1], Tatsunori Ikeda[1], Takeshi Tsuji[1] (1.Kyushu University)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SCG58-08] Resistivity-Based Temperature and Permeability Estimation of the Kakkonda Geothermal Field, Japan, Using a Neural Network

*Ugou Tsubasa[1], Kazuya Ishitsuka[2], Toru Mogi[3] (1.Department of Socio-Environmental Engineering Scool of Engineering Hokkaido University, 2.Division of Urban Management, Grduate School of Engineering, Kyoto University, 3.Division of Sustinable Resources Enginieering, Faculty of Engineering, Hokkaido University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SCG58-09] Preliminary report on geothermal structure revealed by geological and MT surveys around Akayumatasawa river in Sanzugawa caldera, NE Japan

*Keishi Nunohara[1], Kuo Hsuan Tseng[2], Hiroki Okano[1], Yasuo Ogawa[2], Noriyoshi Tsuchiya[1] (1.Graduate school of Environmental Studies Tohoku University , 2.Graduate school of Science , Tokyo Institute of Technology)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SCG58-10] Characterization of hydraulic fracturing phenomena in supercritical geothermal environments revealed by elastic wave measurements

*Miura Takahiro[1], Noriaki Watanabe[1], Kiyotoshi Sakaguchi[1], Ryota Goto, Kota Yamane, Takeshi Komai[1], Youqing CHEN[2], Takuya ISHIBASHI[3], Noriyoshi Tsuchiya[1] (1. Graduate School of Environmental Studies, Tohoku University, 2.Graduate School of Energy Science, Kyoto University, 3.AIST, FREA)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SCG58-11] Experimental measurements of transport pore radius of thermally cracked granite and the relationship of pore structure to permeability

*Sueyoshi Kazumasa[1], Tadashi Yokoyama[2], Ikuo Katayama[1] (1.Department of Earth and Planetary Systems Science, Hiroshima University, 2.Graduate School of Integrated Arts and Sciences, Hiroshima University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[SCG58-12] Geothermal reservoir evaluation by using TL of Quartz and Fluid Flow Simulation Model of the Kakkonda system in Japan

*Alvaro Josue Amaya[1], Nobuo Hirano[1], Noriyoshi Tsuchiya[1] (1.Tohoku University. Graduate School of Environmental Studies)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[S-CG59] Reducing risks from earthquakes, tsunamis & volcanoes: new applications of realtime geophysical data

convener:Masashi Ogiso(Meteorological Research Institute, Japan Meteorological Agency), Naotaka YAMAMOTO CHIKASADA(National Research Institute for Earth Science and Disaster Resilience), Satoshi Kawamoto(Geospatial Information Authority of Japan), Mitsuyuki Hoshiba(Meteorological Research Institute), Chairperson:Mitsuyuki Hoshiba(Meteorological Res. Inst., JMA, Japan), Satoshi Kawamoto(Geospatial Information Authority of Japan)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SCG59-01] Earthquake early warning in the United States and beyond

★Invited Papers

*Richard M Allen[1] (1.University of California Berkeley)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SCG59-02] Study on the relationship between seismometer site environment and earthquake early warning seismic parameter estimation accuracy

*Katsutomo Niwa[1], Naoyasu Iwata[1], Shunroku Yamamoto[1] (1.Railway Technical Research Institute)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SCG59-03] **Prediction of surface ground motion using underground seismic records based on data assimilation (2)**

*Masaya Ishihara[1], Hisashi Nakahara[1] (1.Solid Earth Physics Laboratory, Department of Geophysics, Graduate School of Science, Tohoku University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SCG59-04] Development of Realtlime Long-Period Ground-Motion Prediction System and Demonstration Experiment

★Invited Papers

*Shin Aoi[1], Takeshi Kimura[1], Takashi Kunugi[1], Wataru Suzuki[1], Yadab Prasad Dhakal[1], Naoto Kojya[2] (1.National Research Institute for Earth Science and Disaster Resilience, 2.Japan Meteorological Agency)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SCG59-05] Real-time forecasting of long-period ground motions for the Nankai Trough earthquake: The effectivity of the Green function-based data assimilation method

*Atsuki Oba[1], Takashi Furumura[1], Takuto Maeda[2] (1.Earthquake Research Institute, University of Tokyo, 2.Graduate School of Science and Technology, Hirosaki University)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SCG59-06] Development of EEW system exchanging real-time seismic intensity and seismic waveform

*Shigeki Horiuchi[1], Yuko Sato[1], Taku Urabe[2], Yamaimaiti Nizhamudong[3], Kazuo Sasaki[3] (1.Home Seismometer Corporation, 2.telemetra , 3.Challenge)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[S-CG59] Reducing risks from earthquakes, tsunamis & volcanoes: new applications of realtime geophysical data

convener:Masashi Ogiso(Meteorological Research Institute, Japan Meteorological Agency), Naotaka YAMAMOTO CHIKASADA(National Research Institute for Earth Science and Disaster Resilience), Satoshi Kawamoto(Geospatial Information Authority of Japan), Mitsuyuki Hoshiba(Meteorological Research Institute), Chairperson:Naotaka Chikasada(National Res. Inst. for Earth Science and Disaster Resilience), Masashi Ogiso(Meteorological Research Institute, JMA)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SCG59-07] Enhancements of real time seismic intensity estimation using seismic intensity meters maintained by a local government – Case study on Tottori prefecture -

*Takao Kagawa[1] (1.Tottori University Graduate School of Engineering)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SCG59-08] **Drawig of the realtime seismic intesity on live screen and maximum distribution map for the Earthquak disaster prevension.**
-Planar indication of seismic intensity using surface ground amplification factor-

*Kenji Kanjo[1], Isao Takahashi[1], Yoshinori Shinohara[1], Rami Ibrahim[2] (1.Takamisawa cybernetics Co. Ltd, 2.Earthquake Research Institute, University of Tokyo)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SCG59-09] Improvements of the GEONET real-time analysis system (REGARD) for more reliable operation

*Kazuyuki Ohashi[1], Satoshi Abe[1], Yasuaki Kakiage[1], Satoshi Kawamoto[1], Hiroshi Munekane[1] (1.GSI of Japan)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SCG59-10] Development of “real-time” uncertainty evaluation algorithm for the estimated coseismic fault model using MCMC approach

*Keitaro Ohno[1], Yusaku Ohta[1] (1.Recerch Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SCG59-11] Drifting float measurement of pressure change by tsunami

*Masayuki Obayashi[1], Shingo Watada[2], Hiroko Sugioka[3] (1.Japan Agency for Marine-Earth Science and Technology, 2.Earthquake Research Institute, University of Tokyo, 3.Department of Planetology, Kobe University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[SCG59-12] Development of the Real-time Forecasting for Meteorite Impact Tsunami

*Naotaka YAMAMOTO CHIKASADA[1], Toshitaka Baba[2], Tetsuharu Fuse[3] (1.NIED, 2.Tokushima University, 3.NICT)

[J] Oral | B (Biogeosciences) : B-PT Paleontology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 201A 2F

[B-PT05] Biotic History

convener:Isao Motoyama(Department of Earth and Environmental Sciences, Yamagata University), Takao Ubukata(Division of Geology & Mineralogy, Department of Earth & Planetary Sciences, Kyoto University), Kazuyoshi Moriya(Department of Earth Sciences, Faculty of Education and Integrated Arts and Sciences, Waseda University), Chairperson:Isao Motoyama, Takao Ubukata, Kazuyoshi Moriya

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[BPT05-01] Cause of accelerated evolution of Earth's life; four-layered underground robust bio-communities played a critical role for the accelerated genome evolution as a response of mass extinction

*Shigenori Maruyama[1], Akio Kanai[2], Issay Narumi[3] (1.Earth-Life Science Institute, Tokyo Institute of Technology, 2.keio University, 3.Toyo University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[BPT05-02] Amino acid composition in molluscan shells and its relation to taxa and shell microstructure ~ Toward reconstruction of ancient trophic level using compound specific isotope analysis of amino acids ~

*Naoki Yugami[1], Akiko Goto[2], Robert Jenkins[2] (1.Graduate School of Natural Science & Technology. Kanazawa Univercity, 2.Institute of Science & Engineering . Kanazawa Univercity)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[BPT05-03] Relation of shell form to rocking motion in planispiral cephalopods

*Takao Ubukata[1] (1.Division of Geology & Mineralogy, Department of Earth & Planetary Sciences, Kyoto University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[BPT05-04] Paleoenvironment aross the Meddle Eocene Climatic Optimum

Hiroki Masui[1], *Kazuyoshi Moriya[1] (1.Department of Earth Sciences, Faculty of Education and Integrated Arts and Sciences, Waseda University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[BPT05-05] Reconstruction of the North Pacific subtropical gyre from the Middle to Late Miocene as inferred from radiolarian assemblages

*Shin-ichi Kamikuri[1], Isao Motoyama[2], Taiki Sawada[3] (1.Faculty of Education, Ibaraki University, 2.Faculty of Science, Yamagata University, 3.Japan Petroleum Exploration Co.,Ltd.)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[BPT05-06] Fossilization processes of Pliocene tree fossils from the Yasu River, Shiga Prefecture, Japan: Organic geochemical approach

*Jinya Nakamura[1], Ken Sawada[2], Masashi A Ikeda[1], Hideto Nakamura[3], Minoru Tsukagoshi[4] (1.Graduate School of Science, Hokkaido University, 2.Department of Earth and Planetary Sciences, Faculty of Science, Hokkaido University, 3.Faculty of Science, Osaka City Univerisity, 4.Osaka Museum of Natural History)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 102 1F

[M-IS09] dust

convener:Ishizuka Masahide(Kagawa University), Yasunori Kurosaki(Arid Land Research Center, Tottori University), Thomas Sekiyama(Meteorological Research Institute), Kana Nagashima(Japan Agency for Marine-Earth Science and Technology, Research and Development Center for Global Change), Chairperson:Tsuyoshi Sekiyama

1:55 PM - 2:15 PM JST | 4:55 AM - 5:15 AM UTC

[MIS09-01] Global modeling study of atmospheric supply of lithogenic and pyrogenic Fe-containing aerosols to the ocean

★Invited Papers

*Akinori Ito[1], Akitomo Yamamoto[1], Michio Watanabe[1], Maki Noguchi Aita[1], Ying Ye[2] (1.Japan Agency for Marine-Earth Science and Technology, 2.Alfred Wegener Institute for Polar and Marine Research)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[MIS09-02] Regional variations in the elemental and mineral compositions of solid particles in rainwater in Iran

*Yoriko Yokoo[1], Chihiro Sakamoto[1], Atsushi Kitamura[1], Ryo Anma[2], Shiva Mehrabani[3] (1.Faculty of Science and Engineering, Doshisha University, 2.Tokushima University, 3.Kurdistan University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[MIS09-03] Comparison of airborne microbial variations in air samples from Asian-dust source and arrival regions

*Teruya Maki[1], Tatsuyuki Fujita[1], Yuuma Mastuba[1], Yasunori Kurosaki[2], Masahide Ishizuka[3], Kei Kawai[4], Yasunobu Iwasaka[5] (1.College of Science and Engineering, Kanazawa University, 2.Arid Land Research Center, Tottori University, Tottori University, 3.Faculty of Engineering, Kagawa University, 4.Graduate School of Environmental Studies, Nagoya Universit, 5.Center for Environmental Creative Studies)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[MIS09-04] Prediction of health effects of cross-border atmospheric pollutants using the Model of Aerosol Species in the Global Atmosphere (MASINGAR)

*Kazunari Onishi[1], Thomas Sekiyama[2], Yasunori Kurosaki[3], Masato Shinoda[4] (1.Graduate School of Public Health, Support Unit for Conducting Clinically Essential Studies, St.Luke's International University, 2.Meteorological Research Institute, 3.Arid Land Research Center, Tottori University, 4.Graduate School of Environmental Studies Nagoya University)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[MIS09-05] Dust layer captured by an inversion layer over the Gobi Desert on 29–30 April 2015

*Kei Kawai[1], Yuta Nishio[2], Kenji Kai[1,3], Jun Noda[4], Erdenebadrakh Munkhjargal[1,5], Masato Shinoda[1], Nobuo Sugimoto[6], Atsushi Shimizu[6], Enkhbaatar Davaanyam[5,7], Dashdondog Batdorj[8] (1.Nagoya University, 2.Japan Meteorological Agency, 3.Ibaraki University, 4.Rakuno Gakuen University, 5.Information and Research Institute of Meteorology, Hydrology and Environment, Mongolia, 6.National Institute for Environmental Studies, 7.University of Tsukuba, 8.National Agency for Meteorology and Environmental Monitoring, Mongolia)

[J] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 102 1F

[M-IS09] dust

convener:Ishizuka Masahide(Kagawa University), Yasunori Kurosaki(Arid Land Research Center, Tottori University), Thomas Sekiyama(Meteorological Research Institute), Kana Nagashima(Japan Agency for Marine-Earth Science and Technology, Research and Development Center for Global Change), Chairperson:Kana Nagashima

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[MIS09-06] Favorable regions for dust haze transport revealed by ensemble simulations

*Kazunori Ogohara[1], Shogo Isoda[1] (1.School of Engineering, University of Shiga Prefecture)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[MIS09-07] Measurement of adhesion force of individual aerosol particles by atomic force microscopy

*Kohei Ono[1], Yuki Mizushima[4], Ayumi Iwata[3], Furuya Masaki[1], Nozomu Tsuchiya[1], Atsushi Matsuki[2] (1.Graduate School of Natural Science and Technology, Kanazawa University, 2.Institute of Nature and Environmental Technology, Kanazawa University, 3.Faculty of Science and Technology, Keio University, 4.College of Science and Technology, Kanazawa University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[MIS09-08] Occurrence of micro-meso scale dust storms and its relationship to the vegetation and topography in Mongolian grassland and Gobi Desert

*Kenji Kai[1], Kei Kawai[2], Teruya Maki[3], Jun Noda[4] (1.College of Education, Ibaraki University , 2.Nagoya University, 3.Kanazawa University, 4.Rakuno-Gakuen University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[MIS09-09] A trial of elucidation for dust emission conditions in East Asia by synoptic data analyses and a field observation

*Yasunori Kurosaki[1], Jing Wu[1], Batjargal Buyantogtokh[1], Ishizuka Masahide[2], Batdelger Gantsetseg[3] (1.Tottori University, 2.Kagawa University, 3.IRIMHE, Mongolia)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[MIS09-10] Monitoring and assessing aeolian desertification processes based on a dust erodibility index – A case study in the Xilingol grassland, China

*Jing Wu[1], Yasunori Kurosaki[1], Chunling Du[2], Tao Wang[3] (1. Arid Land Research Center, Tottori University, 2.School of Economics and Management, Inner Mongolia Agricultural University, 3.Northwest Institute of Eco-Environment and Resources, Chinese Academy of Sciences)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[MIS09-11] Influences of land surface conditions and human activities on dust events in Inner Mongolian grasslands, China

*Mei Yong[1], Masato Shinoda[2], Nandintsetseg Banzragch[2] (1.Inner Mongolia normal university, 2.Nagoya university)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | Convention Hall B 2F

[M-IS12] tsunami deposit

convener:Takashi Chiba(Faculty of Bioresource Sciences, Akita Prefectural University), Tetsuya Shinozaki(Center for Research in Isotopes and Environmental Dynamics (CRiED), University of Tsukuba), Daisuke Ishimura(Department of Geography, Tokyo Metropolitan University), Chairperson:Daisuke Ishimura(Department of Geography, Tokyo Metropolitan University)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[MIS12-01] Geological Record of Tsunamis and Storms Influenced by Relative Sea-Level Change, Southern Hidaka Coast, Hokkaido, Japan.

*RYO NAKANISHI[1], Satoshi Okamura[1,2], Tsumoru Sagayama[3], Yusuke Yokoyama[4], Yosuke Miyairi[4] (1.Hokkaido Edu. Univ., 2.Hokkaido Soil Res. Co-op., 3.HRCG, 4.Univ. Tokyo)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[MIS12-02] Before and after relationship between the seismic uplift and the large tsunami due to the seventeenth-century giant earthquake observed in the seismic barrier systems around the Kuril subduction zone

*Futoshi Nanayama[1,5], Kazuaki Watanabe[1], Keita Fukatsu[2], Takeshi Hasegawa[4], Kiyoyuki Shigeno[3], Masayuki Ishii[6], Kazuhito Ishiwata[7], Shigeto Inokuma[8] (1.Geological Survey of Japan, AIST, 2.Notsuke Peninsula Nature Center, 3.Meiji consultant Co., Ltd., 4.Ibaraki University, 5.CWMD, Kumamoto Univ., 6.Ishii Professional Engineer Office, 7.Betsukai municipal museum, 8.Nemuro City museum history and nature)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[MIS12-03] Coastal landform changes and Washover deposits due to high waves generated by anatmospheric low-pressure system in June 2016 at Horokayanto, Hokkaido, Japan

*Takashi Chiba[1], Yuichi Nishimura[2] (1.Faculty of Bioresource Sciences, Akita Prefectural University, 2.Graduate School of Science, Hokkaido University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[MIS12-04] Survey of tsunami deposits in Kunashiri Island: Results obtained in the 2015-2018 projects

*Yuichi Nishimura[1], Yasuhiro Takashimizu[2], Daisuke Sugawara[3], Takafumi Enya[4], Takashi Chiba[5], Ryo Nakanishi[6], Alexander Shishkin[7], Alexey Gorbunov[8], Victor Kaistrenko[8], Asuka Takahashi[9], Hiroki Muramatsu[10], Yasuyuki Kawazoe[11], Naofumi Takamatsu[11] (1.Graduate School of Science, Hokkaido University, 2.Institute of Humanities, Social Sciences and Education, Niigata University, 3.Museum of Natural and Environmental History, Shizuoka, 4.Hokkaido Museum, 5.Faculty of Bioresource Sciences, Akita Prefectural University, 6.Hokkaido Education University, 7.Shikotan Geophysical Observatory, 8.Institute of Marine Geology and Geophysics, Russian Academy of Sciences, 9.Japan Meteorological Agency, 10.Geospatial Information Authority of Japan, 11.Ministry of Education, Culture, Sports, Science and Technology)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[MIS12-05] Deposit-based assessment of tsunami size: example from Nankai-Trough earthquakes

*Daisuke Sugawara[1], Kentaro Imai[2], Shinsuke Okada[3], Takuto Maeda[4] (1.Museum of Natural and Environmental History, Shizuoka, 2.JAMSTEC, 3.Tohoku University, 4.Hirosaki University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[MIS12-06] Flume experiments for understanding variety of tsunami deposit

★Invited Papers

*Naofumi Yamaguchi[1] (1.Center for Water Environment Studies, Ibaraki University)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | Convention Hall B 2F

[M-IS12] tsunami deposit

convener:Takashi Chiba(Faculty of Bioresource Sciences, Akita Prefectural University), Tetsuya Shinozaki(Center for Research in Isotopes and Environmental Dynamics (CRiED), University of Tsukuba), Daisuke Ishimura(Department of Geography, Tokyo Metropolitan University), Chairperson:Tetsuya Shinozaki(Center for Research in Isotopes and Environmental Dynamics, University of Tsukuba)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[MIS12-07] **Inverse modeling of Tsunami deposit using Deep Learning Neural Network**

*Rimali Mitra[1], Hajime Naruse[1] (1.Kyoto University, Graduate School of Science)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[MIS12-08] Numerical estimation of tsunami size using boulders deposited by the 2011 Tohoku-oki tsunami at Settai, Miyako city, Japan

*Tatsuya Takei[1,4], Kazuhisa Goto[2], Masaki Yamada[3] (1.Department of Earth Sciences, Graduate School of Science, Tohoku University, 2.International Research Institute of Disaster Science (IRIDeS), Tohoku University, 3.Earthquake Research Institute, University of Tokyo, 4.Department of Complexity Science and Engineering, Graduate School of Frontier Sciences, Tokyo University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[MIS12-09] Constraint of the ages of historical tsunami deposits on the Ishinomaki Plain

*Hiroshi Tetsuka[1], Kazuhisa Goto[2], Takashi Ishizawa[1], Daisuke Sugawara[3], Yusuke Yokoyama[4], Yosuke Miyairi[4] (1.Department of Earth Science, Tohoku University, 2.International Research Institute of Disaster Science, Tohoku University, 3.Museum of Natural and Environmental History, Shizuoka, 4.Atmosphere and Ocean Research Institute, University of Tokyo)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[MIS12-10] Non-destructive analyzes of sediments to discern tsunami-related mud cap and overlying muds to improve age determination of tsunami deposits

*Takashi Ishizawa[1], Kazuhisa Goto[2], Yusuke Yokoyama[3], Yosuke Miyairi[3] (1.Department of Earth Science, Tohoku University, 2.International Research Institute of Disaster Science, Tohoku University, 3.Atmosphere and Ocean Research Institute, The University of Tokyo)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[MIS12-11] Sedimentological and paleontological studies of storm surge deposits in intertidal mud floor -case study of Ena Bay on Miura Peninsula, Central Japan.

*Akihisa Kitamura[1], yamamoto yuka[1], Takashi Toyofuku[2] (1.Institute of Geosciences, Faculty of Science, Shizuoka University, 2.Japan Agency for Marine-Earth Science and Technology (JAMSTEC))

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[MIS12-12] Shallow marine tsunami deposits and bioturbation

★Invited Papers

*Koji Seike[1] (1.Geological Survey of Japan, AIST)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[M-IS16] Dynamics of eruption cloud and cumulonimbus; modelling and observation

convener:Eiichi Sato(Meteorological Research Institute), Fukashi Maeno(Earthquake Research Institute, University of Tokyo), Takeshi Maesaka(National Research Institute for Earth Science and Disaster Resilience), Chairperson:Eiichi Sato(Meteorological Research Institute)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[MIS16-01] **Observations of Volcanic Eruption Columns with Different Types of Weather Radars**

★Invited Papers

*Masayuki Maki[1], Takehiko KOBORI[1], Yura Kim[1], Yasushi Fujiyoshi[2], Eiichi Sato[3], Hidehiko Tokushima[4], Masato Iguchi[5] (1.Kagoshima University, 2.Hokkaido University, 3.Meteorological Research Institute, 4.Field Researchers Corporation, 5.Kyoto University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[MIS16-02] Observation of Eruption Plumes by X-Band MP radar and Lidar at Sakurajima and Kuchinoerabujima

*Haruhisa Nakamichi[1], Atsushi Shimizu[2], Makoto Shimomura[1], Magfira Syarifuddin[1], Masato Iguchi[1] (1.Sakurajima Volcano Research Center, Disaster Prevention Research Institute, Kyoto University, 2.National Institute for Environmental Studies)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[MIS16-03] 2018-2019 Kuchinoerabu-jima eruption plume/cloud echoes observed by JMA weather radar network

*Eiichi Sato[1], Keiichi Fukui[2], Toshiki Shimbori[1] (1.Meteorological Research Institute, 2.Japan Meteorological Agency)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[MIS16-04] Numerical Study on the Ejection Conditions of Ash Clouds during Recent Eruptions of Kuchinoerabujima Volcano

*Yasuhiro Ishimine[1], Teruki Oikawa[2], Nobuo Geshi[2] (1.Research and Education Center for Natural Hazards, Kagoshima University, 2.Geological Survey of Japan, AIST)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[MIS16-05] Image analysis of volcanic clouds during the 2011 Kirishima Shinmoedake eruption

*Takehiko KOBORI[1], Kisei KINOSHITA[1], Naoko IINO[2], Masayuki MAKI[1], Seiji FUKUSHIMA[1] (1.Kagoshima University, 2.Kumamoto University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[MIS16-06] Cloud Radar Network for Early Detection of Cumulonimbus Generation

*Takeshi Maesaka[1], Tadayasu Ohigashi[1], Koyuru Iwanami[1], Shin-Ichi Suzuki[1], Yukari Shusse[1], Namiko Sakurai[1] (1.National Research Institute for Earth Science and Disaster Resilience)

[J] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 304 3F

[M-IS19] Paleoclimatology and paleoceanography

convener:Yusuke Okazaki(Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University), Akira Oka(Atmosphere and Ocean Research Institute, The University of Tokyo), Michinobu Kuwae(Center for Marine Environmental Studies), Hitoshi Hasegawa(Faculty of Science and Technology, Kochi University), Chairperson:Hitoshi Hasegawa

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[MIS19-17] Paleotemperature and precipitation history (18.1–4.5 ka) in stalagmite bulk and clumped isotopes from Hiroshima, Japan

*Hirokazu Kato[1], Shota Amekawa[1], Akihiro Kano[1] (1.Department of Earth and Planetary Science, The University of Tokyo)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[MIS19-18] Terrestrial paleoclimate since 80 ka recorded in stable and clumped isotopes of two stalagmites obtained from the Pacific side of the Japanese islands

*Shota Amekawa[1], Hirokazu Kato[1], Akihiro Kano[1], Kenji Kashiwagi[2], Taiki Mori[3], Ryoko Senda[3], Chuan–Chou Shen[4] (1.Graduate School of Science, The University of Tokyo, 2.Graduate School of Science and Engineering for Research, University of Toyama, 3.Graduate School of Integrated Sciences for Global Society, Kyushu University, 4.Department of Geosciences, National Taiwan University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[MIS19-19] Seasonal changes in Li/Ca ratio and inferred phytoplankton abundance as analyzed by daily growth increments of *Pecten albicans* (Bivalvia)

*Kondo Yasuo[1], Hondo Shutaro, Hasegawa Hitoshi[1], Nshio Yoshiro[1], Hirota Takayoshi (1.National University Corporation Kochi University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[MIS19-20] Geological reconstruction of Antarctic Ice Sheet deglaciation on Soya Coast, East Antarctica since the Last Glacial Maximum

*Moto Kawamata[1], Yusuke Suganuma[2,1], Koichiro Doi[2,1], Takanobu Sawagaki[3], Akihisa Hattori[1] (1.Department of Polar Science, School of Multidisciplinary Science, SOKENDAI (The Graduate Unversity for Advanced Studies), 2.National Institute of Polar Research, 3.Hosei University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[MIS19-21] Os isotope record of the Quaternary seawater derived from pelagic sediment in the Lau Basin, western South Pacific Ocean, and its implications for global climate changes

*Yusuke Kuwahara[1], Kazutaka Yasukawa[1,2], Koichiro Fujinaga[2,3], Tatsuo Nozaki[4,3,5,2], Junichiro Ohta[2,6,3], Honami Sato[2,4], Jun-Ichi Kimura[6], Kentaro Nakamura[1], Yasuhiro Kato[3,1,2] (1.Department of Systems Innovation, School of Engineering, The University of Tokyo, 2.Ocean Resources Research Center for Next Generation, Chiba Institute of Technology, 3.Frontier Research Center for Energy and Resources, School of Engineering, The University of Tokyo, 4.Research and Development Center for Submarine Resources, Japan Agency for Marine-Earth Science and Technology , 5.Department of Planetology, Graduate School of Science, Kobe University, 6.Department of Solid Earth Geochemistry, Japan Agency for Marine-Earth Science and Technology)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[MIS19-22] Rapid glaciation and sea level changes during the Last Glacial Maximum and the deglaciation

*Yusuke Yokoyama[1], Tezer M Esat[9], William G Thompson[10], Alexandar L Thomas[11], Jody W Webster[2], Yosuke Miyairi[1], Chikako Sawada[1], Takahiro AZE[1], Hiroyuki Matsuzaki[1], Jun'ichi Okuno[3], Stewart Fallon[9], Juan-Carlos Braga[12], Marc Humblet[4], Yasufumi Iryu[5], Donald C Potts[13], Kazuhiko Fujita[6], Atsushi Suzuki[7], Hironobu Kan[8] (1.Atmosphere and Ocean Research Institute, University of Tokyo, 2.University of Sydney, Australia, 3.National Institute of Polar Research, 4.Nagoya University, 5.Tohoku University, 6.University of the Ryukyus, 7.The Geological Survey of Japan, AIST, 8.Kyushu University, 9.Research School of Earth Sciences, The Australian National University, Australia, 10.Woods Hole Oceanographic Institute, USA, 11.University of Edinburgh, UK, 12.Universidad de Granada, Spain, 13.University of California Santa Cruise, USA)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 304 3F

[M-IS19] Paleoclimatology and paleoceanography

convener:Yusuke Okazaki(Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University), Akira Oka(Atmosphere and Ocean Research Institute, The University of Tokyo), Michinobu Kuwae(Center for Marine Environmental Studies), Hitoshi Hasegawa(Faculty of Science and Technology, Kochi University), Chairperson:Yusuke Okazaki

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[MIS19-23] Long-chain alkenediones found from marine sediments and their unsaturation ratios: key compounds to study the evolution of alkenone biosynthetic pathway?

*Satoshi Furota[1], Hideto Nakamura[2], Ken Sawada[3] (1.Department of Biogeochemistry, Japan Agency for Marine-Earth Science and Technology (JAMSTEC), 2.Faculty of Science, Osaka City University, 3.Department of Earth and Planetary Sciences, Faculty of Science, Hokkaido University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[MIS19-24] **Geomorphic and pedogenic forcing on the distribution of organic matter from vegetation to soil- a concern for paleoenvironment studies**

*Biswajit Roy[1], Kanva Goyal[1], Prasanta Sanyal[1] (1.Indian Institute of Science Education Research Kolkata)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[MIS19-25] Sea surface salinity of the Kuroshio Current along the Nansei Islands in the mid-Holocene inferred from fossil corals

*Kohki Sowa[1], Chuki Hongo[2], Kentaro Tanaka[3], Takuma Fujii[4], Saburo Sakai[1], Kosei E. Yamaguchi[6,5] (1.Japan Agency for Marine-Earth Science and Technology, 2.Ryukyu University, 3.The University of Tokyo , 4.Kagoshima University, 5.Toho University, 6.NASA Astrobiology Institute)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[MIS19-26] An ocean-dynamic model for the periodic inflow of Tsushima Current in the early Holocene

*Atsuhiko Isobe[1] (1.Research Institute for Applied Mechanics, Kyushu University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[MIS19-27] Centennial to millennial scale variability of the Aleutian Low and Westerly Jet during the Holocene

*Kana Nagashima[1], Naomi Harada[1] (1.Japan Agency for Marine-Earth Science and Technology, Research and Development Center for Global Change)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[MIS19-28] **Monsoon-related errors in paleotemperature estimation based on leaf margin analysis in central Japan**

*Yuqing Wang[1], Arata Momohara[1], Yongjiang Huang[2] (1.Graduate School of Horticulture, Chiba University, 2.Key Laboratory for Plant Diversity and Biogeography of East Asia, Kunming Institute of Botany, CAS)

[O-01] Exploring Buratamori - How to make science accessible

convener:Kazutaka Mannen(Hot Springs Research Institute of Kanagawa Prefecture), Takayuki Ogata(Disaster Prevention Research Center for Island Regions, University of the Ryukyus), Chairperson:Takayuki Ogata

Buratamori is a Saturday prime-time TV show of NHK (Japanese public broadcasting). Each episode features geoscience of a region including geography, geology, history and ecology, and local experts host a comedian named Tamori, who has a wide knowledge and a female announcer, who represents ordinary citizen. Such a style of the show has been popular among people in this decade and geoscience experts also highly regard the show. In this session, directors and previous hosts of the show describe its making process from each point of the view. Since the show needs to reach widely, bold simplification of complex scientific context is sometimes unavoidable, and this makes tension between the producers and experts. Through the session, we would like to discuss how the experts can make a simple but adequate explanation for geoscience issues to wide audience.

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[O01-01] Lessons from Buratamori – An introduction to the session

★Invited Papers

*Kazutaka Mannen[1] (1.Hot Springs Research Institute of Kanagawa Prefecture)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[O01-02] **The history of Buratamori**

★Invited Papers

Lessons from Buratamori –An introduction to the session

*Kazutaka Mannen[1]

1. Hot Springs Research Institute of Kanagawa Prefecture

Buratamori, airing from 7:30 pm on every Saturday, is a TV program broadcasted by NHK (Japanese public broadcast). In the program, local experts on geology, geography and history host a well-known TV talent Tamori and a female announcer and stroll a location to reveal its history and development with them. This program originally started in 2008 as a late-night program featuring areas in Tokyo and its surrounding and won the Geographical Society of Japan Award in 2011. Since 2015, the TV program has been aired in the prime time as the present and began to feature locations all over Japan. After this time, the TV program has won awards from National Geographical Information Authority of Japan, Geological Society of Japan and Japanese Geotechnical Society. As implied from presenters of the awards, the Buratamori is highly recognized by earth scientists in Japan. In this session, we would like to reveal how the program, which satisfies even professional earth scientists, was made from diversified stand points including the TV producer, experts who host the show and the audience. The followings are my schedule and personal impression when I hosted the show.

I have hosted three episodes entitled “Hakone” (aired on April 22, 2017), “Hakone Sekisho (checkpoint)” (May 13, 2017), and “Hot springs in Hakone” (October 6, 2018), as a local geological expert. The preparation process for the episodes aired in 2017 began in the late December 2016 with a phone call from NHK to my office. The crew spent all January in 2017 to gather diverse information of the featuring area. The outlines of the episodes were fixed in the mid-February and I was requested to be the host by the directors. In the early March, the directors presented scripts for the episodes and a rehearsal without Tamori and the announcer was held. The shooting was held in the mid-March. After the filming, I was requested to review the the scripts of narration and animation movies that would be used in the episodes to help audience to understand until 2 weeks before the airing.

The preparation process of the program, which includes intensive information gathering by the crew members and detailed discussion with the experts, were interesting and very impressive for me. The effort made by crew to keep the cast members relax during filming was also impressive.

Recently, chances for scintist to explain his/her research to the taxpayers are increasing. Such a scientist can learn from the TV crews who have several specific capabilities including 1) extensive information gathering, 2) insight that extracts reality of the featuring area, 3) story making to convey the gathered information to the public and 4) efforts to keep the filming location relax and delightful.

On the other hand, the TV program simplifies scientific context boldly and this bothers experts in the show deeply. In my talk, my experience of such simplification will be also presented and discussed briefly.

The history of Buratamori

*Mikio Hayashi[1]

1. Japan Broadcasting Corporation

Development of the program

TV program “Buratamori” (City walking with Tamori’s view) started as a pilot late-night program in December 2008. At that time, NHK (Japan Broadcasting Corporation) had a unit named Program Development. Four members of the unit including the author created the program. The first episode of “Buratamori” was “Harajyuku and Omote-sando”. Even it was aired in the late night, the episode, which deeply read city sceneries looked by many people every day, received a lot of feedbacks from the audience.

Starting as a regular program

After the airing of the pilot version, the program started as a regular series including 15 episodes (October 2009 to Marth 2010) aired from 10:00 pm, each of which was 43 minutes long. Tamori hosted a regular program on NHK for the first time in the 20 years since he had hosted a show named “Watching”. After that, Buratamori had continued as a regular program of a season from October to March for 3 years. During this period, corners named “Delusion CG”, which created imaginal ancient view of a town using computer graphic, and “Buratamo photo studio”, which showed photos taken by Tamori, were popular. In the presentation, the author will show the materials used in the development of the program.

Making of the first Buratamori

The early program looks same as the present style from the audience’s view but there are differences. Most of the experts appeared in the program were researcher of civil engineering especially urban planning, development and renovation. The most significant difference of the making is the walking time by the directors. At that time, “riddle” given to Tamori in the present program does not exist. However, Tamori found “mysterious scenery” in the show and the background of the scenery was explained in the program. Since it was very difficult to find “mysterious scenery” and “topic” in the well-known Tokyo, the directors of the program walked a lot to search them until their shoes literary wearing out.

Present

The present regular broadcast from 19:30 pm every Saturday started from April 2015 has been watched by many people. Buratamori features joy of walking in the city; however, tend to focus on geology a lot recently. The present version continued 5 years. We would like to focus on not only geology but also history, geography, customs and culture depending on episodes to be an attractive TV program that

©2019. Japan Geoscience Union. All Right Reserved.

unlock the secret of city and history of the location.

My experience as a geoscientific guide for the NHK-TV program Buratamori

*Masato Koyama[1]

1. Shizuoka Univ.

Buratamori is a popular NHK-TV program featuring a famous talent, Mr. Tamori, who visits various localities and tries to solve subjects about origins of local natural and social sceneries, products, and sightseeing resources. Many geoscientists, biologists, archeologists, historians, and other natural and social scientists appear as guides and lead Mr. Tamori to a final answer for each round of the program. The involving scientists do not only play touring guides but also make much efforts as advisors for selection of localities and contents. They also propose experiments showing natural processes and check scenarios, narration, and explanatory CG animations etc. The author reports experience as one of the geoscientific guides for the Buratamori and considers about how to explain complicated scientific knowledge simply, comprehensibly, and enjoyably.

A Visualized History by Buratamori

*Noriko Matsuda[1]

1. Kyoto Prefectural University

A lecturer is an urban and architectural historian researching history of development and origin of cities from geological, architectural, social and cultural point of view. Backgrounds and circumstances which have had brought the current situation of lands, our dwelling spaces or any other spaces and places related to our life, have being explored through out the research. Essential relationship between lands and human and its fundamental meanings are considered from these studies.
Buratamori sets a question about a location near around the beginning of the show. The question seems to be an easy question to answer so that television viewers and actors can casually imagine a plot of the show whether if he/she is for or against the question.
However, giving an appropriate answer to this “easy” question is actually not an easy thing even for experts. This is not just because the question was created by a production team referenced various fields of academic studies, but also it was intended to allow anyone who have heard the question would associate the phrase with the location. That is to say, the question is well-balanced between academic complexity and popular understandability.
After giving the question, a route of city/land walk is defined by the question. Several experts will describe the place in turn and turn about during the walk. This relay-style description gives plurality or gives diversified observation. Finding an answer to the question in such way is similar to method of field survey. In a field survey, an object that are huge scale things such as cities, mountains or civil engineered structures or a vast scale of time are physically comprehended through our hands, feet or eyes that are literally small human scaled subject.
Therefore, the route or the plot of the show tends to be something that is visually understandable due to its media, a TV show. For example, historical documents, pictures and photos or remains at the site will fulfill a role. On the other hand, things that are not clear at a glance or articles that are historically important requiring complicated description are omitted. Such topics will be examined in the symposium.

[O-01] Exploring Buratamori - How to make science accessible

convener:Kazutaka Mannen(Hot Springs Research Institute of Kanagawa Prefecture), Takayuki Ogata(Disaster Prevention Research Center for Island Regions, University of the Ryukyus), Chairperson:Kazutaka Mannen(Hot Springs Research Institute of Kanagawa Prefecture)

Buratamori is a Saturday prime-time TV show of NHK (Japanese public broadcasting). Each episode features geoscience of a region including geography, geology, history and ecology, and local experts host a comedian named Tamori, who has a wide knowledge and a female announcer, who represents ordinary citizen. Such a style of the show has been popular among people in this decade and geoscience experts also highly regard the show. In this session, directors and previous hosts of the show describe its making process from each point of the view. Since the show needs to reach widely, bold simplification of complex scientific context is sometimes unavoidable, and this makes tension between the producers and experts. Through the session, we would like to discuss how the experts can make a simple but adequate explanation for geoscience issues to wide audience.

The role of experiment in NHK's entertainment / educational program "Buratamori"

*Shintaro Hayashi[1]

1. Akita University Graduate School of Education

What is "Buratamori"?

"Buratamori" is an entertainment / educational program that has been broadcast from NHK(Nippon Hoso Kyokai;Japan Broadcasting Corporation) TV since 2008, and its viewer rating sometimes exceeds 15%. In the program, both Tamori and NHK 's beautiful female announcer are thinking about various questions while walking around various places and discovering various things. Also, the program progresses according to the question of the guiding person. Something related to geology and geography often appears in the question, and it exerts a great effect on outreach of earth science. I appeared as the main guide person of "# 81 Towada Lake and Oirase: Why did Towada Lake become a mysterious lake?".

Guide person's responsibility

The Guide person of "Buratamori" is responsible for the scientific accuracy of the program.In order to guarantee the accuracy of the program, the guidance person takes a lot of time to investigate. In the case of a speaker, I referred to more than 100 books and papers related to Towada Lake and Oirase gorge. In addition to this, the guiding person also attends work of the location and rehearsals, to ensure the accuracy of the program.

Experiment in "Buratamori"

In the program of "Buratamori", experiments are often used as a means of explanation. In the program of "# 81 Towada Lake and Oirase: Why did Towada Lake become a mysterious lake?", I explained how to make Lake Caldera using cocoa and condensed milk.

Requirements for experiment to be adopted in "Buratamori"?

Actually, there are many experiments which were not adopted in the program. One example is "water cooled fractured lava experiment". I suggested it twice in other programs of "Buratamori", but both were rejected.Probably the reason for rejecting "water-cooled fractured lava experiment" is 1) it is not visual, 2) the materials such as glass and water are not very impressive.

"Buratamori" and outreach

Outreach activities in the field of earth science are important in three points: 1) acquisition of research funding; 2: training of successors; 3: recognition by the general public (Kamada, 2004). For that reason, it is necessary for scientists to transmit the results obtained by earth science in an easy-to-understand manner.

There are two outreaching effects of "Buratamori" . Firstly, "Buratamori" has a high viewer rating and outreach to many citizens is possible. Secondly, educational effect on scientists is great. Scientists learn how to make the program easier from the director.

Becoming a guide person of "Buratamori" is to use a lot of energy and time. However, as there is a large outreach effect, researchers should respond positively.

Keywords: "Buratamori", experiment, outreach

An attempt of field work for middle and high school students to comprehend an “area” in an integrated manner

*Takeshi Uemura[1], Shigeyuki Yokoi[2]

1. Osaka Prefectural Otemae Senior High School part-time course, 2. Kaijo Junior and Senior High School

In the school education, things in our daily life and society are subdivided into subjects to study. Specialized teachers teach in the classes of middle and high schools and students tend to attend a class passively. However, the real things are mixture of contents dealt in various subjects. To solve emerging problems in our society, we need an ability to cooperate perseveringly with people having various background.

Based on this perspective, the authors launched a course named “General Field Exercise” for students between third-year of middle school and second year of high school. Approximately 15 students voluntarily attended the course, which lasted for two years. In this course, we focused on an “area” as the study target. Participants who have various background explore the “area” to comprehend the “area” in an integrated manner. Teachers of various subjects including earth science, Japanese history, Japanese language and etc. in charge of the course tried to study with the students from their point of view. Before going out to the “area”, teachers and students had a discussion in the classroom to share targets to solve in the “area”. Based on the proposals and preferences of the students, we set “area” and made contents of the course. The first “area” set in the course was Shinagawa, where is adjacent of the school and the Shinagawa’s religious connection led us city of Fuchu where we had three excursions. During the summer break, we went Osaka to have a field excursion of three days and two nights.

In Osaka, we walked around the Uemachi Hills to watch its morphology and historical heritages and visited Shitenoji temple, which have a history longer than 1400 years. On the approach to the temple, the earth-science teacher explained the relationship with fault activity that uplifted the Uemachi Hills and a slope seen in west of the approach. After that, the teacher of Japanese history led students to watch historical building and a monument of Ansei Tokai Earthquake and tsunami (1854) in the temple. The monument was built by townspeople of the area to commemorate victims of the earthquake and tsunami. The students started to read epigraph on the monument and discuss on the content with teachers. A discussion on tsunami caused by the Ansei Earthquake was led by teachers of Japanese history and earth-science. After the visit to Shitenoji temple, someone proposed to walk and see other temples on the way down from the temple.

As shown in above, we eliminated barrier between subjects and the students realized that the things they were facing were mixture of history and morphology. The teachers gave general direction of the excursion; however, the teachers exchanged their roles with the students. The teachers and students both learned deeply and independently.

Desirable way of outreach activities in the Museum,learn by participating in the making process of "Buratamori".

*Inoue Motoko[1]

1. Saitama Museum of Natural History

To promote earth science,it's important to make the general public to feel familiar with earth science and see the fun of it .Promoting popular interest is one of the missions of Natural History Museum,but it is too difficult to satisfy all museum users who have various levels of geoscientific literacy.The stuff of TV show,"Buratamori”,gave me a clue to settle such problems.I learn 5 important viewpoint of outreach activities by participating in the making process of "Buratamori”.

1) We should understand the thinking process of the general public,who are not much interested in earth science.
2) We should summarize relevant information of various field (earth science,history,culture) in each local area,and associate it with the life of the general public.
3) We should focus more on familiar stories in the local area than theory to promote interest of the general public.
4) Simple and easy-to-understand explanation is more important than showing the accuracy of the study results.
5) It is important for us to show people that we enjoy learning earth science rather than showing our knowledge.

Methodology of Geoscientific Outreach of “Buratamori”

*Takayuki Ogata[1]

1. Disaster Prevention Research Center for Island Regions, University of the Ryukyus

Buratamori produced by NHK contributes especially to geoscientific outreach and lifelong education for leaning on various geographical and geological topics. Such geoscientific topics related seamlessly with other contents on history, biology, agricultural and engineering sciences. Seamless geoscientific stories (geostories) are also produced in geoparks as a method for geoconservation, geotourism and geoscience education. Geostories require well-selected and arranged contents targeting historical, vertical and/or horizontal phenomena based primarily on many geoscientific evidences. Much many Japanese geoscientists also watch Buratamori because various topics are interpreted by many specialists on geography and geology. Geoscientists interest scientific evidences and interpretations on each specialties, and multidisciplinary and interdisciplinary relationships to other disciplines. Comprehensive and seamless stories of Buratamori enhance educational effects as a methodology for outreach and science communications, which are supported by geoscientific knowledges of many scientists, directors, producers and Mr. Tamori.

The challenges of Asteroid Exploration Mission Hayabusa2 and its results up to now

*Makoto Yoshikawa[1]

1. Japan Aerospace Exploration Agency

As the follow-on mission of Hayabusa, the first asteroid sample return mission in the world, Hayabusa2 was launched in December 2014. While the main purpose of Hayabusa was demonstration of technology, the main purpose of Hayabusa2 is to do scientific researches. Particularly the important subject is to study water and organic matters that existed when the solar system was born. In addition to this, it is also an important purpose to establish more reliable technology for planet exploration based on the experience of Hayabusa, which had a lot of technological troubles.

After about three and half year space journey, Hayabusa2 arrived at Asteroid Ryugu in June 2018. At first, we observed Ryugu in detail by using remote sensing instruments on board, then we were successful to land small rovers and a lander on the surface of Ryugu. However, we postponed the touchdown to get the surface materials of Ryugu to February 2019 from October 2018 of the original plan. After the touchdown, we will carry out an experiment to make a small crater of the surface of Ryugu. Hayabusa2 will leave Ryugu at the end of 2019, and will return to the earth at the end of 2020.

The asteroid Ryugu, which has a shape of a spinning top and which is covered by a lot of boulders, is very interesting from the point of science. It is rather different from what we assume before the arrival.

In this presentation, we will talk about the challenges of Hayabusa2 based on Hayabusa and the scientific results up to now.

Earth's core revealed by ultrahigh-pressure experiments

*Kei Hirose[1,2]

1. Earth-Life Science Institute, Tokyo Institute of Technology, 2. Department of Earth and Planetary Science, The University of Tokyo

The interior of the Earth is under high pressure and high temperature. The condition at the center of the Earth is 364 gigapascals and about 5000 kelvins. Such extreme condition can be generated in a laser-heated diamond-anvil cell (DAC). Any materials existing inside our planet can be synthesized using this technique.

I will discuss the formation and evolution of the Earth’ s core on the basis of recent DAC experimental results. Our recent work has shown that the core composition has changed to a large extent since its formation by exsolving oxide and silicates. Such core-derived oxide and silicates may have caused “anomalies” presently observed in the deep mantle and core.

I will introduce the latest works on core formation and evolution as well as ultrahigh-pressure experimental techniques using a DAC.

[O-04] New earth and planetary science education created by hybrid community between society and JpGU

convener:Yasushi Fujiwara(Evening Classes; Integrated Course, Kanagawa Prefectual Mukainooka Technical High School), Hiroaki Akimoto(Faculty of Economics,Dokkyo University),
Chairperson:Yasushi Fujiwara(Evening Classes; Integrated Course, Kanagawa Prefectual Mukainooka Technical High School), Hiroaki AKIMOTO(Dokkyo University)

In 2017, the curriculum guidelines for elementary and junior high school were announced by the Ministry of Education, Culture, Sports, Science and Technology. In addition high school curriculum guidelines were announced in 2018.
 These guidelines show "What we learn for (goals and contents of subjects and courses)" and "How to learn (improvement of learning course)" in order to foster student qualities and abilities.
 They also highlight how to develop a curriculum which is open to society and share the common understanding of "fostering of student qualities and abilities".
 Furthermore, High School/University Articulation Reforms will be regarded as important to considering the contents of university education and the admissions so that the results at elementary and secondary education are carried over to university education, and academic ability is reliably fostered.
 Earth and planetary science education also needs to clarify "what we learn for" and respond to what society demands, proposing inquiry activities through observation and experiments in the learning process.
 This session aims to deepen understanding about expectations for new earth and planetary science education and issues to be solved by participants from various viewpoints, including teachers, researchers, students, and citizens.

Discussion

In the next Course of Study, let's send information on world standard "geography / geography" from Japan to the world

*YOJI TAKIKAWA[1]

1. NPO Association of Science Curriculum Initiative NPO Galileo Science Workshop

Previously, at the science education research meeting, a high school geology teacher introduced that "photographs before and after the earthquake" taken in his area, "predicting the dangerous place" is used for his lessons . I learned that we can predict where danger is.
Another geological teacher went to see the principal who invited me to come to my high school and said he refused "I do not want to work for a dangerous school in such a lowland". It might seem like a strange teacher at the present time, but I think that [the crisis management of Japan with many earthquakes] was quite different if these knowledge became common sense of citizens. It is also understood from this that learning of "Earth science education - natural geography, geology, mineralogy, geophysics, oceanography, meteorology etc" is indispensable for earthquake, disaster prevention, environmental understanding. However, teachers of earth science are currently endangered species in Japan. In this situation I hear that it may be forced to withdraw from the forefront of geoscience education.

On the other hand, the New Course of Study guarantees importance on "subjective, interactive and deep learning (active / learning)", not only knowledge but also "student’ s inquire” is claimed to be valued . This direction is also common to "PISA test of OECD, National curriculum of the UK, Standard NGSS of science education of the USA, etc." In short, it is considered important to acquire the "motivation, method, and the living knowledge on which it is based" necessary for the child to continue learning throughout his life. For this reason, the Ministry of Education, Culture, Sports, Science and Technology is also changing the way "college entrance examinations are implemented", especially for high schools and universities to change the direction of learning from "knowledge injection type education".

In the era when "birthrate aging and declining birthrate" and "IT" are rapidly changing the society, we are approaching a milestone that we have to reveal "content and method of education" to foster children appropriate for the next era in a fairly rapid manner. In "Geography / geography education", it is necessary to reconsider the significance of "what to teach" again. And it is time to re-send "geography / geography education" from Japan to the world. I hope everyone will work in a meaningful direction.

Keywords: New Course of Study, Active learning, Inquiry activities, Reform of entrance exam from high school to university, STEM education, The era of "low birthrate and aging" and "IT"

What a mantle scientist hopes geoscience education

*Natsue Abe[1]

1. R&D Center for Ocean Drilling Science Japan Agency for Marine-Earth Science and Technology

When asking what kind of images you have about the Earth's mantle, most people answer "molten magma". People are probably influenced by movies broadcasting on TV, novels such as "Journey to the center of the earth by Jules Verne" and "Japan Sinks by Sakyo Komatsu", or many movies (such as Center of the earth) are strongly influenced. In general, people seem to think as follows. Because there is a hot substance deep under the ground, the "mantle" under the crust is a melted magma, and thinking that the liquid that reached the surface with some meter will erupt as lava It seems to be. I heard a conversation in the Kanto region and was shocked. Since the aftershock of the Great East Japan Earthquake on March 11, 2011, the aftershocks occurred quite a lot, "the Japanese archipelago became loose and decided to sink into the melted" mantle = (magma, but this is wrong!) " There was a person who was threatened by the fear of sinking into the lava. We geoscientists know the Japanese archipelago will never sink into the mantle in that short time-scale and never disappear our life time. Just having this basic knowledge, we are not trapped such fear, and probably know better how to deal with natural disasters such as earthquakes than general people. I think we earth scientists need to act and prepare for natural disasters as a norm for the general public. In this presentation, I would like to talk about some examples cited from my lecture and outreach experience.

As a mantle petrologist who study mantle peridotite, I strongly expect "geoscience classes" in junior high and high school that students learn basic knowledge to be able to properly fear natural disasters and prepare for it. Not only the students who are currently taking "Basic Earth Sciences", but also students entering the Department of Science other than those who wish to enter the Department of Earth Sciences at least as living in Japan, I hope that you will learn the knowledge of Geoscience literacy as a compulsory subject in high school. Contents that are covered within the scope of the current high school "basic earth science" is sufficient, broadly "scientific literacy" is needed for thinking deeply and act properly when something happens.

New high-school compulsory subject “General Geography” and related cooperation of geographers and earth scientists for human resource development

*Takashi Oguchi[1]

1. Center for Spatial Information Science, The University of Tokyo

In Japanese senior high schools, a new subject “General Geography” will be compulsory from the 2022 fiscal year. Although this subject belongs to a section of social sciences under the official education system, it puts emphasis on some physical sides of geosciences such as natural hazards, global environmental problems, and applications of digital data using GIS. Therefore, the new subject will contribute to education and human resource development in not only geography but also broader geosciences. To facilitate this, geographers and geoscientists belonging to the Japan Geoscience Union as well as some committees and subcommittees of Science Council of Japan should cooperate, as is the case with a recently established SCJ subcommittee for high-school education in geosciences and geography.

Visualization of terrain by Red Relief Image Map(RRIM) and geoscience education

*Tatsuro Chiba[1]

1. Asia Air Survey Co., Ltd.

1.Introduction

Three-dimensional understanding of terrain in geoscience education is fundamental and important. For that, the reading of contour lines is a big problem. The contour line shows the planar position of the line of intersection between the topography and the plane as a representation method of the terrain. By altering the altitude at equal intervals, it is visualized as a striped pattern. In principle, horizontal and vertical planes can't be visualized. It is possible to objectively express the topography without individual skill. It is possible to transform mesh data, which is a wonderful invention. This skill is indispensable in order to read topography such as topography map of the GSI.

2. Numerical terrain data and terrain representation

Digitization of terrain had gradually become advanced since the 1980s. The national land numerical information started at 250 m, 50 m, 10 m, 5m. On the other hand, the technology for visualizing this method has remained around the time of low data density, there is no change, and the problem that detailed data can't be fully expressed can also be raised. It was difficult to read all the data in the shadow map, the gradient map, the advanced gradation diagram, and the like. Shaded figures had problems such as irregularities reversed depending on the light source direction, and there was a problem that it was impossible to distinguish between steps and grooves.

3. Principle and advancedness of RRIM

Chiba invented RRIM triggered by the topography survey of the Aokigahara ocean in Mt. Fuji in 2002. This was to visualize detailed data of a 1 m mesh by aerial laser measurement and complex topography of the lava surface where the irregularities are distributed complicatedly and to capture a large topography. The expression that it is redder as steep slope, brighter as a ridge and darker as a valley has the feature that it can be understood immediately even by ordinary people who do not receive special training and education. In addition, this figure could be overlapped with conventional contour diagrams, overlapped with advanced steps, and the understanding of the topography was greatly promoted. In many cases, it is used in media such as BURATAMORI, and recently it has become possible to select it as one of the backgrounds in geological map NAVI and GSI map.

4. JPGU and RRIM

In Asia Air Survey, as a place to transmit the goodness of the red 3D map, I regarded the exhibition of JPGU as a very good opportunity and have held a booth exhibition every year. For the first time here, some high school students also saw the red stereoscopic maps as an opportunity to be interested in topography and geology. It also leads to a series of work with JAMSTEC based on the idea that the exhibition here can be applied to the ocean bottom topography, and its submarine topographical map is bringing the further effect of geoscience education. Also, analog model experiments that flow shampoo lava on the topographical model of red 3D map repeated every year was very effective for understanding the hazard map. I would like to continue exploring what I can do for geoscience education through the activities of JPGU.

[O-04] New earth and planetary science education created by hybrid community between society and JpGU

convener:Yasushi Fujiwara(Evening Classes; Integrated Course, Kanagawa Prefectual Mukainooka Technical High School), Hiroaki Akimoto(Faculty of Economics,Dokkyo University), Chairperson:Yasushi Fujiwara(Evening Classes; Integrated Course, Kanagawa Prefectual Mukainooka Technical High School), Hiroaki AKIMOTO(Dokkyo University)

In 2017, the curriculum guidelines for elementary and junior high school were announced by the Ministry of Education, Culture, Sports, Science and Technology. In addition high school curriculum guidelines were announced in 2018.
 These guidelines show "What we learn for (goals and contents of subjects and courses)" and "How to learn (improvement of learning course)" in order to foster student qualities and abilities.
 They also highlight how to develop a curriculum which is open to society and share the common understanding of "fostering of student qualities and abilities".
 Furthermore, High School/University Articulation Reforms will be regarded as important to considering the contents of university education and the admissions so that the results at elementary and secondary education are carried over to university education, and academic ability is reliably fostered.
 Earth and planetary science education also needs to clarify "what we learn for" and respond to what society demands, proposing inquiry activities through observation and experiments in the learning process.
 This session aims to deepen understanding about expectations for new earth and planetary science education and issues to be solved by participants from various viewpoints, including teachers, researchers, students, and citizens.

Discussion

A lesson plan using Tsunami to cultivate the ability to think critically about a subject based on the data given in New government curriculum guidelines for "Basic Earth Science"

*Kodama Hidefumi[1]

1. Chiba Prefectural Matudokokusai High School

New government curriculum guidelines for "Basic Earth Science" show cultivating the ability to think scientifically based on the data, in addition to observation, experiments.

I will compare New "Basic Earth Science" for current one and present a lesson plan using Tsunami for cultivating the ability to think scientifically.

Keywords: New government curriculum guidelines, Tsunami

The planning of “Integrated Geography” and its aimed competency

*Yasutaka Kogawa[1]

1. Okayama Prefectural Tsuyama High School

The next curriculum guidelines were announced in March 2018, and “Integrated Geography” of required subject is provided as the new subject of geography for “sustainable society”. On International Charter on Geographic Education, five main concepts are “Location and Distribution”, “Place”, ”People-Environment Relationships”, ”Spatial Interaction”, ”Region”. These concepts are one of the guideline on constitution of geographical curriculum, and through International Geography Olympiad, International standard such as thought and skill which is cultivated in geographical education is indicated to high school students in all over the world.
To the implementation of “Integrated Geography”, what we are going to consider when we plan the class. As the point of view, based on the test of International Geography Olympiad and the present condition of the geographical perspective and thinking skill of student in Japan, this presentation introduce The planning of “Integrated Geography” and its aimed competency.

Earth and planetary science education considered by the current student

*Hideto Otsuka[1]

1. Geology Course, Department of Science, Faculty of Science, Shinshu University, National University Corporation

It is necessary that Earth science and geography education for elementary and high school arranges the opportunity to touch the real things. In elementary school, there are many classes to touch the real things, but in high school, we don't have enough time to explain with them. I think that education with using the real thing, understanding of the learning purpose of the student, and knowledge of teacher to answer student's questions.
At first, the earth and planetary science needs to use the knowledge not only sciense but also various information. The students are good at considering and discussion with the real things, but it is difficult to understand conceptually field. So, we should present the real things to the students.
Secondly, it is necessary to understand a learning purpose so that a student is interested. The students like to study outdoor, and understand that studying the earth science contribute to thier lives, such as disaster prevention.
Thirdly, it is important to have the ability that teachers assist for the students to practice deep learning. It is necessary that teachers answer their questions, and lead them to understand.
From these, I think that we should teach earth and planet science practically and more clearly. It is improvement of the individual ability of the teacher to be important above all. Even if it is difficult to become the expert of all fields of earth science, the geography, it is important to deepen the knowledge. It is good for an opportunity attracting the interest of the student to teach the state-of-the-art study and common sense. I hope that practically and developmental earth and planetary science education become popular in the future.

Invitation to Geography —Relationship Between Geography and Intellectual Curiosity in Daily Life–

*Takuya Miyao[1]

1. Master Program in Education, University of Tsukuba

I received geography education in school, learned geography at university, and now I’ m studying geography education in graduate school. In such a position, I’ d like to mention the abilities and various perspectives obtained from that looking back on myself that has been studying geography. Specific details are as follows.

Why Am I fascinated to Geography?

I’ ve been faced to the subject of geography, so what is the trigger that I was interested in geography? I’ d like to mention about the opportunity that I was involved in geography through reconsidering myself.

Relations Between Everyday Life and the Viewpoint That Can Get by Learning Geography, Application to Geography

Academic geography is close to our everyday life. It is because geography is a discipline that deal with an actual proof, and especially, the contents we learn from junior high school or high school have many things applying to information and experience we see in our daily life. So, what is the competency that acquired from learning geography? The typical one is “geographic viewpoint and way of thinking.” Then, if we acquire that competency, what are the benefits in daily life? I hope to mention based on my experience and the idea of graduate students who have been on the same situation.
On the other hand, the core point of view of the new geography course in Japanese high school, such as “GIS,” “international Understanding,” “disaster prevention,” there is no doubt that these contents are related to our living area when thinking on the micro scale. For students to learn geography actively, it may be necessary to incorporate contents that make use of students’ knowledge and experiences into the introduction of lessons. I suppose that this is the same in earth science.

About Learning Geography at University and Graduate School

In this part, I would like to mention about two things. One is about university education. It is often said that “geography is memorized subject,” but I strongly feel that was the lecture I took in a university. In teaching subjects, it is desirable to have opportunities for teachers and students to exchange opinions on the contents and methods of classes making full use of the characteristics of geography.
The other is about university and graduate school education. There are few opportunities for learning collaborated in geography, history and civics. It is necessary to exchange opinions among these subjects because these are not independent subjects, and there are many parts that work mutually.

Let's build a bridge between "Rika" and society with new geography and geology education in class

*Naoki Hosaka[1]

1. science writer

Science does not seem to work well when it comes to the consensus formation of modern society, such as global warming. It can be due to the lack of reality of science, although it closely related to the social agenda. New geography and geology education should be a bridge between science and society.

Keywords: science, society, global

[O-05] English improvement tips for Japanese scientists

convener:Chisato Yoshikawa(Japan Agency for Marine-Earth Science and Technology), Wonsuh Song(Waseda University), Rumi Ohgaito(Japan Agency for Marine-Earth Science and Technology), Chairperson:Chisato Yoshikawa(JAMSTEC), Wonsuh Song, RUMI OGAITO(JAMSTEC)

"Presentation in English" is inevitable skill not only for researchers but also for business people or students. In this session, we invite a native English-speaking researcher and a researcher of linguistic education. We learn misleading or unnatural expressions that Japanese tend to do in presentations in English. A mini-workshop is also planned in the session. In this workshop, the lecturers give advises for short presentations given by several Japanese. Why don't you join us to have practical learning to improve your presentation skill?

[O05-02] How to deliver good presentations in a foreign language

★Invited Papers

*S. Lan Smith[1] (1.Marine Ecosystem Dynamics Research Group, Research Centre for Global Change, Japan Agency for Marine-Earth Science and Technology)

11:25 AM - 12:15 PM JST | 2:25 AM - 3:15 AM UTC

Discussion

Giving a successful presentation in English: Mission Possible!

*Joel Laurier[1]

1. University of Tsukuba

As with all skills, delivering a successful presentation requires painstaking effort. For people presenting in their second (or third) language, the task is even more daunting because it requires detailed attention to each spoken word. This presentation aims to help presenters of all levels, from the beginner to the seasoned expert, deliver easy to understand and effective public speeches. We will first look at common mistakes made in delivering oral presentations, then look at proposed ways to prepare and deliver quality speeches. A special emphasis will be placed on effective techniques to use in English presentations given by non-native presenters. Attendees will learn how to use body language, effective visuals, and story telling to deliver quality presentations.

How to deliver good presentations in a foreign language

*S. Lan Smith[1]

1. Marine Ecosystem Dynamics Research Group, Research Centre for Global Change, Japan Agency for Marine-Earth Science and Technology

Presenting in a foreign language, for example at international scientific meetings such as JpGU, can be an intimidating challenge. This challenge includes not only communicating one’ s own ideas clearly, but also understanding and responding to critical questions, typically within only a few minutes. We researchers can all benefit from continually developing the skills to present in an engaging way that makes a good impression on the audience. To this end, I will share my thoughts based on my experiences as a native English speaker who has worked as a researcher in Japan for 20 years. I have presented results in Japanese at many seminars, conferences, hearings at funding agencies, and job interviews. Of course, no native Japanese would ever mistake me for a native speaker, as will be obvious to all attendees! But still, I have found ways to communicate effectively and have even become nearly as comfortable presenting in Japanese as in my native English. My techniques include: 1) use simple wording, clear statements, and slides that are not too complicated, 2) practice each presentation at least three times, cut out the unnecessary, and get comfortable with the flow, and 3) engage actively with questioners and ask them to clarify their questions if necessary. Accept the challenge, build up your presentation skills, and expand the possibilities for your own career!

[O-06] How to cope with intensifyng storm and flood disasters

convener:Jun Matsumoto(Deaprtment of Geography, Tokyo Metropolitan University), Yukihiro Takahashi(Department of Cosmosciences, Graduate School of Science, Hokkaido University), Akira Wada(Tokyo Institute of Technology), Chairperson:Jun Matsumoto(Tokyo Metropolitan University)

In the year 2018, we experienced severe rainfalls in July and severe typhoons in September in West Japan, which impressed us that severe storm and flood disasters have been intensifying. Will such severe disasters intensify in future? We will discuss how to cope with intensifying storm and flood disasters. All the oral presentations are invited talks by the specialists in the Japan Geoscience Union (JpGU), and the Japan Academic Network for Disaster Reduction (JANET-DR) which was established in 2016. We will also exhibit poster presentations of various research activities in JpGU and JANET-DR.

Extreme rainfall and heat wave over Japan in 2018 summer: A series of extreme events and underlying global warming

*Hisashi Nakamura[1]

1. Research Center for Advanced Science and Technology, University of Tokyo

In early July extreme rainfall occurred particularly over western Japan and the Tokai region, named “the Heavy Rain Event of July 2018”, which caused widespread havoc. It was followed by heat wave that persisted over most of Japan in setting the highest temperature on record in late July.
The rain event can be attributed to two extremely moist airflows from the Tropics confluent persistently into western Japan in addition to large-scale ascent along the stationary Baiu front. The heat wave is attributable to the enhanced surface North Pacific Subtropical High with a prominent barotropic anticyclonic anomaly just north of western Japan. The consecutive occurrence of these extreme events was related to persistent meandering of the upper-level subtropical jet, indicative of remote influence from the upstream. The heat wave can also be influenced by enhanced convective activity under the above-normal warmness over the tropical North Pacific. The global warming can influence not only the heat wave but also the rain event, as suggested from long-term increasing trends observed over Japan in intensity of extreme precipitation and water vapor amount. Another contribution was possible from anomalous warmth over the midlatitude Northern Hemisphere observed since March 2018.

Influence of meteorological disasters on marine ecosystem

*Yu Umezawa[1,2]

1. Tokyo University of Agriculture and Technology, 2. Study Group on Marine Environmental Problems, the Oceanographic Society of Japan

Since the establishment in 1973, the Study Group on Marine Environmental Problems, the Oceanographic Society of Japan, has been organizing a night sessions and symposiums on marine environmental problems, and summarizing recommendations based on scientific knowledge.

In recent years, with the global warming, an increase in meteorological disasters such as typhoon, localized torrential rain and flood damages has been greatly affecting marine ecosystems, especially in coastal waters. However, our group has not done any efforts to consider weather disasters as one risk of marine environmental problems. In this presentation, I will report on previous studies on the effects of weather disasters on marine ecosystem and hope that this will be utilized in future collaborative research.

Keywords: coastal areas, marginal seas, climate change

Understanding of geomorphic condition indicating the flooding disaster and hazard mapping

*Yohta KUMAKI[1]

1. Senshu University

It is important for the general public to know the place where the natural disaster risk is high. Some geomorphic features are strongly relating to flood or debris flow and useful for understanding the risk. For example, alluvial cone is a highly possible place of debris flow. Geomorphic features have been formed by repetitive phenomena that cause rapid landform changes, i.e. natural disasters. Therefore, it is useful for disaster estimation to know the geomorphic features. The geomorphic survey can be done everywhere at low cost using topographic maps, digital elevation models and air-photos.
The geomorphic condition has been basic information of hazard mapping. Hazard maps, however, show very much simplified information. It is desirable that people can judge the disaster risk by themselves. For it, some kinds of geomorphological maps are available in big plains in Japan.

Keywords: disaster risk, debris flow, landform change, geomorphological map

A role of free satellite remote sensing data as a case study of heavy rain disaster in July 2018

*Yuji Sakuno[1]

1. Graduate School of Engineering, Hiroshima University

A heavy rain disaster occurred mainly in western Japan In July 2018. Immediately after the disaster, various types of aerial photographs and satellite remote sensing (RS) images were taken. In this presentation, I will introduce ground surface analysis using optical and synthetic aperture radar (SAR) in land and inland water around Hiroshima prefecture and their data roles which can be obtained free of charge, especially. It is useful to show the state of landslides and river sediment accumulation clearly by making difference image before and after the disaster using satellite optical sensors data such as LANDSAT-8 and Sentinel-2 with 10 to 30 m resolutions. However since such optical sensors are influenced by the cloud, it is not suitable for rapid damage estimation. Therefore, the difference image analysis similar to the optical sensor using SAR data such as Sentinel-1 was conducted. By this work, in particular, the flooded area was quickly extracted. In the future, we will make these tasks manual, and if any satellite data is downloaded, anyone will make software that can do the same analysis quickly. By regularly conducting data processing courses using such manual and software on local administrative agencies and consultants in construction, we would like to aim at early utilization of RS data in the event of frequent disasters.

State of the Crisis Mapping for heavy rain in west of Japan, 2018.

*Taichi Furuhashi[1]

1. Aoyama Gakuin University

In early July 2018, heavy rain disasters happend in West part of Japan, floods and landslides occurred in many areas, including Mabi-cho in Kurashiki-shi, Okayama Prefecture. We worked with students on crisis mapping activities to implement maps of disaster affected areas as Volunteered Geographic Information (VGI). Specifically, navigation guide maps, evacuation centers / temporary toilets locations etc. were published on the map. In this session, we will report on current issues toward generalization of crisis mapping approach and future.

Keywords: GIS, VGI, map

A Study on Spatial and Temporal Resolution of Evacunation Infomation for Effective Evacuation Behavior

*Michinori Hatayama[1]

1. Disaster Prevention Research Institute, Kyoto University

1. Introduction

In recent years, heavy rains and typhoons that have never been experienced in the past have attacked Japan, such as Northern Kyushu District Heavy Rain in 2017 and Heavy rain in July, 2018, due to the effects of climate change, leaving large damages in various places. In natural phenomena never experienced in the past, actions that protect lives, in other words, appropriate evacuation are required. Evacuation information that triggers evacuation is important, but in some cases, because it will create residents who don’ t take initiative for their evacuation, various discussions have been made on when and how to use and how to utilize evacuation information. In the case of the Izu Oshima Sediment disaster that occurred due to heavy rain accompanying Typhoon Wipha in 2013, the evacuation recommendation was not issued, and in Hiroshima landslide disaster caused by the Heavy Rain in August, 2014, the delay of the evacuation information was pointed out. Following these issues, the "Guidelines on evacuation advisory" was revised in the year of 2017. However, there remains room for discussion as to whether these information are linked to evacuation behaviors. In this paper, we discuss these issues.

2. Evacuation Information and Expected Behavior

In the "Guidelines on evacuation advisory", it is recommended to prepare criteria according to local circumstances about evacuation preparation, evacuation recommendation, and evacuation order from the view points of receivers. Evacuation actions were defined as follows;

(1) evacuation to the "urgent evacuation places" which are designated by administration,

(2) evacuation to the "safe place nearby", and

(3) movement to more secure room inside the building.

3. Temporal Resolution of Evacuation Information

In floods caused by heavy rain and sediment-related disasters, evacuation information will be announced in conjunction with time prediction of rainfall. In recent years, the occurrence of disasters is often expected to be late at night, but even if disaster information is announced at midnight, in many cases it cannot lead to evacuation behavior. Considering this, evacuation is proceeding from the time zone where evacuation behavior can be taken, but evacuation information in the absence of sense of crisis often leads to evacuation behavior.

4. Spatial Resolution of Evacuation Information

Evacuation information is generally presented to certain areas rather than to individual units. This spatial resolution does not have unified standards, but it varies from local governments. When the area is large,

©2019. Japan Geoscience Union. All Right Reserved.

there are many places where high risk and low risk are mixed within the area, and many residents judge that it is not necessary to take evacuation action. However, it is difficult for the municipalities that do not allocate adequate personnel to respond to disasters, it is difficult to narrow down the areas further and it is difficult to judge whether evacuation should be made for each door.

5. Conclusion

Residents cannot be judged of evacuation behavior by evacuation information unless they know its time resolution and spatial resolution. In order to properly receive these information and to take appropriate action, it is necessary for residents to raise their awareness. In order to realize this, it is required not only to prepare administrative policies but also to arrange arrangements in the region and home.

[O-06] How to cope with intensifyng storm and flood disasters

convener:Jun Matsumoto(Deaprtment of Geography, Tokyo Metropolitan University), Yukihiro Takahashi(Department of Cosmosciences, Graduate School of Science, Hokkaido University), Akira Wada(Tokyo Institute of Technology), Chairperson:Akira Wada(Tokyo Institute of Technology), Yukihiro Takahashi(Hokkaido University)

In the year 2018, we experienced severe rainfalls in July and severe typhoons in September in West Japan, which impressed us that severe storm and flood disasters have been intensifying. Will such severe disasters intensify in future? We will discuss how to cope with intensifying storm and flood disasters. All the oral presentations are invited talks by the specialists in the Japan Geoscience Union (JpGU), and the Japan Academic Network for Disaster Reduction (JANET-DR) which was established in 2016. We will also exhibit poster presentations of various research activities in JpGU and JANET-DR.

Multi-layered Countermeasures against Widespread Devastating Flood Disasters

*Koike Toshio[1]

1. International Centre for Water Hazard and Risk Management

The largest water vapor convergence since 1958 was recorded across western Japan in early July 2018, breaking the records of 24-to-72-hour rainfall at many stations in the area and causing devastating disasters including floods due to bank breaches and overflows, debris flows, and urban inundations. We also witnessed new types of disasters induced by multiple causes including the backwater phenomenon at confluence zones and floods involving a huge scale of floodwater and sediment transport simultaneously. Furthermore, eight dams in western Japan exhausted their flood control capacities and had to start emergency water-discharge operations to avert reservoir overflows from the heavy rainfall. In addition, we later learned that dam discharge warnings were not used effectively to support residents in safe evacuation. As a consequence, 232 people either died or went missing, and prefectures in western Japan suffered significant economic damage. The number of more than 200 victims was the worst case since 1982. To prevent the recurrence of devastating disasters over a wide area, the Council for Social Infrastructure Development analyzed the characteristics and issues of the July 2018 disasters and submitted a report including the recommended countermeasures based on the key strategies to the Minister of Land, Infrastructure, Transport and Tourism on December 13, 2018. Towards building a community where everyone evacuates proactively, the report recommends that each community develop a cooperative framework to strengthen self-help and mutual support by enriching information of hazards, risks and evacuation and improving communication methods in cooperation with the mass media and the ICT private sector. The report also proposes more resilient infrastructure design, development and operation against complex disasters and hazards which exceed infrastructure capacities and suggests strategies for the implementation of quick disaster responses and recoveries and extra considerations of disaster risks in community development. We need to promote such multi-layered countermeasures as a package to cope with unprecedented disasters.

Keywords: flood, debris flows, backwater, emergency water-discharge operations to avert reservoir overflows

Technologies and wisdom in housings and buildings for protecting our lives from river floods

*Kazuo Tamura[1]

1. Seismic Design Laboratory

There exist many areas which have high risk of flood damages in Japan. River dykes or dams have been constructed to suppress flood damages. However, these countermeasures are not enough, in the condition that severe meteorological phenomena with heavy rainfalls become more frequent. We should make use of technologies and wisdom or ideas in the field of buildings to protect our lives or to maintain our living environment. The river management of the whole river basin, with planning the houses or buildings of the area, is necessary against these severe conditions.

In this presentation, the author explains current situation and applicable technologies of building structures, focusing on maintaining safety of our lives against river floods.
For example, raising the ground level of the building is one selection for the countermeasure against floods. Another idea is to construct high strong foundation walls under the wooden housing to avoid flooding. The piloti structure whose first floor is supported by columns with no walls is effective to decrease flood water pressure to the building. The base isolated building on the piloti structure can decrease both flood load and earthquake load.

[O-07] Kitchen Earth Science: Let's stimulate your brain by hands-on experiments!

convener:Ichiro Kumagai(School of Science and Engineering, Meisei University), Miwa Kuri(International Research Institute of Disaster Science, Tohoku University), Kei Kurita, Mie Ichihara(Earthquake Research Institute, University of Tokyo), Chairperson:Ichiro Kumagai(Meisei University), Miwa Kuri(東北大学災害科学国際研究所), Mie Ichihara(Earthquake Research Institute, The University of Tokyo), Kei Kurita

"Kitchen Earth Science" aims at understanding a natural phenomenon in Earth and planetary sciences by analogue experiments using goods and tools in our daily life. Analogue experiments have a function to unveil the fundamental physics governing the phenomenon. At the same time, they essentially include uncertainties so that unexpected results are frequently obtained, which have a potential for surprising discoveries. These findings also provide a good opportunity for deeply thinking, and raise new questions to explore. Such experience is precious not only for young researchers in Earth and planetary sciences, but also non-expert people who need a scientific thinking to live wisely. In this session, we focus on "advantages of doing hands-on science experiments" and discuss the significance of analogue experiments with uncertainties, which cause unpredictable results: even if the experiment fails, we learn a lot of things from the failure which may lead to a great success. We are accepting a variety of experimental researches and case studies on scientific education such as introductory educational experiments for Earth and planetary sciences in elementally and junior/high schools, general science education and interdisciplinary researches in post-high schools, and new approaches to citizen science and outreach. We welcome all the participants who are interested in Kitchen Earth Science to stimulate your brain by hands-on science experiments.

Analogue experiments for understanding a crystal morphology variation of igneous rocks using a no-calorie sweetener

*Kuniyuki Furukawa[1], Ririka Watanabe[1], Risa Ito[1], Saori Kotani[1]

1. Faculty of Business Administration, Aichi University

Crystallization of a magma is progressed during cooling. The number and morphology of crystals are chiefly controlled by degree of undercooling of a magma. Since igneous rocks are generally formed under various cooling profiles, crystal occurrences of natural igneous rocks are varied. As it is generally known, difference of crystal textures between plutonic and volcanic rocks are generated from difference of cooling rate. However, only that knowledge is not enough to understand results of field or microscopic observations. Therefore, students, who major in geology or petrology, should be understand general crystallization process. In this presentation, we propose the easy analog experiments to understand crystallization process of silicate melt.

Erythritol ($C_4H_{10}O_4$), which is no-calorie sweetener, is used for the experiments. The melting temperature is 121 ˚C, and erythritol can be easily melted using a hot plate. Since the melted erythritol is relatively low viscosity, crystallization is easily induced even if low degree of undercooling. This characteristic is different from a sugar.

We melted 25 g of erythritol in a petri dish with 90 mm in diameter. The petri dish including melted erythritol was cooled via various cooling rate. In the result, the crystal morphology was varied from euhedral to dendritic, and spherulitic with increasing degree of undercooling. The crystal size tends to be small with increasing degree of undercooling. The occurrences of crystal textures are consistent with those of natural igneous rocks.

The cooling rate can be easily quantified using an infrared thermometer. The boundary of cooling rate between euhedral and dendritic crystal formations was about 12 ˚C/min. The boundary of cooling rate between dendritic and spherulitic crystal formations was about 40 ˚C/min. Furthermore, latent heat could be also analyzed when crystallization progress. Latent heat is important, because it affect to rheology of advancing lavas or a magma chamber. The in-situ crystallization can be observed under a microscope. We consider that these experiments are strongly effective for geology and petrology education.

Making volcanic edifice with edible lava

*Tatsuo Kanamaru[1], Akihiko Fujinawa[2]

1. Department of Earth and Environmental Sciences, College of Humanities & Sciences, Nihon University, 2. Department of Earth Sciences, Faculty of Science, Ibaraki University

Volcano is a window through which inside of the living earth can be seen, and also gives us a lot of grace and pleasure. On the other hand, volcanic disasters always hit human societies sitting on volcanic countries. In order to feel familiar with the volcano and get along well with the volcanoes, it is very important to know how the volcanoes have been formed. For this purpose, it is best to observe directly a volcanic eruption or perform a geological survey. However, it is difficult for non-experts to do the field survey. Therefore, efforts to make volcanoes understandable easily even by non-experts have to be made. In fact, the effort such as flow experiment of lava flow using miniature model, analog experiment of eruption using food, etc. have been conducted actively in recent years (e.g. Hayashi, 2006). In this presentation, we will introduce a lava flow experiment using pseudo-magma material prepared by mixing chocolate, gelatin, milk and heating it in a microwave oven. In addition, making pseudo-scoria formed by foaming of the same substance will be exhibited. In the lava flow experiment, it is possible to produce characteristic forms on the real lava flow surface, such as lava inflation, lava levee, ropy lava, etc. Pseudo-scoria produced by the experiment is optimum for observation of bubbling of lava.

Columnar joint: Geometric pattern analysis and analogue experiment using starch pastes

*Yuri Akiba[1], Aika Takashima[1], Hiroyuki Shima[2]

1. Graduate School of Life and Environmental Sciences, University of Yamanashi, 2. Department of Environmental Sciences, University of Yamanashi

Columnar joints are prismatic cracks that regularly penetrate the rock body. They are formed by contraction of cooled lava followed by sequential crack advances. Worldwide famous examples include: Giant's Causeway in Northern Ireland, Fingal Cave in the UK, and Devil's Tower in the United States.

Despite of much efforts reported thus far, a clear understanding for its formation mechanism has not yet been obtained, mainly because of the difficulty of experimental reproduction. In the last two decades, the situation changed drastically; it was discovered that regular crack structures, which look similar to columnar joints, can be realized very easily using starch paste. The way to make them is shown below. First, starch powder and distill water is mixed thoroughly to make paste. Next, this paste is poured into a container. Then, the surface of the paste is irradiated by an incandescent lamp, and it is left for a long time. As the moisture evaporates from the surface, the paste goes drying and causes cracking. As time elapses further, the cracks at the surface progress inward, and we finally obtain a prismatic structure which regularly penetrates the entire paste. After completely drying, a polygonal network pattern is generated on the surface of the paste.

Obviously, columnar joint and starch paste are different in the chemical composition, length scale, and crack initiation factors. But a similar prismatic crack is formed --- Why? This question motivated us to investigate the statistical properties of the polygonal pattern in both two systems.

Our drone aerial shooting of columnar joints was carried out at the following four domestic sites: (1) Tatami-ishi in Okinawa, (2) Tatami-ga-fuchi in Yamaguchi, (3) Tawara-iso in Shizuoka, and (4) Hi-no-misaki in Shimane. Importantly, the SiO_2content in constituent igneous rocks depends on the sites: the sites 1 and 3 are andesitic, the site 2 is basaltic, and the site 4 is rhyolitic. This difference would have influenced the statistical properties of the polygonal network pattern observed at present. Meanwhile, our starch-paste experiment was aimed at evaluation of the following two effects on the geometry of the polygonal crack pattern: (1) the fluctuation width in the size distribution of constituent starch particles, and (2) the degree of sphericity of the particles. To this end, we used two types of starch, corn starch and potato starch. We also examined the degree of correlation between the film thickness of the paste and the crack pattern obtained.

The first main finding was regarding the characteristic length scale of the polygonal network. For columnar joints, the length scale varies from sites to sites, probably because of the difference in the SiO_2 content. For the desiccated starch paste, the length scale increased with the film thickness only for the potato starch paste. The latter result can be explained from the water diffusion process in the paste and the spatial nonuniformity in the water concentration. Since both the water diffusion and concentration in the paste are directly affected by the size and shape of the constituent particles, our result indicates that the geometry of the dry crack pattern strongly depends on the particles' size and shape.

The second main finding was regarding the number of vertices in polygons. In columnar joint, pentagons

©2019. Japan Geoscience Union. All Right Reserved.

and hexagons occurred in an almost equal frequency. On the other hand, in desiccated starch paste, only pentagons frequently occurred. This result can be interpreted by the difference in cooling/drying speed.

The third finding was regarding the probability distribution of polygon area. Both for the two systems, the distributions are well fitted on the curve of gamma distribution. This suggests the existence of a unified pattern formation mechanism which is common to both the cooling contraction of magma and the drying shrinkage of paste. Details of the results and its interpretation will be given in my talk of the session.

Keywords: igneous rock, rock fracture, drying paste, desiccation crack, polygonal pattern

Viscoelastic characterization of a solid projectile impact onto a dense potato starch suspension

Kazuya Egawa[2], *Hiroaki Katsuragi[1]

1. Graduate School of Environmental Studies, Nagoya University, 2. Department of Earth and Planetary Sciences, Nagoya University

Dense suspension of non-Browning particles (e.g. mixture of water and potato starch) shows complex rheological properties such as discontinuous shear thickening (DST) [1]. Usually, DST is defined by the sudden jump of viscosity at a certain shear strain rate. The viscosity jump is observed in steady-state rheometry. However, in a very recent study, elasticity of DST fluid has also been measured by a steady penetration of a rod into a DST fluid [2]. In addition to the steady penetration, various impact experiments onto DST suspensions have also been performed to reveal the fundamental physical process of DST. The solid-like and/or peculiar behaviors have been found in the impacted DST fluid as well (e.g. dynamic jamming [3], dynamic fracturing [4], and negative pressure pulse [5]). Moreover, peculiar surface deformation and/or stable hole structure of the vibrated DST fluid has also been found under the influence of vibration [6]. Nevertheless, the origin of DST has not yet been understood well. Much more detail analyses of the transient rheological properties of DST fluid is necessary. The impact response is a useful way to approach the transient dynamics, Therefore, in this study, we perform a simple solid-projectile impact onto a DST fluid target (dense potato starch suspension), in order to observe the penetration and rebound dynamics. From the experimental results, the rebound timescale and restitution coefficient are measured. To characterize the transient viscoelasticity, we assume a simple linear viscoelastic model. Using the model, the effects of impact inertia, boundary conditions, and mechanical vibration on the rheological properties of the impacted DST fluid are systematically studied. Besides, to investigate the effect of vibration to the rheological properties of DST fluid, mechanical vibration is also used. Namely, the transient viscoelasticity of the vibrated DST fluid is experimentally measured. These results will be presented.

Pattern formation within a sandpile formed by a mixture of grains: The selection of stratification and segregation patterns

*Michiko Shimokawa[1], Hidestugu Sakaguchi[2]

1. Fukuoka Institute of Technology, 2. Kyushu University

By pouring a mixture of two types of grains into a large vertical cell of narrow dimensions, an avalanche occurs toward the bottom of the sandpile, and the mixed grains separate into their respective grain types due to the Brazil nut effect, which is caused by the vibration of the avalanche. The effect causes spontaneous formations of stratification patterns or segregation patterns in a sandpile. The selection of the pattern in the sand pile is determined by a competition of angles of repose and the grain sizes of the two grain types. In the condition of a formation of a segregation pattern, a size of grain A is larger than that of grain B, and a repose angle of grain A is smaller than that of grain B. On the other hand, the grain size and repose angle of grain A are larger than those of grain B for the formation of the stratification pattern. We investigate pattern formation in a sandpile by pouring a ternary mixture of grains into a narrow vertical cell. Size segregation in avalanches causes the formation of patterns. Four kinds of patterns emerge: stratification, segregation, upper stratification–lower segregation, and upper segregation–lower stratification. A phase diagram is constructed in a parameter space of θ_{11}/θ_{33} and θ_{22}/θ_{33}, where θ_{11}, θ_{22}, and θ_{33} are the repose angles of small, intermediate, and large grains, respectively. To qualitatively understand pattern formation, a phenomenological model based on a roll-or-stay rule is proposed. A similar pattern formation is found in a numerical simulation of the phenomenological model. These results suggest that the ratios of the repose angles of the three grain types are important for pattern formation within a sandpile.

Significance of the guide to introduce the landscape interestingly

*Daisuke Fukushima[1]

1. Sakurajima Museum

One of the objectives of the geopark is to convey the connection between the earth, people and nature. Many of those who have learned earth science can imagine the formation of the earth from the topography and geology, from which you can imagine the connection with people and nature. However, since many general people do not have knowledge of earth science, it is difficult to understand the story of the connection between the earth, people and nature from the landscape in front of the eyes.

On the other hand, there are many people who have deep knowledge about their hobbies and work, can imagine and enjoy various things. For example, if a person who likes history went to a famous battlefield, it would be possible to imagine and enjoy events of hundreds of years ago. However, it is familiar scenery for many general people. Whether you can enjoy the scenery is proportional to knowledge and imagination. If you have a lot of knowledge, the range you can imagine will expand and you will be able to enjoy various sceneries.

The role of the guides is to introduce the scenery interestingly even if the customer does not have knowledge. The guides provide the necessary knowledge to bring out imagination, take you to a place suitable for imagining, use imagery, photographs, illustrations etc so that guides and customers can imagine similar images. Then, the scenery in front of you seems to change, and you can know the story. It is the best way to tell the connection between earth and people and nature. Therefore, the role of the guide in geoparks is very important.

Understanding of "geology" without difficult explanation. - Let's conduct experiment to tell about geology more easily. -

*Hikaru Yokoyama[1]

1. Hokusho University

In the geopark, it is necessary to positively transmit the geoscientific appeal of the area. However, in Japan, many people are not sufficiently educated about geology. Therefore, it is very important task to communicate about the geological phenomena to the citizen easily.

Model experiments are one effective means to tell phenomena difficult to express in words easily. Several activities have been conducted to deepen understanding of geology through model experiments. "The kitchen volcano experiments" is an example of a typical model experiment. Experiments that can easily model geological phenomena and convey it are essential communication tools for the dissemination of geoparks and educational activities.

In this presentation, I will give some examples of experiments to model and convey complex geological phenomena. I will propose the effect of dissemination activities through experiments and how to utilize the experiment in geopark.

The appealing points and challenges of Japanese geoparks, as seen from a foreigner’ s point of view.

*Jagoda Woloszyn[1]

1. Oki Islands UNESCO Global Geopark Promotion Committee

It has been almost three years since I started my work as a Coordinator of International Relations at the Oki Islands UNESCO Global Geopark Promotion Committee. Before coming here, I did not even know that organizations like geoparks existed. Therefore, at the beginning, Japanese geoparks became my model for geoparks. During my presentation I will talk about the appealing points of geoparks in Japan from an amateur’ s point of view.

Geopark Promotion Committees in Japan have the necessary resources to gather information about not only the local geology, but also the local nature, history and culture. Therefore, they can function as a hub for human resource development projects and high-quality tourism product creation.
I wish to look at the challenges that geopark promotion committees face in Japan, as well as talk about the differences between Japanese and European geoparks. Focusing on the differences resulting from the different starting points of the networks, differences in geopark office organization style and culture differences in working style, I will touch upon what I believe the networks can learn from each other.

[O-08] How to make the image of the earth's phenomenon to the general people in the Geopark

convener:Noritaka Matsubara(Graduate School of Regional Resource Management, University of Hyogo), Yayoi ICHIHASHI(Sado Island Geopark Promotion Office), Hokuto Obara(Mine-Akiyoshidai Karst Plateau Geopark Promotion Council), Marekazu OHNO(Unzen Volcanic Area Geopark Promotion Office), Chairperson:Yayoi Ichihashi, Hokuto Obara, Hiroko Imai, Noritaka Matsubara(兵庫県立大学大学院), Suzuka Koriyama(San'in Kaigan Geopark Promotion Council)

unesco global geoparks give international recognition for sites that promote the importance and significance of protecting the Earth's geodiversity through actively engaging with the local communities. in order for the general people to understand the earth's activity, it is necessary to imagine the phenomenon of the earth. in this session, we discuss about how to make the image of the earth's phenomenon to the general people in the Geopark.

What do we need to do fun geotours that interests the earth?

*kana nishitani[1]

1. Global nature club

I think that guides need to improve interpretation skills in order to make customers fun and make feel be on the earth.

I will apply my daily guide to the four elements "①Theme ②Organized ③Relative ④Enjoyable" which are said to be necessary for the interpretation, will organize it. And I will consider what is important for geo guide.

The Important Things in Communicating Earth's Activity to Local Residents: the Awareness during Four Years after Changing a Job from a Geoscience Postdoc to a Curator

*Kyoko Kanayama[1]

1. San'in Kaigan Geopark Museum of the Earth and Sea, Tottori Prefectural Government

Four years ago, I changed a job from a postdoctoral researcher at a university to a curator at the Tottori Prefectural Government. After my career change, a target for my communication changed from scientists and graduate students having a passion for earth sciences to local people and administrative staff who had never learned earth sciences deeply. How can I let them know the interest for earth sciences?
I believe the interest about earth sciences is to come to realize or imagine that "the earth is active". However, I feel many people are less interested in earth sciences because there is little opportunity to feel its interest. One of my missions as a curator is simply passing on "the earth is active" to as many people as possible.
What I gradually learned from my experience as a curator for four years is that telling memories of landscape and life which listeners had seen could link to their interest for earth sciences when I tell about earth activity. Including these stories, I would like to talk about some perceptions that I gained through the curatorial work in my presentation.

"Blatamori" How to communicate the earth activities valued by guide guides

*Makoto Hasuoka[1], Yusuke Suzuki[2], Hiroko Imai[3]

1. Bandai-san Geopark Council, 2. Izu Peninsula Geopark Promotion Council, 3. COM SUPPORT OFFICE

It is not easy for ordinary people and local residents who do not have expertise to image the earth's activities in the geopark - know the importance of geodiversity. In each geopark, local people such as experts and geo guides unravel the phenomena related to the activities of the earth and the relationship between people and the earth, communicate their enjoyment and importance to the general public through guided tours and activities There.
NHK Blatamori introduces to the tea room that it is close to activities that this geopark region is practicing.This program is a program of the concept that Mr. Tamori of the guru walking master approaches the history of the unknown city and the lives of people while walking around the glove.

[J] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

Sun. May 26, 2019 3:30 PM - 5:00 PM JST | Sun. May 26, 2019 6:30 AM - 8:00 AM UTC | A02 TOKYO BAY MAKUHARI HALL

[P-PS07] Formation and evolution of planetary materials in the Solar System

convener:Yoko Kebukawa(Faculty of Engineering, Yokohama National University), Wataru Fujiya(Ibaraki University, College of Science), Shin Ozawa(Department of Earth Science, Graduate School of Science, Tohoku University), Megumi Matsumoto(Graduate School of Science, Tohoku University), Chairperson:Megumi Matsumoto, Wataru Fujiya

This session will focus on the evolution in the Solar System with interaction and co-evolution in minerals, water, organic matter, and noble gas in meteorites and interplanetary dust particles. New innovative analytical and theoretical techniques in various fields will be discussed. The developing methods are welcome to submit for the future mainstream of meteorite study. In order to explore the planetary materials and their evolution, both meteorite studies and experimental approaches are necessary. In this session, we will discuss these topics from extraterrestrial sample analyses and experimental works. Research works on undifferentiated and differentiated meteorites and parent body processes such as aqueous alteration, thermal metamorphism, shock metamorphism, volcanic activity, and core-mantle-crust differentiation are especially included in this session.

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

Sugars are essential components of DNA and RNA and also are essential substrates of glycolysis. Ribose is especially an important sugar as the sole component in RNA that supports both genotype and phenotype of primordial life. Investigations of sugars in meteorites have been conducted since more than 50 years ago. However, no extraterrestrial sugar that composes life has been found from any astronomical samples including meteorites, although several sugar-related compounds have been detected from meteorites. This would be preliminary because of the low concentration, difficulty in extraction, and the absence of suitable derivatization for gas chromatographic separation. Therefore, we developed a protocol to extract and analyze sugars in meteorites. We have also investigated the compound-specific carbon isotope ratios (δ^{13}C values) of sugars. All meteorites have some possibilities of biological contamination, since they have been collected on the terrestrial environment filled with biota. Thus, the evaluation of the source of sugars in meteorites (i.e., biological or extraterrestrial) is significantly important. Biological sugars are all have negative δ^{13}C values (against VPDB). Conversely, soluble organic compounds in meteorites like amino acids, nucleobases, amines, and sugar-related compounds all have positive carbon δ^{13}C values. Thus, the isotope ratios are an essential indicator for the evaluation of the origin of sugars in meteorites. In this presentation, we show the results of identification and carbon isotope ratio analysis of sugars for two CR2 chondrites. We also report the mineral composition, and chemical state of C in insoluble organic matter in these meteorites.

Earth is habitable even in the inner planetary region where volatiles are depleted, so that there should be sources and mechanism to supply them to earth. It has been revealed by the recent exploration of outer planets and comets that volatile components such as water and organics exist abundantly in the outer planetary region, where it is colder than in the inner planetary region. According to the researches, the existence of organic matter cannot be ignored for understanding the nature of small bodies in the outer planetary region (e.g., bodies in Edgeworth Kuiper Belt bodies or Oort Cloud). As means to get samples of that region not in the space but on the Earth, there are Antarctic MicroMeteorites (AMMs) [1]. There are interplanetary dust particles (IDPs) drifting in the interplanetary space, ejected from small solar system bodies such as asteroids and comets. Those dusts are called micrometeorites when they fall to the earth, and they are called AMMs especially when they fall to the Antarctic ice sheets. The size of MMs is defined as less than 2 mm. The accretion rate of MMs reaching the Earth’ s surface has been estimated tens of thousand tons in the previous study, which is about ten times as much as the annual influx of meteorites to the Earth [2]. Since soluble organic matter (SOM) and insoluble organic matter (IOM) are present in the MMs, it is considered that MMs rather than meteorites dominantly contributed to the supply of volatile components to the inner planetary region where they were deficient [3].

In order to understand chemical characteristics of organics in IDPs, we are aiming for the detection of SOM in AMMs. While it is difficult to determine the structure of IOM because they are Kerogen-like macromolecules, the structure of SOM can be determined. Therefore, it can be the key of elucidating the evolution of materials (chemical reaction) in the low temperature environment of the outer solar system specifically. In the previous study, samples were collected by filtering the melted water, so that no molecular species were evidently identified to have originated from primitive MMs [4, 5]. In this study, ice blocks that were collected from an ice sheet in Antarctica were sublimated as it was in order to prevent the leakage of SOM during sample collection. The apparatus for sublimation of ice blocks consists of a vacuum chamber with a sample holding jig and a dish for collecting sublimation residue set in the climate chamber. In order to prevent the ice blocks from melting before it is enough evacuated, the temperature in the climate chamber was set at -10.0 degrees Celsius. The whole apparatus was set and cooled in advance in the climate chamber. After ice blocks were set on the jig in the vacuum chamber, evacuation was started. In order to increase the efficiency of sublimation, the temperature in the climate chamber was set at 40.0 degrees Celsius after the pressure in the chamber reaching about 80 Pa.

About 330 g of Antarctica ice blocks were sublimated experimentally using the above apparatus. The residue was observed with a stereoscopic microscope. Most of the residue was occupied with white aggregated particles. According to the part of the observation by SEM-EDS, it was found that they are composed of Na, Cl, Ca, C, O and other elements. Their chemical compositions indicate that they should be marine or continental aerosols [6]. Particles composed of silicate minerals containing Mg and Fe were also found in the residue. The composition of them is consistent with that of AMMs [7]. However, it needs

©2019. Japan Geoscience Union. All Right Reserved.

to be confirmed whether it is AMM by analytical methods such as μ-FTIR, μ-Raman, DESI-Orbitrap MAS and so on. We are planning to analyze samples in various ways, mainly on the degree of polymerization of insoluble organic matter and identification of soluble organic matter.

Magnesium-containing organic compounds in the Tagish Lake and Murchison meteorites.

*Minako Hashiguchi[1], Hiroshi Naraoka[2,1]

1. Research Center for Planetary Trace Organic Compounds, Kyushu University, 2. Department of Earth and Planetary Sciences, Kyushu University

Introduction: Recent compound analyses using high-resolution mass spectrometry (HRMS) from the solvent extracts of the Murchison meteorite (CM2) reported various CHO, CHNO, CHOS and CHNOS compounds [Schmitt-Kopplin *et al.*, 2010] and ~600 alkylated homologues of CHN compounds [Naraoka *et al.*, 2017]. CHOMg compounds were also identified from methanol extracts of various meteorites by using HRMS [Ruf *et al.*, 2017]. To understand chemical evolution of the meteoritic organic matter, investigation of their relationship with surrounding minerals by *in-situ* analysis is necessary. Our previous studies revealed spatial distribution of alkylated homologues of CHN compounds in the Murray and Murchison meteorites using desorption electrospray ionization (DESI) with HRMS [Naraoka and Hashiguchi, 2018; Hashiguchi and Naraoka, 2019], but clear relationship with specific minerals was not found. In this study, we carried out DESI-HRMS imaging on the Tagish Lake meteorite to reveal the relationship between SOM and minerals.

Experimental: Fragments of the Tagish Lake (Ung-C2) meteorite and the Murchison meteorite with a flat surface of each meteorite were embedded in indium or alloy with low melting point (60 ºC). The DESI-HRMS imaging was performed using a 2D DESI ion source equipped with Orbitrap MS. A spray solvent was methanol 100% with the flow rate of 2–3 μL/min, and electrospray voltage was set at 3 kV. The positive ions (m/z 60–500) were collected with mass resolution of 140,000 ($m/\Delta m$ at m/z 200) on the surface of Tagish Lake (2.5×2.5 mm^2) and Murchison (4.5×4.5 mm^2). Antigorite grains was also analyzed to understand adsorption effects of organic compounds on clay minerals during storage in a clean room (Class 1000). After the imaging, FE-SEM-EDS analysis was carried out on the samples without coating and polishing.

Results and Discussion: Any CHN compounds were not detected from the Tagish Lake by DESI-HRMS imaging, whereas several alkylated homologues of CHN compounds were identified from Murchison similar to the previous study [Hashiguchi and Naraoka et al., 2019]. The distinctly different organic characteristics between the two meteorites was contrast to previous bulk analysis showing its quite low abundance of CHN compounds in Tagish Lake relative to Murchison [e.g. Pizzarello *et al.*, 2006]. Instead of the CHN compounds, abundant Mg-containing organic compounds were identified from Tagish Lake with mass precision of <1.5 ppm. Isotopomers of $^{24\text{-}26}$Mg for compounds were identified using the exact mass and Mg isotope simulation. Several families of $C_nH_mO_xMg^+$ (n=0-10) different from the compounds identified by Ruf *et al.* (2017), and $C_nH_mN_yO_xMg^+$ (n=1-7) were assigned using Kendrick mass defect plots. The Mg-organic compounds were also detected from Murchison, however, the abundance was more than an order of magnitude lower than that in Tagish Lake. By DESI-HRMS analysis on antigorite grains, some Mg-organic compounds (e.g. $C_nH_{2n+2}NO_2Mg^+$ families) showed high ion intensity after storage for 1 month, indicating their adsorption effects on the clay minerals. In contrast, other Mg-organic compounds were not found by the adsorption effect, suggesting that these compounds were indigenous in the meteorites.

The CHOMg and CHNOMg compounds showed a similar spatial distribution with various intensity among the different families in both meteorites. In the Tagish Lake meteorite, they were likely to be concentrated in the matrix with less framboidal magnetite and relatively saponite/serpentine-rich region. This indicates that the Mg-organic compounds might have been formed by ion exchange between organic species and

©2019. Japan Geoscience Union. All Right Reserved.

the clay minerals during aqueous alteration. Moreover, the Mg-organic compounds and CHN compounds were also distributed in matrix of Murchison, however, their spatial distributions were different, suggesting different origins between these compounds.

Interactions between minerals and organic materials on thermal processes in meteorite parent bodies

*Naoki Hirakawa[1], Yoko Kebukawa[1], Kensei Kobayashi[1]

1. Yokohama National University

Introduction:
Carbonaceous chondrites and several other chondrites contain a few wt.% of organic matters. Pearson et al. (2002) reported co-existence of organic matters with phyllosilicates in the matrix or chondrule rim and discussed the roles of phyllosilicates on alteration of organic matters during aqueous processing in a meteorite parent body. However, interaction between minerals and organics has not been well-known compared to interactions between minerals and water or organics and water. In this study, molecular cloud organic material analogue (Kouchi et al, 2002; hereafter called MC) was heated with powdered minerals using an autoclave to understand, 1) the effect of minerals on thermal metamorphism of organic matter, 2) whether minerals were affected by organic matter or not.

Methods:
MC was prepared by mixing chemical compounds based on Kouchi et al. (2002). Samples used in this study were MC (5 g), MC (0.25 g) with olivine (0.25 g), and MC (0.25 g) + montmorillonite (0.25 g). Each sample was put in a pyrex glass tube without sealing and the tube was placed in the autoclave. The autoclave was purged with N2+H2 gas mixture (99 : 1, v/v). The samples were heated at 200 ˚C, 300 ˚C, and 400 ˚C in the autoclave for 5 hours under 1 atm. After cooling to room temperature, recovered samples were analyzed using FT-IR, GC/MS, XRD and SEM-EDS.

Results and Discussion:
MC heated products: Changes of the peak position and the intensity of carbonyl C=O in IR spectra with temperatures were consistent with the products at each temperature detected by GC/MS. The long-chain carboxylic acids in the initial MC were converted into long-chain ester compounds at 200 ˚C. Long-chain ester, amide and nitrile compounds were produced at 300 ˚C, and long-chain alkane and nitrile compounds were produced at 400 ˚C. Dehydration condensation of carboxylic acids with alcohols and amines in the initial MC formed esters and amides, respectively, at 200 ˚C and 300 ˚C. Alkanes and nitriles were formed at 400 ˚C through thermal cracking of long chain aliphatic compounds and dehydration of amides, respectively.

Monoaromatic hydrocarbons also increased at 400 ˚C. Monoaromatic hydrocarbons were probably formed through thermal cracking of bridged aromatic hydrocarbons (e.g.,
4,4’ -methylenebis-(2,6-dimethylphenol)) in the initial MC at 400 ˚C.

Effects of minerals: Changes in the peak position of carbonyl C=O was more significant with montmorillonite than with olivine. Carbonyl C=O significantly decreased at 300 ˚C and 400 ˚C with montmorillonite. This result could be explained by the differences of acidity and contact surface area of olivine and montmorillonite.

Alexander et al. (2007) reported that both O/C ratios and H/C ratios of insoluble organic matter (IOM) in heated CM chondrites and ordinary chondrites decreased by heating. However, O/C ratios of IOM in heated CM chondrites were much lower than these in ordinary chondrites when compared at the same

©2019. Japan Geoscience Union. All Right Reserved.

H/C ranges. It may indicate that pyrolysis of IOM in heated CM chondrites was promoted by co-existed phyllosilicates even at lower degree of thermal processes compared to IOM in ordinary chondrites which contain large amount of olivine but less phyllosilicates.

Alteration of minerals: Possibility of partial hydrous alteration in olivine to serpentine was found in products at 200 ˚C and 300 ˚C by SEM observations, while the alteration was not detected at 400 ˚C. It could be due to the dehydration of MC that hydrates olivine at 200 ˚C and 300 ˚C. This result might indicate that hydrated minerals could have formed without water but with organics in some meteorite parent bodies accreted inside the snow line. Further analysis using TEM is now being conducted to confirm the formation of phyllosilicates on the surface of olivine particles reacted with MC.

Organic matter in carbonaceous chondrite lithologies of Almahata Sitta meteorite, a polymict ureilite

*Yoko Kebukawa[1], Michael Zolensky[2], Cyrena Anne Goodrich[3], Motoo Ito[4], Nanako O. Ogawa[5], Yoshinori Takano[5], Naohiko Ohkouchi[5], Hiroki Suga[9], Matthew Marcus[6], David Kilcoyne[6], Takuji Ohigashi[7], Zia Rahman[2], Muawia H. Shaddad[8], Kensei Kobayashi[1]

1. Yokohama National University, 2. NASA Johnson Space Center, 3. Lunar and Planetary Institute, 4. Kochi Institute for Core Sample Research JAMSTEC, 5. Japan Agency for Marine-Earth Science and Technology, 6. Lawrence Berkeley National Laboratory, 7. Institute for Molecular Science, 8. University of Khartoum, 9. The University of Tokyo

The Almahata Sitta (AhS) meteorite is a brecciated, polymict ureilite that has originated from the near-earth asteroid 2008 TC3 which is classified as an F-type asteroid (a group in C complex) in spectroscopic taxonomy [1]. Carbonaceous chondritic lithologies AhS 671 and 91/91A have been characterized and contain phyllosilicates, bruennerite, dolomite, magnetite, fayalite, ilmenite, phosphates, pyrrhotite, and pentlandite [2]. These lithologies are breccias and enclose fragments of ureilitic olivine and pyroxene [2]. We investigated organic matter (OM) in AhS 671 and 91A with various methods including C and N elemental and isotopic analysis and FTIR for bulk samples (~100 μg), and microscopic analysis of their FIB sections using STXM/C-XANES and NanoSIMS.

AhS 671

The IR absorption spectrum of AhS 671 show phyllosilicates and carbonates consistent with mineralogical observations [2], and similar to the IR spectra of CI chondrites [3]. AhS 671 contains 3.9 ±0.22 wt.% of C and 0.19 ±0.02 wt.% of N with δ^{13}C = -3.8 ±0.7 ‰and δ^{15}N = 50.5 ±2.6 ‰. Its δ^{15}N and N/C ratio (0.042 ±0.002, atomic) is close to the values of insoluble organic matter (IOM) in the Tagish Lake meteorite [4]. Note that the N/C ratio of OM in AhS 671 would be higher than the value of the bulk sample since the bulk value includes carbonates.

C-XANES spectra of the organic-rich regions in the AhS 671 FIB section show large peaks at 285 eV assigned to aromatic carbon with no other specific features. Although, organic matter in AS 671 is highly aromatic, there is no 1s-σ^* exciton peak at 291.7 eV of graphene structures that is characteristic of thermally-metamorphosed meteorites [5]. Such characteristics are similar to the C-rich aggregate in the Zag clast [6]. The difference of their organic matter is related to morphology; Zag organics form large (over 10 μm) aggregates while those in AhS 671 are smaller and mixed with the matrix at the submicron scale. δ^{13}C and δ^{15}N obtained with NanoSIMS in C-rich areas are homogeneous with averages of 3 ±3 ‰ and 234 ±32 ‰, respectively. The δ^{15}N is higher than the bulk value and is close to the value of IOM of CR chondrites [7]. The δD value in C-rich areas is 988 ±59 ‰. It is similar to the value of IOM of CI and CM chondrites [7], but less than the value of CRs [7]. The N isotopes of organic matter in AhS 671 shows an isotopically heavier than ureilitic fragments of AhS (-53 to -94 ‰[8]) and rather close to the values of primitive carbonaceous chondrites. However, OM is dominated in aromatic structure without any sign of graphitization.

AhS 91A

Not like AhS 671, the IR absorption spectrum of AhS 91A show no sighs if phyllosilicates and carbonates. The C and N contents vary up to 4.8 wt.% and 0.056 wt.%, respectively, with the average δ^{13}C of -17 ±8

©2019. Japan Geoscience Union. All Right Reserved.

‰. It is consistent with the heterogeneous nature of AhS 91A. We could not obtain C-XANES due to low C contents in the FIB section of AhS 91A. We are going to analyze an additional FIB section since AhS 91A is highly heterogeneous.

Considering the molecular structure and the nitrogen isotope composition, the organic matter in AhS 671 is similar origin to the C-rich aggregate in the Zag clast [6], and thus perhaps related to D/P asteroids.

Thermal Evolution of Hydrous Minerals on Small Bodies: To Understand Thermal Histories of Ryugu and Bennu

*Kana Ishimaru[1], Shogo Tachibana[2]

1. University of Tokyo, 2. UTokyo Organization for Planetary and Space Science, University of Tokyo

Asteroid sample return missions JAXA's Hayabusa2 and NASA's OSIRIS-REx are currently exploring asteroids Ryugu and Bennu, respectively. Infrared spectroscopic observation done by the near-infrared spectrometer on board Hayabusa2 (NIRS3) suggests that Ryugu has a weak absorption feature of hydrous minerals, while the visible and infrared spectrometer on board OSIRIS-REx (OVIRS) have detected a clear absorption feature of hydrous minerals on the surface of Bennu. These findings indicate that two asteroids experienced different thermal histories, and dehydration of hydrous phases could have occurred more effectively on Ryugu. It is thus important to understand thermal transformation processes of hydrous minerals, but there has been limited kinetic data that can be extrapolated to the processes occurring in the geologic timescale. Therefore, with the aim of understanding thermal metamorphism on Ryugu/Bennu, we conducted heating experiments of serpentine in vacuum.

The starting material of serpentine was ground into powder using an agate mortar and pestle to a particle size of ~1 μm. Samples were heated at 500 - 800˚C, for durations of 2 –88 hours in vacuum (10^{-4} –10^{-5} Pa). The analyses were done with XRD (X-ray powder diffraction) at the University of Tokyo and FTIR (Fourier transform infrared spectroscopy) at Hokkaido University. The weight changes of the samples were obtained by weighing them before and after the experiments using an electric balance.

The serpentine samples heated at 500˚C were dehydrated with heating, but crystalline serpentine was still dominant in the run products. The samples heated at 600˚C decomposed to become amorphous. The XRD spectra of the samples heated at 650℃ show the presence of small and broad peaks of olivine that recrystallized from the amorphous and also a slight halo representing remaining amorphous. The samples heated at 700˚C also have small and broad XRD peaks of olivine without the halo feature of amorphous silicate. The XRD spectra of the samples heated at 800˚C show the strongest peak of enstatite in addition to the peaks of olivine. FTIR spectra also confirm the above observations.

The FTIR spectra of the samples heated at 650˚C and 700˚C were analyzed further to obtain the kinetics of crystallization of olivine from dehydrated serpentine. The absorbance ratio of the peaks at 10.4 and 11.4 mm, both of which are characteristic of olivine, was converted into the degree of olivine crystallization based on the results by [1]. The time evolution of crystallization degree at 650 and 700˚C were fitted by the Johnson-Mehl-Avrami-Kolmogorov equation with the Avrami exponent of 1.5 [1], and the crystallization rate constant k [$h^{-1.5}$] of 0.032 and 0.34 were obtained at 650 and 700˚C, respectively. The estimated activation energy for the crystallization is 356 kJ mol^{-1}.

The TTT (time-temperature-transformation) diagrams for dehydration and recrystallization of serpentine were obtained. The dehydration timescale was adopted from [2]. Considering that the decay of ^{26}Al with a half-life of 0.72 My is a possible heat source within parent bodies of Ryugu and Bennu in the early Solar System, the heating time scale should be shorter than 10 Myr. The diagram indicates that Bennu, with a clear infrared feature of hydrous minerals should not have experienced heating at >350 K on its parent body. Ryugu, with a subtle feature of hydrous minerals may have been heated at >450 K on its parent body. Fujiya et al. (2012) [3] estimated that within a 60-km sized asteroid accreted 3.5 Myr after the Solar System formation, the highest temperature is about 400 –450 K that lasts for 2 –3 Myr at 3 km distance from the center. If this is the case, most part of the asteroid was kept below 350 K, which could be similar to Bennu. In order to dehydrate Ryugu, its parent body may have been larger than 60 km in diameter or may have accreted earlier than 3.5 Myr after the Solar System formation with a more available heat source (^{26}Al).

Sun. May 26, 2019 3:30 PM - 5:00 PM JST | Sun. May 26, 2019 6:30 AM - 8:00 AM UTC | A03 TOKYO BAY MAKUHARI HALL

[P-EM19] Frontiers in the solar physics

convener:Shinsuke Imada(Institute for Space-Earth Environmental Research, Nagoya University), Takaaki Yokoyama(School of Science, University of Tokyo), Toshifumi Shimizu(Institute of Space and Astronautical Science, JAXA), Yukio Katsukawa(National Astronomical Observatory of Japan, National Institute of Natural Sciences), Chairperson:Shinsuke Imada

To date, we have three Japanese satellite missions to observe solar atmosphere, i.e., "Hinotori", "Yohkoh", and "Hinode", and revealed very dynamic nature of the solar atmosphere.These satellite observations allow us to see magnetic activities in the corona in X-ray, which cannot be obtained by ground-based telescopes. Also, thanks to seeing free condition, "Hinode" continuously observes the magnetic field in the photosphere. From these experiences, we have learned following three important requirements for the future missions to solve "coronal heating" and "solar flare" problems;1) seamless and simultaneous observation covering all temperature regimes from the photosphere to the corona, 2) high spatial and temporal resolution to resolve elemental structures and to track their evolution, 3) plasma diagnostic capability to quantify the dynamics of elementary processes. Recently, solar physics community in Japan proposed Solar-C_EUVST mission which is intended to be launched in middle of 2020s. Further, next-generation instruments, such as Parker Solar Probe (PSP), the Daniel K. Inouye Solar Telescope (DKIST), and SUNRISE will appear even before Solar-C_EUVST. Several proposals, e.g., PhoENiX, are also appearing. We will discuss in this session what we should study for further understanding of solar physics from current observations and numerical simulations and what we must prepare before 2020s. We welcome participations and presentations especially from Solar Terrestrial Physics (STP) community.

The Sun-Geospace connection: toward the 25th solar cycle

*Yoshizumi Miyoshi[1], Shinsuke Imada[1]

1. Institute for Space-Earth Environmental Research, Nagoya University

One of the major goals of solar-terrestrial physics is to understand how the transfer of Sun and solar wind energy into the Geospace and vice versa. In the last decade, there have been several flagship missions in Geospace; NASA/THEMIS, Van Allen Probes, and MMS, and JAXA/Arase, making important contributions to our understandings of how the Geospace responds on variations of Sun and solar wind. Solar atmosphere is also observed and monitored by modern satellite, such as Hinode, and Solar Dynamics Observatory. The present solar cycle (cycle 24) is one of the weakest cycles in these 100 years. Existing missions successfully observe several abnormal phenomena during weak solar cycle, such as extremely low-density solar wind, strong asymmetry for solar polar magnetic field, or relatively weak geomagnetic activities. For example, large flux enhancements of the outer belt associated with huge magnetic storms have not observed in cycle 24. Further, a lot of cycle prediction studies suggest that next solar cycle (cycle 25) is also as weak as cycle 24. There are also several preexisting and under-preparing missions which will be flagship missions during solar cycle 25. In this presentation, we briefly review highlights from these missions and discuss what subjects are important for the next decade, i.e, the 25th solar cycle to understand coupling process between Sun and Earth.

Unsolved problems of the solar wind turbulence

*Munehito Shoda[1]

1. Graduate School of Science, University of Tokyo

The solar wind is characterized by fluctuations extending from MHD to kinetic scales and therefore is a unique laboratory of plasma turbulence. Despite a number of spacecraft missions for solar wind observation and numerical simulations, the solar wind turbulence involves several unsolved problems. These problems are related to problems in solar physics, including coronal heating and solar wind acceleration. In this talk, I will review unsolved problems of the solar wind turbulence and the latest understandings on them. Predictions for (and results of) Parker Solar Probe would also be discussed.

Keywords: MHD turbulence, MHD waves, solar wind acceleration

The Solar-C_EUVST Epsilon mission

*Toshifumi Shimizu[1]

1. Institute of Space and Astronautical Science, JAXA

Solar-C_EUVST (EUV High-Throughput Spectroscopic Telescope) is a solar physics mission which mission concept proposal has been selected as a candidate for JAXA competitive M-class missions in July 2018. As a fundamental step towards answering how the plasma universe is created and evolves, and how the Sun influences the Earth and other planets in our solar system, the proposed mission is designed to comprehensively understand how mass and energy are transferred throughout the solar atmosphere. The onboard science instrument EUVST is an EUV spectrometerwith slit-jaw imaging system that will simultaneously observe the solar atmosphere from the photosphere/chromosphere up to the corona with seamless temperature coverage, high spatial resolution, and high throughput for the first time. It is designed to provide an answer to the most fundamental questions in solar physics: how fundamental processes lead to the formation of the solar atmosphere and the solar wind, and how the solar atmosphere becomes unstable, releasing the energy that drives solar flares and eruptions. The mission will be launched and installed to a sun-synchronous polar orbit by a JAXA Epsilon vehicle in the first half of 2025. The paper will provide the overall description of the mission concept, science, and the latest status.

Advanced Observations of the Solar Atmosphere by a Balloon-Borne Telescope SUNRISE-3

*Yukio Katsukawa[1], Carlos Quintero Noda[2], Masahito Kubo[1], Hirohisa Hara[1], Toshifumi Shimizu[2]

1. National Astronomical Observatory of Japan, 2. ISAS/JAXA

The solar chromosphere interfacing the solar surface (i.e. photosphere) and the corona is not a simple intermediate atmospheric layer transmitting magnetic energy, but a region where strong non-linearity drives dynamic phenomena, such as turbulence, shocks, and jets. Because the dynamics are likely to be responsible for injection of non-thermal energies into the corona and the solar winds, the chromosphere is one of the most important targets in the solar and stellar physics. It is necessary to quantitatively observe 3D magnetic and velocity fields to cover the dynamics in the chromosphere together with energy generation in the photosphere. We plan to acquire high-quality 3D magnetic and velocity fields for the first time by the SUNRISE-3 balloon-borne solar telescope planned for 2021. We are building a high precision spectro-polarimeter called SCIP (SUNRISE Chromospheric Infrared spectro-Polarimeter) to be installed in SUNRISE-3 for precise spectro-polarimetric observation of near-IR spectral lines sensitive to magnetic fields in the photosphere and the chromosphere. To interpret the SUNRISE-3 data, we are developing numerical modeling of the dynamic phenomenon in the solar atmosphere as well as tools to interpret radiative transfer through the atmosphere. The goal is to understand the conversion process of magnetic energies in the astrophysical plasma based on spatially resolved observations of the Sun.

Radiation magnetohydrodynamic modeling of solar coronal dynamics

*Haruhisa Iijima[1]

1. Institute for Space-Earth Environmental Research, Nagoya University

We present highly dynamic simulations of solar corona that exhibit intermittent heating and brightening based on the radiation magnetohydrodynamic model. The recent development of observational instruments allows us to access a large amount of remote-sensing image of the solar atmosphere. Because of the high nonlinearity of the solar atmosphere, the interpretation of the observational data is becoming more difficult. One approach to overcome this difficulty of the observational interpretation is to compare the observational data with synthesized realistic numerical simulations more directly. Realistic model of the solar corona should take into accout various physical processes like the radiative transfer, non-ideal equation of states, and thermal conduction. Our radiation magnetohydrodynamic model RAMENS is one of such solvers that can model the realistic solar dynamics from the upper convection zone to the corona. Recently, we further develop this code by including the semi-relativistic correction of the Alfven wave and thermal conduction to avoid severe time stepping near the active region. This new code allows us to simulate the highly dynamic solar corona within a moderate numerical cost. In the presentation, we will report our implementation of the semi-relativistic correction and present new energetic coronal simulations.

Detection and energy derivation of nano-flares based on deep learning

*Toshiki Kawai[1], Shinsuke Imada[1]

1. Institute for Space-Earth Environmental Research, Nagoya University

Coronal heating is one of the long-standing problems in solar physics. So far, two primary mechanisms have been proposed to explain how the corona is heated, namely small-scale magnetic reconnection and wave dissipation. To estimate the contribution of small-scale magnetic reconnection, so called nano-flares, to heat the corona is crucial to solve the coronal heating problem. The purpose of this study is to develop a method which can accurately detect nano-flares and estimate their energies. Firstly, we carry out one-dimensional hydrodynamic simulations of coronal loops heated by nano-flares which have wide range of energy ($10^{23} < E < 10^{27}$ erg). Secondly, we calculate the temporal variation of EUV and soft X-ray spectra of coronal loops from the simulation results by using CHIANTI atomic database. We perform these procedures more than 1,000 times with randomized flare energy and occurrence time to produce various datasets. Finally, we train a Deep Neural Network (DNN) by using these datasets to estimate the energy distribution and occurrence times of flares from soft X-ray observation. Moreover, we apply trained DNN to actual soft X-ray observations. As a result, we obtain reasonable occurrence times and energies of flares comparing another method which regards flare energy as change amount of thermal energy of the loop.

[P-AE20] Exoplanet

convener:Masahiro Ikoma(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Norio Narita(University of Tokyo), Chairperson:Norio Narita(University of Tokyo), Masahiro Ikoma(The University of Tokyo)

Exoplanetary science, which began with the discovery of a hot Jupiter in 1995, has reached a major turning point by the discovery of countless super-Earths by the Kepler mission. More recently, planets that are similar in size to the Earth and also receive similar amounts of stellar radiation (namely, located in the so-called habitable zone) have been discovered around nearby stars such as Proxima Centauri and TRAPPIST-1. As a result, not only theoretical, but also observational studies on the atmospheres and surface environments of Earth-like exoplanets have been started. Moreover, the number of planets discovered around early-type and late-type stars has become large enough that the occurrence rate and orbital distribution of planets around a wide variety of host stars have become clear. Thus, new observational insights, which become the basis of pan-planet formation theory, are now gathering. While exoplanets have been mainly targeted for astronomy until recently, it can be said that earth planetary science is finally becoming a research field to make a central contribution. In this session, we aim to share cutting-edge research results in exoplanetary science which is in such a transition period.

Gravitational Microlensing Surveys for Exoplanets

*Daisuke Suzuki[1]

1. Institute of Space and Astronautical Science / Japan Aerospace Exploration Agency

Gravitational microlensing can detect cold planets beyond the snow line. It is sensitive to the planets down to the Earth mass. Thus, it is only microlensing among the current exoplanet detection methods that can probe the outer planets orbiting other stars. In this talk, we present the recent microlensing statistical study which finds a disagreement between the observed planet mass-ratio function and the prediction from the population synthesis models based on the core accretion model. The models predict 7 - 10 times fewer planets at mass-ratios of $10^{-4} < q < 10^{-3}$ than found by the microlensing observations. This implies that the formation of gas giants may involve more complicated processes than assumed by the standard core accretion theory. Or, it implies that the planet formation process may vary significantly as a function of host star mass, because the population synthesis models have been calibrated for planets around solar-type stars while microlensing observations are biased toward lower-mass stars.

We also present recent planet discoveries with mass constraint and/or measurement by using the space-based observations or 10m class telescopes. Finally, we introduce future, infrared microlensing surveys, such as the PRIME (PRime-focus Infrared Microlensing Experiment) project and NASA’s WFIRST (Wide Field Infrared Survey Telescope) microlensing survey.

Doppler planet searches targeting stars in solar neighborhood

*Bunei Sato[1]

1. Tokyo Institute of Technology

A precise Doppler measurement is one of the powerful techniques to detect planets orbiting stars. The technique is applicable to the detection of planets with a wide range of orbital parameters, such as semimajor axis and eccentricity, mass, and host stars. The planets detected by the Doppler surveys can thus help us to gain a general understanding of planet formation and evolution. Furthermore, given the high detection efficiency of planets of the Doppler technique compared to transit ones, it is highly useful to search for planets around stars in solar neighborhood.

We have been conducting Doppler planets searches for planets around nearby giant stars, that is evolved intermediate-mass stars, for about 20 years with 188cm telescope and High Dispersion Echelle Spectrograph (HIDES) of Okayama observatory. We have also started intensive Doppler monitoring of nearby bright solar-type stars at Okayama aiming to explore low-mass planets in their habitable zones. Thanks to refurbishment of the HIDES last year, we can now achieve a Doppler precision better than 1 m/s. In this February, a new planet search program targeting nearby low-mass M-type dwarfs was launched with use of the new InfraRed Doppler instrument (IRD) of Subaru 8.2m telescope. The program aims at detecting earth-mass planets in their habitable zones as well as uncovering population of planets around them. Here we report the latest results from these planet-search programs and discuss future prospects.

Development of MuSCAT3 for ground-based follow-up observations of TESS candidate exoplanets

*Norio Narita[1,2,3], Akihiko Fukui[2], Masahiro Ikoma[2], Motohide Tamura[1,2], Nobuhiko Kusakabe[1], Mayuko Mori[2], Tomoyasu Yamamuro[4]

1. Astrobiology Center, 2. University of Tokyo, 3. JST, 4. OptCraft

NASA's Transiting Exoplanet Survey Satellite (TESS), launched on 2018 April 18, will start its survey for northern sky from 2019 summer. TESS is expected to find a large number of candidate transiting exoplanets after 2019 autumn.
Toward the start of the northern sky survey, we are now developing a 4-color simultaneous camera MuSCAT3 for the 1.2m telescope located in the Fred Lawrence Whipple Observatory on Mt. Hopkins in Arizona, USA. This is a successor of existing multi-color simultaneous cameras MuSCAT1/2 on the 188cm telescope in Okayama, Japan and on the 1.52m telescope in Tenerife, Canaries, Spain. MuSCAT3 will work with MuSCAT1/2 and enable 24-hour multi-color simultaneous imaging/photometry in the northern hemisphere. This is the one and only multi-color transit observation network in the world as of 2019. Thereby, we can conduct intensive ground-based follow-up observations rapidly after TESS's data releases, and can lead in discriminating and finding true interesting transiting planets in the world.
In this presentation, we will introduce the specifications of MuSCAT3 and the 1.2m telescope, and present prospects of MuSCAT3 development and synergies with TESS and MuSCAT1/2.

Keywords: exoplanets, transit, instrument, TESS

Effect of metallicity and eddy diffusion on transmission spectra of hazy exoplanet atmospheres

*Yui Kawashima[1], Masahiro Ikoma[2]

1. SRON Netherlands Institute for Space Research, 2. The University of Tokyo

Recently, properties of exoplanet atmospheres have been constrained via multi-wavelength transit observation, which measures an apparent decrease in stellar brightness during planetary transit in front of its host star (called transit depth). Sets of transit depths so far measured at different wavelengths (called transmission spectra) for some exoplanets are featureless or flat, inferring the existence of haze particles in the atmospheres. Previous studies that addressed theoretical modeling of transmission spectra of hydrogen-dominated atmospheres with haze used some assumed distribution and size of haze particles. In Kawashima & Ikoma (2018), we developed new photochemical and microphysical models of the creation, growth, and settling of haze particles for deriving their size and number-density distributions in close-in warm (< 1000 K) exoplanet atmospheres.

In this study, we explore the dependence of the production rate of haze and the resultant transmission spectra on metallicity and eddy diffusion coefficient. We find that the photodissociation rates of the hydrocarbons, which are related to the haze monomer production rate, are basically smaller for higher metallicity in spite of their increased abundances. This is because of the enhanced photon-shielding effect by the major photon absorbers, H_2O, CO, CO_2, and O_2, existing at higher altitudes than the hydrocarbons. Thus, the transmission spectrum for higher metallicity atmosphere is less affected by haze. We also find that the efficient eddy diffusion yields a steep Rayleigh-scattering slope in the optical and more prominent molecular-absorption features, which is the dependence opposite of condensation clouds.

Mineral clouds of fluffy aggregates: how they form in exoplanetary atmospheres and influence transmission spectra

*Kazumasa Ohno[1], Satoshi Okuzumi[1], Ryo Tazaki[2]

1. Department of Earth and Planetary Science, Tokyo Institute of Technology, 2. Astronomical Institute, Tohoku University

Observations of transmission spectra have suggested ubiquity of high-altitude clouds in exoplanetary atmospheres. Recent theoretical studies have examined the formation of high-altitude clouds; however, they usually need to assume vigorous vertical mixing to explain the observations, which is orders of magnitude stronger than that suggested from general circulation models. The discrepancy might be caused by an assumption of the compact spheres for cloud particles adopted in previous studies. Because the hot environment of exoplanets leads to the formation of mineral condensates, they potentially grow into fluffy aggregates with very low sedimentation velocity that can be easily transported to high altitude. In this study, we investigate the influences of the particle porosity on vertical profiles of the clouds using a microphysical model taking into account the vertical transport, particle growth, and porosity evolution of cloud particles. We will demonstrate that the particle density can be lower than the material density by 2–3 orders of magnitude. As a result, the vertical extent of the clouds is potentially much larger than that expected in previous studies. We also calculate synthetic transmission spectra with fluffy-aggregate clouds. The fluffy-aggregate clouds largely obscure molecular signatures in the spectra and produce a characteristic spectral slope in visible to near-infrared wavelength. Finally, we compare the synthetic spectra with the transmission spectrum of GJ1214b, a super-Earth suggested to have clouds at ~0.01mbar in pressure, and find that the observed spectra can be explained by the mineral cloud of fluffy aggregates if atmospheric metallicity is higher than 100 times solar abundance. The predicted high atmospheric metallicity might encapsulate information about the formation process of GJ1214b.

Orbital Architecture of Planetary Systems Formed by Giant Impacts

*Eiichiro Kokubo[1]

1. Division of Theoretical Astronomy, National Astronomical Observatory of Japan

In the standard scenario, the final stage of terrestrial planet formation is giant impacts among protoplanets. In this stage protoplanets gravitationally scatter each other and collide until the system reaches a stable configuration. We investigate the final orbital architecture of planetary systems realized by this process by *N*-body simulation. We find that the ratio between the physical and Hill radii of protoplanets determines the system architecture and it becomes compact and dynamically cold as the ratio increases. We also compare the results with the oribital architecture of exoplanetary systems.

Thermal convection in the mantle of super-Earths

*Takehiro Miyagoshi[1], Masanori Kameyama[2], Masaki Ogawa[3]

1. Japan Agency for Marine-Earth Science and Technology, 2. Ehime University, 3. University of Tokyo

Thermal convection in the mantle of super-Earths is one of the most important issues to understand their thermal history and surface environment. It is also linked to the habitability of planets because it controls the plate motion, material circulation, the vigor of core convection and planetary dynamos, and so on.

One of the most important differences between the Earth’s and super-Earth’s interior is that there is a strong adiabatic compression effect in super-Earths. Usually, this effect is ignored in modelling the dynamics in the mantle of the Earth because the effect is small in the Earth. However, this effect becomes strong as the size of planets increases so it cannot be ignored in large planets. In this paper we introduce our results of numerical simulation studies of thermal convection in super-Earths (up to ten times the Earth’s mass) with this effect (Miyagoshi et al., 2014; 2015; 2017; 2018). We also take account for high Rayleigh number which is relevant for super-Earths, and temperature-dependent viscosity contrast and depth-dependent thermal expansion coefficient.

We found that the activity of ascending hot plumes is lowered as the planetary size increases. In contrast, the activity of cold plumes is not lowered even in large planets. The efficiency of heat transport by thermal convection is significantly lowered compared with the results with Boussinesq approximation in which there is no adiabatic compression and which is often used in models for the Earth. We also found the convective regime diagram in massive super-Earths (ten times the Earth’s mass) and how the threshold between stagnant-lid regime and weak-viscosity-contrast regime is determined.

We also found the effects of adiabatic compression become substantial when the planetary mass exceeds about 4 times the Earth’s mass. The plate thickness increases and the convective velocity is almost constant as the planetary mass increases. These results are in a striking contrast with earlier predictions that are made by the Boussinesq approximation models.

We also explored the thermal evolution process in massive super-Earths (ten times the Earth’s mass). At initial the shallow mantle of the planet is hotter than expected from the adiabatic extrapolation from the deep mantle, as expected when the planet is formed from giant impact. We found that the influences of an initial temperature distribution continue extremely long in massive super-Earths. In our case, transient layered convection caused by the initial temperature distribution continues for as long as several to ten billion years before it yields to a whole layer convection.

Our results suggest that the tectonic activities such as plate motion and hot spot volcanisms hardly occur as planetary size increases. The planetary magnetic field is expected to be not so strong in massive super-Earths because of the weak efficiency of heat transport by the mantle convection. In addition, especially in massive super-Earths, special attention for the extremely long transient stage which is affected by the initial temperature distribution is necessary to discuss details of its interior and tectonic activities.

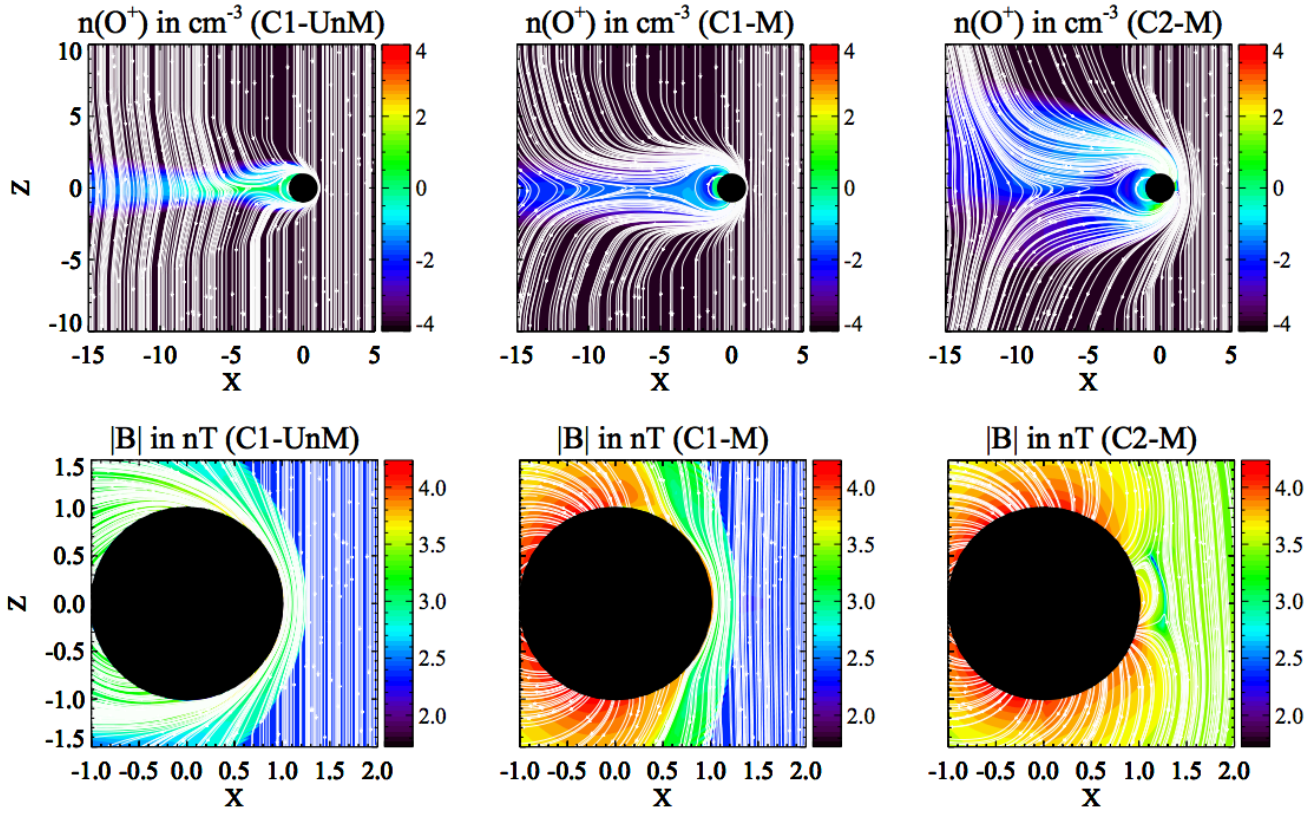
Atmospheric escape from M-dwarf exoplanets and implications for habitability

*Chuanfei Dong[1]



1. Princeton University

In the last two decades, the field of exoplanets has witnessed a tremendous creative surge. Research in exoplanets now encompasses a wide range of fields ranging from astrophysics to heliophysics and climate science. One of the primary objectives of studying exoplanets is to determine the criteria for habitability, and whether certain exoplanets meet these requirements. The classical definition of the Habitable Zone (HZ) is the region around a star where liquid water can exist on the planetary surface given sufficient atmospheric pressure. However, this definition largely ignores the impact of the stellar wind and stellar magnetic activity on the erosion of an exoplanet's atmosphere. Amongst the many factors that determine habitability, understanding the mechanisms of atmospheric loss is of paramount importance.

We will discuss the impact of exoplanetary space weather on the long-term climate evolution and habitability, which offers fresh insights concerning the habitability of exoplanets, especially those orbiting M-dwarfs, such as Proxima b and the TRAPPIST-1 planets. I will focus on a wide range of atmospheric compositions, ranging from exo-Venus candidates to ocean worlds; the latter being a unique class of planets with water-rich surfaces and atmospheres that do not currently exist in our Solar system. For each of these cases, we will demonstrate the importance of the exoplanetary space weather on atmospheric ion loss and habitability.

Keywords: atmospheric escape, planetary habitability, M-dwarf exoplanets, stellar wind and magnetic activity, Proxima b, the TRAPPIST-1 planets

Theoretical emission spectra of hot rocky super-Earths: Lack of alkali metals due to atmospheric escape

*Yuichi Ito[1,2], Masahiro Ikoma[2]

1. Department of Cosmosciences, Graduate school of Science, Hokkaido University, 2. Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo

Until today, over 1000 exoplanets whose radii are less than 2 Earth radii have been discovered. About 50% of those planets have radiative equilibrium temperatures high enough to melt and vaporize rock. Thus, if rocky like CoRoT-7b, they likely have atmospheres composed of rocky materials (e.g., Schaefer & Fegley 2009, Ito et al.2015). We call such a rocky vapor atmosphere a mineral atmosphere in this study. In addition, previous studies showed that atmospheric loss processes such as atmospheric escape cause selective depletion of Na and K in the atmosphere and magma ocean, because of the high-volatility and low abundance of Na and K in rocks. Also, our new 1-D hydrodynamic model of the highly UV-irradiated mineral atmosphere (Ito & Ikoma, in prep) suggests that the hydrodynamic escape is massive enough to remove completely Na and K during the early stage of the host star. Thus, the detection of a mineral atmosphere would provide definitive evidence that the planet is rocky. Moreover, identifying the mineral atmosphere composition, especially the presence or absence of Na and K, would give constraints on the magma composition which could trace not only the interior but evolution of planets.

In this study, we focus on the temperature-pressure structure and detectability for emission spectra of the mineral atmosphere in hydrostatic equilibrium on a hot rocky super-Earth. Also, we investigate the impact of the selective depletion of Na and K on the thermal structure and emission spectra. In order to investigate it, we use the hydrostatic/radiative/chemical equilibrium atmospheric model for mineral atmospheres (Ito et al. 2015) which calculates the gas-melt equilibrium composition of the mineral atmosphere, vertical thermal structure and secondary eclipse depths. We show our results for higher planetary equilibrium temperature (2500, 3000K) such as CoRoT-7 b and Kepler-10 b. We find that the thermal inversion structure of the mineral atmosphere without Na and K is hotter than that of the atmosphere with Na and K. This is mainly because the atmosphere inefficiently emits photons in visible wavelength region due to the lack of Na and K. Our feasibility assessment demonstrates that identification of mineral atmospheres with and without Na and K on hot rocky super-Earths in secondary transit is possible via observation from space telescopes.

Hot Rocky Super-Earths atmospheres, a revision of gas phase metal chemistry and the relevance of reverse chemistry

*Sebastian Danielache[1,2], Takahashi Yuta[1], Miguel Yamila[3], Simoncini Eugenio[4], Grassi Tommaso[5]

1. Department of Materials & Life Sciences, Faculty of Science & Technology, Sophia University, 2. Tokyo Institute of Technology, Earth-Life Institute , 3. Leiden Observatory, Leiden University, 4. Simoncini Telai Gambassi Terme, 5. University Observatory Munich, Ludwig-Maximilians-University

There are approximately 2600 reported exoplanets. Among these celestial bodies there is a class of super-Hearts with an orbit smaller than Mercury (0.387 AU) know as Hot Rocky Super-Earths (HRSE). The proximity of this rocky type of planets to their parent start means that their surface can be similar to Bulk Silicate Earth (BSE) at high temperatures. Currently, there are few attempts to estimate the atmospheric composition and chemistry of a HRSE.

A Climate of tidally locked terrestrial exoplanets

*Takanori Kodama[1]

1. University of Bordeaux

Most of the studies for habitable planets focus on to determine the boundary of the habitable zone. From observation of exoplanet, planets with mass between the Earth and super-Earth around low-temperature star have been discussed. The rotation of such a planet is locked due to the tidal effect from the central star because they locate near the central star.

On most of the previous studies, they used one-dimensional climate models and estimated the habitable zone assuming water-rich planets, like the Earth. Recently, studies of habitable climate using a three-dimensional climate model have begun. They show that the habitable zone estimated by 3D GCM (three-dimensional general circulation model) is greatly different from that by the 1D climate model. The most important difference is the distribution of cloud in the planetary atmosphere. A terrestrial planet with liquid water on the surface around a low-temperature star has clouds in high altitude around the sub-stellar point, leading higher albedo. As a result, it can maintain a warmer climate if it is located out of the habitable zone estimated by a 1D climate model. However, when the rotation period of a planet is short enough, the pattern of the circulation changes to the super-rotation. In this case, no such clouds are formed around the sub-stellar point.

I investigate the pattern of the circulation and habitability for TRAPPIST-1 d and Proxima Centauri b. Additionally, I also investigate the effect of the distribution of water on the planetary surface on the formation of cloud.

Current status of WSO-UV/UVSPEX for discovery of Earth-like planets

*Shingo Kameda[1], Osada Naoya[1], Takanori Kodama[2], Go Murakami[3], Keigo Enya[3], Masahiro Ikoma[4], Norio Narita[5], Naoki Terada[6], Hitoshi Fujiwara[7]

1. School of Science, Rikkyo University, 2. University of Bordeaux, 3. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 4. Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 5. National Astronomical Observatory of Japan, 6. Graduate School of Science, Tohoku University, 7. Faculty of Science and Technology, Seikei University

The World Space Observatory for Ultraviolet (WSO-UV) is an orbital optical telescope with a 1.7-m diameter primary mirror currently under development. The WSO-UV is aimed to operate in the 115- to 310-nm UV spectral range. Its two major science instruments are UV spectrographs and UV imaging field cameras with filter wheels. The WSO-UV project is currently in the implementation phase, with a tentative launch date in 2023. As designed, the telescope field of view in the focal plane is not fully occupied by instruments. Recently, two additional instruments devoted to exoplanets have been proposed for WSO-UV, which are the focus of this paper. UVSPEX, a UV-spectrograph for exoplanets, aims to determine atomic hydrogen and oxygen abundance in the exospheres of terrestrial exoplanets. The spectral range is 115 to 130 nm, which enables simultaneous measurement of hydrogen and oxygen emission intensities during an exoplanet transit. A study of exosphere transit photometric curves can help differentiate among different types of rocky planets. The exospheric temper- ature of an Earth-like planet is much higher than that of a Venus-like planet because of the low mixing ratio of the dominant coolant (CO2) in the upper atmosphere of the former, which causes a large difference in transit depth at the oxygen emission line. Thus, whether the terrestrial exoplanet is Earth-like, Venus-like, or other can be determined.

Origin of cosmic dust: Galaxy-scale perspective

*Akio Inoue[1,2]

1. Osaka Sangyo University, 2. Waseda University

Galaxies are the fundamental component of the Universe. In the Milky Way Galaxy and other galaxies in the present (i.e. nearby) Universe, the mass ratio of dust and stars integrated over a galaxy-scale is about 0.1%. On the other hand, in the Universe several hundreds million years after the Big Bang, some galaxies have been detected in dust with ALMA but others haven't. The dust-to-stellar mass ratio integrated in a galaxy-scale is distributed over more than an order of magnitude. In this talk, I will discuss the reason of this diversity in dust mass in the early Universe and the origin of dust in a galaxy-wide scale.

SPICA and future infrared observations of cosmic matters

*Issei Yamamura[1]

1. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency

SPICA (Space Infrared Telescope for Cosmology and Astrophysics) is an ESA-JAXA joint mission for infrared astrophysics. The main goal of the mission is to make significant contribution to answer the essential questions; how the universe has evolved to the current state of being rich in metals and cosmic dust, and how our solar system involving life has formed and developed.
SPICA is equipped with a 2.5 m telescope operated at cryogenic temperature (8 K). Three scientific instruments on board are SPICA Mid-infrared Instrument (SMI), SPICA Far-infrared Instrument (SAFARI) and Magnetic field explorer with Bolometric Polarimeter (B-BOP). SMI covers 18-36 μm with spectral resolutions R~100 or 2000, and 12-18 μm with R~28000 and it is also capable of imaging at 34 μm. SAFARI observes 34-230 μm in four wavelength bands at spectral resolution of R~300 or 2000-11000. B-BOP carries out imaging polarimetry at 100, 200, and 350 μm.
Thanks to the cryogenic telescope and the cutting-edge sensor technique, SPICA will realize sensitivity two orders of magnitude better than that in the previous missions such as Herschel. Significant fraction of the observing time will be open to the committee as proposal-based observations. Various celestial objects can be targets for observation with SPICA. For instance, high-quality spectroscopic data of trans-Neptunian objects and planet-forming circumstellar disks may clarify detailed formation process of our solar system. Observation of circumstellar dust of mass-losing stars at various environments will inform us how the cosmic dust are provided into our universe.
SPICA was selected as one of three candidates for ESA Cosmic Vision M5 mission from 25 proposals in May 2018, and it is currently under conceptual design. JAXA is a major partner, and will provide cryogenic payload module (PLM) and SMI. SAFARI and B-BOP are provided by the European consortia. The final selection of M5 will be in mid 2021, and the launch is expected to be late 2020's.

Engineering first light of a new mid-infrared instrument MIMIZUKU

*Takafumi Kamizuka[1], Takashi Miyata[1], Shigeyuki Sako[1], Ryou Ohsawa[1], Masahito S. Uchiyama[1], Tomohiro Mori[1], Yutaka Yoshida[1]

1. Institute of Astronomy, School of Science, the University of Tokyo

The University of Tokyo is currently constructing an observatory, the University of Tokyo Atacama Observatory (TAO), in the Atacama Desert in Chile. The site is located at the summit of Cerro Chajnantor, whose altitude is 5640 m. The high altitude and the dry climate decrease the water vapor in the atmosphere (Precipitable Water Vapor <0.5 mm) and improve the atmospheric transmittance in the infrared region. Therefore, the site is one of the most ideal places for infrared observations on the ground. By placing a large-aperture telescope (6.5 m in diameter) at the site, we make the TAO a cutting-edge facility for infrared observational astronomy. The Mid-Infrared Multi-field Imager for gaZing at the UnKnown Universe (MIMIZUKU) is the first-generation mid-infrared instrument for the TAO. The main features of MIMIZUKU are: 1) wide wavelength coverage from 2 to 38 microns, 2) high-spatial resolution, and 3) accurate calibration of the atmospheric absorption. The wide wavelength coverage is achieved by installing three optical channels, NIR, MIR-S, and MIR-L, covering 2.0-5.3, 6.8-26, and 24-38 microns, respectively. Each channel can perform imaging and low-resolution spectroscopic observations. The high spatial resolution is achieved by the large-aperture telescope, which determines diffraction-limited spatial resolution. The calibration accuracy of the atmospheric absorption is improved by installing a special optical device called Field Stacker. The Field Stacker has three movable mirrors and is placed on the telescope focal plane. The mirrors pick off the light from two sky regions and combines them into one field. Then, we can observe two different sky regions simultaneously. By using this function, we can perform simultaneous observations of scientific target and reference object. Simultaneous observations allow us to compensate the time variation of the atmospheric absorption and improve accuracy of its calibration. If this function successfully works, we can realize stable and accurate observations even in wavelength regions with low atmospheric transmittance, like ozone absorption region around 9.6 microns and long-wavelength mid-infrared regions in >20 microns.

Ahead of the completion of the TAO, planned around late-2020, engineering observations of MIMIZUKU were carried out at the Subaru telescope in July and December, 2018. In these observations, the functions of the MIR-S channel and the Field Stacker device were tested. As for the imaging functions, the spatial resolutions in the N- and Q-bands were confirmed to be 0.32 and 0.59 arcsec, respectively. It means that MIMIZUKU can achieve diffraction-limited images in the mid-infrared regions. As for the spectroscopic functions, spectral resolutions for the N- and Q-band modes were measured to be 180 and 100, respectively. These are consistent with the designed values. In addition, the effectiveness of the Field Stacker on the calibration of the atmospheric absorption were also confirmed. It was found that we can reduce the photometric uncertainty to a few percent even under the condition where the photometric count varies with >10 % (p-v) due to the atmospheric variation. As for the spectroscopy, Q-band spectroscopic observations, which have been difficult in ground-based observations, were realized. We found that the atmospheric absorption can be calibrated with the Field Stacker and that we can get spectra in 17-24.5 microns with fluctuations less than 5%.

These capabilities enable us to perform wide-wavelength spectroscopic monitoring observations. Such observations are useful to investigate time variation of temperature and amount of dust produced by dust-forming events around evolved stars like red giants and supernovae. In this presentation, we will

Properties and space exposure of Quenched Nitrogen-included Carbonaceous Composite (QNCC)

*Izumi Endo[1], Itsuki Sakon[1], Takashi Onaka[1], Yoko Kebukawa[2], Kensei Kobayashi[2], MITA Hajime[4], Hajime Yano[3]

1. University of Tokyo, 2. Yokohama National University, 3. ISAS/JAXA, 4. Fukuoka Institute of Technology

Organics are abundant in the present universe. However, we have limited knowledge on their origin and how they have contributed to life in solar system. The Unidentified Infrared (UIR) bands are ubiquitously seen in the various astronomical environments and should be important signals to understand how the primitive form of organics has emerged in the universe because the carriers of the bands are generally believed to be organic species. We have, for the first time, succeeded in synthesizing laboratory organics called Quenched Nitrogen-included Carbonaceous Composite (QNCC) whose infrared properties successfully reproduce the characteristics of the UIR bands observed around classical novae. We have found that N/C ratio (atom) of QNCC is 3-5% based on the measurement with Elemental Analyzer/Isotope Ratio Mass Spectrometer (EA/IRMS). X-ray Absorption Near Edge Structure (XANES) analysis of QNCC have indicated that amine (C-N) structures are contained in the QNCC. We have concluded that amine structures contribute to the broad feature around 8μm which characterize the UIR bands observed around classical novae. The broad band around at 8μm seen in infrared absorption spectra of QNCC is also seen in those of insoluble organic matter (IOM) in carbonaceous chondrites. N/C ratio of QNCC is almost consistent with that of IOM (2-5%). Therefore, QNCC is an important material to investigate the origin of primitive organics in solar system.
Based on above results we have launched a new space exposure experiment of QNCC using ExHAM (Exposed Experiment Handrail Attachment Mechanism) on the International Space Station (ISS) / Japanese Experiment Module ‘Kibo’. This space exposure experiment aims to verify the hypothesis that organics which originates in evolved stars have delivered and contributed to primitive organics in solar system by investigating the changing in properties of QNCC exposed in solar neighborhood space environment and comparing with those of organic matter contained in meteorites. In this presentation, we will report the nature of QNCC which is the strong candidate of the carriers of the UIR bands observed around classical novae and the latest progress of space exposure experiment of QNCC.

Shape dependence of dust absorption opacity in the Rayleigh domain

*Ryo Tazaki[1], Hidekazu Tanaka[1]

1. Astronomical Institute, Tohoku University

In various astrophysical environments, dust absorption opacity must be assumed to estimate dust mass by observations. Cosmic dust particles often have radii smaller than FIR or more longer wavelengths, and hence, they are typically in the Rayleigh domain at these observing wavelengths. It is known that absorption opacity in the Rayleigh domain sensitively depends on the shape of dust particles. In this study, we study how dust coagulation alters absorption opacity in the Rayleigh domain by using the T-Matrix Method. We find that higher-order terms of harmonic expansion of the electromagnetic field must be taken into account to reproduce strong field appearing around contact points between monomer particles. As a result, we show that coagulation can enhance dust absorption opacity by a factor of about 2 for silicate and about 5 for carbonaceous particles. We discuss appropriate approximate methods to mimic the shape effect of dust absorption opacity.

Keywords: Non-spherical dust particles, Absorption opacity, T-Matrix Method

Modeling of the H_2 ortho-para spin conversion on grain surfaces in star- and planet-forming regions

*Kenji Furuya[1], W. M. C. Sameera[2], Tetsuya Hama[2], Naoki Watanabe[2], Yuri Aikawa[3]

1. Center for Computer Sciences, University of Tsukuba, 2. Institute of Low Temperature Science, Hokkaido University,, 3. The University of Tokyo

Hydrogen is the most abundant element in the universe. In star- and planet-forming regions, hydrogen is primary present in H_2, which has two nuclear spin configurations, ortho and para. As the internal energy difference between ortho-H_2 and para-H_2 (170 K) is much higher than the typical temperature of star-forming regions (around 10 K), the H_2 ortho-to-para ratio (OPR) can affect the chemical evolution, including deuterium fractionation, significantly.

H_2 molecules form on grain surfaces with the statistical OPR of three. The ortho-para spin conversion proceeds through proton exchange reactions with H^+ and/or with H_3^+ in the gas phase. Laboratory experiments have found that the H_2 spin conversion can also occur on bare grains and on amorphous water ice in laboratory timescales (around a few hours). Given this very short timescale, it has been thought that the spin conversion on surfaces affects the H_2 OPR evolution in star- and planet-forming regions. However, its efficiency in the astronomical conditions remains unclear; almost all H_2 is present in the gas phase rather than on grain surfaces, and thus the spin conversion timescale of overall H_2 (i.e., gas + solid) via the spin conversion on surfaces depends on how efficiently gaseous and solid H_2 interact.

We investigate the efficiency of the H_2 spin conversion on grain surfaces under physical conditions that are relevant to star- and planet forming regions. We utilize the rate equation model that considers adsorption of gaseous H_2 on grain surfaces which have a variety of binding sites with different potential energy depth, thermal hopping and desorption of adsorbed H_2, and the spin conversion. We find that the conversion efficiency depends on H_2 gas density and surface temperature. As a general trend, increased H_2 gas density reduces the conversion efficiency, while the temperature dependence is not monotonic; there is a critical temperature at which the efficiency is maximum. We will discuss whether the spin conversion on surfaces can dominates over that in the gas-phase in star- and planet-forming regions.

Thermal processes of primary silicate dust in protoplanetary disk: Constraints from oxygen isotope exchange kinetics between amorphous silicate and water vapor

*Daiki Yamamoto[1], Shogo Tachibana[2], Noriyuki Kawasaki[1], Minami Kuroda[1], Naoya Sakamoto[3], Hisayoshi Yurimoto[1,4]

Mass-independent oxygen isotope variations of extraterrestrial materials is considered to be a result of oxygen isotope exchange between ^{16}O-rich primitive materials and ^{16}O-poor gaseous reservoirs (Yurimoto & Kuramoto, 2004; Lyons & Young, 2005). Because the isotope exchange rate is controlled by the physicochemical condition of protoplanetary disks, oxygen isotopic compositions of extraterrestrial materials could be a good tracer for the disk conditions. However, little has been known about the kinetics of isotope exchange reaction for oxygen in the disks. We focused on oxygen isotope evolution of amorphous silicate dust, which is recognized as primitive material in protoplanetary disks, and investigated oxygen isotope exchange kinetics between amorphous silicates and water vapor.

A series of oxygen isotope exchange experiments between submicron-sized grains of amorphous silicate with forsterite and enstatite stoichiometry and ^{18}O-enriched water vapor (97% ^{18}O) were carried out at 803–1123 K and water vapor pressure (P_{H2O}) of 0.01–1 Pa using a gold-mirror vacuum furnace equipped with a gas flow system (Yamamoto & Tachibana, 2018). The run products were analyzed with FT-IR (JASCO FT-IR 4200), XRD (Rigaku SmartLab), and FE-SEM (JEOL JSM-7000F). The bulk oxygen isotope composition was determined as an average of multiple measurements for a pelletized sample by SIMS (Cameca ims-6f and -1280HR).

An infrared absorption peak of amorphous silicate at ~10 micron shifted to longer wavelengths with time by annealing with $H_2{}^{18}O$ vapor of 0.3 Pa at 803–883 K for amorphous forsterite and at 923–1003 K for amorphous enstatite, whereas such a shift was not observed for samples annealed in the presence of isotopically normal water vapor of 0.3 Pa. The relative peak shifts of the 10 micron feature of amorphous forsterite and enstatite correlate with their oxygen isotopic compositions, suggesting that the peak shift was caused by the isotope exchange of oxygen between amorphous silicates and $H_2{}^{18}O$ vapor. Temporal change of the degree of isotope exchange under these conditions was governed by diffusive isotope exchange with the isotope exchange rate of D ($m^2\ s^{-1}$) = (1.5 ±1.0) $\times 10^{-19}$exp[−161.5 ±14.1 (kJ mol^{-1}) R^{-1} (1/T−1/1200)] for amorphous forsterite and D ($m^2\ s^{-1}$) = (5.0 ±0.2) $\times 10^{-21}$exp[−161.3 ±1.7 (kJ mol^{-1}) R^{-1} (1/T−1/1200)] for amorphous enstatite. At P_{H2O}= 0.01 Pa, the isotope exchange reaction for amorphous forsterite is controlled by a supply of water vapor at 853 and 883 K, and the supply-controlled isotope exchange rate was evaluated. Crystallization of amorphous forsterite dominated over oxygen isotope exchange at a higher temperature of 1073 K because crystallization precedes the oxygen isotope exchange reaction. The oxygen isotope exchange timescales for amorphous forsterite and enstatite dust under protoplanetary disk conditions suggest that the primary oxygen isotope signatures of amorphous silicate dust would be erased by thermal annealing at temperatures above 500–650 K within the lifetime of protoplanetary disks.
Cometary silicate dust collected by the Stardust mission has ^{16}O-poor isotopic compositions close to the

©2019. Japan Geoscience Union. All Right Reserved.

terrestrial value (McKeegan et al., 2006; Nakamura et al., 2008). If primitive silicate dust in the protosolar disk has the same ^{16}O-rich composition as the Sun, this observation implies that comets accreted silicate dust that was thermally processed at temperature above ~500–650 K in the inner Solar System and transported to the comet formation region (e.g., Nuth, 1999; Ciesla, 2007). This could also explain that presolar silicate grains are not a major component in cometary silicates (Floss et al., 2013). The effective radial transport of inner disk materials to the outer part of protoplanetary disks may provide some constrains on the dynamics of protoplanetary disks prior to planet formation.

Birth-place of comet 17P/Holmes from its mass fractions of minerals

*Shinnaka Yoshiharu[1], Takafumi Ootsubo[2], Hideyo Kawakita[1], Mitsuru Yamaguchi[1], Mitsuhiko Honda[3], Jun-ichi Watanabe[4]

Comets are considered as the most pristine icy small objects in the solar system. They are likely to have kept the information about the solar system formation. Physical properties of cometary dust grains and composition of cometary volatiles are precious clues to physico-chemical conditions of the solar nebula. Comet 17P/Holmes is a Jupiter-family comet with an orbital period of ~7 yrs. Comet Holmes exhibited a great outburst starting on UT 2007 October 23 when the comet was 2.5 au from the Sun and five months after the perihelion passage. Because the observed relative abundance ratios of volatiles with respect to water in comet Holmes are enriched compared with other comets (Dello Russo et al. 2016, Icarus, 278, 301), it is thought that the nucleus of comet Holmes formed at a further distance from the Sun in the solar nebula (SN).

Silicate grains in the interstellar space are considered almost in amorphous form (only a few percent of mass or less is considered as crystalline for silicate; Kemper et al. 2004, ApJ, 609, 826). However, abundant crystalline silicate grains have often been found in cometary grains (up to ~80% by mass with large variety among comets; Hanner et al. 1994, ApJ, 425, 274; Wooden et al. 1999, ApJ, 517, 1034; Ootsubo et al. 2007, P&SS, 55, 1044, and references therein). It is thought that these crystalline silicates in comets formed by annealing of interstellar amorphous silicate grains or by direct condensation of gaseous materials in a hot region of the SN, and incorporated into cometary nuclei after they were transported to the cold comet-forming region (several to 30 au from the Sun). In this scenario, it is expected that mass fraction of the crystalline silicates in cometary dust grains tends to be smaller at further distances from the Sun.

We discuss the possibility that comet Holmes formed in a colder region in the SN rather than other comets based on the mass fraction of crystalline silicates in silicate grains. We derived mineral abundances in comet Holmes by applying the thermal emission model for cometary dust grains (Ootsubo et al. 2007, P&SS, 55, 1044; Shinnaka et al. 2018. AJ, 156, 242) to the mid-infrared spectra of comet Holmes taken with the COMICS on the Subaru Telescope from UT 2007 October 25 to 28. The derived mass fraction ratios of crystalline silicate of comet Holmes (~30%) is the almost smallest among comets studied in previous articles, supporting the hypothesis that comet Holmes formed at a further distance from the Sun in the SN compared with other comets. At such a cold region, hyper volatile ices like CO and amorphous water ices (possible energy sources for explosive sublimation) would be abundant.

Comparison of grain properties in interplanetary dust from different types of parent bodies by mid-infrared spectroscopic observations with AKARI

*Aoi Takahashi[1], Takafumi Ootsubo[2], Hideo Matsuhara[2], Fumihiko Usui[3], Itsuki Sakon[4], Hiroki Chihara[5]

1. The Graduate University for Advanced Studies, 2. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 3. Kobe University, 4. University of Tokyo, 5. Osaka Sangyo University

Interplanetary dust (IPD) diffusely distributes in interplanetary space and is thought to be recently supplied from the inside of primordial planetesimals like asteroids or comets. The IPD’ s grain properties, such as compositions and crystal morphologies, depend on the types of parent bodies and can give us the information on the environment in the proto-solar system. The properties can be investigated in terms of silicate features around 10 μm seen in the zodiacal emission spectra. Since the IPD originating from different types of the parent bodies have different spatial distributions, it is important to survey the silicate features at various sky directions. For example, the asteroidal IPD locally distributes at low specific ecliptic latitudes and observed as band structures near the ecliptic plane. On the other hand, because of the variety of comets' inclinations, the cometary IPD distributes more globally than the asteroidal IPD does. The IPD from theJupiter Family Comets (JFCs) can form the dust cloud with a broad distribution in ecliptic latitudesaround the ecliptic plane, while the IPD from the Oort Cloud Comets (OCCs) is expected to distribute isotropically.

We obtained the high signal-to-noise zodiacal emission spectra at 74 different directions of the sky by using the mid-infrared slit-spectroscopic data obtained with the Infrared Camera on board the Japanese AKARI satellite. They exhibit the excess emission feature at the 9-12 μm range and even some sharp peaks. In order to identify the constituents, we compared the shape of spectral featureswith absorption coefficients of 4 types ofcandidate materials: amorphous with olivine composition, amorphous with pyroxene composition, forsterite (Mg2SiO4, one of olivine crystals), and ortho-enstatite (MgSiO3, one of pyroxene crystals).

The IPD was found to typicallyinclude small silicate crystals, especially enstatite grains with extreme crystal morphologies. We also found that the shape of spectral features slightly changesdependingon the sky directions.As the result of the investigation into peak wavelengths and the excess strength of each peak, the IPD at the higher ecliptic latitudes seems to have lower olivine/(olivine+pyroxene) ratio.At the sky directions toward the asteroidal dust band structures, the feature shapes show a difference which cannot be explained only by the difference in theolivine/(olivine+pyroxene) ratioand may indicate contamination of the hydrated minerals.

We will present the results of the grain properties of the IPD originating from some types of the parent bodies, and give the implications for the environment in the proto-solar system.

Formation of forsterite crystal induced by ultraviolet irradiation of water ice ice on amorphous Mg_2SiO_4 particles

*Akira Kouchi[1], Yuki Kimura[1], Yasuhiro Oba[1], Tetsuya Hama[1], Naoki Watanabe[1], Shogo Tachibana[2], Akira Tsuchiyama[3], Satomi Enju[3], Takafumi Ootsubo[4]

In comets, both crystalline and amorphous silicates have been observed by infrared telescopes. It has been proposed that crystalline silicates were formed by annealing of amorphous silicates, direct condensation in hot region of proto-solar nebula, or heating due to radical recombination in organic refractory mantle. In the present study, we have experimentally investigated another possibility, heating due to radical recombination in water ice by ultraviolet (UV) irradiation.

Three amorphous silicate fine particles made by gas condensation using induction thermal plasma (ITP) were used as starting materials: Mg_2SiO_4, $MgSiO_3$, and GEM-like composition (SiO_2-rich). Amorphous fine particles were put on amorphous Si thin film (5 nm in thickness), and cooled to 10 or 82 K in ultra-high vacuum transmission electron microscope. Amorphous water ice was prepared by vapor-deposition on the sample, and irradiated with a D_2 lamp. During UV irradiation, structural change was observed by electron diffraction.

We observed the formation of forsterite crystals from amorphous Mg_2SiO_4 at 82 K, whereas the crystallization did not occur at 10 K. No crystalline phase was observed for amorphous $MgSiO_3$ and amorphous GEM-like silicate at 10 and 82 K.

These results could be explained by radical-radical recombination reactions following the photodissociation of water molecules by UV-rays, reactions (1) and (2),

$H_2O + UV \rightarrow OH + H.$ (1)

$OH + H \rightarrow H_2O + 4.8$ eV. (2)

The formation of forsterite crystals can be induced by the energy released by reaction (2) only for amorphous Mg_2SiO_4, because the value of 4.8 eV is sufficiently larger than the activation energy for crystallization of amorphous Mg_2SiO_4 (3-4 eV), but smaller than that of amorphous $MgSiO_3$ (9 eV) and amorphous GEM-like silicate. No forsterite formation at 10 K may be explained by the low mobility of H atoms and OH radicals at the ice/Mg_2SiO_4 interface at 10 K, which strongly decrease the efficiency of reaction (2) compared with 82 K.

From these results, we propose a new route for the formation of crystalline forsterite in cometary coma by solar UV irradiation with ice-covered amorphous Mg_2SiO_4 particles. Comparison with observation will be presented.

Condensation experiments in the sytem Fe-Mg-Si-O-S using induction thermal plasma: implication to GEMS forming condition

*Satomi Enju[1], Hayate Kawano[1], Hisashi Komaki[2], Akira Tsuchiyama[1]

1. Department of Earth and Planetary Sciences, Graduate School of Science, Kyoto University, 2. JEOL Ltd.

GEMS (Glass embedded metal and sulfides) are the major component of CP-IDPs, which are thought to be one of the most primitive materials in the solar system [1]. Synthetic experiments based on the condensation model [1] are performed to form GEMS analogue particles [2, 3], but systematic experiments including sulfur are not performed so far. In this study, synthetic experiments are performed in the system Fe-Mg-Si-O-S, with systematic change in redox condition, to understand the GEMS forming condition.

Induction thermal plasma (ITP) system was used for the condensation experiment. This system creates high temperature plasma (up to 10^4 K) which evaporates the starting material, and forms condensates in the rapid cooling environments. Plasma gas is Ar and He, with chamber pressure 70 kPa. Starting material are mixture of powder regents (SiO_2, Si, MgO, Fe, FeS_2) with GEMS mean composition [1]. Redox condition change by SiO_2/Si ratio and feeding rate (fd) of the starting material. 10 experiments are performed in total. Products were analyzed by X-ray diffraction, scanning electron microscope and transmission electron microscope.

Products were composed of fine grained condensates and coarse grained evaporation residues (1-100 μm). All condensates were formed of amorphous silicate (AS) spheres, 10-100 nm in diameter. They coexist with Fe bearing particles (<30 nm), inside and on the surface of the AS. Condensates were categorized into the following five types.

A: Fe-rich AS, including Fe metal particles

B: Fe-rich AS, with FeS particles on the surface

C: Fe-rich AS showing biphasic separation texture, with FeS particles on the surface

D: Fe-poor AS showing biphasic separation texture, with Fe particles coexisting with FeS on the surface

E: Fe-poor AS showing biphasic separation texture, with Fe_3Si (gupeiite) particle coexisting with MgS (niningerite) or FeS particles on the surface

Type A, B and C were observed in the oxidative experiment, type A and D in the intermediate experiment and type E in reductive experiment.

Formation process was considered, taking into account the grain formation process model [4]. As a basic process, AS condensates first, followed by Fe particles and finally formation of sulfides. In oxidative condition, some Fe are taken into AS as FeO (type A, B), and for the lack of Fe in gas, Fe particles did not condensate or minor condensates sulfidated into FeS (Type B, C). If there was abundant Fe in gas, Fe particles condensates on the surface of AS at relatively high temperature above glass transition temperature, and moves inside the melt before sulfidation due to surface energy (type A). In reductive

©2019. Japan Geoscience Union. All Right Reserved.

condition, Fe is scarcely included in AS (type D, E). In type D, Fe metal particles condensates on the surface of the AS glass and partially sulfidized. Type E is the most reductive condition, Fe_3Si occurring instead of Fe metal, with MgS and FeS.

In this study, synthesized condensates had some of the features of GEMS, but condensates completely similar to GEMS (Fe-poor AS including many Fe metal particles, with FeS on the surface) was not observed. Considering the formation model in the study, GEMS is thought to be formed in the redox condition similar to type C-D. In their formation, Fe particles condensates at relatively high temperature on the surface of AS and moves inside the melt (like type A), and condensation of Fe particles continues at the surface of the AS below glass transition temperature, which is followed by sulfidation.

The initial abundance of ^{92}Nb in the outer solar system.

*Yuki Hibiya[1,2], Tsuyoshi Iizuka[2], Hatsuki Enomoto[2]

1. Japan Agency for Marine-Earth Science and Technology, 2. The University of Tokyo

Introduction: The *p*-process radionuclide niobium-92 (^{92}Nb) decays to zirconium-92 (^{92}Zr) by electron capture with a half-life of 37 million years (Ma). The system is a promising chronometer for addressing the early solar system evolution and planetary differentiation [1, 2]. Thus, the initial abundance of ^{92}Nb and its distribution in the early solar system provide valuable constraints on the time-scale of our solar system evolution, and on the origin of *p*-process nuclides. The initial ^{92}Nb abundance at the solar system formation was previously determined to be $(^{92}Nb/^{93}Nb)_0 = (1.7 \pm 0.6) \times 10^{-5}$, applying the internal isochron approach to the NWA 4590 angrite (U–Pb age: 4557.93 ±0.36 Ma) [2]. This value is consistent with those obtained from eucrites, ordinary chondrites, and mesosiderites [1, 3], indicating that ^{92}Nb was homogeneously distributed among their source regions. Yet, all samples previously studied for ^{92}Nb are thought to have originated from the inner solar system. Here we report internal Nb–Zr isochron dating of Northwest Africa (NWA) 6704.
NWA 6704 is a primitive achondrite having a fresh igneous texture [4] with a U–Pb age of 4562.76 ±0.30 Ma [6]. This meteorite underwent melting above liquidus temperature and subsequent rapid cooling (> 10^{-1} °C/yr; [4]), making the effect of differing closure temperatures between the U–Pb and Nb–Zr systems insignificant. Furthermore, this meteorite has $\Delta^{17}O$, $\varepsilon^{50}Ti$, $\varepsilon^{54}Cr$ and $\varepsilon^{84}Sr$ values similar to those of carbonaceous chondrites [4-6], indicating that it samples the same reservoirs in the solar nebula as the carbonaceous chondrite parent bodies (i.e., the outer solar system). Thus, NWA 6704 enables us to evaluate the distribution of ^{92}Nb between the inner and outer solar system for the first time.

Results & Discussion: We prepared mineral and whole rock fractions from five fragments of NWA 6704. All Nb–Zr isotopic data were obtained by the ICP mass spectrometry. The isochron defines an initial $^{92}Nb/^{93}Nb$ of $(2.8 \pm 0.3) \times 10^{-5}$ at the time of NWA 6704 formation. By combining this value with the U–Pb age of NWA 6704, an initial $^{92}Nb/^{93}Nb$ of $(3.0 \pm 0.3) \times 10^{-5}$ at the time of solar system formation is derived. The obtained value is distinctly higher than the initial value in the inner solar system of $(1.7 \pm 0.6) \times 10^{-5}$ [2]. This indicates that ^{92}Nb was heterogeneously distributed in the protoplanetary disk before the formation of NWA 6704, and was relatively enriched in the outer solar system. The difference between these two initial values causes the apparent Nb–Zr age difference of ~30 Ma, demonstrating that the current canonical value of $(^{92}Nb/^{93}Nb)_0 = (1.7 \pm 0.6) \times 10^{-5}$ should not be used for the Nb–Zr dating of planetary materials from the outer solar system. The newly obtained initial $^{92}Nb/^{93}Nb$ value is clearly higher than the expected value in the model of ^{92}Nb synthesis by Type Ia supernova (SNIa) [7]. Thus, our results require another production site to be invoked for selectively producing ^{92}Nb. At the moment, only the ν-process in Type II supernova (SNII) [8] satisfies such requirement. If so, our finding suggests that the time-interval from the last SNII explosion to the formation of our solar system needs be <100 My and that nuclides synthesized by the last SNII were preferentially implanted or preserved in the outer solar system. Such enrichment of the last SNII components in the outer solar system may account for the isotopic dichotomy between carbonaceous and non-carbonaceous meteorites [e.g., 9].

[A-AS06] Progress in dense observation and numerical modeling of micro-scale meteorology

convener:Junshi Ito(Atmosphere and Ocean Research Institute, The University of Tokyo), Kentaro Araki(Meteorological Research Institute), Jun-ichi Furumoto(Research Institute for Sustainable Humanosphere, Kyoto University), Kuniaki Higashi(Research Institute for Sustainable Humanosphere, Kyoto University Metroweather Co., Ltd.), Chairperson:Junshi Ito(The University of Tokyo), Kentaro Araki(Meteorological Research Institute)

Recent progresses in observations and numerical simulations enable to unveil details in micro- or sub-kilometer scale meteorology. Low level convergences and heat island effects in the micro-scale may be sometimes associated with extreme atmospheric phenomena such as wind gusts and torrential rainfalls. Numerical simulations with very fine resolution may even predict occurrences of such phenomena. This session is welcome to researches and future scopes in the field of micro-scale meteorology.

The Shonai area railroad weather project has investigated fine-scale structure of wind gust dynamics and kinetics such as tornadoes, downbursts, and gust fronts. As part of the project, in order to improve our understanding of near-surface tornadic features, we developed a linear array of wind and pressure sensors (**LAWPS**: **L**inear **A**rray of **W**ind and **P**ressure **S**ensors) for high resolution in situ measurements in winter tornado cores. The wind and pressure sensors were deployed along a 1.2-km-long linear array that is located parallel to and about 100m from the shoreline. Wind data are obtained using 12 two-dimensional fast-response ultrasonic anemometers placed at a height of 5 m at intervals of 100 m. Pressure data are obtained using 25 barometers placed at a height of 50cm at intervals of 50 m. The pressure ports are designed and loaded to the barometers to reduce the dynamic pressure associated with wind and turbulence. Sampling intervals for both wind and pressure measurements are 100 msec and the sampling are synchronized by the external trigger from data logging computer. In this presentation, the system overview and the measurement technique will be described.

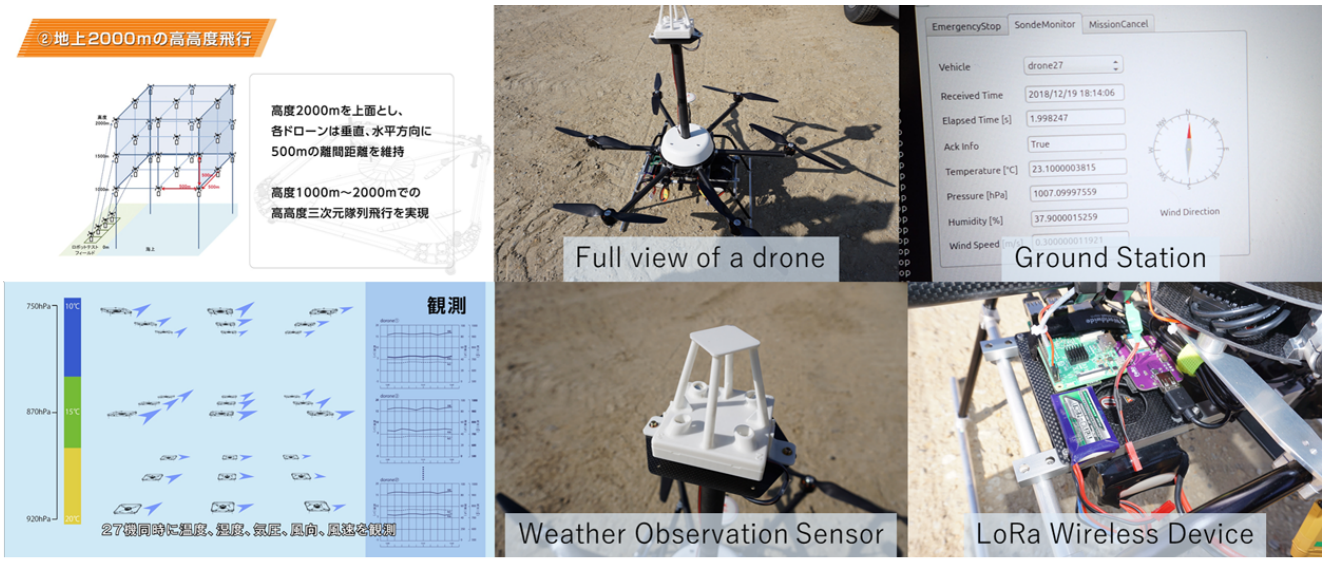
Mesoscale fixed point weather observation architecture by Drone fleet

*Yuichi Yaguchi[1], Masayuki Itaha[4], Shuzo Nakano[3], Kazuhiko Yamagishi[2], Tatsuya Iyobe[5]

1. The University of Aizu, 2. e-Robotics Fukushima Co., Ltd., 3. East-Japan Accounting Center Co., Ltd., 4. Japan Environment Research Co., Ltd., 5. Iyobe Shoji Ltd.

To know the generation mechanism of low clouds in the troposphere, we need to place a weather sensor with a certain density in the space of the radius from 2 to 20 km and from 1000 to 2000 meters altitude as the mesoscale meteorological observations. Such the studies of meteorological observations such as Mesonets (Rezaul. MAHMOOD, et. al., 2017) in the United States, and also studied in Japan (Kazuo SAITO, 2012), measure the weather information from the ground and satellites as the mesoscale meteorological observations. For practically, this information is used as a high-precision weather forecast with simulation (Kazuo SAITO, 2016). However, SODAR and LIDAR used for observation from the ground have limitations on the degree to measure wind direction and wind power (Dimitrios V. KANELLOPOULOS, 2016, Yoshiki ITO, 2009). Radiosonde is possible to measure the wind direction and force, but it has also limitation to sense from 2000 to 10000 meters because it cannot be placed directly at a specific point and can only obtain point information in chronological order. Although observations using aircraft can obtain temperature and humidity, it is difficult to correctly obtain wind direction and force based on the moving speed of the aircraft and turbulence of air current caused by the aircraft itself. The satellite sensor is one of the strong tool for large-scale meteorological measurement, but the spatial resolution is about 1.5 km and it is very difficult to sense a small area (Ryosuke NIWA, 2009).



In this research, in order to solve these problems by direct measurement, we propose a technique to measure using unmanned aerial vehicles at the same time. Specifically, six-propellers multicopter, generally called a drone which can hover for about 30 minutes per one and has a wind resistance of 20 m/s is manufactured, and a portable weather observation device utilizing ultrasonic wave is installed here. This meteorological observation device calculates the wind direction and wind force by calculating biaxial wind force by using ultrasonic waves. In addition, we install atmospheric temperature, humidity and barometer on weather observation equipment, and store on the payload computer a drone a measurement that is equal to or higher than the radiosonde. This meteorological observation device is raised by a mast to a height that does not affect disturbance of draft airflow measured in advance and measures it. In addition, the data accumulated in the payload computer are organized at about once every second, and it is transmitted to the ground from the 920 MHz compact power-saving radio station based on the LoRa modulation method and it is possible to display in real time. We can sense weather information at a fixed point on the mesoscale by aggregating this data at the same time at multiple sites through the Internet. In addition, since multi-copiers are out of the category of light aircraft of the aeronautical law up to 25 kg weight, we can easily skip to the altitude prescribed by the aeronautical law at the present time. However, since the altitude aimed for this research is to fly at a height where the clouds can reach from 1000 m to 2000 m, it is necessary to negotiate with the Ministry of Land, Infrastructure and Transport and air traffic control in advance.

As an actual demonstration, it was verified whether the drone of a single machine can be raised to an altitude of 500 m, 1000 m, 1500 m, 2000 m, respectively, and real time measurement can be performed. In the experiment conducted between 6:30 and 7:00 in the morning on 20, 21, 22 December 2018, the wind speed on the ground was about 3 to 5 m/s, but at the altitude of 1500 m it was 13 m / s For the first time. In addition, we confirmed that such information is transmitted to the ground in real time and can be

©2019. Japan Geoscience Union. All Right Reserved.

viewed directly. Moreover, using another drone equipped with the equivalent system, 27 drones flying into mesh type of 3 x 3 x 3 at intervals of 30 m in a space up to 100 m in height, verified to stay at the fixed point, succeeded doing. Using these combinations makes it possible to observe a fixed point in a wide area.

Potential of dense weather event observation using surface optical fiber cable and DAS technology

*Tsunehisa KIMURA[1]

1. Schlumberger

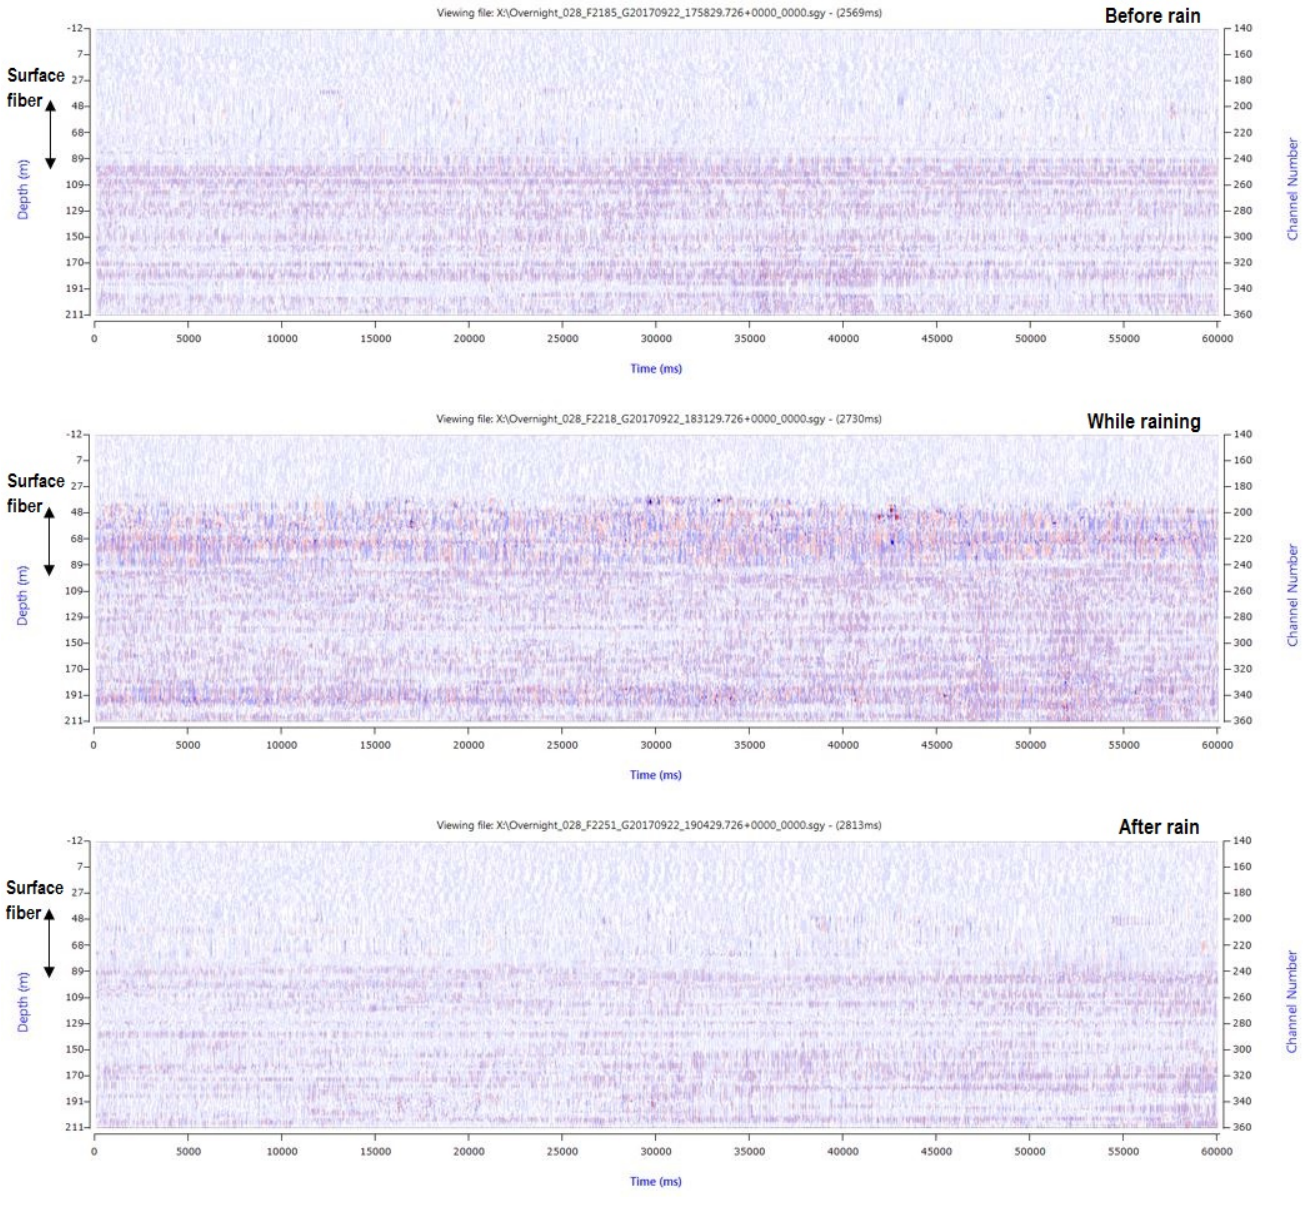
Distributed acoustic sensing (DAS) technology is introduced in the oil and gas industry from around 2011 for monitoring pipelines and sensing intruders. In recent years, application of the latest optical fiber sensing technology using differential phase data called heterodyne distributed vibration sensing (hDVS) has made it possible to acquire the seismic data including the Vertical Seismic Profile (VSP)[1)]. Three-dimensional imaging can also be performed by a 3DVSP method[2)]. We have described the observation of natural earthquakes and waves, targeting the detection of tsunamis, using the hDVS device at recent JpGU and the seismological society of Japan (SSJ)[3)].

In September 2017, in cooperation with the Engineering Advancement Association of Japan (ENAA), we conducted a demonstration experiment of DAS technology including earthquake observation using optical fiber cable buried at depth of about 20 cm. Of the 400 m long optical fiber cables, 300 m was set back and forth in a 100 m long trench and the remaining 100 m was made to run along the ground surface, and then connected to a hDVS Tier-3 acquisition device. In other words, the optical fiber cable of about 50 m section that caused the ground to travel was under an environment susceptible to changes in weather. On the second day of the 4-day observation period, there was also a time zone in which rain fell and occasionally intense. Especially during the nighttime, continuous observation was carried out, so the fiber optic cable that crawled on the ground surface has not only accidental phenomena such as car traffic ground noise and natural earthquake, but also stationary phenomenon which seems to be the influence of rain fall was recorded. An example is shown in Fig 1.

This suggests that DAS technology using optical fiber as a vibration sensor may be used for weather observation. The hDVS/DAS records with GPS time stamp; the maximum observation length is depending on the type and state of fiber, but using low-loss single mode fiber a range of 40 km is achievable. If we can observe meteorological conditions over a range of tens of kilometers with a resolution of several tens of meters with a single device, we could issue more detailed warnings.

Installation of optical fiber for communication in Japan is often installed in the air such as utility pole and iron tower, except for the trunk communication network in the metropolitan area. Such optical fibers are directly influenced by rain and wind, however influence of noise sources generated on the surface such as vehicles, railways, factories, etc. is small. In other words, if you connect an hDVS/DAS device to an optical fiber on a transmission line called OPGW (optical fiber composite overhead ground wire), there is a possibility that weather network can be constructed in a short period of time. In the case of rain, when the rain is calm, the rate at which rain strikes the OPGW decreases, vibration or the dynamic strain of the optical fiber appears less, that is, the signal of hDVS/DAS is small. When the rain intensifies, the rate at which rain hits OPGW increases, vibration appears greatly, the signal of hDVS/DAS is large. So, it is possible to quantitatively observe local rainfall at intervals of several tens of meters. It would be possibly quantifying the size of rain drops as well as state of rain drops whether liquid or icy.

If rainfall and wind volume are large and change at the same time as a typhoon, it will be possible to take a method to separate each event. In the case of rain, raindrops collide with the fiber-optic cable, causing



©2019. Japan Geoscience Union. All Right Reserved.

vibration, which is supposed to be more microscopic vibration and the frequency range of vibration is higher. On the other hand, in the case of wind, it seems that the frequency range is low due to macro vibration which affects the entire fiber optic cable between towers. When observing the ocean bottom earthquake using JAMSTEC owned submarine optical fiber cable, we observed the wave at the same time, but it is possible to separate two different events by changing the gauge length, which was presented at SSJ 2018[4]. Reprocessing the raw data for different gauge length is a capability that is unique to hDVS amongst the available DAS techniques. Real-time simultaneous observation of rainfall and wind will be possible by improving the hDVS system.

By connecting hDVS to underground, ocean floor, and terrestrial optical fiber networks, the possibility of constructing a comprehensive disaster prevention observation network of earthquakes, volcanoes, tsunamis, and observation of typhoons and Guerrilla rainstorm, has come to be seen.

Acknowledgements: We thank ENAA for permission to show recorded the hDVS data.

Case study of environmental conditions and cloud microphysical properties of winter convective clouds developed in the Kanto plain

*Kentaro Araki[1], Shinsuke Satoh[2], Takuya Tajiri[1]

1. Meteorological Research Institute, 2. National Institute of Information and Communications Technology

In winter, convective clouds sometimes develop and cause local snowfalls and lightning strikes in the Kanto plain in Japan. To understand and forecast these winter convective clouds, detailed observations of environmental conditions and cloud microphysical properties are required. In this study, we performed a case study on the winter convective clouds on 26 January 2019, and examined the temporal variation of environmental conditions and properties of cloud and precipitation by using Japan Meteorological Agency (JMA) analysis data, dense surface meteorological observation data, Himawari-8 data, JMA operational radar data, photograph data of precipitation particles derived from citizen science, disdrometer and microwave radiometer data obtained at the Meteorological Research Institute in the Tsukuba, Ibaraki.

On 26 January, the surface pressure pattern was the winter monsoon type and the upper cold vortex moved to the northern Japan. Since the Kanto plain was located on the southeastern side of the cold vortex, synoptic condition was favorable for convection development in the Kanto plain. In respect of the mesoscale environments, the low-level convergence line was formed in the Kanto plain by west-northwesterly and northerly airflows that crossed the mountain areas. The Himawari-8 infrared images captured the cloud street associated with the convergence line from 13:30 JST (=UTC+9h), and radar echoes of convective clouds were observed by JMA Tokyo radar from 14:40 JST. Two convective clouds developed in the convergence line and passed over Tsukuba from about 15:30 to 16:30 JST. From the results of one-dimensional variational (1DVAR) analysis combined with numerical weather model and microwave radiometer data, it was found that thermodynamic environments significantly got unstable at 15 JST because of increases of low-level atmospheric temperature and influence of upper cold air flow.

Disdrometer in Tsukuba observed precipitation of two convective clouds from 15:34 to 15:44 JST and from 16:03 to 16:32 JST. Results of zenith-looking observation by micro rain radar showed the existence of echo at the altitude of 3-5 km 5-10 minutes before the surface precipitation at 15:34. Liquid water path (LWP) derived by the microwave radiometer significantly increased about 20 minutes before the surface precipitation by the first convective cloud, and the value of LWP in the case of second convective cloud was smaller than that of the first one. Results of disdrometer observation showed characteristics of the precipitation particles were similar to that of typical lump graupel, and fall velocity of the particles from the first convective cloud was significantly greater than that of second one. Photograph data by citizen science revealed that the graupel particles from the first convective cloud had densely rimed structures compared with those of second one. These differences of cloud microphysical properties would be due to the difference of the life stages of the convective clouds.

Numerical simulation of the urban effect on the atmospheric boundary layer structure in Tokyo using the SPUC urban canopy scheme

*Naoko Seino[1]

1. Meteorological Research Institute

Seino et al. (2018) investigated the influence of urbanization in the Tokyo area and showed that about one degree temperature rise in the central urban area in Tokyo can lead to 10% precipitation increase in August. We examined new method of the initial temperature field preparation in the model simulation, in which previously predicted temperatures of urban canopy elements were used as their initial temperatures in the succeeding simulation. Simulation results for one month in summer showed that the implementation of this forecast-cycle procedure improved the surface air temperature representation. On the other hand, comparisons with the winter observation results indicated that the atmospheric boundary layer height was underestimated in the model results. We will validate the model performance in other observation cases for the better understanding of finer scale features of urban effect.

Surface layer model for instantaneous wind speeds designed by deep learning

*Junshi Ito[1,2], Hideaki Mouri[2]

1. Atmosphere and Ocean Research Institute, The University of Tokyo , 2. Meteorological Research Institute

parameterizations consider the Monin-Obukhov similarity law for diagnosing momentum transports between the lowest atmosphere and ground. This law was found in the relations between temporally averaged (typically periods of 10 minutes) wind speeds and momentum fluxes. We have suggested that it is inappropriate to apply the law for the parameterization in large eddy simulations in which turbulence fluctuation is involved in resolved wind speed at each grid point. However, we do not know a good alternative to the law.

In this study, we perform a preliminary attempt to apply the deep learning technique for the parameterization. Results of wind tunnel experiments are used for the date to be learned: the relationship between wind speeds and momentums fluxes in a short time scale (1 second, typically) was obtained in the condition with steady external winds and neutral stratification over ten hours.

Nine-tenth of the wind tunnel data for three kinds of different external wind speeds was inputted to the routine of the TensorFlow library. Then the validation is performed by the left of the data. The result shows that diagnoses of the momentum fluxes through the trained network show far better performances than those of the misused Monin-Obukhov law.

If the wind speed is inputted in training, the network overfits the other wind speed that has not been used for the training. It would be better to consider normalize wind speeds for the training to apply a wide range of wind speeds.

[A-OS21] Physical, biogeochemical, and ecological aspects and their mutual relations in the Indian Ocean

convener:Yukio Masumoto(Graduate School of Science, The University of Tokyo), Hiroaki Saito(Atmosphere and Ocean Research Institute, The University of Tokyo), Iwao Ueki(JAMSTEC Japan Agency for Marine-Earth Science and Technology), Chairperson:Yukio Masumoto

Recent discovery of new climate modes and development of basin-scale and regional
observing systems in the Indian Ocean advance researches on physical, biogeochemical,
and ecological aspects of ocean variations. In addition, international and interdisciplinary
research programs in the Indian Ocean, such as IIOE-2 and EIOURI, are now being
conducted in earnest, under which the R/V Hakuho-maru cruise in the eastern Indian
Ocean will be took place in Nov./Dec. 2018, for better understanding of eastern Indian
Ocean conditions through multi-disciplinary approaches. This session invites papers on
physical, biogeochemical, and ecological aspects in the Indian Ocean and relations
among these elements of the ocean variations, to facilitate integrated understanding of
the Indian Ocean variability, as well as to stimulate collaborative researches among the
relevant scientists. Preliminary results from observation campaigns, a new perspective
on research collaboration, and/or sharing information on future observing activities are
also welcome.

Coastal upwelling events and barrier layer observed along the southwestern coast of Sumatra

*Takanori Horii[1], Iwao Ueki[1], Kentaro Ando[1]

1. Research and Development Center for Global Change (RCGC), Japan Agency for Marine-Earth Science and Technology (JAMSTEC)

Coastal upwelling along the southwestern coast of Sumatra during the boreal summer monsoon is closely linked to the El Nino/Southern Oscillation and the Indian Ocean Dipole. To understand the coastal upwelling system, we investigated ocean temperature and salinity variations obtained from Argo floats. During 2013-2017, two Argo floats observed vertical structure of temperature and salinity every 10 days within 100 km from the coast of Sumatra. The floats observed intraseasonal-scale subsurface temperature cooling events with significant upward movements of thermocline. Anomalous local southwesterly winds and equatorial easterly winds explained the temperature cooling and thermocline variations, suggesting that the Argo observation captured coastal upwelling signal. Although these subsurface temperature cooling signals were significant, local sea surface temperature (SST) variations were relatively small. We found that during coastal upwelling events, local SST tended to be disconnected with subsurface cooling by the presence of upper-layer salinity stratification and thick barrier layer which suppressed entrainment cooling.

Mechanisms of the sea surface temperature cooling in the Somalia-Oman upwelling region during the summer monsoon

*Kusumi Takahiro[1], Shoichiro Kido[1], Tomoki Tozuka[1], Yukio Masumoto[1]

1. the Unversity of Tokyo

Alongshore southwesterly winds in the western Arabian Sea associated with the Indian summer monsoon induce coastal upwelling and cool sea surface temperature (SST) along the coast of Somalia and Oman. Since the upwelling region is a moisture source of the Indian summer monsoon rainfall, understanding of the SST variations in this region is crucial for the prediction of the Indian summer monsoon precipitation. In this study, an on-line mixed layer heat budget analysis is conducted to clarify the mechanisms of the SST cooling using the Regional Ocean Modeling System (ROMS) simulation. It is revealed that causes of the SST cooling in the upwelling region are different between the onset (May) and mature phases (June-July) of the Indian summer monsoon. The horizontal advection, surface heat flux, entrainment and vertical diffusion terms contribute to the cooling in the former phase, while the vertical diffusion term plays a dominant role in the latter phase.

Generation of meso-scale eddies in the southern Indian ocean

*Takuro Matsuta[1], Yukio Masumoto[1]

1. Graduate School of Science, The University of Tokyo

A Leeuwin Current region off the coast of western Australia is known as an area of strong meso-scale eddy activity among the midlatitude eastern boundary current regions. While these eddies are believed to be generated through mixed barotropic and baroclinic instability associated with the poleward-flowing Leeuwin Current, their relative importance as well as interactions between eddies and large-scale circulations need to be investigated in detail. Motivated by the above, an analysis on energy conversion between eddy field and mean flow is conducted. Results revealed detailed spatial distributions of large baroclinic energy conversion. The interactions between density anomalies and the thermal front near 30˚ S play an important role in making the baroclinic energy conversion.

Summary of R/V Hakuho-Maru observations (KH-18-6) for Integrated physical, biogeochemical, and ecosystem research in the eastern Indian Ocean

*Yukio Masumoto[1], Hiroaki Saito[2]

1. Graduate School of Science, The University of Tokyo, 2. Atmosphere and Ocean Research Institute

R/V Hakuho-Maru cruise (KH-18-6) was conducted from Nov. 6 (leaving from Phuket) to Dec. 29 (Arriving at Fremantle) to facilitate integrated physical, biogeochemical, and ecosystem researches in the eastern Indian Ocean, which is a core research project under EIOURI and IIOE-2. The first leg occupied the 88E section from the Bay of Bengal down to 20S, while the second leg observed the region between the Java Island and northwestern Australia. During these legs, measurements of physical, chemical, biological, and ecological parameters were taken place by multiple equipment such as CTD casts, water sampling, LADCP, net observations, turbulence measurements. This presentation introduce summary of observations conducted during the cruise and highlights some preliminary results, together with the basic conditions during the observations.

Distribution and photodegradation of fluorescent dissolved organic matter in the eastern Indian Ocean

*Shigenobu Takeda[1]

1. Nagasaki University

Dissolved organic matter (DOM) is one of the major carbon reservoirs in the ocean, and a fraction of DOM fluoresces blue light when excited by UV light. Two main components of fluorescent dissolved organic matter (FDOM) are protein- and humic-like fluorophores. The environmental dynamics of FDOM in the open ocean has been reported to include photodegradation at surface layers and production through microbial decomposition of organic matters in deeper layers. Humic-like FDOM may playing a role as natural organic ligands for several dissolved trace metals such as iron in intermediate and deep waters, and therefore studies on the distribution and dynamics of FDOM are also important for better understandings of trace-metal cycles in the ocean.

During a KH-18-6 cruise by the R/V Hakuho-maru in November 2018, observations were conducted along a transect at 88ºE in the eastern Indian Ocean, where changes in biological activities of organic matter production and decomposition are remarkable in the north-south direction. Vertical distributions of FDOM fluorescence intensity were obtained at 9 stations along the transect from 16.5ºN to 20ºS. Seawater samples collected using Niskin-X bottles on a CTD-Carousel system were filtered through a filter unit having 0.2 μm pore-size and fluorescence intensity of FDOM was measured onboard by Trilogy Laboratory Fluorometer (Turner Designs) equipped with UV module (7200-067W, Excitation 350/80 nm; Emission 410-450 nm) using the 4 ppb quinine sulfate solution as a standard. In order to evaluate photodegradation of FDOM, selected filtered seawater samples were placed in 500 ml quartz bottles and these bottles were exposed to sunlight in an on-deck running seawater tank. Changes in fluorescent intensity of FDOM were monitored every 24 hours for 5 days.

The vertical distributions of FDOM fluorescence intensity showed nutrient-type profile; very low values at the surface, enrichment at intermediate depth, and gradual decrease in deep layers. A distinct peak of fluorescence intensity was also observed at the oxygen minimum layer just below the subsurface chlorophyll maximum. Along the N-S transect, fluorescence intensity of FDOM in the water column was highest at 15ºN in the Bay of Bengal, and there was a decreasing trend to the southward direction. The FDOM fluorescence intensity generally correlated with apparent oxygen utilization (AOU) in the intermediate and deep layers. However, high fluorescence intensities deviate from the FDOM-AOU relationship were measured below the subsurface chlorophyll maximum layer in the Bay of Bengal, suggesting that characteristics of fluorophores produced by microbial decomposition of organic matters might varies depending on the depth and area of the sea. In the solar irradiation experiments, a significant photobleaching was observed within 24 hours followed by gradual decrease in FDOM fluorescence intensity during the remaining period of the experiments. It indicate the existence of fluorophores having different photolability in the FDOM. One of the experiments also showed control of FDOM photodegradation by the irradiation level. These results suggest that light field and vertical mixing process near the sea surface as well as vertical difference in quality and quantity of organic matter for decomposition by diverse microbial community could have a strong influences on dynamics of FDOM in the eastern Indian Ocean.

Observed subsurface Chlorophyll maximum in the tropical eastern Indian Ocean during KH18-6 Leg3 cruise

*Iwao Ueki[1], Kosei Sasaoka[1]

1. JAMSTEC Japan Agency for Marine-Earth Science and Technology

To enhance interdisciplinary understanding of the eastern Indian Ocean upwelling study, R/V Hakuho-Maru KH18-6 cruise has been conducted in November-December 2018. During the Leg-3 cruise; started from Jakarta in 06 December and arrived at Fremantle in 29 December, physical, chemical and biogeochemical observations at more than 30 stations along 3 sections have been conducted. During the Leg 3 cruise, climate condition of the Indian Ocean became a neutral condition after positive Indian Ocean Dipole event. At the eastern section from the station 22 (12°S, 112.5°E) to station 34 (24°S, 111° E), we can capture predominance of eddy activity at around 16°S. In terms of chlorophyll distribution, subsurface maximum were recognized at the all stations. However, the distribution was modified in associated with the eddy activity. The details will be shown in the presentation.

[A-CG43] Adaptation for climate change and social implementation

convener:Yoichi Ishikawa(JAPAN Agency for Marine-Earth Science and Technology), Shingo Watanabe(Japan Agency for Marine-Earth Science and Technology), KOJI DAIRAKU(National Research Institute for Earth Science and Disaster Resilience), Chairperson:KOJI DAIRAKU(National Research Institute for Earth Science and Disaster Resilience), Yoichi Ishikawa(JAPAN Agency for Marine-Earth Science and Technology)

Adaptation for climate change is urgent issue since increasing risk of natural disaster, such as typhoon and heavy rain and harmful effect of high temperature on agriculture are expected. "Climate change adaptation law" has passed the National Diet in 2018, in which the vision are given to build a secure, safe and sustainable society that is able to minimizing and avoiding damage. These actions to formulate the adaptation plan are expected to rapidly spread for local governments.
For this purpose, simulation of climate change projection, downscaling technique to obtain the detailed estimation of climate change in local scale, the evaluation of risk to contribute the formulation of adaptation plan are necessary, as well as the issue for social implementation such as co-design working with stakeholders.
We will discuss the current status of the simulation modeling and knowledge gap between the scientists and stakeholders.

Effects of afforestation and climate warming on evapotranspiration and river discharge in the upper Chao Phraya River basin

*Kumiko TAKATA[1], Naota Hanasaki[1]

1. National Institute for Environmental Studies

In the Chao Phraya River basin (hereafter as CP), deforestation has been proceeding in the upper mountainous regions; and in the uppermost tributary of the Nan River the increasing trend in low flow was observed, that could potentially be related to deforestation in the basin (Tebakari et al., 2018). Besides, runoff in CP is projected to increase under the global warming particularly in the rainy season (Kotsuki et al., 2014), that would enhance the risks of floods which regularly occur in the late rainy season. Since afforestation has effects to decrease the annual runoff and its peak amount, it is considered as an adaptation measure. However, it also has effects to increase evapotranspiration, that would enhance the water scarcity in the dry season.

In this study, offline experiments were conducted with a land surface model, MATSIRO (Takata et al, 2003; Nitta et al., 2014) that explicitly considered the processes of vegetation canopy to examine the effects of afforestation on river discharge and evapotranspiration in the upper CP under a warmed climate. The meteorological conditions for the 20th century (1981-2004; Kotsuki et al., 2013) and the future (2040-2059 and 2080-2099, Watanabe et al., 2014) with two warming scenarios and three climate models were used. Three experiments were conducted at the horizontal resolution of 5 arc-minutes: the first one is with the vegetation distribution in 2000 (control, CTL), the second one is with that in 1970 (AFR20) in which cropland is 20% less than CTL, and the third one is with that in 1950 (AFR100) in which most of the land is covered with natural vegetation (AFR100).

The annual precipitation, runoff, and evapotranspiration were increased by the warming. About 80% of the precipitation increase turned into the runoff increase, and the remaining 20% into evapotranspiration. The annual increase in runoff was reduced by 3-5% with AFR20 and 10-15% with AFR100 in the mid-21st century. The reduction shrinks with the progress of the warming which agrees with the report by Chacuttrikul et al. (2018), though the simplified simulation for changes in soil properties by afforestation suggested an enhancement of the reduction. The runoff reduction by forest-cover increase was due to the enhancement of evapotranspiration increase. Looking into the seasonal pattern of the changes, the runoff increase corresponds to about 75% of the precipitation increase in the rainy season. The evapotranspiration increase in the rainy season was about 10%, and the remaining 15% turned into the evapotranspiration increase in the dry season. In conclusion, the effect of runoff reduction by forest-cover increase was marked in the rainy season, while the effect of evapotranspiration enhancement was marked in the dry season. It is therefore necessary to take note the both effects of runoff reduction in wet season and evapotranspiration enhancement in dry season, in considering afforestation for an adaptation measure for water management issues.

Hybrid downscaling using high-resolution RCM information and rainfall-runoff-inundation model simulations

*Yasutaka Wakazuki[1,2], Shiori Abe[4], Yosuke Nakamura[3,4]

1. Ibaraki University, 2. Japan Agency for Marine-Earth Science and Technology, 3. Public Works Research Institute, 4. Mitsui Consultants Co., Ltd.

The statistical downscaling is calculated with lighter computational costs for various patterns of climate states in future which are needed to estimate uncertainty of regional climate change. However, the estimation accuracy is low in areas of poor observations. On the other hand, dynamical downscaling with high-resolution regional climate model (RCM) use huge computational costs, whereas climatological features are well reproduced even in areas of poor observations. A statistical downscaling method as a hybrid-downscaling making use of the advantage of super high-resolution dynamical downscaling is proposed in previous JPGU annual meeting. In addition, the reproducibility of intense precipitation was improved by introducing a new precipitation correction method applying PDF for hourly precipitation. Downscaling results of climate change projections had been used for simulations of rainfall-runoff-inundation (RRI) model with the target area of Kinu and Kokai river basins, Kanto, Japan. The regional climate projection showed almost 6 % increase of precipitation in the river basins. In a simulation, the yearly maximum of daily precipitation was predicted to increase about 15 %, which is almost the same as the increase rate of yearly maximum of river discharge, 12 %. On the other hand, the increase rate of yearly maximum of peak water level was estimated to be only 1 %. In Japan, several high-risk water levels are configured at observation points. The frequencies of moderate high-risk water levels were projected to significantly increase. On the other hand, the changes in the frequencies of severe high-risk water levels were projected to be small. The small increase rate was due to structure of cross sections of the river and the dam control model. The inundation areas and depths were also calculated. The increase rate of the inundation area was estimated to be about 35 %. The risk of large inundation is regarded to increase in the future climate.

Development of a global water risk assessment tool to support investigation of adaptation to climate change in the private sector: Calibrating parameters of a global water resources model by Approximate Bayesian Computation

*Naota Hanasaki[1]

1. NIES National Institute of Environmental Studies

Private companies need to avoid the harmful impacts on their business and express their plans and actions toward climate change. To support climate change adaptation planning of private sectors, an open global water risk assessment tool is being developed.

The global hydrological model H08 can simulate not only natural hydrological cycle but also human water use simultaneously at a daily interval at a spatial resolution of 0.5 degree. By feeding future climate scenarios and socio-economic assumptions to H08, one can analyze the change in hydrological cycle and water requirement/use due to global change with spatiotemporal details. Although these features are useful to investigate the risks of flood and drought in the future, the uncertainty in the model hampers effective interpretation. In particular, the simulation performance at the places where production bases are located is crucial for private companies. Therefore, parameter calibration was performed which has been seldom carried out at a global scale.

In this study, we applied the Approximate Bayesian Computation (ABC) to calibrate four key hydrological parameters of H08. Altogether 5000 simulations were conducted by changing four parameters randomly. By identifying the range of each parameter that showed the best performance in reproducing the past, we systematically calibrated the ranges of four parameters. This approach was applied for 64 basins with more than 500,000km2 of catchment area in the world. The results showed that calibrated parameters produced reasonable simulation results for most of the basins in the world. In the presentation, the results for smaller catchments and daily simulations will be presented.

Verification of SI-CAT ocean products around Japan

*Goro Yamanaka[1], Hideyuki Nakano[1], Kei Sakamoto[1], Takahiro Toyoda[1], Shogo Urakawa[1], Hiroyuki Tsujino[1], Shiro Nishikawa[2], Tsuyoshi Wakamatsu[2,3,4], Yoichi Ishikawa[2]

1. Meteorological Research Institute, 2. JAMSTEC, 3. Nansen Environmental and Remote Sensing Center, 4. Bjerknes Centre for Climate Research

We examined SI-CAT ocean products around Japan, such as sea surface temperature (SST) and sea level, Kuroshio, and sea-ice in the Sea of Okhotsk. We used the SICAT10 Version 2 data, in which the North Pacific Ocean model with a resolution of 10 km was driven by JRA-55 and CMIP5 (MIROC5, MRI-CGCM 3, GFDL-ESM2M, IPSL-CM5A-MR) atmospheric forcing under the present climate (1960-2005). Observation data used for verification are COBE-SST2 and CMEMS. We made a t-test for the mean difference between the observed and simulated fields, as well as a f-test for the ratio of the observed variance to the simulated. The p-value was taken as a measure of the reliability of the model. The simulated SSTs generally capture the dominant low-frequency modes in the North Pacific in each run. In the sea around Japan, the reliability of the variability is relatively high except for the regions where eddy activity is enhanced, such as off the east of Tohoku and off the south of Japan. The regional averaged SSTs show a long-term upward trend as in the observation. Compared to the reliability of the simulated SST, that of the simulated sea level is relatively low, but the average sea level around Japan shows low-frequency variability associated with PDO as well as long-term upward trends related to the global warming. The average Kuroshio flow path and the position of Kuroshio Extension are generally well captured by the 10 km model. The latitudes of the simulated Kuroshio Extension show no remarkable trend like observation. In the Sea of Okhotsk, the simulated sea ice area during the winter is captured in the IPSL run, but is underestimated (overestimated) in the MIROC run (the MRI and GFDL runs). The long-term trend in winter shows a statistically significant decrease in the GFDL run, which is similar to the observation.

Downscaling and Reanalysis of Coastal Current System on the Ibaraki Coast with Included Freshwater Impact

*Josko Troselj[1], Yuki Imai[2], Junichi Ninomiya[3], Nobuhito Mori[1]

1. Coastal Engineering Laboratory, Disaster Prevention Research Institute, Kyoto University, 2. Graduate School of Engineering, Kyoto University, 3. Kanazawa University

Introduction and Objective

Global mean sea level, surface temperatures and extreme precipitation amounts are expected to increase in 21st century under the climate change impact. It will especially affect coastal zones which are sensitive to all of these factors because extreme freshwater inflow, inundation levels, erosion as well as fishery industry nearshore are expected to be largely impacted. Coastal processes, such as variabilities of shallow water temperatures, cannot be precisely reproduced by coarse scale global climate models and therefore downscaling the coastal current system to fine resolution scales is needed.

Objective of the study is providing fine scale 7-years ocean circulation reanalysis and assessment of natural variabilities of physical processes of the coastal ocean by downscaling of coastal current system for Ibaraki prefecture in Japan from 10 km scale parent dataset to related projections of 222 m scale on the Ibaraki coast, particularly taking into account freshwater outflow impact from 3 major rivers (Tone, Naka and Kuji). Our results can be used for adaptation of countermeasures for climate change impact assessment.

Methods

We continued the study from Troselj et al. (2018) with improved downscaling model methodology and extended analyzed period into 7 years (2000-2006). We applied better vertical transformation equation (Vtransform=2, new formulation developed by A. Shchepetkin) and different vertical stretching function (Vstretching=4, where A. Shchepetkin improved double stretching) compared to Troselj et al. (2018). River forcing conditions were applied as observed river temperature and discharge (MLIT, 2017) with constant salinity of 0.5 PSU for Tone, Naka and Kuji rivers.

Discussions

We validated our modelled results with observed sea surface temperature data from Hasaki point (PARI) and satellite images from MGDSST for winter and spring seasons (Figure 1). Results for all seasons will be presented on the conference. The modelled results corresponded well with Hasaki observations in winter and with MGDSST observations in spring season and their mean and variabilities were improved compared to FORA results. Reason for that might be because vertical mixing in spring and summer seasons is lower than in autumn and winter seasons. We expect that Hasaki observations, which are located 2-3 meters below sea level, will have better fit with the modelled results during colder seasons when vertical mixing is higher. Similarly, we expect that MGDSST observations of sea surface layer will

©2019. Japan Geoscience Union. All Right Reserved.

have better fit with the modelled results during warmer seasons when vertical mixing is lower.

We showed that reproducibility of coastal natural variabilities of physical processes is increased compared to parent dataset FORA when using downscaling, both for sea surface temperature and salinity. Our model reproduced bigger variabilities of both temperature and salinity in vicinity of the coast than in the offshore zone, and it was not well reproduced in FORA.

We showed monthly, seasonal and inter-annual trends in magnitudes and directions of coastal currents. The reproducibility of the trends was improved compared to FORA, because our model provides more precise fine scale representation of coastal currents.

Summary

We conducted dynamic downscaling and reanalysis of coastal current system on the Ibaraki coast particularly considering freshwater outflow impact, with improved methodology and extended targeted period from previous study. We showed that variability of sea surface temperatures in coastal shallow waters is better represented with the downscaling than with the coarser parent model.

Estimation of the Japanese sardine stock in relation to the future Kuroshio variability

*Haruka Nishikawa[1], Shiro Nishikawa[1], Tsuyoshi Wakamatsu[2,3], Yoichi Ishikawa[1]

1. Japan Agency for Marine-Earth Science and Technology, 2. Nansen Environmental and Remote Sensing Center, 3. Bjerknes Center for Climate Research

Stock of the Japanese sardine (*Sardinops melanostictus*) shows a drastic variation. The principal driver of the stock variation is the Kuroshio velocity, and the second important driver is sea surface cooling. The Japanese sardine spawn in the Kuroshio water of south of Japan during winter and the larvae grow during the transportation by the Kuroshio. Lower the temperature of the Kuroshio water, the nursery ground, more favorable the condition is for feeding and growth of the larvae and consequently the sardine stock becomes higher. Thus the Japanese sardine stock level is strongly affected by the Kuroshio variation. The Kuroshio water temperature in winter tends to be lower during the year of low Kuroshio velocity. This is because, the Kuroshio water from subtropical region can have enough cooling by the time its arrival to near Japan. The Kuroshio velocity has a decadal to multi-decadal scale variation. The past sardine stock variation tended to be higher in the low Kuroshio velocity regime. Since the Japanese sardine is an important commercial fish in Japan, the future sardine stock, especially under the influence of the climate change, is one of the social concerns. The nursery grounds of the Japanese sardines are distributed in the very narrow area along the Kuroshio path and its analysis requires high resolution data. However, the spatial resolutions of the current climate projection products, CMIP5, are generally too coarse to reproduce the narrow Kuroshio path. Recently, we have succeeded at dynamical downscaling of multiple CMIP5 ocean products to 0.1º horizontal resolution products. In this study, we first develop a sardine stock estimation model that reproduce the past stock fluctuation based on the temperature in the nursery grounds. Then we input the future temperature from the downscaled simulation into the sardine stock model to project its future stock. We’ll discuss how the sardine stocks fluctuate in future especially in relation to the Kuroshio variability.

[A-CG43] Adaptation for climate change and social implementation

convener:Yoichi Ishikawa(JAPAN Agency for Marine-Earth Science and Technology), Shingo Watanabe(Japan Agency for Marine-Earth Science and Technology), KOJI DAIRAKU(National Research Institute for Earth Science and Disaster Resilience), Chairperson:Yoichi Ishikawa(JAPAN Agency for Marine-Earth Science and Technology), KOJI DAIRAKU(National Research Institute for Earth Science and Disaster Resilience)

Adaptation for climate change is urgent issue since increasing risk of natural disaster, such as typhoon and heavy rain and harmful effect of high temperature on agriculture are expected. "Climate change adaptation law" has passed the National Diet in 2018, in which the vision are given to build a secure, safe and sustainable society that is able to minimizing and avoiding damage. These actions to formulate the adaptation plan are expected to rapidly spread for local governments.
For this purpose, simulation of climate change projection, downscaling technique to obtain the detailed estimation of climate change in local scale, the evaluation of risk to contribute the formulation of adaptation plan are necessary, as well as the issue for social implementation such as co-design working with stakeholders. We will discuss the current status of the simulation modeling and knowledge gap between the scientists and stakeholders.

Recent progress of Japan’s regional downscaling project (SI-CAT) and CORDEX Asia Empirical-Statistical Downscaling (ESD)

*KOJI DAIRAKU[1]

1. National Research Institute for Earth Science and Disaster Resilience

As a Japan’s national project, SI-CAT develops reliable technologies to find climate change adaptation measures in collaboration with researchers of geoscience, social science and humanities, and officials of local governments from the beginning of the project to avoid and reduce various threats of climate change.

We conducted dynamical downscaling experiments with horizontal grid spacing of 5km and 2km to reproduce regional climate information. We examine the performance of the regional climate model (NHRCM) to represent severe precipitation events occurred around Gifu and Nagano region. To examine the performance in ungauged mountainous regions, the runoff analysis was conducted. It indicates the overestimation of precipitation. We conduct the ensemble downscaling experiments using database for Policy Decision making for Future climate change (d4PDF) to detect the climate change impact in this region.

Multi-model large ensemble regional climate scenarios over Japan and CORDEX Asia are developed by using CMIP5 GCMs (RCP2.6 and RCP8.5) and a statistical downscaling (Bias Corrected Spatial Disaggregation (BCSD)) to investigate uncertainty of projected change associated with structural differences of the GCMs for the periods of historical climate (1950-2005) and near future climate (2026-2050). Uncertainty range information of the regional climate scenarios support various regional adaptation measures and informed decision making. Based on the SI-CAT experiences, the CORDEX Asia ESD group enhances and integrates the science and application of downscaling activities in Asia by sharing and exchanging data, knowledge, and techniques.

Assessment of Flood Risk in Hokkaido, northern Japan, Associated with Climate Change

*Hoshino Tsuyoshi[1], Tomohito J Yamada[1], Dzung Nguyen-Le[1], Masaru Inatsu[1], Tomonori Satou[1], Hiroaki Kawase[2]

1. Hokkaido University, 2. Meteorological Research Institute

In August 2016, 4 typhoons sequentially attacked Hokkaido region (Northern part of Japan) within 2 weeks and caused severe flood damage. Because this sequential typhoon attack is the first time in recorded history and remarked maximum rainfall amount on many observatories in Hokkaido region and this heavy rainfall caused various flood disaster (inundation caused by dyke break, damaged to load and farmland), it became one of a trigger that led river administrators (Hokkaido regional development bureau of the Ministry of Land, Infrastructure and Transport (MLIT) and Hokkaido prefectural government) to consider flood risk change associate with climate change. Actually, they organized a committee in order to project future flood risk in Hokkaido. MLIT has also organized a committee since fiscal 2018 in order to consider flood prevention plan associate with climate change. As can be seen these backgrounds, projection of future flood risk became important and urgent issue. This study quantified flood risk under both historical and warmer climate condition by using a large ensemble simulation dataset.

In this study, we analyzed characteristics of annual maximum rainfall over river basins in Hokkaido region under historical and warmer climate conditions in order to evaluate flood risk change. This research used d4PDF (database for Policy Decision making for Future climate change) which consists of large ensemble climate data (historical climate: total 3,000 years, 2K warmer climate: total 3,240 years, 4 K warmer climate: total 5,400 years). This research conducted dynamical downscaling (DS) using a regional climate model for annual maximum rainfall events detected from d4PDF (convert from 20 km to 5 km) in order to take into account topographic effect and shapes of the target river basin more precisely. This research focus on not only rainfall amount but also weather pattern which caused heavy rainfall. We classified weather patterns based on SOM (Self Organizing Map) and evaluated their return period.

The rainfall after DS under historical climate condition and rainfall obtained from observation results have similar frequency in terms of rainfall amount and include many events which exceed maximum recorded rainfall. These results show that DS is effective way to make many possible heavy rainfall patterns. The comparison between historical and future climate showed that rainfall amount significantly increase. Especially, low probability rainfall (e.g. 99 percentile value) become much heavier. Because of the increase of rainfall amount, estimated inundation area become larger and estimated fatalities increase under same occurrence probability. Climate change caused not only increase of rainfall amount but also concentration of heavy rainfall in spatiotemporally. Because heavier and more concentrated rainfall causes increase of peak discharge and change of characteristics of flood damage, the change of rainfall characteristics must be considered for flood disaster prevention plan. Classification of weather pattern shows the factor of heavy rainfall changes in warmer climate.

These results show necessity of flood protection plan considering climate change and large ensemble climate dataset can be greatly helpful for planning. This study became the core of the discussion at the committee related to future flood risk in Hokkaido, Japan which was held in fiscal 2017, future flood control measures are going to be discussed based on these results.

Intensification of sub-daily and daily rainfall extremes from densely distributed records for Japan

*Megumi Watanabe[1], Sayaka Yoshikawa[1], Shinjiro Kanae[1]

1. Tokyo Institute of Technology

Rainfall intensity is projected to increase in most regions under warmer climates, and the increase in heavy rainfall will be larger than that in the mean rainfall. The increase in rainfall intensity caused by global warming was often predicted by studies with climate models. There is an argument that climate models tend to underestimate the observed changes in heavy rainfall intensity. Meanwhile, it has been suggested that, to first order, the intensification of heavy rainfall in a warmer climate could follow the Clausius-Clapeyron (CC) relationship which states that warmer air has a higher water vapor holding capacity. According to the C-C relationship a rainfall intensities are estimated to increase by ~7% per degree warming. However, observed evidence that detects CC-related changes both in daily and sub-daily (e.g., hourly) rainfall extremes between two periods (namely the past and the present) is limited. A comprehensive result derived from observed data confirmed that the intensification rate of daily precipitation is close to the rate of CC in Europe, but their analysis was done for daily precipitation only and limited observation data over a large region was used. Another recently published analysis for Australia shows on average a CC-like response for daily extremes and a super-CC (double to triple CC) response for hourly extremes which is also suggested in temperature-rainfall scaling. Nevertheless, large regional variability in their results derived from sparsely distributed observations from the tropics to mid-latitude calls for an analysis of densely-distributed observations in a single climatic zone. In this study, we try to analyze whether the CC relationship, or super-CC, can be applied to the intensification of both daily and sub-daily rainfall extremes over Japan. We also try to show the sensitivity of the estimated intensification of rainfall extremes caused by setting of the past and present period, referenced stations. We used rainfall data at more than 700 stations with less than 1% missing data for the entire area of Japan. We divided whole observation period into the past and present period. We then defined extreme precipitation criteria in the previous period at each individual observation point and counted the number of the event of extreme precipitation. Finally, we calculated the intensification rate of rainfall extremes from the past to present period. In the results, we show that the intensification rate of sub-daily extremes is higher than that of daily extremes. However, the magnitude of intensification rate greatly differs depending on referenced period, the number of stations and rate of increase in temperature.

A Content-Based Database System for Large Ensemble Future Climate Simulations

*Yujin Nakagawa[1], Shintaro Kawahara[1], Fumiaki Araki[1], Daisuke Matsuoka[1], Yoichi Ishikawa[1], Mikiko Fujita[1], Shiori Sugimoto[1], Yasuko Okada[1], Sho Kawazoe[1], Shingo Watanabe[1], Masayoshi Ishii[2], Ryo Mizuta[2], Akihiko Murata[2], Hiroaki Kawase[2]

1. Japan Agency for Marine-Earth Science and Technology, 2. Meteorological Research Institute

Analyses of large ensemble data of future climate are quite useful in order to produce probabilistic future projection of climate change in various interdisciplinary fields related to, e.g., hydrology, civil engineering, adaptation planning for global warming. Ensemble data of "+2K future climate simulations" are currently generated by "Social Implementation Program on Climate Change Adaptation Technology" (SI-CAT) as a part of a database for Policy Decision making for Future climate change (d4PDF; Mizuta et al. 2016) produced by Program for Risk Information on Climate Change. Those data consist of global warming simulations and regional downscaling simulations around Japan. Considering that those data volumes are too large, i.e. a few petabytes, to download to a local computer of users,
a user-friendly system is required to search and download data which satisfy requests of the users.
In order to provide functions to extract necessary data from +2K future climate simulations to the users, we developed “System for Efficient content-based retrieval to Analyze Large volume climate data (SEAL)”. Existing web-based search systems for climate simulations are designed to find data files using metadata associated with a data file itself. On the other hand, the SEAL allows the users to extract necessary data using metadata associated with contents of a data file such as physical values. The SEAL mainly consists of a relational database, a data download function and web-based user interface. Among the three main features, a key role is provided by the relational database using PostgreSQL which is designed to be registered temporally and spatially compressed data. The data download function allows the users to download temporally and spatially extracted data based on search results obtained by the relational database. In addition, the web-based user interface allows the users to easily use the relational database without knowledge about PostgreSQL. We also prepare a guidebook for usage of the SEAL. The SEAL is currently in test operation on our local server for SI-CAT members.
The SEAL and the guidebook will be released on Data Integration and Analysis System Program (DIAS) after end of fiscal year 2018. Techniques of the SEAL might be quite useful for simulation, experimental and observational data in other research fields. We report functions and some case studies of the SEAL.

Climate change impact assessment in Shikoku with the ensemble climate prediction database d4PDF

*kouhei yoshimura[1], Nasu Seigo[1], Patricia Sanchez[2]

1. Kochi University of Technology, 2. University of the Philippines Los Baños

In considering water disaster prevention as a climate change adaptation policy, it is necessary to utilize the climate change projection model. However, the projection model output has some problems mainly in spatiotemporal resolution, bias and uncertainty. When preparing countermeasures according to disaster risks in each region, these problems and characteristics of these GCMs must be taken into consideration. In the presentation of last year, we evaluated the impact in the Yoshino River basin climate change prediction model output CMIP 5 with statistical downscaling, but some problems were clarified.It is important to apply dynamical downscaling including a large number of outputs for appropriate impact assessment.

We used the ensemble climate prediction database d4PDF to evaluate the impact of climate change in the Yoshino River Basin in this study. We made a comparison with the grid near Sameura Dam in the Shikoku mountain area, Tokushima and Kochi. In the Shikoku mountains, the observation rainfall amount are close to members with a lot of rain ,and in Tokushima it was close to members with little rainfall. In Kochi, the model output can not reproduce heavy rainfall caused by typhoon or special factors that occurred in the past. As a result, it is clear that it can be utilized without bias correction for the risk assessment if the scale and rainfall characteristics of the Yoshino river basin area, but it can not be used as it is in smaller rivers and rivers with localized rainfall.

In Sameura Dam, a renewal project to expand the drainage channel is planned. This project makes it possible to release dam water more quickly and increase flood control capacity. At the same time, dam operator are planning to revise the operation rules and increase the ability to respond to large floods.
In order to develop climate change adaptation measures utilizing Sameura Dam, which is a key to flood control and water use in the basin, we should optimize the dam operational rule according to not only flood flow rate but also the trend of the dam reservoir volume of the long term. In order to estimate the dam water level at the time of large scale flooding, we compared the relationship between the discharge rate into the dam and the amount of monthly rain in April to June. GCM greatly differed from non-global warming experiments in each GCM, GCM increased the occurrence of floods from low rain, and GCM tended to have more precipitation in the year when flooding occurred. Compared with the non-global warming experiment, the trend greatly differs in each GCMs. A GCM has the trend increasing the occurrence of floods in drought condition, and other GCM tended to have more precipitation in the year when flooding occurred. For this reason, it is difficult to fixedly change the operational rules of the dam, and it is considered that an "adaptive" approach is required according to changes in rainfall characteristics due to climate change.
In addition, as a result of interviews with local government in the downstream section, it became clear that they are concerned about the risk of complex disasters of flooding in and out of water. Due to heavy rain caused by typhoons and the like, inundation flooding occurred, there is a possibility that evacuation routes in urban areas will be disrupted. In addition, the rainfall in the upstream generated flood and it reaches the downstream section after several hours, and is exposed to the risk of flooding the outside. For this reason, the flood flow rate in the downstream section and the time difference from the rainfall occurrence to the flood arrival were analyzed. The time from heavy rain to flood reached fluctuated

©2019. Japan Geoscience Union. All Right Reserved.

stronger than the current reproduction. As a result, it became clear that diversification of complex disaster scenario is necessary.

Caution zone quantification risk to sediment disaster adaptation due to climate change

*SEIKI KAWAGOE[1], YOSUKE SAITO[1], HIROMICHI SUZUKI[1]

1. Fukushima university

Heavy rainfall disaster is predicted by extermination metrological condition due to climate change. We must estimate future risk based on trend in the future. It's necessary to manage sustainable counter measures to shift smoothly from present to future. In this study, risk evaluation is obtained to apply climate model outputs. We developed high resolution landslide risk model (Saito et al, 2017), and showed risk distribution information. These risk distribution indicate to pay attend some scenario conditions (Rain condition: directly rain outputs, and probable maximum precipitation condition, Time scale: near future and future, RCP scenario: 2.6 and 8.5). Especially, this study result indicate potential risk by probable maximum precipitation. This result predict to target of upper limit to disaster mitigation. It is useful of mitigate planning at regional area. Therefore, this risk outputs target to sediment disaster caution zone. Sediment disaster caution zones set high risk area, and it is a set area to give priority to a disaster prevention measure as an area in present.

As results, it was possible to specify about 10000 points of high dangerous area. Therefore, An adaptation method to these point group was planned.

[H-GG02] Use, change, management of natural resources and environment: Interdisciplinary perspectives

convener:Yoshinori OTSUKI(Institute of Geography, Graduate School of Science, Tohoku University), Gen Ueda(Graduate School of Social Sciences, Hitotsubashi University), Takahisa Furuichi(Graduate School of Science, Hokkaido University), Toru Sasaki(Miyagi University of Education), Chairperson:Yoshinori OTSUKI, Gen UEDA

In this session, the situation and history of use, changes and management of natural resources and environment from various regions under diverse socio-economic and natural conditions are reported. Findings from local-scale fieldwork and feedbacks on their methodology and/or research concepts are particularly encouraged to be shared and discussed. A variety of research topics are covered through both human-ecological and earth-scientific perspectives, including local knowledge of natural resources and environment, environmental and climatic history, environmental geography, environmental degradation through resource use and/or management, effects of climate change, related socio-economic changes and adaptation for livelihood security, political ecology, and issues for overcoming gaps in linking between local and broader-scale (national, regional and global) studies.

In volcanic area, volcanic ash is generally utilized for making pottery as one of materials. Then the chemical analysis of the volcanic glass contained in the paste of the pottery can provide available data to clarify the production and the distribution of the pottery. This approach, which is recently being developed in Japanese archaeology, is supposed to be valuable also in El Salvador, Central America, because chemical composition of volcanic glass from the late quaternary tephras in the area has been previously obtained by using a wave-length-dispersive electron microprobe analyzer (WDS).
The present preliminary work aims at illustrating chemical composition of volcanic glass contained in the paste of Usulutan pottery, which is a kind of mesoamerican pottery style in the period from 400 B. C. to 600 A. D. and has been found out in a broad area of Central America. Chemical analyses for two samples, both of which are Usulutan-type ceramic pieces and are collected in Chalchuapa, El Salvador, were performed using the WDS (JEOL JXA-8800RL) in the Department of Global Environment and Disaster Prevention Sciences, Hirosaki University. As a result, the volcanic glass in the both samples is chemically similar to the Arce tephra, ejected from Coatepeque Caldera in 72 ka, particularly to the middle unit of the tephra. This result indicates that the Usulutan potteries analyzed in the study would be produced in the distribution area of the Arce tephra including Chalchuapa. Moreover, volcanic grains with particular size were possible to be collected selectively to make the potteries, because the middle unit of the Arce tephra is finer than the other units around Chalchuapa.

Preliminary magnetic biomonitoring study of the spatial distribution of roadside pollution using *Cryptomeria japonica* tree bark

*Nagisa Sawada[1], Kazuo Kawasaki[1]

1. University of toyama

Magnetic biomonitoring methods have been shown to be effective for monitoring roadside pollution. Most such studies have focused on tree leaves and only a few systematic magnetic investigations have reported on tree barks. However, tree barks could be an effective candidate for biomonitoring because tree barks can be sampled at any height above the ground. Our aim is test the efficiency of using the magnetic properties of *Crypotomeria japonica*, Japanese cedar tree, bark for monitoring roadside pollution and estimating the tree-dimensional distribution of roadside pollution. One bark sample was collected from the road-facing side of the tree and second from the forest-facing side. The samples were collected at heights of 0.5, 1.0, and 1.5 m from the ground at 18 sites along a local road in Suzu-city, Ishikawa, resulting in 108 samples in total. Stepwise isothermal remanent magnetization(IRM) acquisition and subsequent alternative field demagnetization tests indicate that the main magnetic minerals attached to the bark are pseudosingle-domain(PSD) magnetite and maghemite. The maximum saturation IRM intensities occur near the roadside and the intensities decrease rapidly by ~2 m from the roadside. Also, the higher the height above the ground, the lower is the observed SIRM intensity. Therefore, likely the magnetic minerals in tree barks are derived from passing vehicles. The results show that environmental magnetic measurements on tree barks are an effective method for estimating roadside pollution in three-dimensional space.

Preliminary environmental magnetic results from heavy metal contamination around the Erdenet Cu-Mo deposit, Mongolia.

*Kazuo Kawasaki[1], Ryuki Tonami[2], Solongo Tsetsgee[3], Baasansuren Gankhurel[3], Keisuke Fukushi[4]

1. Graduate School of Science and Engineering for Research, University of Toyama, 2. Department of Earth Sciences, University of Toyama, 3. Kanazawa University, 4. Institute of nature & Environmental Technology, Kanazawa University

The Erdenet Cu-Mo porphyry deposit in Mongolia is one of the largest mines in the world and it has been operating since 1978. The ore processing waste is pumped into a tailings pond that contains ~400 million tons of tailings and 15 million m^3 of supernatant water. Environmental magnetic results are reported here for surrounding topsoils, stream sediments and sediments from the pond. The rock magnetic analyses indicate that the main magnetic minerals are pseudosingle domain magnetite and/or partially oxidized magnetite with minor pyrrhotite. This magnetic mineralogy is consistent through all samples, indicating that the observed fluctuations of magnetic susceptibility and saturation isothermal remanent magnetization (SIRM) intensity record the abundance of magnetic minerals in the samples. Based on geochemical analyses of the topsoils and stream sediments, positive correlations are found between susceptibility and SIRM intensity with heavy metal concentrations such as Cr and Zn. Further, SIRM intensity showed a more positive correlation with heavy metal concentration than susceptibility, implying that some of magnetite may be substituted by metal ions. These results indicate that environmental magnetic monitoring, especially the SIRM intensity, can be a rapid and cost-effective method for studying the spatial distribution of heavy metals in the Erdenet area.

Sediment and its movement as natural resources and environment

*Takahisa Furuichi[1], Sachi Wakasa[2], Shigeru Mizugaki[3], Masanori Nunokawa[3]

1. Graduate School of Agriculture, Hokkaido University, 2. Graduate School of International Resource Sciences, Akita University, 3. Civil Engineering Research Institute for Cold Region

1. Introduction

Sediment is not well recognized as a natural resource, compared with, for instance, forest and water. Sediment is also an important constituent of the environment but is not fairly acknowledged. In this paper, we identify benefits derived from sediment as a natural resource as well as a constituent of the environment. Problems caused by sediment movement are also located in various environmental settings. Then, we review an effective analytical framework of sediment movement and give research perspectives on sediment and its movement as natural resources and environment.

2. Terminology of ‘sediment’

‘Sediment’ refers to basically unconsolidated collection of solid particles in the size from clay to boulder consisting of rock clasts, mineral fragments, volcanic materials, weathering residual materials, biological remains etc. Solid particles may be coated by materials from different origins through adsorption and/or precipitation processes. ‘Debris’ is a synonym of ‘sediment’ but tends to be used when cobbles and boulders are included. ‘Deposit’ is also a synonym of ‘sediment’ but may be used particularly for settled sediment. ‘Sediment’ is a useful term which can be used for collection of solid particles in transport and after deposition, regardless of its particle size distribution.

3. Benefit and problems of sediment as natural resources and the environment

Sediment is a resource material for buildings and civil engineering structures. In some areas, humus-rich sediment is collected and distributed to agricultural fields as natural fertilizer. Sediment develops landforms, such as alluvial plains, river banks and beds, coastal banks and beaches, which provide the essential places for human life, agriculture and ecological habitats. On the other hand, sediment can cause various problems. 1) Sediment disaster is one of the most serious sediment-causing problems around the world. Other issues include 2) the problems in water quality and local water transportation in Lake Inle of Myanmar, 3) the problem in water quality by suspended sediment being delivered from many coastal catchments into the Great Barrier Reef lagoon in northwestern Australia, 4) heavy metal pollution by discharge of mine tailing (polluted sediment) from the Bor Mine into the Danube River in Serbia, 5) river incision and/or coastal erosion due to local deficit of sediment, and 6) deterioration of ecological habitat environments due to changes in landforms along rivers and coasts as well as in particle size distribution. Thus, sediment-causing problems commonly occurs by human interventions or extreme events (rain and earthquake) and extreme events (rain) are partly but importantly related to climate change.

4. Sediment budgets as an analytical framework

Many sediment-causing problems are commonly induced by rapid or sudden change in rates of erosion (or discharge) and deposition (or inflow) of sediment. ‘Sediment budgets’ are a quantitative, schematic

©2019. Japan Geoscience Union. All Right Reserved.

account of sediment movement in the target area, in which erosion (source) and deposition (sink) as well as outflow from the target area (output) are linked. It is displayed in the form of a simple diagram, which makes a sediment budget considerably useful in planning countermeasures for sediment-causing problems.

5. Research perspectives

Given that sediment is clearly a constituent of the environment, it should be better recognized, even in the academic arena, as an important natural resource, like forest and water. Scientific research will objectively analyze both benefits and problems concerning sediment and its movement. Such research encourages the multidisciplinary approach with earth, ecological and social sciences.

Reutilization of waste bamboo from oyster farming

*KIYOSHI SAIJO[1]

1. Miyagi University of Education

The shelves for oyster farming in the Matsushima Bay, Miyagi Prefecture are made of many Moso bamboos. Those bamboos, as being soaked in sea water, become degraded within about three years and be replaced by new ones. As the result, the used bamboos change into waste. It is estimated that about 40 to 50 thousands waste bamboos per year appear from oyster farming in the Matsushima Bay. This study presents that the author's attempts to reutilize these waste bamboos as resources which may contribute to local agriculture and environmental improvement.

Disturbance of sea floor by large earthquake and formation of earthquake-induced event deposit: Where is a suitable location for deep-sea turbidite paleoseismology

*Ken Ikehara[1]

1. Institute of Geology and Geoinformation, National Institute of Advanced Industrial Science and Technology

Surface sediment remobilization is a relatively new idea for generating earthquake-induced fine-grained turbidites. It is important for repeated deposition of fine-grained turbidite by every earthquake to deposit enough amounts of sediments, which are resuspend and redeposit by the next earthquake, on the slope. Remobilized sediment may move downslope gravitationally, and deposit in a depression at the base of slope. Sediment accumulation between earthquake events should be large enough for distinguishing each event deposits (fine-grained turbidites). Thus, the basin at the foot-of-slope with high sedimentation rate is a suitable location for deep-sea turbidite paleoseismology.

Keywords: turbidite, paleoseismology, surface sediment remobilization

The Diatom Assemblages as the Indicators for Huge Tsunami Sedimentations and Recover Processes of Environment at Kesennuma Bay, Tohoku, Japan

*Kaoru Kashima[1], Ryozo Shiomi, Yu Fukumoto[3], Tsuyoshi Haraguchi[2]

1. Department of Earth and Planetary Sciences, Kyushu University, 2. Department of Geosicneces, Graduate School of Science, Osaka City University, 3. Ritsumeikan University

Kesennuma Bay is located north of Sendai, Miyagi Prefecture, and is an enclosed bay along the Pacific Ocean. It was damaged by the Tsunami at 2011 East Japan Tsunami (March 11, 2011). About 1500 persons were killed and 10,000 houses were broken by the tsunami along the bay. The oil from the broken oil flowed into the bay, and fired for several days at the north part of the bay. The oil fire left the serious influences for the plankton flora, and took huge damage for the fishery production of the bay for several years.

The tsunami currents occurred huge scale of sedimentation and erosion within the bay. Dr. Tsuyoshi Haraguchi, Osaka City University, compared the detail measurements of the submarine topography of the bay between in 2010 (one year before the tsunami), 2011 (one month later the tsunami) and in 2013 (two years later the tsunami) and presumed the distributions of erosion and deposition areas in the bay by the tsunami current. The maximum sedimentation by the tsunami current reached more the 3m, at north and east part of the bay. He also took core samplings of the tsunami deposits where the sedimentary parts, and made clear that almost of the tsunami deposits were consisted of clay or silt materials. The sand material (the Tsunami Sand) distribution was very limited in the bay (the margin of the bay).

Diatom are clay or silt size (less than 100 μm), and we tried to trace the transportation processes by the tsunami of silt and clay materials using diatom assemblages in the sediments. The samples for diatom analysis in the Kesennuma Bay were as follows:

(a)The surface deposits at 26 sites in the bay, taken in 2010 (one year before the tsunami), in 2012 (one year after the tsunami) and in 2014 (three years after the tsunami)
(b)Three drilling cores at the tsunami deposits in the bay taken in 2013 (two years after the tsunami).
(c)Three drilling cores at the Tsunami deposits at 1960 Chilli Tsunami (1960 Valdivia Earthquake Tsunami) taken 2009, two years before the 2011 Tsunami.

At the tsunami currents in 2011, a lot of inland deposits along the coasts flowed into the bay by the back current of the tsunami. The ratio of the freshwater diatom assemblages in the bay surface deposits increased about 50%, and it presumed the strong sedimentation of freshwater materials from inland coasts by the tsunami.

The 1960 Chilli Tsunami (1960 Valdivia Earthquake Tsunami) had long-period waves (about 100 minutes interval). The waves looked gently moved on the surface, but the strong erosion and sedimentation processes were occured at the submarine floor of the bay.

The fluctuations of “go” and “back” currents of tsunami were kept as the laminated structures in the core deposits in the bay clearly. Diatom assemblages also fluctuated according to the laminated

©2019. Japan Geoscience Union. All Right Reserved.

structures. Ratio of off shore marine diatoms increased at the “go” stages, and freshwater diatoms from inlands increased at the “back” stages.

Niger Delta dynamic phase in the Gulf of Guinea during the last 20 ka: Panacea for the sustainable development of the region

*Onema Christopher Adojoh[1], Marret-Davies Fabienne[2], Tetsuji Muto[3]

1. Missouri Univetrsity of Science and Technology, Rolla, USA, Dept of Geoscience, Geological and Petroleum Engineering, 1400 North Bishop, Post Code 65401, 2. School of Environmental Sciences, University of Liverpool, L69 7ZT, UK, 3. Nagasaki University, Japan, Dept of Environmental Science and Fisheries, 1-14 Bunkyomachi, Nagasaki, 8528521

The Niger Delta is ideally located in a region of great sensitivity to climate change and sea level fluctuations and offers the possibility to provide insights on Late Quaternary environmental change in Equatorial West Africa. In comparison with other major tropical deltas, this deltaic system’ s response to past climate change and sea level fluctuations during the last 20 ka is poorly understood due limited studies in the basin. This presentation documents the detailed analyses of a multi-proxy dataset collected from three gravity cores obtained from the shallow margin of the Niger Delta to fill this scientific knowledge gap. The dataset included sedimentology, grain size, geochemistry, calcareous nannoplankton, foraminifera, and palynomorphs. The study hypothesised that the dynamics of the Intertropical Convergence Zone (ITCZ) and sea level fluctuation played a major role in shaping the landscape in the Niger Basin and adjacent coastal regions.

The palynological sequences defined in the three gravity cores show very similar fluctuations; afromontane forest (Podocarpaceae), freshwater swamp (Cyperaceae), savannah (Poaceae) and lowland rainforest (Polypodiaceae) dominated the late glacial and deglaciation periods, followed by the development of mangrove vegetation (Rhizophoraceae) during the interglacial in Early to mid-Holocene. These records suggest dry conditions and lower sea level during the late glacial and deglaciation periods, and warm conditions leading to the rise of the sea level during the interglacial.

The two stages of evolution at different periods has resulted in an improved understanding of the paleoenvironmental dynamics for the sustainable development of the region.

K-feldspar post-IR IRSL ages suggest the presence of MIS 5a–c marine terraces in the eastern margin of the Kanto Plain, central Japan

*Toru Tamura[1,2], Hiroko Okazaki[3], Hiroomi Nakazato[4], Tomonori Naya[1], Rei Nakashima[1]

1. Geological Survey of Japan, AIST, 2. Graduate School of Frontier Sciences, University of Tokyo, 3. Natural History Museum and Institute, Chiba, 4. National Agriculture and Food Research Organization

There has been a long-standing question about the Late Quaternary tectonics of the Kanto Plain nearby the triple junction of the plate boundaries. The Last Interglacial (MIS 5e) raised marine terrace has been widely correlated over the Kanto Plain and supposed to represent a general uplift trend associated with local variations. However, a thick accumulation of Quaternary sediments indicates the Kanto Plain had been subsided in the longer-term, and it is unclear when and how the recent uplift trend started. Fragmentary evidences have been recently presented for revising the tectonic history of the Kanto Plain. In the Iioka Plateau, at the eastern end of the plain, a part of the marine terrace formerly correlated with the MIS 5e was constrained to have ages of the MIS 5a or 5c by the composite chronology. As sea levels in the MIS 5a and 5c were much lower than MIS 5e, this revision poses a question about the consistent uplift of the Kanto Plain since the MIS 5e.

K-feldspar post-IR IRSL (pIRIR) ages are presented here to examine the marine terrace in the Kashima Plateau, eastern Kanto Plain, which has also been exclusively correlated as the MIS 5e. The sediment succession of the Kashima Plateau is characterized by marine to brackish deposits with pIRIR ages of the MIS 7 or 9, overlain by the succession of shallow-marine deposits. The shallow-marine succession is variable; in the landward section it is exclusively fine to medium sands overlain by a several meters thick aeolian unit, while the seaward section is gravelly coarse sands with negligible aeolian capping. This variation is corroborated with pIRIR ages. The landward and seaward sections are dated as 137±14 to 155±12 ka, and 86±9 to 105±8 ka, respectively. pIRIR ages are likely to be overestimated by several thousand to ten thousand years. Therefore, the Kashima Plateau represents a composite marine terrace that is correlated with the MIS 5e and MIS 5a or 5c in the landward and seaward sections, respectively. Along with the Iioka Plateau, this composite marine terrace occurs throughout the eastern margin of the Kanto Plain, which requires the Late Pleistocene tectonic history of the Kanto Plain to be reconsidered.

Tephrostratigraphy of drilled core C9010E off the Boso Peninsula: as a preliminary report

*Kaori Aoki[1], Makoto Kobayashi[1], Masanori Murata[1], Takehiko Suzuki[1]

1. Research Center for Volcanic Hazards and Their Mitigation, Tokyo Metropolitan University

We investigate the history of volcanic activities in north Izu Islands, and try to establish the high-resolution tephrochronology (Aoki *et al.,* 2019). Today, we present a part of the result of tephra correlations intervening in the sediment core off the Boso Peninsula, on the basis of the geologic, petrographic and geochemical characters of tephra samples collected at the reference sites on land. The sedimentary core C9010E was drilled at the site (34˚33.46'N, 139˚53.38'E, water depth: 2027.25 m) of about 40 km south of Boso Peninsula by the D/V *Chikyu* in 2009. The length of all core is 190.38 m. We collected 314 samples for tephra analysis from this core, including 161 tephra samples described (Tsuchiya *et al.*, 2009). The major-element chemistry of volcanic glass shards in the fraction of 63-125 μm for all samples have been determined by EPMA of the Center for Advanced Marine Core Research, Kochi University.

Firstly, all samples were checked roughly, and some fine glassy samples which might be correlated to widespread marker tephras were picked up and analyzed. As a result, correlatives for Aso-4 (87.1 ka; Aoki, 2008) at the depth 149.08 mbsf, On-Pm1 (95.7 ka; Aoki *et al.*, 2008) at 158.244 mbsf, and Aso-ABCD at 25 cm below On-Pm1 were found, respectively. Secondly, it is summarized the result of analysis for 28 samples (No.1~28) from the top of core to approximately 30 mbsf. Ten samples consist of mainly scoria clasts. Another 20 samples are rich in felsic volcanic glass shards, and including plagioclase, quartz (including beta-quartz), orthopyroxene, hornblende, cummingtonite, and occasionally biotite. The content of SiO_2 in felsic volcanic glass shards is 77.9-78.8 wt% generally, and it is so much. Except No.18 (16.722-16.772 mbsf), the contents of FeO* (0.59-0.74 wt%) and CaO (0.34-0.70 wt%) in felsic volcanic glass shards are remarkably low, on the other hand, the contents of Na_2O (4.12-4.25 wt%) and K_2O (3.45-4.15 wt%) are relatively high. These characters of major-element composition are resembled to them of felsic tephras provided from Niijima and Kozushima during late Quaternary. Furthermore, we tried to correlate each tephra bed in the core C9010C to each eruptive event based on the major-element composition. The probabilities that No.1 (1.15-1.17 mbsf) as the highest layer correlates to Niijima Mukaiyama tephra (AD886), and No.2 (1.63-1.66 mbsf) correlates to Kozushima Tenjyosan tephra (AD838) are high. No.8 (9.36-9.48 mbsf), No.12 and No.13 (14.32-14.65 mbsf), and No.14, No.15 and No.16 (No.14.65-15.54 mbsf) will correlate to the eruptive events of Miyatsukayama SW, Shikinejima, and Miyatuskayama on the Niijima main island, respectively (Kobayashi *et al.*, 2019a). The petrographic and geochemical characters of No.19 and No.20 (19.90-19.00 mbsf), No.21 (19.31-19.34 mbsf), and No.28 (29.49-30.66 mbsf) are resemble to the events of Akasakimine on Niijima main island. There are hemipelagic ooze of 11 m thick, including several scoria layers, between No.19 and No.28. Kobayashi *et al.* (2019a) report Akasakimine events are several eruptions at ca.15-20 ka, therefore it would make sense for the time interval of 11 m-thick sediment between No.19 and No.28. Above-mentioned correlatives to tephras provided from Niijima island consists of felsic volcanic glass shards mainly, only a small amount of scoria grains is included. No.18 (16.72-16.78 mbsf) is sorted glassy tephra mainly, with gray to beige fine bubbled pumices, which maximum diameter is 7 mm. There are almost volcanic glass shards including a small amount of plagioclase, quartz and orthopyroxene, not scoria grains and lithic fragments in the fraction of 63-250 μm. The content of SiO_2 is 78.8 wt%, FeO* is 1.24 wt%, CaO is 1.25 wt%, Na_2O is 4.76 wt%, and K_2O is 1.22 wt%. We consider that No.18 would be correlated to tephra provided from the submarine volcano Oomurodashi at 13.4 ka (Hamuro *et al.*, 1983; Saito and Miyairi, 2008; Tani *et al.*,

Late Quaternary fluvial terraces and piracies in the Tanagura area, along the upper reaches of Kuji River, NE Japan

*Yuichi Kato[1], Takehiko Suzuki[1]

1. Graduate school of Urvan Environmental Sciences, Tokyo Metropolitan University

In the Tanagura area, the upper reaches of Kuji River and the Yashiro River (a tributary of the Abukuma River), both river basins are in contact with each other. In this area, landforms showing piracies by the Kuji River exist. Previous studies have also suggested the occurrence of capturing. However, ages of piracies have not yet been determined. For determination of ages occurring piracies, chronology of terraces was established in the Tanakura area.
In this area, three landforms showing piracies exist. Timing of occurring piracies can be divided into two. In this paper, we named three paleo-rivers captured by Kuji River, that is, Ko-Uwadai River captured in the former and Ko-Mukaihara River and Ko-Shimohabara River in the later.
Fluvial terraces formed with the base level of erosion by the Abukuma River are classified into Yashiro River High terrace (YH), ditto Middle 1 terrace (YM1), ditto Middle 2 terrace (YM2) in descending order. Those by Kuji River are classified into Kuji River High 0 terrace (KH0), ditto High 1 terrace (KH1), ditto High 2 terrace (KH2), ditto Middle 0 terrace (KM0), ditto Middle 1 terrace (KM1), ditto Middle 2 terrace (KM2), ditto Low 0 terrace (KL0), ditto Low 1 terrace (KL1) and ditto Low 2 terrace (KL2) in descending order. YH formed by Ko-Uwadai River and YM2 by Ko-Mukaihara River and Ko-Shimohabara River displays characteristic topographies that indicate piracies.
KM1 consists of terrace deposits with a thickness of 2 m was covered with a tephric loess of which thickness is 3 m. This tephric loess includes AT tephra (30 ka) just above flood loam. Therefore, it is concluded that KM1 was formed at shortly before 30 ka.
KM2 consists of terrace deposits with a thickness of ca 4 m, and tephric loess or sediment covering terrace deposits was not recognized. Terraces identified as KM2 are broadly distributed in transitional zone from mountain to major valleys, terrace gravels of KM2 are coarser and are not well sorted. This suggests KM2 gravel have been deposited under the glacial stage environment. Because glacial stage after the deposition of AT is only MIS2, KM2 gravel have been deposited in 20–15 ka.
KL1 consists of terrace deposits consisted of sub-rounded gravels with a thickness of 1–2 m. There is no tephric loess on this gravel bed. KL1 where the last stage of the Jomon Period site situated on is younger than KM2. This show that KL1 was emerged at 15 ka to 2 ka.
YH consists of terrace sediment with a thickness of 4 m and it is covered by tephric loess of 8 m in thickness. This tephric loess includes two scoria fall deposits possibly correlated to be one of Ns-Sr6 (150 ka) to Ns-Sr12 (200 ka). Considering the age of YH, that is 150–200 ka.
YM2 consists of terrace sediment with a thickness of 2–3 m. Tephric loess or this sediment was not recognized. It seems that there is no tephric loess or at most 1 m in thickness. Geology and landform of YM2 is similar to those of KM2. This show that these terraces have been formed simultaneously. Considering the emergence of YM2 with piracy by Kuji River basin, the age of YM2 is around 20–15 ka.
Then, we consider when these piracies were occurred. Considering Ko-Uwadai river, the older limit of age in capturing is the formation of YH. YH would have been dissected by valley formed in an interglacial epoch, however, there is no valley. This suggests piracy occurred in MIS6 to MIS5e (200–125 ka).
Considering Ko-Mukaihara River and Ko-Shimohabara River, the older limit of age in capturing is the formation of YM2. In addition, the younger limit is KL1 because profiles of tributaries of Kuji River formed by capturing Ko-Shimohabara River are continual to KL1. Thus, piracy probably occurred in 20–2 ka.
Both piracies were occurred in glacial stage to interglacial stage condition. In conclusion, these piracies

occurred under the influence of climate change.

[J] Oral | H (Human Geosciences)：H-QR Quaternary research

Sun. May 26, 2019 1:45 PM - 3:15 PM JST | Sun. May 26, 2019 4:45 AM - 6:15 AM UTC | 102 1F

[H-QR05] Quaternary, Diachronic dynamics of human-environment interactions

convener:Mamoru Koarai(Earth Science course, College of Science, Ibaraki University), Ken Ikehara(Institute of Geology and Geoinformation, National Institute of Advanced Industrial Science and Technology), Masayuki Hyodo(Research Center for Inland Seas, Kobe University), Chairperson:Mamoru KOARAI(Ibaraki University), Tomonori Naya(産業技術総合研究所)

Humans have attained their specific development by indigenous cultures and evolved through environmental adaptation. The session raises issues of human-environmental interactions, views from diverse changes of climate, ocean, land and biota having made striking influence on humans. It welcomes various fields from human-environment change and their chronometric dating among Quaternary disciplines.

Landform features of Okinoshima of Munakata city

*Takahito Kuroki[1]

1. Faculty of Education, Univ. of Teacher Edu. Fukuoka

The Sacred Island of Okinoshima and Associated Sites in the Munakata Region was registered as a World Heritage in July 2017. Okinoshima located about 70 km northwest of Kyushu main island is a small island with maximum altitude above sea level of about 240 m and an area of about 960,000 m^2. The island consists of a steep cliff and gentle slope and the area of the plain is small. It consists of shale in the southwest part, quartz porphyry in the northwest part, and talus deposit in the southeast part, which has a unique landform distribution. Many historical relics were discovered and investigated there. Many precious votive offerings were conducted to pray for safety ocean voyages from the 4th to the 9th centuries and a sacred place, Okitsu-miya of Munakata Taisha is settled on the gentle slope on the south side of this island. Residents have unwritten taboos that forbid actions such as removing anything from the island, or revealing anything seen or heard there.
From the GIS analysis of various kinds of geographic information, I created maps of land and seabed of it and examined the features of the landforms. Furthermore, I carried out morphological and geological surveys on site. Fundamental geospatial data of GSI, map information related to isobaths of JHA and airborne laser scanner data of Munakata city are used as the geographic information. Basic ground elevation maps, slope maps, relief maps and 3D images were created. A landform classification map of land was made by interpretation of each basic map and field survey. Especially in the southwest part, the distribution of steep cliff and landslip lobe, which indicates the existence of landslides, is distinctive. In addition, the three groups of lineaments that trend west-southwest can be interpreted on the ground. From the 3D images etc., it can be identified that the altitude of Okinoshima is about 340 m above the flat seabed. The topography of seabed in the southern part of Okinoshima, is a shallow flat table in the west side and a concave area inclining to the east in the east side. Other landform features that should be investigated in the future are also confirmed in Okinoshima.
In this presentation, I would like to introduce features of the landforms clarified from the analysis of maps by GIS on Okinoshima where access is restricted.

Musashino Uplands in Tokyo and the southern Saitama Prefecture, had been investigated by many researchers for the last 90 years. The uplands, with wide area of 45km E -W and 25km N-S, are composed of Musashino and Tachikawa alluvial fans of MIS 5c to MIS 3 and Shimo-sueyoshi marine terraces of MIS 5e, as a type area in the Late Quaternary in Japan.
Recently great advancement in technology changes the research condition also in geomorphology and Quaternary geology.
First, GSI digital elevation model of 5m, is recently opened to the public. It is strongly useful data and tools to analyze precise classification of landforms in densely-developed urban areas like Tokyo. It provides us new maps as Red Relief Map (designed by T. Chiba), new type erosion depth map (by T. Chiba), and Rainbow Color Contour Map (Suginaka et al., 2018), all of them contributed to make a new division of landforms in Musashino Uplands with accuracy of 1 meter.
Second, a great number of digitized boring data and analyzing tools have been opened to the public. We have used more than 50 thousands data in the Musashino Uplands and Tokyo Lowland. These data revealed the underground geology in shallow part (20 to 100 meters in depth) continuously.
Third, tephrochronological studies in southern Kanto Plain have been established. However, in Tokyo area, distant from the source volcanoes, tephra studies were not enough. Moreover, the studied sites located only at the margin of the uplands. Recent progress in tephrochronology brings us to analyze cryptotephra for the age determination of the older fan gravels of research boring cores at the important site of the fan surface.
Those three new research conditions enable us to renew the division of landforms in Musashino Upland and Tokyo lowland.
Fourth, we created a new system using an automated program analyzing geological sequence from a vast number of boring data.
Main characteristics of this approach is to combine new results of computer-supported geomorphological and shallow geological data, with field-based knowledge and analog-type analyses such as a number of geologic profiles.

Sedimentological characteristics of the Ome Formation exposed on the western margin of Musasino Upland, central Japan

*Takako UTSUGAWA[1], Masaaki Shirai[2], Hiroka Kato[2], Sayuri Kato[3]

1. Department of Geography, Rissho University, 2. Department of Geography, Tokyo Metropolitan University, 3. Hamura City

The Ome Formation defined on the middle 20th century has not been understood enough due to various facies of the formation reported by previous studies and destruction of the outcrops by urbanization. We examined sedimentological characteristics of the Ome Formation distributed in Ome and Hamura cities, Tokyo, central Japan.

Musashino Upland, a large alluvial fan located in the southwestern part of Kanto Plain were formed by the Tama River (ca. 100-20 ka). Along the Tama River, multiple fluvial terraces have formed since the last interglacial (e.g., Ueki and Sakai, 2007). Juen (1964) reported a sandy conglomerate being distinguishable from the upper terrace deposits and the lower Onita (Kasumi) Formation in Kazusa Group, exposed at the terrace cliff along the Tama River. Based on the boring core investigation, it was revealed that the similar sediments have been buried under the western part of Musashino Upland (e.g., Yamazaki, 1978).

A surviving outcrop of the Ome Formation, 20 m thick clast-supported sandy conglomerate has exposed at the terrace cliff located around the boundary between Ome and Hamura cities. The formation is mainly composed by cobbles (5-20 cm in diameter). Boulders (20-40 cm in diameter) make channel-like structures in the basal part of the formation. Microscopic observation revealed that shale fragments were abundant as much as sandstone fragments. Sandstone gravels were the major component followed by chert and shale gravels derived from the Kanto Mountains (accretionary complex). Weathered granitoid gravels were also a few included.

The ratio of chert gravel in the Ome Formation shows downward increase. Chert gravel abundance of the basal Ome Formation is almost equal to one of the Onita Formation, it may imply that hard and durable chert gravels composing the Onita Formation had been reworked and included in the basal Ome Formation. The averaged imbrication of gravels of the Ome Formation indicated NNW direction. It means that the palaeocurrent was similar with the present Tama River current.

Ueki and Sakai (2007) hypothecated that Ome Formation is an aggregation of multiple channel deposits during several interglacial-glacial periods. Based on the sedimentological characteristics of Ome Formation as described above and the established boring core information, we also estimated the distribution of Ome Formation buried around the western part of Hamura City.

Acknowledgement
A part of this study is supported by Municipal history compilation office in Hamura-city (2014-2018).

Stratigraphy of Tokyo Formation: re-examination of Kita-Ku Central Park core

*Tomonori Naya[1], Kentaro Sakata[1], Tsutomu Nakazawa[1], Takehiko Suzuki[2], Toshio Nakayama[3]

1. Geological Survey of Japan, AIST, 2. Tokyo Metropolitan University, 3. Tokyo Metropolitan Government

We re-examined the Kita-ku Central Park core to examine the stratigraphy of Tokyo Formation. Several depositional cycles consistent with gravels, sands and mud were observed at shallower than the depth 30 m of this core. A pumice layer was found at about 15 m depth of this core, which can be correlated with Km2 tephra of the Kamiizumi Formation of Shimosa Group, suggesting that the Middle Pleistocene sediments corresponding to MIS 7e is distributed in shallow subsurface at this area.

S-wave veolocity structure and ground motion characteristics of "loam terraces": Examples from the eastern part of Utsunomiya City, Tochigi Prefecture, central Japan

*Tsutomu Nakazawa[1], Ikuo Cho[1], Kentaro Sakata[1]

1. Geological Survey of Japan, AIST

S-wave velocity structure and ground motion characteristics of “loam terraces” are examined in the eastern part of Utsunomiya City, Tochigi Prefecture, northern Kanto Plain, central Japan. The microtremor array observations reveal that the average S-wave velocitity in the upper 30 m (AVS30) becomes lower and the peak frequency in the H/V spectrum sifts to the lower value in higher terraces. These are considered to be influenced by the thickness of the loam bed (S-wave velocity: ~150 m/s) covering gravelly terrace deposits. We should note that the relatively low frequency (1.5–2 Hz) ground motion would be more largely amplified in the higher terraces and hills compared with the lower terraces.

The relationship between liquefaction distribution and microtopography classification during the 1948 Fukui earthquake - Toward improvement of liquefaction hazard map -

*Haruka Tani[1], Masanobu Shishikura[2]

1. Housei University, 2. Institute of Earthquake and Volcano Geology, National Institute of Advanced Industrial Science and Technology

Introduction
In most of the cases of recent large-scale natural disasters, it seems that the present hazard maps cannot have forecasted its damages precisely (Wakamatsu et al., 2017; Une et al., 2015). This is because the specific method for establishing a hazard map is not defined nationally and it is entrusted to each local government. For further disaster prevention and reduction, it is important to establish a more reliable hazard map with a low cost and simple method. Forecast of liquefaction occurrence from a geomorphological point of view can respond to such demand. Nakao et al. (2015) proposed a method for creating a liquefaction hazard map based on the liquefaction hazard evaluation criteria and corresponding geomorphic classification from past liquefaction cases in the Kanto region. However, even in regions other than the Kanto region with different geomorphic development histories, it is not certain whether these criteria are effective. This study treats the case of the liquefaction caused by the 1948 Fukui earthquake (M 7.1) in the central part of Fukui City and examines the issues of present hazard map. Then we would like to propose the direction for creating more precise liquefaction hazard map.

Method
To clarify the liquefaction distribution of the Fukui earthquake, I obtained old air-photographs of the survey area taken by GHQ immediately after the earthquake published by the Geospatial Information Authority Japan (GSI). This study independently defined the criteria of air-photo interpretation to identify the traces of liquefaction. The results of air-photo interpretation were drawn on the map by vector data using QGIS and compared to present hazard map and various geomorphic classification maps published by GSI.

Results and Discussion
Comparison results of the liquefaction distribution of the 1948 Fukui earthquake revealed from air-photo interpretation in this study with various maps suggest that the geomorphic classification defined by Nakao et al. (2015) can apply to this study area. And also our results can newly propose some geomorphic features relating to liquefaction. For example, liquefaction occurred intensively near the old artificial bank overlapped with the former river channel, and also old bank at the adjacent point with the natural levee located on the outer shore of the former meandering river. Because beneath such areas are composed of thick loose sand, liquefaction can easily occur and geomorphic condition triggered lateral flow.
From the above results, it can be regarded that the risk of liquefaction occurrence varies depending on the combination with surrounding microtopography. Therefore, consideration of microtopography is indispensable for establishing liquefaction hazard map.
The liquefaction hazard map of Fukui City is hardly consistent with the liquefaction distribution due to the 1948 Fukui earthquake and does not reflect the actual liquefaction risk, because the present hazard map does not only refer to liquefaction history but also does not consider microtopography.For more precise forecast the liquefaction damages, we propose that the liquefaction hazard map should be established by

©2019. Japan Geoscience Union. All Right Reserved.

considering liquefaction history and microtopography.

Remained Issues
Because this study uses old black and white air-photographs, there is some difficulty part to detect details of liquefaction. To reveal the relationship between the liquefaction distribution and microtopography, it is necessary to conduct a field survey and interview to victims. The relationship between the distance from the seismic source of the 1948 event and the reaction of each microtopography is not yet resolved because this study focused on only in the central part of Fukui City. Therefore, it is also necessary to conduct air-photo interpretation in whole areas of the liquefaction damage caused by the 1948 event.

[H-CG30] Safety of nuclear power plants against inland earthquakes

convener:Daisuke Suetsugu(Department of Deep Earth Structure and Dynamics Research, Japan Agency for Marine-Earth Science and Technology), Satoshi Kaneshima(Department of Earth and Planetary Sciences, Kyushu University), Takeshi Sagiya(Disaster Mitigation Research Center, Nagoya University), Kohta Juraku(Department of Humanities, Social and Health Sciences, School of Engineering, Tokyo Denki University), Chairperson:Daisuke Suetsugu, Kohta Juraku

We have organized sessions in the JpGU meeting on nuclear power plants in Japan mainly from a viewpoint of earthquake science since 2013. Topics in the sessions include risks of nuclear power plants related to earthquakes, volcanic activities and tsunamis, as well as the problem of communication gap between scientists and engineers on those risks.
In the 2019 JpGU meeting, we propose the session that focuses mainly safety against inland earthquakes. For a last decade, strong inland earthquakes occurred, such 2007 Off Niigata-Chuetsu earthquake (M6.8), 2008 Iwate-Miyagi earthquake (M6.9), 2016 Kumamoto earthquake, which did damage to regions near the earthquakes. Recently, 2018 Hokkaido east Iburi earthquake (M6.7) gave devastating effects to the epicentral area. Considering the high activity of inland earthquakes, it is important to reconsider the safety measures of nuclear power plants against strong inland earthquakes.
We would encourage discussions from a broad viewpoint across science and engineering, such as evaluation of strong motion due to inland earthquake and anti-seismic capability of nuclear power plants.
We welcome papers of other topics relevant to relationship of earthquake science and nuclear power plants, too.

Thickness of the seismogenic layer beneath the Japanese Islands and its relation to crustal earthquakes

*Junichi Nakajima[1]

1. Department of Earth and Planetary Sciences, Tokyo Institute of Technology

The thickness of the seismogenic layer is one of the fundamental parameters for earthquake hazard analysis. Large earthquakes often rupture the entire brittle seismogenic layer, and so the thickness of the seismogenic layer is a primary control on the size of earthquakes. Omuralieva et al. (2012) estimated the cut-off depth (D90) of crustal seismicity beneath Japan using a high-quality seismic catalogue of the Japan Meteorological Agency. D90 is defined as the depth above which 90% of the earthquakes occur. The obtained D90 shows a considerable lateral variation, ranging from ~5 km to ~40 km. The D90 is deep along the Pacific coast of eastern Japan, while it is locally shallow around volcanic areas. These lateral variations in D90 are inversely correlated to values of surface heat flow. In this talk, I summarize the recent result of D90 in Japan and discuss the relation among D90, thermal structure, and the size of crustal earthquakes.

Problems with active fault evaluation in nuclear safety regulation

*Yasuhiro Suzuki[1]

1. Nagoya University

There are various factors behind the underestimation of active faults during the safety review of nuclear power plants. I have disclosed this problem in my books (“Nuclear Power Plants and Active Faults” published by Iwanami-Shoten in 2013, and “Active Faults and Nuclear Regulation in Japan”, in-edit). In the past, safety review was conducted in two stages—site review and seismic review, and active fault survey was conducted only in the latter. Therefore, we could not use active fault information for site determination. Moreover, the safety regulation rules (Regulatory Guide for Reviewing Seismic Design) were bylaws of government authorities that did not possess external binding power. Furthermore, it allowed arbitrariness in interpreting the definition of active faults. In the above-mentioned case, although problems related to laws and ordinances have improved due to the establishment of New Regulatory Requirements after the formation of the Nuclear Regulation Authority (NRA), the problem of the NRA itself having no authority to investigate remains. In this presentation, I discuss issues of active fault evaluation in safety regulation.

Usually, the construction of nuclear plants should be conducted as follows: (1) determine if an active fault exists in the premises or in the vicinity, ② estimate earthquake ground motion and ground deformation by active faulting before designing, or ③ avoid. This flow is the basic policy of the NRA examination team that I was a part of, for the New Regulatory Requirements. ③ "Avoid" means moving the location or refraining from constructing at the site. However, there was no corresponding description in the earlier regulatory guide. The New Regulatory Requirements prohibit important facilities from being installed on the outcrop of "faults etc. that may possibly activate in the future". In addition, operating is not permitted unless it meets the requirements. While there have been objections to this, we can discuss again how to better understand "avoiding". However, revising New Regulatory Requirements should be based on social consensus. I will discuss here several scientific subjects regarding ① "active fault recognition" and ② "prediction of earthquake motion and displacement".

The longer active fault is, is the larger ground motion generated? –Surface and buried rupture earthquakes-

*Takao Kagawa[1]

1. Tottori University Graduate School of Engineering

Ground motion characteristics from surface and buried rupture earthquakes are demonstrated. Magnitude of surface rupture earthquake is large and it causes heavy damages in wide area. However, it is considered that ground motions from buried rupture earthquake is larger than those from surface rupture earthquake assuming same magnitude for both types of earthquake.

In case of aseismic design for important facilities, fault rupture scenarios tend to be conservative such as setting a long active fault with large magnitude. The larger magnitude is, the longer predominant period of ground motion from the earthquake is. However, ground motion in short period range that really affects on the target facility does not grow so large. Short period ground motion is affected more by fault distance than magnitude. Unfortunately, it is possible that larger ground motions in short period range are generated from small buried earthquakes than from large surface earthquake. Furthermore, probability of small buried rupture earthquakes are larger than that of large characteristic surface rupture earthquake. It might be an important issue for important facilities located in specific regions.

Seismic safety of nuclear power plants against inland crustal earthquakes and the "science vs. engineering problem"

*Katsuhiko Ishibashi[1]

1. Emeritus Professor, Kobe University

The seismic safety of nuclear power plants (NPPs) against inland crustal earthquakes has been a big problem in Japan since a nuclear reactor developed in the United Kingdom, an aseismic country, was introduced as the first commercial reactor in the 1950s (e.g., Ishibashi, 2015). However, even now, this problem has not been settled at all. In this presentation, first I review various problems of seismic safety of NPPs related to inland crustal earthquakes referring to the ongoing safety regulation. Then, I discuss the so-called "science vs. engineering problem" concerning NPPs' seismic safety.

The fundamental problem in the seismic safety of NPPs against inland crustal earthquakes is that the largest earthquakes which could affect each NPP severely by strong ground motion, or surface fault dislocation, or coseismic crustal deformation, or ground failures, or large tsunami, cannot be predicted precisely because of the intrinsic nature of earthquakes. Active faults don't indicate seismic fault planes of future earthquakes, and distribution of SMGAs (Strong Motion Generation Areas), stress drop values nor slip amounts on SMGAs cannot be known beforehand. Thickness of earthquake generation layers in the upper crust around each NPP is also obscure, though very important. In addition, prediction of occurrence and strong motion of slightly deep earthquakes in special tectonic environments such as the 2018 Hokkaido earthquake (M_J 6.7, H37km, maximum observed PGA 1796 Gal) is extremely difficult.

These essential difficulties bring underestimation of DBEGM (Design Basis Earthquake Ground Motion) or tsunami, and missing of possible crustal movement, which have actually occurred in several NPPs. Successive large aftershocks which may cause severe effects to a NPP damaged by the main shock is also a serious problem, but is not taken into account in NPPs' earthquake countermeasures. Next NPP accident in Japan may be brought about by this kind of phenomena.

Challenges to Seismic Safety of Nuclear Power Plants

*Tatsuya Itoi[1]

1. The University of Tokyo

Risk of nuclear power plants under threat of earthquake is not only a function of seismic hazard but also a function of a complex socio-technology system related to nuclear power plants.

Characteristics of seismic hazard can be summarized as follows:

- Strong ground motion is a phenomenon which is spatially distributed and affects simultaneously in space

- We cannot identify a worst-case ground motion because of inherent variability of earthquake (aleatory uncertainty),

- Uncertainty due to our limitation of knowledge is another source of reason why we cannot identify worst-case ground motion (epistemic uncertainty),

- There exists large uncertainty in prediction of rare (usually large) earthquake because of large epistemic uncertainty. Large epistemic uncertainty can be observed as different judgements among experts on the same issue.

A complex socio-technology system related to nuclear power plants is composed both of physical subsystems and of human and organizational subsystems. This means that not only the capacity of physical systems but also organizational resourcefulness and framework to prepare for and deal with such events should be carefully examined, when we discuss the capacity of nuclear power plants under extreme earthquake.

When organizational resourcefulness and framework is discussed, a sensitivity and adaptation to social preferences is important. For example, safety requirements to nuclear power plants shifted and will shift over time.

What is equally important is that recognition that uncertainty related to seismic hazards are shared among stakeholders and framework to deal with it should be prepared. One of good practices is considered to be an introduction of a process like SSHAC process [1], where representing the center, body and range of technically defensible interpretation is an aim. It is also important to recognize that scientific knowledge on natural hazards like earthquake also grows and sometimes shifts over time. Integrated decision making

process on nuclear safety issues which helps to ensure consistent and transparent decision should be a key to deal with these issues.

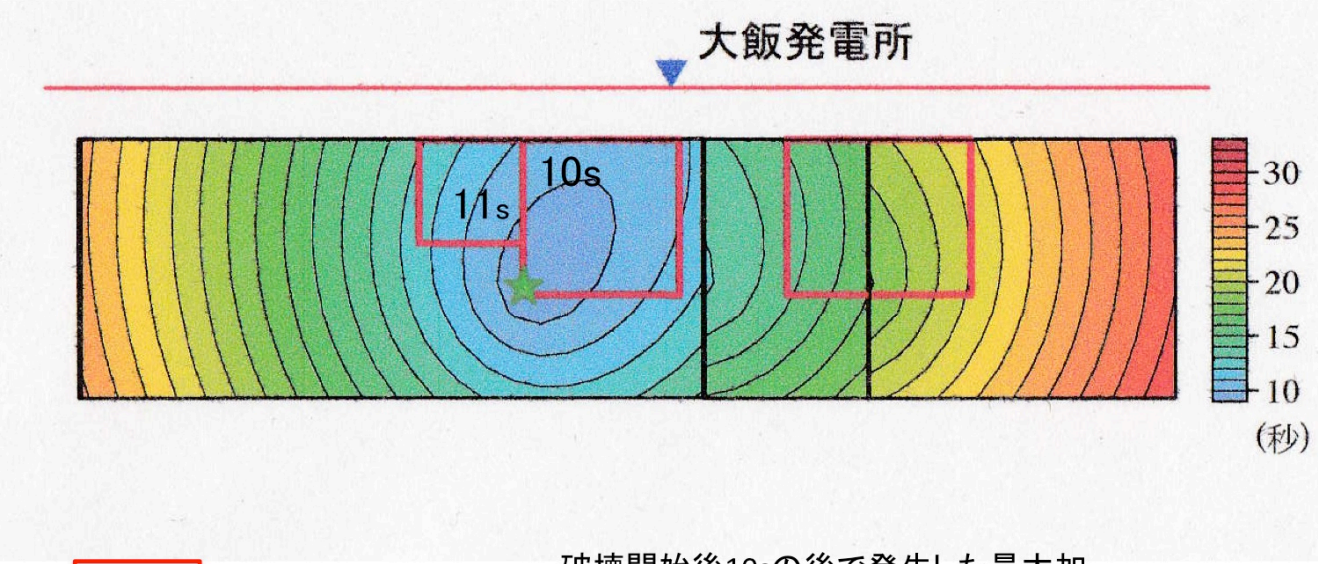
Strong motion at Ooi nuclear power plant



*Kunihiko Shimazaki[1]

1. University of Tokyo

The design basis seismic acceleration at Ooi Nuclear Power Plant is estimated as 856gal by using Irikura and Miyake (2001)'s 'recipe' and consideration on uncertainty in short-period spectral level. It appears to be smaller than so-called cliff edge acceleration estimated as 1260gal. However, more realistic acceleration would be greater than this cliff edge level.

Discussion

Long-term beach observation and future shoreline prediction

*Masayuki Banno[1]

1. Port and Airport Research Institute

Port and Airport Research Institute (PARI) has measured daily beach profiles since 1986 at the Hasaki coast of Japan. This long-term and high-time-resolution beach profile data is used to understand the nearshore processes and predict the future beach morphological change. The talk will be about the long-term beach observation data and the future projection of the shoreline change in response to SLR and wave climate change under global climate change. Long-term beach observation data available at the other beaches will also be introduced.

Migration of sand waves observed in Okinose area of Osaka Bay

*Kojima Hibiki[1], Tetsuo Matsuno[2,3], Mamoru Sano[2], Nobukazu Seama[3,2], Noritaka Endo[4], Ken'ichi Ohkushi[1], Atsushi Tani[1]

1. Graduate School of Human Development and Environment, Kobe University, 2. Kobe Ocean Bottom Exploration Center(KOBEC), Kobe University, 3. Graduate School of Science / Faculty of Science, Kobe University, 4. School of Geoscience and Civil Engineering College of Science and Engineering, Kanazawa University

A micro-topography formed on unconsolidated sand particles by water flow with wavelengths from a few meters to several hundreds of meters is called sand waves. On the seabed (water depth between 30-45 m) in Okinose, eastern margin of Awaji Island in Osaka Bay, Japan, sand waves of a range of wavelengths between 10-100 m are observed. In this area, there is a constant flow called Okinose Return Current. Although it is important to elucidate the detailed characteristics, formation mechanism, and migration mechanism of the sand waves in Okinose due to the viewpoint of protection of marine resources and ocean navigation security, they have not been well studied (Yashima, 1992). Therefore, we investigated sand waves on the seabed in Okinose six times in about a year to reveal which direction and how long the sand waves migrate in this period.

We investigated the bathymetry of Okinose using the Multi-Narrow Beam Echo Sounder (MBES) mounted on FUKAE MARU (Kobe University, Graduate School of Maritime Sciences). In addition, seabed samples were obtained using a grab type mud sampler. Dates of the observation were September 27 and November 12 in 2017, and March 24, August 31, September 26, and October 13 in 2018. Survey area was south-north 2 km and east-west 1 km.

Analysis of the bathymetry revealed the sand waves with different wavelengths in southeast Okinose. Following the criteria given by Perillo and Ludwick (1984), sand waves were classified into three types by the wavelengths and the wave heights; large sand waves (wavelengths more than 50 m, wave heights more than 2 m), small sand waves (wavelengths between 10-50 m, wave heights between 0.6-2 m), and megaripples (wavelengths less than 10 m, wave heights less than 0.6 m). In these observations, large sand waves did not move, whereas small sand waves migrated 5 m to the north and megaripples would change every day. Since sand waves usually migrate to the direction of the residual current (Nemeth et al., 2002), our observation of the small sand waves is consistent. In addition, despite three natural disasters of the Osaka Northern Earthquake on June 18, 2018 and two typhoons No.20 on August 23 and No.21 on September 4 both in 2018, large sand waves were not changed obviously.

The structured sand waves have been reported (e.g. Osumi Strait in southern Kyushu, Japan (Ikehara, 1998) and Cadiz Bay in Spain (Nemeth et al., 2007)). Our investigation revealed that the sand waves in Okinose were also structured and classified into three types. Generally, wavelengths and wave heights of sand waves are determined by water depth, particle size of the sediment, and sea flow above the seabed. Therefore, it is important to evaluate the sea flow over the sand waves to understand their formation and migration mechanisms. In the next step, we have a plan to simulate the flow above the seabed of Okinose to approach the formation and migration mechanisms of Okinose sand waves.

Inverse analysis of lobe/gully on Mars: examination by 2D Voellmy fluid model

Kyohei Noumura[1], *Hajime Naruse[1]

1. Department of Geology and Mineralogy, Graduate School of Science, Kyoto University

It has been known lobate deposits accompanied with small gullies distribute on the surface of Mars, but their origin has not been clarified yet. Topographic features of lobate deposits on Mars resemble deposits of debris flow on Earth, which is a flow composed of high-concentration and fluid (water). Therefore, lobate deposits have been focused as proxies of fluid phase of water on Martian surface environments. However, several studies suggested that lobate landform can also be formed by other processes such as rock avalanches, and thus water in fluid phase may not be required for producing such deposits. Thus, the controversy on existence of fluid water has not been settled. To this end, this study aims to distinguish the formation process of lobes on Mars by inverse analysis of rheological properties of the flow. Two dimensional Voellmy fluid model was employed as the forward model, which has been proved to be capable of reproducing behavior of debris flows or snow avalanches on Earth. Istok Crater that locates in mid latitudes of the southern Hemisphere of Mars was chosen as the study area. Geomorphology of a lobate deposit on the northern fringe of the crater was measured from DEM, and the rheological parameters of the flow was reconstructed by parametric optimization of the forward model to fit the calculation results to actual geomorphology. As a result, the inverse analysis suggested that the rheological property of the formative process of the lobate deposit was quite different from terrestrial debris flows estimated on Earth. Also, the reconstructed parameters largely deviated from other known processes such as rock or snow avalanches. This may imply that the unknown processes such as avalanches of CO2 frost that does not exist on Earth should be supposed as the formation process of lobes.

Development of provenance study using quartz shapes and surface microtextures

*Hiromi Itamiya[1], Ritsuko Sugita[1], Toshihiko Sugai[2]

1. National Research Institute of Police Science, 2. The University of Tokyo

[Introduction]
Quartz is highly resistant to weathering and various surface microtextures are formed and preserved on grains. The microtexture of a quartz surface (MQS) reflects the sedimentary history of the grain, including its parent rock, transportation process, and depositional environment. The relationship between MQS and sedimentary history has been investigated by using scanning electron microscopy (SEM) (Krinsley et al. 1973; Mahaney, 2002). The types and frequency of microtexture may be different from previous studies in foreign countries because MQS relates to the geological and geomorphological settings at sampling sites. However, surface textural analysis has primarily been used to estimate fault activity, and the variation in MQS have not been studied aiming to the provenance study in Japan. In this study, we observed the quartz grains of Japan to reveal the relationship between quartz morphological features and sedimentary history. In addition to the SEM observation, the image analysis and statistics analysis were applied.

[Sampling and methods]
Nineteen fluvial sediments and nineteen coastal sands were collected in Japan. Carbonates, iron oxides and organic matters were removed from samples by chemicals and quartz grains (0.1 to 1 mm) were randomly handpicked under a stereomicroscope. After coating with a layer of platinum, twenty quartz grains for each sample were observed by SEM. Quartz shape was estimated by roundness (Takashimizu et al. 2016) and fractal dimension (Suzuki et al. 2013) using SEM images and ImageJ. A total of fifteen MQS was observed with reference to the previous study (Vos et al. 2014). The number of grains possessing each microstructure was counted in every sample. Their frequency distributions were applied to the principal component analysis (PCA) using statistical software.

[Result and Discussion]
Fluvial grains showed angular outline, high relief and large number of conchoidal fractures, which were probably produced by a powerful impact or pressure on the grain surface (Vos et al. 2014). Small hole of less than 10 μm can be observed on some samples. It derived from small inclusions, and its frequency may show the differences of parent rocks of samples.
Most of the quartz in seacoast are characterized by rounded outline and medium to low relief. On the surface, there are many v-shaped percussion cracks, which are produced by grain-to-grain collision in subaqueous environment (Krinsley et al. 1973). Some coastal samples had angular outline and many conchoidal fractures like fluvial sediments, but v-shaped percussion cracks are scarcely observed. It may be because grains of these coastal areas were supplied by steep rivers near sampling site. It means quartz shapes and surface microtextures of beach sands relate to the sediment supply.
Frequency distribution of MQS was applied to the PCA, and samples collected from the same area could be grouped in PCA scores plot. The first principal component (PC1) was explained by chemically formed microtextures and the second principal component (PC2) was explained by mechanically ones. PCA is effective method to grouping the samples under similar sedimentary history.
It is revealed that the morphological diversity of quartz grains can be observed, even in areas with complex geological and geomorphological settings such as Japan. The types of MQS were similar to the

©2019. Japan Geoscience Union. All Right Reserved.

previous studies in foreign lands, but some types were sparsely observed compared to the previous report. MQS reflect parent rock, transportation systems and depositional environment, so it is important to comprehensively discuss the result of quartz analysis referring to the natural environment of sampling area.

Detrital heavy mineral record and Nd-Sr isotopic signature in Bengal Fan

*Kohki Yoshida[1], Cruz Jarrett[2], Manoj M.C.[3], Nozomi Hatano[5], Christian France-Lanord[4], Takeshi Kuritani[6]

1. Department of Geology, Faculty of Science, Shinshu University, 2. Florida State University, 3. Birbal Sahni Institute of Palaeosciences, 4. CNRS- Universite de Lorraine, 5. Graduate School of Science and Technology, Shinshu University, 6. Hokkaido University

The Bengal fan was formed by detritus shed by the Ganges and Brahmaputra rivers, reflecting India-Asia plate collision. The “IODP Expedition 354: Bengal Fan” recovered sediments recording the tectonic and climatic history related to the Himalayan orogeny (Fance-Lanord et al., 2016). We examined the heavy mineral assemblage, chemical composition of specific minerals and Nd-Sr isotope in the sediments deposited from the Miocene to present in the deepest hole (U1451A and B) in this expedition to clarify the detailed denudation history of the Himalayas. In addition, the heavy minerals in modern river sediments, taken from the Ganges and the Brahmaputra River in eastern India, are examined to compare with the Bengal Fan sediments.

The basal horizon of the Bengal Fan sediments, which consists of the latest Oligocene to earliest Miocene, was supplied by high-grade metamorphic terrene, correlatable to the High Himalaya Crystalline (HHC). Also, mafic metamorphic detritus, such as blue-green amphibole, were supplied suddenly from 14-13 Ma. Rare chromian spinels and Na-amphiboles were found in several horizons. These mafic detritus were actively provided after 7 Ma. These detritus were probably provided from the Yarlung-Tsangpo Suture Zone (YTSZ). After 6 Ma, olivine-pyroxene rich horizons are frequently intercalated in the Quaternary series. Tentative dominance of specific metamorphic minerals suggests episodic sediment production around HHC and YTSZ. The predominance of mafic minerals after 6 Ma indicates the contribution of the Brahmaputra River was increased. It is reported that the bed load sediments in the upper stream of the Brahmaputra River are characterized by the predominance of olivine, pyroxene, and ilmenite with a minor amount of spinels (Garzanti et al., 2004).

The depth profile of Sr-Nd isotopic signatures in the Bengal Fan sediments shows significant temporal variations. The range in 87Sr/86Sr and εNd indicate the dominance of Himalayan source. These signatures are bracketed by sediments from the Ganges, Brahmaputra River sands overlap with a data of the Lower Meghna (Pierson-Wickmann et al., 2001) indicating that the sediments in Bengal Fan are mixed products supplied from these two big rivers. Also, the Sr-Nd isotope depth profiles show a change in isotopic compositions around the lower part of the Middle Miocene.

These mineralogical and isotopic signatures indicate a relatively reduced supply of sediments from Brahmaputra river during the early Miocene time. The Sr-Nd isotopic signatures, the occurrence of mafic minerals and rare chromite grains also show significant variations indicating changes in the relative proportion of sediments originated from two big rivers. Especially in Pliocene and Quaternary sequences, the heavy mineral assemblage and Sr-Nd isotope signatures display a rapid and frequent change in the relative portion of sediments from both revivers. This is possibly related to the historical change of Brahmaputra river discharge refracting river capturing in eastern Himalayan syntaxis.

Evaluation of plant-fragment concentration mechanism in the turbiditic sediments in the Bouma Sequence by biomarker analysis in the Kawabata Formation, Yubari area, central Hokkaido, Japan.

*Hiroyasu Asahi[1], Satoshi Furota[2], Ken Sawada[3]

1. Graduate School of Science, Hokkaido University, 2. Japan Agency for Marine-Earth Science and Technology, 3. Department of Earth and Planetary Sciences, Faculty of Science, Hokkaido University

Kawabata Formation distributed in Yubari area, central Hokkaido, is formed by basin-filled and slope-apron turbidite systems, and sandstone and mudstone are mainly predominated as turbiditic sequence. Distinctive plant-fragment concentrated sandstones were found in the Kawabata Formation, and their sedimentological and biomarker analyses suggested that these sediments were deposited by hyperpycnal flow (Furota et al., 2014). However, such thin layer concentrated plant fragments are also formed in the typical turbidite characterized as the Bouma sequence. In the present study, we conducted biomarker analysis of sandstone and mudstone characterized as the Bouma sequence from the Kawabata Formation to evaluate sedimentological processes and to compare plant-fragment concentrated sandstones in hyperpycnite.

The sandstones and mudstones analyzed were collected from the route of the Soumokumai-zawa River, Yubari, central Hokkaido, during 2017. For the biomarker analysis, lipids were extracted with dichloromethane/methanol, and separated to aliphatic, aromatic and polar fractions. These lipids were identified and quantified by GC-MS and GC-FID.

The turbiditic sequence analyzed is about 15cm thick, and corresponds to the Bouma sequence, but no containing Td unit. Sedimentary layer equivalent to Ta units consists of medium-fine sands with tiny black plant-fragments. Tb unit consists of fine sands with parallel laminations containing the concentrated plant fragments. Tc unit also consists of fine sands about 1-2cm thick without cross laminations, and the concentrated plant fragments are observed as many black bands in this unit. Te unit is massive sediment that consists of very fine sands to silty muds without plant fragments.

Concentrations of *n*-alkane in the turbiditic sequence are the minimal values in the Ta units. The concetrations increase in Tb and Tc, and then decrease in Te units. This trend is also shown in variations in the concentrations of plant-derived terpenoids. Pristane/Phytane ratios are the highest value (ca. 5) in Tb and Tc units, indicating much higher contribution of terrestrial plant-derived particles in these sedimentary phases. The ratios of C27/C29 sterane, which are indicators of marine / terrigenous material ratios as source of organic matter, tend to decrease from Ta to Tc units, and are especially about 0 at Tc unit. On the other hand, the C27/C29 sterane ratio of the Te unit shows the highest value in the turbiditic sequence. These results imply that terrigenous components were separated and concentrated in specific layers by turbidity flow, which differs from continuous transport of terrigenous organic matter by hyperpycnal flow. Triterpenoids and diterpenoids are useful as angiosperm and gymnosperm (conifer) biomarkers, respectively. The diterpenoid compositions and HPP, which is an indicator of coniferous vegetation, are hardly changed throughout Ta to Te units. Triterpenoid compositions are also almost constant within the turbiditic sequence. These results suggest that the terrigenous materials were homogenized in sediments during transporting and reworking by turbidity current. In addition, A-ring degraded triterpenoid (des-A triterpenoids) were detected as major components in all sediment units. The

©2019. Japan Geoscience Union. All Right Reserved.

des-A triterpenoids are thought to be generated by microbial degradation during early diagenesis. The des-A triterpenoid compositions are also nearly constant as the results of diterpenoids and non-degraded triterpenoids. However, the ratios of des-A triterpenoid/pentacyclic (non-degraded) triterpenoid are higher throughout the turbiditic sequence, especially Tb and Tc units. Furota et al. (2014) reported that the des-A/pentacyclic triterpenoid ratios in sandstone units were clearly lower than mudstone units in the hyperpycnite, suggesting that more fresh terrigenous organic matter is rapidly transported by the hyperpycnal flow. On the other hand, our results imply that terrigenous matter is not rapidly deposited and reworked by turbidity current forming a typical Bouma sequence, and might be diagenetically altered in these processes. Thus, it is suggested that organic geochemical features are clearly different between the hyperpycnal and typical turbidity flows, and the hyperpycnal flow system occurs the effective transport and deposition of fresh terrigenous organic matter compared to those by turbidity current.

Tectonic behavior of a forearc basin reconstructed using turbidites: an example from the Plio-Pleistocene Kakegawa Group, central Japan

*Sone Haruki[1]

1. Graduate school of Shimane University, Natural Science and Technology, Major in Science of Environmental systems, Geoscience corse

The present study reconstructed the tectonic behavior of a forearc basin using the characteristics of turbidites. Topographic obstacles within a basin affects on the pathway of a turbidity current, causing the flow reflection or deflection within the basin. Turbidites recording flow reflections by outer rim of a forearc basin have been reported from the middle part of the Plio-Pleistocene Kakegawa Group, distributed in western Shizuoka, central Japan. Previous studies reconstructed basin geometry using reflected turbidites using the following concepts: (1) a turbidite sand bed tends to be thicker at the foot of slope where turbidity currents are locally stagnated. Thus the lateral thickness variation of a turbidite sand bed provides the location of foot of slope(s) within the basin. (2) A mud bed covering a turbidite bed becomes thickest at the basin center. The basin geometry reconstructions in the several horizons in the middle Kakegawa Group revealed the shift of the basin center and basin width through time. This methodology needs to be applied for the lower Kakegawa Group in order to understand the tectonic evolution of the basin. The present study described the turbidite beds in the lower part of the group and measured paleoflow and paleoslope directions from the ripple cross-lamination and inclined axis of small slump folds in order to reconstruct the behavior of the early phase of the Kakegawa Forearc Basin.

The lower Kakeagwa Group consists of alternations of sand and mud beds. The turbidite beds in the middle group are made up of fine-grained to very-fine-grained sand and show the characteristics of reflected turbidite without distinct massive division. The turbidites in the lower part, however, show the characteristics different from those in the middle part: they have a massive division with a coarse-grained to very-coarse-grained basal part, and thinner parallel and cross laminated divisions, showing the features of proximal turbidite. Some turbidites host wavy lamination, showing convex-up geometry, which is interpreted as the internal structure of antidunes. The top of the underlying mud beds are locally missing, where the overlying sand bed decomes thicker, and there are local mud clasts beds within the mud bed in some locations: these characteristics are interpreted as having been associated with a small-scale submarine slide. The dominant flow directions range from the east to the south, indicating offshore-ward flows. The division deposited from a reflected current is thinner than that in the middle part, and is not found in some turbidites: the turbidite beds in the lower part are thus interpreted as having been deposited mostly from obverse turbidity currents and having deposited on a slope environment dipping toward the offshore. The studied part of the lower group was resulted from the progradation of sediments from the north, and the basin center appears to have been located further offshore than that in the middle part of the group. Our turbidite observation resulted that there is a minor changes in frequency of reflected turbidites in the measured successions. For knowing the reason for such changes, we need more description of the turbidites in the distal area. As one of the possible reasons, the variation in uplift rate of the outer rim of the basin could be considered.

Most benthos floats up in liquefied sandy substrates: quantitative evaluation by measuring living-organism density

*Koji Seike[1], Shinji Sasa[2], Kotaro Shirai[3], Kaoru Kubota[4]

1. Geological Survey of Japan, AIST, 2. Port and Airport Research Institute, 3. AORI, The University of Tokyo, 4. Kochi Institute for Core Sample Research, JAMSTEC

Seabed liquefaction substantially affects benthic ecosystems. To investigate exogenous-forced behavior of organisms in liquefied substrates, we measured the body density of benthic organisms including bivalves, gastropods, annelids, and echinoderms collected from some localities in Japan, and compared them with the liquefied substrate density. Density of most measured benthic species showed was less than that of the liquefied seafloor sediments, suggesting that these species would float upwards in liquefied substrates. In contrast, a few individuals of three species showed higher body densities than the density of the liquefied sediments. These heavier benthic species would be expected to move downward during liquefaction of the substrate. These findings indicate that body density may determine the response of each benthic species to seabed liquefaction, forcing them to move upward or downward depending on their body density.

[H-CG33] Useful life-support systems in closed bio-ecosystems

convener:Kaori Tomita-Yokotani(Faculty of Life and Environmental Sciences University of Tsukuba), Masanori Shinohara(Teikyo University of Science), Shunta Kimura(Graduate School of Life and Environmental Sciences, University of Tsukuba), Chairperson:Shunta Kimura

In this session, since 2011, we and invited researchers have been introducing and discussing about practical and useful life-support systems in closed bio-ecosystems for inhabitation on extraterrestrial environments. Not only biological studies but also engineering ones including broad research fields are our target. And also, we assume that it is indispensable to discuss about these interdisciplinary fields beyond the generation for inheriting to our next generation and for developing our field. Theme from old and basic to current and applicative from senior to youth including undergraduate are welcomed.

Discussion

Closed bio-ecosystems in extraterrestrial environments-Research in closed bio-ecosystems

*Kaori Tomita-Yokotani[1]

1. Faculty of Life and Environmental Sciences University of Tsukuba

Researchers in this session have been studying useful life-support systems in closed bio-ecosystems since 2011. The final goal of our studies is to inhabit in extraterrestrial environments. There are various field of research related to biological and technical systems in closed systems. We have to have discussions with the researchers from a wide range of ages because our results will be inherited by the next generation. Here, I will introduce our session’ s outline and the contents of individual presentation. This year, we will focus on food for humans. The results of our discussions will contribute to our goal.

Concept and Studies of Aquaculture in Space -In the Past and Future-

*Masato Endo[1]

1. Tokyo University of Marine Science and Technology

Aquaculture as a food production subsystem of closed ecological human habitat in space was advocated to provide animal protein especially, various examinations related with it have been proceeded by our studies for 20 years. In actual, the scientific knowledge of response in aquatic animals under gravity changing in space environment and fish production with material circulation has been accumulated. These results show the possibility of aquaculture in space, that will be the necessary basic data to realize a human life under space environment in the future. The concept and the studies of aquaculture in space have been focused on the production technology so far. Regarding improvement of the productivity, the introduction of automatic fish rearing and plankton culture system that has been developed at the ground level will be required. Apart from that, the consideration of material flow in the whole space habitat, and post-harvest technology will be needed. The comprehensive deliberations including other subsystem about the material and energy flows will be required, the study will be needed to conduct the various simulations with mathematical models made from the accumulated basic data of modules and subsystems constituting human space habitat. The preservation of products will be also required as the buffer of material circulation, therefore the applications of freezer storage, canned food and retort food production are necessary. Diversity of food consumption and artificial ecosystem considering the demands and limitations should be eventually investigated for good human life of space habitation. Various requirements and limitations occur to the construction of material flows in the artificial ecosystem, chose of produced species, and selection of the cooking methods. The preparation of their options is essential in consideration of the requirements and limitations for the whole facility of human space habitat.

1. Jumonji University, 2. University of Tsukuba, 3. The University of Tokyo, 4. Mie University

It is an important to proper nutrient intake in order to maintain health for habitation in space such as Mars. The intake of proper nutrients for people to maintain health depends on age, sex, physique, physical activity situation. Furthermore, there are racial differences, and each country has established nutritional requirements for health.
Here, we will consider the proper nutrient intake in the space environment based on nutritional requirements on the ground. Then we will show combinations of several species as candidates of space food material for effective nutrient intake and propose cooking recipes used their species.

Investigation of the effect of jog deviations on Riedel fractures by three-dimensional elasto-plastic analysis

*Tomohiro Toyoda[1], Toshihiro Noda[2], Shotaro Yamada[1], Akira Asaoka[3]

1. Nagoya University, Graduate School of Engineering, 2. Nagoya University, Disaster Mitigation Research Center, 3. Association for the development of earthquake prediction

The Riedel fracturing process is strongly affected by the presence of jogs. For example, Fig. 1 describes left strike-slip fault with discontinuity of fault zone. The jog on the far side will be expanded with an accumulation of fault displacement and it causes depression of the ground surface as shown in Fig. 2(a), whereas the jog on the front side will be compressed and it causes bulge of the ground surface in Fig. 2(b). These transtensional/transpressional deformation fields called pull-apart/push-up are under the pure shear on which the tension/compression is superposed due to the presence of jogs. Authors have conducted three-dimensional elasto-plastic finite deformation analysis considering jogs of pull-apart and push-up as boundary conditions to numerically obtain the Riedel fracturing process. The abstract especially reports numerical investigations on the effects of the jog deviation on the angle of Riedel shears with principal stress rotation.

Simulations are implemented with the dynamic/static soil-water coupled elasto-plastic finite deformation analysis code ***GEOASIA***. Although the analysis code can accommodate two-phase analysis, only the one-phase analysis is carried out in the abstract. Finite element mesh with consideration of bending fault zone is shown in Fig. 3. Material parameters for SYS Cam-clay model are conformed to the preceding study[2)]. We prepared three models whose length is equal/doubled/tripled to the model in the *y*-direction (α=1, 2, 3). The analysis is conducted parametrically changing the jog deviation *d*=5, 10, 15mm. Figure 4 indicates shear strain distributions at the end of the simulations. The right diagonal Riedel shear band are obtained as a result of shear strain localization.

As for the results of *d*=15mm, the duplexing fracture patterns are obtained on the push-up side (α=1) whilst the P-shears are obtained on the pull-apart side (α=2, 3). However these fracturing patterns could no longer be detected in the cases of *d*=10, 5 mm. Especially in the case of *d*=5mm, only the independent single shears appear on the surface. The result suggests the significance of the installation of jogs to simulate these secondary fractures.

Focusing on the angle of Riedel shears on the tripled scale model α=3, there' s no difference in terms of fracture angles between the push-up and the pull-apart sides. However, the increase of a jog deviation makes Riedel shear angle lower/higher against the strike-slip running direction on the push-up/pull-apart side. It can actually be understood by the change of the principal stress direction. Figure 5 indicates the direction of maximum principal stress on the Riedel fractures above the regions A and B shown in Fig. 3 at the end of calculations, where the clockwise angle against running direction is positive. Because the direction of maximum principal stress in a pure sheared zone (straight fault zones without jogs) should be 45° in general, the angle deviation from 45° can be regarded as a result of jog installation. The figure indicates that the angle of the maximum principal stress become larger/smaller than 45° on the push-up/pull-apart side under transpressional/transtensional stress distribution. However, these transpressional/transtensional stress distribution gradually turn into pure shear with the decrease of a jog deviation. Therefore, the small difference of fracture angle between the push-up and the pull-apart sides with small jog deviation can be understood as a consequence of the increased percentage of pure shear in transpression/transtension.

A survey on earthquake prediction and public warning in seismological community

*Yoshinari Hayashi[1]

1. Faculty of Societal Safety Sciences, Kansai University

We conducted a questionnaire survey to clarify the comprehensive understanding of earthquake researchers about pre-earthquake prediction information. We divided the process up to the earthquake prediction information in following four stages, (1) the presence or absence of a phenomenon preceding a big earthquake, (2) the observability of the phenomenon, (3) the possibility of judging the observed data as abnormal, (4) possibility of public announcement of predicted earthquake information. We asked each researcher to respond with a numerical value of 10% from 0% to 100%. In addition, we asked for the probability of the success rate that the earthquake will occur in several days to one week.

A total of 129 researchers covered the delegates of the Japan Seismology Society, and 90 % respondents got responses. As delegates from the seismological society are elected by election by members, it can be thought that researchers who have certain insight in the field are selected. Responding to the questionnaire was basically based on requesting face-to-face at the meeting of the Fall Meeting in 2018, and asked for a reply by e-mail to those who could not do so.

In the tentative counting result, there is a wide range of responses from 0% to 100% in any of the four stages until public announcement success of the earthquake prediction information, and among seismologists it is obvious that there are various recognition in earthquake prediction. The average value of each stage is (1) "presence / absence of phenomenon" 47%, (2) "availability of observation" 47%, (3) "judgeability of the observed data as abnormal " 28%, (4) " public announcement possibility of predicted information" 41%. When we multiplied all respondents' answers of all four stages, the average value was only 6%. This is lower than the value expected by citizens and administration. In order to master information with low probability and low announcement frequency, it is necessary to consider reasonable countermeasures on the premise of a longer warning period with extremely low prediction rate and hit rate in comparison with civic perception.

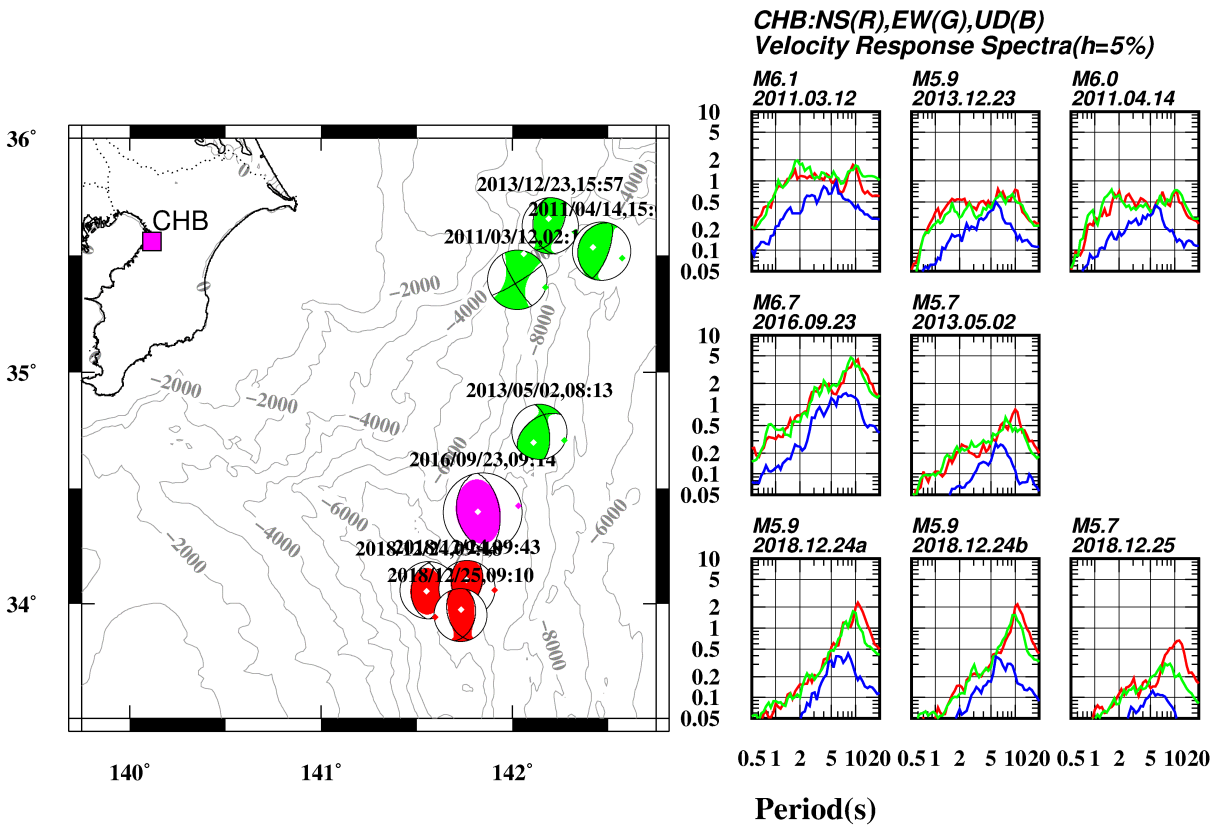
Long-period strong ground motion of the Tokyo Bay area during the events occurred in the plate triple junction area

*Tomiichi Uetake[1]

1. R&D Department, TEPCO research Institute, Tokyo Electric Power Company



Uetake (2018) analyzed the velocity records of the Tokyo Bay area during the M6.7 earthquake of September 23, 2016 occurred in the north side of the plate triple junction. The velocity spectra of these data showed that the short period component was small and the component with the period of 10 seconds was large comparing with the records observed during the same magnitude events and at almost same distance. After that, in the south side of the triple junction area, two M5.9 earthquakes occurred on December 24, 2018, and one M5.7 earthquake occurred on December 25, so we have compared these earthquake records with those of the 2016 event. Furthermore, we tried to compare to the records of the north side events along the Japan Trench.

First, we analyzed the characteristics of the records from the M5.9 earthquake occurred at 9:18 on December 24, 2018. We used the records obtained by the broadband velocity type strong-motion seismograph installed in the thermal power plants on the Tokyo Bay shore. Four observation stations exist on the east coast of the Tokyo Bay and eight observation stations exist on the west coast. The epicentral distance is from 210 to 230 km for the observation points on the east coast and Yokosuka. The epicentral distance is from 230 to 240 km for the observation points on the west coast except for Yokosuka. Long-period ground motion continued for a long time in the velocity traces at any observation point, and the significant wave packets are recognized especially at observation stations in the northeastern coast of Tokyo Bay. The velocity response spectrum with damping of 5% were calculated from observed data, there is a peak at around 10 seconds in period at any observation station, and the short period side is small. The amplitude of the spectra at period of 1 to 2 seconds is under one-fifth of amplitude at period of 10 seconds. A clear group dispersion was recognized in the waveform of the northeastern coast of the Tokyo bay by the multi-pass filter analysis, this means that the surface wave component was dominant. These features are similar to the M6.7 event in 2016. A similar tendency can also be confirmed with the M 5.9 event at 9:43 on December 24, 2018 and the M5.7 event on 25 December 2019.

Next, we compared the ground motions of the 2018 events with those of the events occurred in the north side of the plate triple junction along the Japan Trench. The events with M 5.7 or more occurred in the south area from 35.5 degrees north latitude in 2008 to 2018 were selected. There are few occurrences of large earthquakes in this area, and the next 4 events were selected. M 5.5 on May 2, 2013, M 6.1 on March 12, 2011, M 6.0 on April 14, 2011 and M 5.9 on 23 December 2013 in order from the south. Examining the characteristics of the velocity response spectrum with damping of 5% of these events, the velocity response spectra of the event on May 2, 2013 shows a similar shape to the events in the vicinity of the triple junction, but those of the other three events show different shape. The velocity response spectra of these three events are large in the short period side and almost the same amplitude in the period range from around 2 seconds to 10 seconds as shown in figure. This suggests that there is a regionality in the seismic source characteristics of the earthquake along the Japan Trench.

Time-frequency and engineering characteristics on offshore ground motion

*CHEN Su[1], FU Lei[1], LI Xiaojun[1]

1. Institute of Geophysics, China Earthquake Administration

Based on the offshore ground motions collected from California, U.S and Sagami trough zone, Japan, the time-frequency distribution feature of offshore ground motions was analyzed by Hilbert-Huang transform method. The corresponding spectral accelerations and dynamic amplification factor spectrum were compared with the design spectra in relevant seismic design standards. The research results indicate that, the offshore ground motions contain a wealth of long period component, the long period and ultra-long period component were dominant in frequency range. The energy distribution of the normalized marginal spectrum was correlated with epicenter distance. The horizontal offshore ground motion’ s energy was much larger than that of the vertical ground motion. Moreover, the further finds show that the dynamic amplification factor β-values of most offshore ground motions are greater than the current platform value of seismic design standards used, i.e., their long-period components are comment larger than that the seismic design standards given, so it is risky to carry out offshore facilities seismic design by land seismic design standards. In view of that there are lots of actual engineering structure, such as long-span bridges, oil and gas platform, etc., the long period components of offshore ground motions should be paid more attention in offshore engineering structure seismic design.

Long-period Ground Motion from Hypothetical Megathrust Earthquakes along the Nankai Through using the Ambient Seismic Field

*Loic Viens[1], Tomotaka Iwata[1]

1. Disaster Prevention Research Institute, Kyoto University

Long-period ground motions from megathrust earthquakes are a real threat for large-scale human-made structures. The Nankai subduction zone, Japan, is expected to host a major megathrust earthquake in the near future and has therefore been instrumented with offshore and onshore permanent seismic networks. To simulate the long-period ground motions that could be generated by such earthquakes, we take advantage of the continuous data recorded offshore (DONET1 and DONET2 seismic stations) and onshore (Hi-net stations). We compute offshore-onshore impulse response functions from the continuous records using seismic interferometry by deconvolution. After amplitude calibration, we show that the impulse response functions reproduce well the long-period ground motions of moderate (M_w ~5) earthquakes. We construct realistic source models of several M_w 8+ earthquake scenarios that we use together with the computed impulse response functions to predict the long-period ground motions in the surrounding region. We finally calculate the velocity spectral response of our simulated waveforms and compare them to those obtained with ground motion prediction equations. This study suggests that the ambient seismic field recorded by the ever-increasing number of ocean bottom seismometers can be used to simulate the long-period ground motions from megathrust earthquakes.

Fault model and strong ground motion evaluation for the Nankai megathrust earthquake

*Dianshu Ju[1], Hiroyuki Fujiwara[2], Nobuyuki Morikawa[2]

1. Ohsaki Research Institute, Inc., 2. National Research Institute for Earth Science and Disaster Resilience

In this study, based on the estimated seismic source area and tsunami source area for the Nankai megathrust earthquake by the Cabinet Office (2012), we figured out the fault parameters for the seismic source, by the procedure of Ju *et al.* (2016) for the subduction plate-boundary earthquakes whose ruptures reach the ground surface (sea bottom). Then, we evaluated the strong ground motions at 10 locations in and around Aichi prefecture and Osaka prefecture, using the empirical Green's function method. As the results of the Nankai megathrust earthquake model, the velocity response spectra of ground motion results of NGY station were about 250cm/s at the peak period 3s, and those of OSK005 were about 100cm/s to 200cm at the period 3s to 4s.

One cause of the strong ground motion characteristics in Mukawa town during the 2018 Hokkaido eastern Iburi earthquake

*Nobuo TAKAI[1], Michiko Shigefuji[2], Takahiro Maeda[3], Masayoshi Ichiyanagi[1], Hiroaki Takahashi[1]

1. Hokkaido University, 2. Kyushu University, 3. NIED

The Hidaka mountain range, central Hokkaido, Japan, formed by the Hidaka arc-arc collision zone, with the Ishikari eastern fault zone on the west side and the Tokachi plain fault zone on the east side. The 2018 Hokkaido eastern Iburi earthquake (Mw 6.6) occurred on September 6, 03:08 JST at this arc-arc collision zone. The Japan Meteorological Agency (JMA) magnitude (Mj) was 6.7 and hypocentral depth was 37 km. The maximum seismic intensity (JMA-scale) 7 was observed in Atsuma town. During this earthquake, 41 people died mainly by a widespread large landslide in Atsuma town. The many building damages by strong ground motion were concentrated around HKD126 site. At K-NET HKD126 and JMA Atsuma Shikanuma stations, strong motion records had strong power to destroy the timber frame buildings. It is an important examination to know the cause of the generation of this destructive strong motion in spite of a low magnitude and deep focus.

We have conducted observations (2018 September 10- December 16) of earthquake ground motion due to aftershocks of this earthquake at near hillside station (MKW01). The target stations' underground shear wave velocity structures were estimated by microtremor array observation and multichannel analysis of surface waves method (Shigefuji et al 2019 Jpgu). We calculated theoretical amplification factor of the SH wave with the estimated shear wave velocity structure. The amplification factor of HKD126 is 5 times larger than the one of the MKW01 at a frequency around 1 Hz. Cause of this tendency are affected by low shear wave velocity in shallow part in HKD126; the engineering bedrock of HKD126 is deeper than the MKW01. We carried out the strong ground motion high-density line array observation (2018 December 01-16) along the line of HKD126 to MKW01 in Mukawa town, to know the changing of the ground motion amplitude by underground structures. We choose the earthquake records which were not affected by the nonlinear effect of soft soil. In these observed spectra, we can also understand the different amplitude as same as the theoretical ones. However, the predominant periods during mainshock is longer than this predominant period of theoretical and weak motion records. Generally, the strong ground motions are affected by the nonlinear response of surface soft soil. The strong motion record of HKD126 was examined the nonlinear effects by the DNL (degree of nonlinear effect) methods. The DNL value is 14.7; this value means large nonlinearity occurred (Noguchi et al. 2013) and the predominant period of the 1-2 s might be moved from the short-period side by this large nonlinearity. The strong ground motion power of 1-2 s during the main shock at HKD126 site was mainly amplified by this shallow underground velocity structure and this predominant range was conceivable changed for long periods side with nonlinear effect moreover.

A further step for studying this earthquake, we will examine the nonlinear effect for HKD126 in detail and we will spread the target area to examine the strong ground motion spatial distribution and discuss the 3-D underground structure.

A part of this study was supported by the Grant-in-Aid for Scientific Research No. 18K19952 and 17H06215 from MEXT of Japan, and MEXT of Japan’ s Earthquake and Volcano Hazards Observation and Research Program.

Estimation of SMGA source model during the 2018 Hokkaido Eastern Iburi (Mw6.6) earthquake

*Susumu Kurahashi[1], Kojiro Irikura[1]

1. Aichi Institute of Technology

1. Introduction

The 2018 Hokkaido Eastern Iburi earthquake (Mw6.6, depth: 37km) occurred in the western Iburi region of Hokkaido, Japan, on September 6, 2018. The maximum seismic intensity with 7 was observed at Atsuma-cho. PGA of 1796 gal is observed at the HKD127(Oiwake) staion. Strong motions during this earthquake were widely observed, because the source depth was deep. We estimated the SMGA source model by comparing the synthetic and observed ground motions from the 2018 Hokkaido Eastern Iburi earthquake.
The observed records of this earthquake have some specific features. The observed ground motion at HKD126 station located in south of hypocenter has pulse-wave with maximum velocity of 158 cm/s. The observed record at HKD127 station located in north of hypocenter has three wave-packets. Observed ground motions at other stations also show three-wacepackets. Then, we estimated the SMGA source model considering these features seen in the observed records.

2. Estimation of the SMGA source model using empirical Green’ s function method

We constructed a characterized source model with SMGAs based on the slip distribution model inverted by Japan Meteorological Agency (2018). The source model of JMA. (2018) consists of one segment fault plane.
The EGF events whose records are used as the EGFs are selected to have hypocenters close to the SMGAs with almost the same radiation characteristics as the target events. We selected the records of an aftershock (Mw 4.3) as the empirical Green’ s functions based on the above conditions.
We calculated the spectral ratios between the mainshock and the EGF events to estimate the corner frequency of the EGF events. The source area and stress parameter of the event were estimated as 3.3km2 and 1.5MPa, respectively, from the seismic moment and the corner frequency using Brune’ s (1970, 1971) formula.
A SMGA area is divided into N x N subfaults, the area of which is taken to be equal to the fault area of each EGF event. Target frequency range is 0.5 - 10Hz. The best-fit characterized source model to simulate ground motions from the mainshock using the EGF method was determined, choosing the starting point, rupture velocity, and slip duration by comparing the observed and synthetic waveforms. The criterion of the best-fit model is to minimize the residuals between the observed and synthetic waveforms. The residual is defined as the sum of the squared residuals of displacement waveforms and acceleration envelopes at KiK-net stations. On the other hands, at K-NET stations, the residual is defined as the sum of the squared residuals of displacement and velocity waveforms to avoid non-lenear site effects on acceleration motions.
The best fitting SMGA source model has three SMGAs. The locations of the SMGAs are the northerm part, southern part and shallow part of the hypocenter. The areas and stress parameters of the SMGAs were estimated to be 136 km^2 and 20-25MPa, respectively. The area of combined SMGAs is agreement in comparison with the scaling relationship of combined asperity area versus seismic moment from Irikura and Miyake (2001).

The sub-theme #3 of the Comprehensive Research Project for the Major Active Faults Related to the 2016 Kumamoto Earthquake by the Ministry of Education, Culture, Sports, Science and Technology (MEXT) developed a three-dimensional underground seismic velocity structure model in the Yatsushiro plain and other areas for improving strong motion prediction for future earthquakes along the Futagawa and Hinagu fault zones because there are still un-ruptured segments remained on these two fault zones.
In the Yatsushiro plain, which is located along the Hinagu fault, seismic reflection surveys using a P-wave vibrator were conducted along two lines in 2017 (Uki line and Yatsushiro line) to investigate the underground structure down to the seismic bedrock. Temporary strong motions stations were installed at 37 sites covering the whole area of the Yatsushiro plain. Small-size microtremor array survey was also conducted at these temporary stations. Large-size microtremor array surveys were carried out at 29 sites with a maximum array radius of 500-600 m in the whole area of the plain. Miniature and irregular array microtremor observations were conducted to survey shallow subsurface structure at 32 sites in the southern part of the Yatsushiro plain. Single-station microtremor H/V observations were carried out at 31 sites in the boundary area between the Yatsushiro and the Kumamoto plains.
Microtremor array measurements were also conducted at most of strong motion stations in the Amakusa Islands, the Minamata-Ashikita area, the Hitoyoshi basin, the Izumi plain, the Tamana plain, the Kikuka basin, Aso area, and the southern part of the Shimabara peninsula, which consists of 23 Large-size arrays and 76 small-size arrays. Single-station microtremor H/V observations were conducted at 47 sites in the Izumi plain and 44 sites the Tamana plain to investigate the spatial variation in the bedrock depth. Miniature and irregular array microtremor observations were also conducted at 48 sites in the Hitoyoshi basin. Hot-springs boring well-logs were collected in the Yatsushiro plain, the Mianamata-Ashikita area and the Hitoyoshi basin.
We modeled the 3D velocity structure above the seismic bedrock using these survey data and existing information. For the Yatsushiro plain, the Rayleigh wave phase velocity and H/V spectra from the microtremor observations were jointly analyzed to obtain the S-wave velocity profile at each measurement site. When we analyzed microtremor data, we referred to seismic reflection profiles and boring log as constraint information for bedrock depth. The sedimentary layers were modeled by two layers with S-wave velocities of 0.6 and 0.9 km/s. Shallow low-velocity layers were also considered above the layer of 0.6 km/s, and we assumed a layer of Vs 2.7 km/s at the top of the seismic bedrock (Vs 3.1 km/s). The top depth of Vs 2.7 km/s is well correlated with the bedrock depth from the reflection surveys, and its depth

©2019. Japan Geoscience Union. All Right Reserved.

ranges from 0.3 to 0.6 km. The thickness of Vs 0.9 km/s is relatively large along the Yatsushiro line compared to the Uki line, which is consistent with interval velocities along these survey lines. Initial velocity model was constructed by the results of microtremor array analysis, and it was revised with H/V spectra at sites where phase-velocity dispersion curve was not available after checking consistency with gravity anomaly and boring well data.
Deep sedimentary velocity structure models were also constructed in the Hitoyoshi basin, the Amakusa Islands, Izumi plain and others using microtremor array surveys. The sedimentary layers were modeled by three layers with Vs 0.6, 0.9 and 1.6 km/s. Hot-spring borehole logs were also used in the Hitoyoshi basin. The seismic bedrock depth (Vs 3.1 km/s) is relatively deep in the eastern part of the Hitoyoshi basin (1.0~1.5 km). The top depth of Vs 1.6 km/s is relatively shallow around Amakusa Kamishima Island, which is consistent with high Bouguer anomaly in this area. The bedrock in the Izumi plain deepens toward the coast.
The final product of the 3D deep sedimentary velocity structure model and its validation by ground motion simulations will be presented in this presentation.

The research group for the Comprehensive Research Project for the Major Active Faults Related to the 2016 Kumamoto Earthquake supported by MEXT (PI: Prof. Hiroshi Shimizu, Kyushu Univ.) has conducted an integrated research on long-term evaluation of earthquake occurrence of active faults (Sub-theme 1), seismic activity and crustal structure (Sub-theme 2), strong ground motion prediction (Sub-theme 3) and outreach (Sub-theme 4). The research group of Sub-theme 3 developed a three-dimensional underground seismic velocity structure model in and around the source area and strong ground motion prediction for future earthquakes along the Futagawa fault zone and the Hinagu fault zone as there are still un-ruptured segments remained on these two fault zones after the 2016 Kumamoto earthquake. In this paper, we present the strong ground motion predictions.

Asano et al. (2019) explained how to develop the three-dimensional velocity structure model up to the engineering bedrock. We developed a subsurface velocity structure model down to the engineering bedrock, using boring database and miniature-size microtremor array measurement (e.g. Senna et al., 2018). We constructed source fault models for the Futagawa fault zone (Uto and Uto-hanto-hokugan segments) and for the Hinagu fault zone (Takano-Shirahata, Northern Hinagu, Southern Hinagu, Northern Yatsushiro Sea, and Southern Yatsushiro Sea segments). The location of the modeled source fault of the Uto segment is set to about 1km north from the present one (HERP, 2013). The active fault traces of the Hinagu fault segments are slightly modified from the research results by Sub-theme 1. We assumed two kinds of models for the dip angle setting of the source fault of the Southern Hinagu segment, 90deg. and 50deg. The latter is assumed referring to the microearthquake distribution by Sub-theme 2. The rake angle for each source fault was determined from the stress conditions of the source fault area by the stress inversion result (Sub-theme 2). The earthquake moment magnitude of the future Futagawa and Hinagu fault zones are 7.0 and 7.3-7.4, respectively.

We used “The Recipe” (Strong ground motion prediction for earthquakes with specified source model) (HERP, 2016) for strong ground motion prediction. The rupture starting points were assumed from the implication of the rupture starting point of the 2016 Kumamoto mainshock on the crustal resistivity distribution (Sub-theme 2). The hybrid (FDM and stochastic Green’s function method) method with the cross-over period of 1 sec was used for simulating ground motions on the engineering bedrock. Seismic equivalent linear analysis was applied to the area of the subsurface velocity model to get the time history of the ground motions at the surface and JMA seismic intensity was calculated using the simulated waveform data. Additionally, we estimated a JMA seismic intensity distribution in Kumamoto prefecture using PGV values of the engineering bedrock and JMA seismic intensity increments by the micro-topography classification and Vs30 values.

Near-surface geophysical survey and hearing survey of housing damages at Yasunaga district, Mashiki Town stricken by the 2016 Kumamoto Earthquakes

*Tomio INAZAKI[1], Takanori Ogahara[1], Hiroshi Kisanuki[2]

1. Public Works Research Institute, Tsukuba Central Institute, 2. PWRI (Present Address: OYO Corporation)

We conducted a detailed geophysical survey to the near surfaces and hearing survey of housing damages at Yasunaga District, Mashiki Town stricken by the 2016 Kumamoto Earthquakes. The geophysical survey was carried out in March 2017 along a 350 m long short survey line set on a road between Route 28 and Akitsu River. Hearing survey was also conducted along the survey line. We directly interviewed with residents in May 2018, or indirectly inspected housing sites. A total of 31 dwellings were surveyed supported by board members of the Yasunaga District community association. We could have quite valuable information on the earthquake related evidences as exemplified as follows; 1) ground water sprang out from an open crack under the floor and the housing was divided into two segments. 2) Dry wells revived just after the earthquake and were still pouring ground water. 3) Bulges were generated along a street or the boundaries between roads and dwellings. Different types were reported on the mode of occurrence of ground deformation between the northern and the southern part of the surveyed district. No specific deformed structure or faulting structure was identified in the near surfaces along the survey line set in the Yasunaga District. In contrast, a thick soft layer characterized as low resistivity and low Vs occupied the surfaces up to 20 m deep at the southern half of the line, or Akitsu lowland area. The above evidences strongly suggest that surface deformed structure observed in the Yasunaga District was originated by non-tectonic forces influenced by local artificial topography and the existence of the soft layer instead of active faulting. Our survey results also demonstrate the importance of high-resolution near-surface geophysical surveying and direct interviewing to the residents for the detailed undestanding of local earthquake disasters.

Evaluation on Influence of Shallow Subsurface Structures to Earthquake Ground Motions in the Kumamoto Plain, Using the Borehole Seismic Data

*Masahiro Korenaga[1], Seiji Tsuno[1], Hiroaki Yamanaka[2], Kosuke Chimoto[2]

1. Railway Technical Research Institute, 2. Tokyo Institute of Technology

The Kumamoto Plain, located in the Northern part of Kumamoto prefecture, Kyushu island, is consist of diluvial plateau in the west slope of Mt. Aso and alluvial lowland formed by Shirakawa and Midorikawa. It is suggested that the earthquake ground motions are amplified largely and intricately, due to the complex and soft soil sediments.

To investigate characteristics of earthquake ground motions in the Kumamoto Plain, we installed temporary seismic stations along the north-south line in Kumamoto Plain, immediately after the 2016 Kumamoto earthquake. We obtained seismic data of the main shock (Mj 7.3, occurred on 4/16 2016) at 2 sites near Mt. Hanaoka, in the northern edge of the Kumamoto Plain. We showed that the strong ground motions observed at the 2 sites during the main shock, were affected by the non-linearity and the polarization to direction of north-south.

To clarify the cause of these distinctive trends of the ground motions, we conducted detailed observations and surveys the site where the main shock was recorded. We installed seismometers simultaneously on the ground and on the engineering bedrock at a depths of 40m, with a sample rate of 1000 Hz. We calculated the Fourier spectral ratio of the seimic data on the ground to the data on the engineering bedrock. As a result, we confirmed that the characteristics of the NS and EW component of the spectral ratio are clearly different around 1-4 Hz. It is suggested that complex shallow subsurface structure affects the polarization to direction of north-south.

In addition, we performed P-S logging to understand shear wave velocity of the alluvial soils to the engineering bedrock at this site. We compared site amplification factors estimated from weak ground motion data to those calculated from P-S logging data and S-wave velocity structures estimated by array microtremor observations. Finally, we discussed the influence of shallow subsurface structure to the earthquake ground motions in complex and soft soil sediments.

Factors of large amplitude ground motions excited by small to moderate earthquakes
- Examination of KiK-net Kuriyama-nishi of the 2013 Tochigi-ken Hokubu Earthquake (Mj6.3) -

*Kentaro Kasamatsu[1], Kenichi Kato[2], Tetsushi Watanabe[2], Tetsuo Shiota[3]

1. Kajima Corporation, 2. Kobori Research complex inc., 3. Shikoku Electric Power CO.,Inc.

In KiK-net Kuriyama-nishi (TCGH07), a large amplitude ground motion with peak acceleration of about 1.2G was observed in the 2013 Tochigi-ken Hokubu Earthquake (Mj6.3). Both borehole and surface records are characterized as being predominant about 6Hz. Hikima (2015) divided small to moderated earthquakes into five group based on the focal region, and examined the difference in site amplifications of TCGH07 using spectral inversion method. Predominant frequency around 6Hz are limited characteristics found only in earthquakes that occurred in the west and vicinity of TCGH07. He guessed that the cause was the influence of site amplification factor and path characteristics.

In this study, in order to investigate the factor of large amplitude earthquake ground motion of TCGH07 from another point of view, we estimated attenuation relationship of the peak acceleration of 5-8Hz ground motion using observation records of small to moderate earthquakes, and evaluated the amplification factor of TCGH07. Futhermore, we investigated the spatial distribution of the residuals for the attenuation relationship in TCGH07, and compared with slip distribution of the main shock.

The attenuation relationship was estimated using borehole records of 17 KiK-net observatories around TCGH07 for inland crustal earthquakes that occurred in the focal region of the main shock. The database used for this study consists of the 1147 records of 178 earthquakes in the range of the hypocentral distance about 3 to 100 km, the focal depth within about 11 km and Mj 2 to 5.2. Maximum acceleration amplitude of the larger of the two horizontal components was used. The attenuation relationship was estimated in a model obtained by adding the term of the site amplification factors to the regression model by Si and Midorikawa (1999). The coefficients for the hypocentral distance representing the viscous damping were given 0.002 with reference to Si and Midorikawa (1999). For the constraint of the solution, KiK-net Fujiwara-2 (TCGH17) with the highest S-wave velocity was taken as the reference of the site amplification factors.

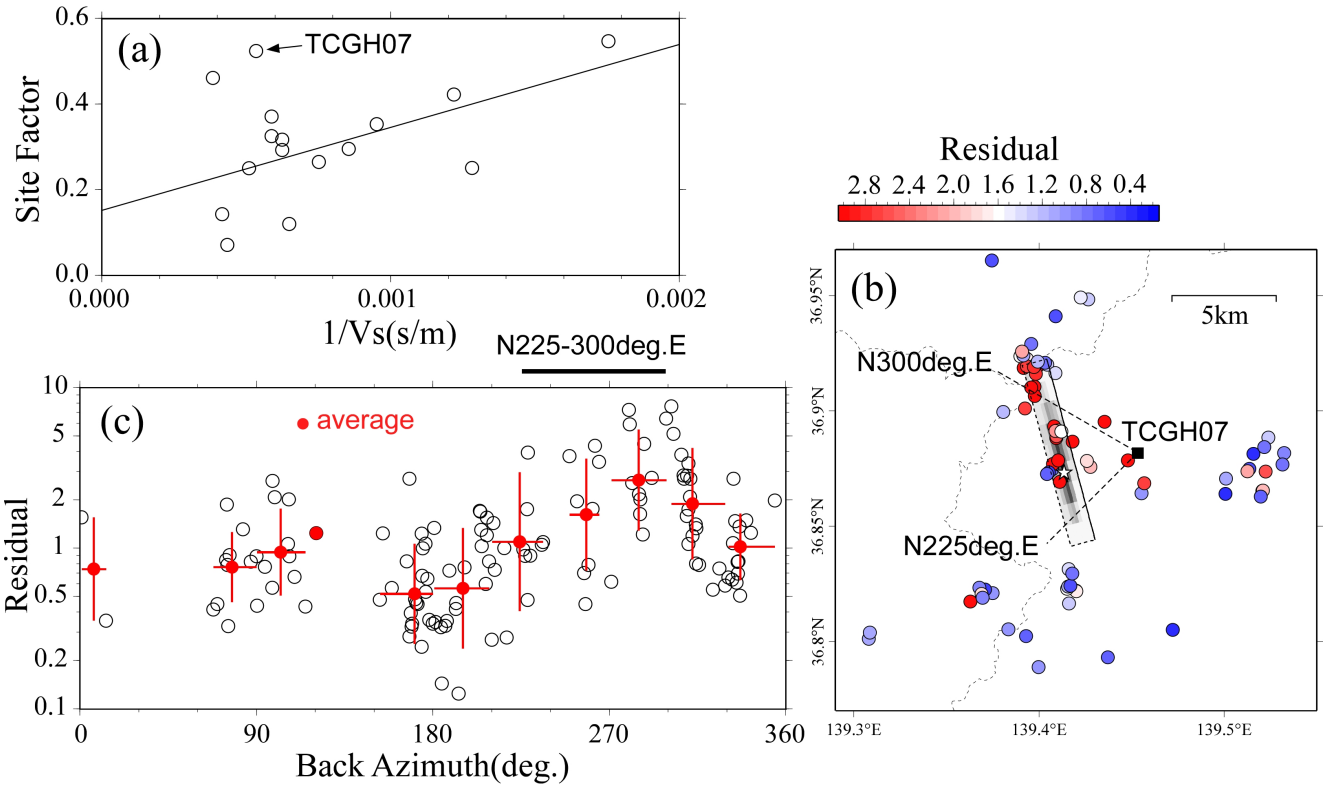

Fig.(a) shows the site amplification factor evaluated at each observatory as the distribution for the S-wave velocity of the observation depth. It tends to be proportional to the reciprocal of S-wave velocity. If the relationship between them is approximated by a linear equation, the amplification factor evaluated in TCGH07 greatly exceeds this average relation. It can be said that TCGH07 is easy to shake at frequency 5-8Hz compared with surrounding observatories. The residual of the maximum acceleration amplitude (observation / attenuation relationship) was evaluated for each earthquake in TCGH07. Fig.(b) shows their spatial distribution. In this figure, the center of the color contour is adjusted to be the average value of the residuals. The gray contour denotes the slip distribution of the main shock by the Hikima (2014). Regional characteristics are found in the distribution of residuals, such as small in the earthquakes that occurred in the south and east, and large in the earthquakes that occurred in the west. Regions where the residuals are large roughly correspond to the slip region of the main shock. Fig.(c) shows the dependence of the residual on the back azimuth. Although there was a bias in the number of earthquakes, the average and

standard deviation calculated by grouping at 30 degree intervals were shown in red circles and lines respectively. Obvious orientation dependence was found. The residual is large in the case of the earthquake occurring in the direction of N225-300deg.E corresponding to the slip region of the main shock. In addition to the shakeability of TCGH07 around 6Hz, the amplitude of the earthquake ground motion is further increased in the case of the earthquake occurred around the slip region of the main shock.

At the time of the main shock, as one of the reasons why the large amplitude ground motion was observed in TCGH07, it can be considered that the site amplification factor is large around 6Hz as pointed by Hikima (2015). However, the regional characteristics of the residuals of the small to moderate earthquakes shown in this study may indicate differences in the excitation characteristics of earthquakes. In that case, even at the time of the main shock, short-period ground motion strongly excited in the region where the residuals were large further increased the amplitude of TCGH07. We are investigating the stress drop of small to moderate earthquakes that occurred in the focal region of main shock.

Source modeling and strong ground motion simulation in the Tokyo metropolitan area of the 1923 Kanto earthquake based on seismic intensity inversion analysis

*Fumino Suzuki[1], Kenichi Kato[1], Katsuhisa Kanda[1], Takashi Ikeda[1]

1. KOBORI RESEARCH COMPLEX INC.

1. Introduction

The 1923 Kanto earthquake had serious damage to the Tokyo metropolitan area. It is concerned that similar large earthquake will occur repeatedly in the future. So, it is important to evaluate characteristics of the source and strong ground motions of this event. The short-period strong ground motions were not recorded during this event. Therefore, the seismic intensity data are effective for the source modeling used to the short-period strong motion simulation. Kanda and Kato (2018) evaluated the short-period spectral level of the acceleration source spectrum A, and number of strong motion generation area (SMGA) by the inversion analysis using seismic intensity data investigated by Moroi and Takemura (2002). In this study, the short-period spectral level A_i of six SMGA by Kanda and Kato (2018) are evaluated, and the strong ground motions of two sites in the Tokyo metropolitan area are simulated using the stochastic Green's function method.

2. Seismic source modeling

A_i's are evaluated referring to A, seismic moment of each SMGA M_{0ai}, and area S_{ai} by Kanda and Kato (2018). Assuming that omega-square model, Brune's model (Brune, 1970, 1971) and circular crack model (Eshelby, 1957) are applicable to modeling of each SMGA, A_i is proportional to M_{0ai}/S_{ai}.

The whole fault A is 4.66×10^{19}Nm/s^2 by Kanda and Kato (2018), and each SMGA A_i is 1.4 to 2.2 $\times10^{19}$ Nm/s^2. The whole fault A by Kato et al. (2013) is 2.46×10^{19}Nm/s^2, and maximum A_i has the almost same level as this. Kato et al. (2013) constructed the source model based on the slip distribution evaluated by Sato et al. (2005) using seismic waveform and geodetic data of The 1923 Kanto earthquake. Therefore this model reflects relatively long period ground motion. This study’ s model based on seismic intensity reflects relatively short period ground motion. Note that the difference.

Each SMGA is converted into a rectangular model holding the area. Strike and dip angle are set along the subducting the Philippine Sea plate. Background area is not considered. Other parameters (density, S wave velocity, rupture velocity (Vr), fmax and radiation pattern coefficient) are the same as those of Kato et al. (2013). Rise time of each SMGA is set from the relationship of $\tau_i=0.5S_i^{1/2}/Vr$. Rupture starting point of the whole fault is set on the SMGA located in the western Kanagawa, and rupture type of each SMGA is multi-hypocenter. The Q value is $100f^{0.7}$ (f is frequency) with reference to Central Disaster Management Council (2004).

3. Strong ground motion simulation

In order to the effect of the source model based on seismic intensity inversion to strong motions in the Tokyo metropolitan area, the strong motions at Asakawa and Etchujima evaluated by the stochastic

Green's function method. Soil structural models follow Kato et al. (2013).
The results of the strong motions evaluation are investigated about differences of 2 sites, contributions of each SMGA and differences from strong motions using the source model of Kato et al. (2013).

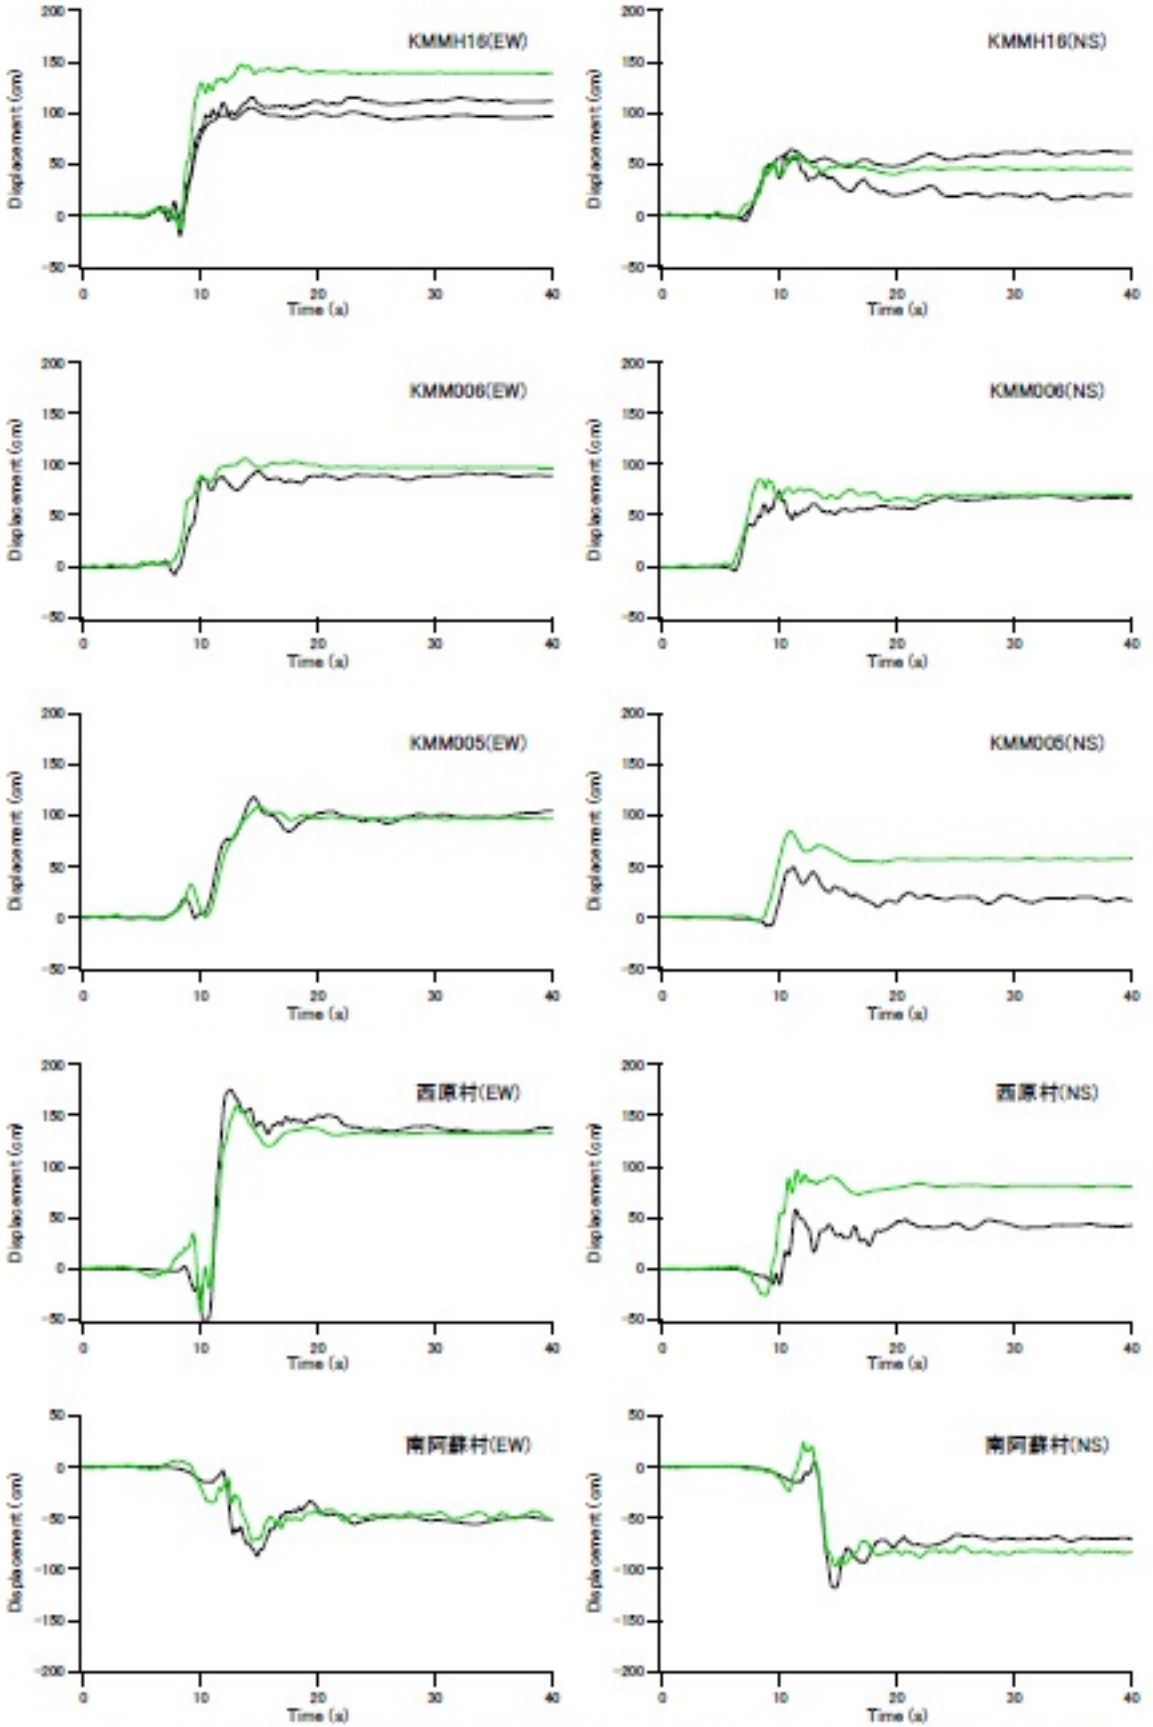
A Simple Fault Model to Calculate Strong Ground Motions Including Fling Steps for the Main Shock of the 2016 Kumamoto Earthquake



*Atsushi Nozu[1], Yosuke Nagasaka[1], Shuanglan Wu[1]

1. Port and Airport Research Institute

A composite source model was developed to simulate strong ground motions during the main shock of the 2016 Kumamoto earthquakes which can consider both fling steps due to slips near the site and pulses from deeper asperities. The authors' intention was to develop a simple source model which can be easily handled by engineers. To this end, a simple geodetic fault model by the Geospatial Information Authority of Japan (GSI), comprising of three faults with uniform slip, was used as a starting point and parameters related to the temporal evolution of the slip were added. The added parameters included the rupture starting point, rupture propagation pattern, rupture velocity and rise time. The resultant model was used as a background region, which was combined with asperities to form a composite source model. The ground motions from the background region were calculated by the discrete wavenumber method (Bouchon, 1981). The ground motions from the asperities were calculated by what we call "the corrected empirical Green's function method" (Kowada et al., 1998; Nozu et al., 2009). The simulation results showed that the composite model can well reproduce near-source displacement and velocity waveforms including fling steps at KMMH16, KMM006, KMM005, Komori and Kawayo, although the model was relatively simple in a sense that the slip-velocity function and the rise time were uniform throughout the background region. A closer look at the results showed that the fling steps were slightly overestimated or underestimated depending on the site. It was obvious that if we had introduced more complicated slip models, the results would have been closer to the observations. However, from an engineering point of view, it was a meaningful result that such a simple source model could explain ground displacements with fling steps without significant discrepancy because, in a prediction problem, it is difficult to assign a detailed slip distribution. On the other hand, to represent pulses with approximate periods of 1 s, it was definitely necessary to consider asperities.

Fling-steps displacements by the discrete wavenumber method

*SHUANGLAN WU[1], Atsushi Nozu[1], Yosuke Nagasaka[1]

1. PORT AND AIRPORT RESEARCH INSTITUTE

The discrete wavenumber method introduced by Bouchon (1977, 1981, 2003), provides a way to accurately calculate the complete Green’ s functions for many problems with a minimum amount of mathematics, and it is appropriate to represent the seismic waves by the summation of plane waves in the wavenumber domain for each frequency. However, there are still some problems to be solved by adoption of this approach in several specific cases. For example, the effects of imaginary part of complex frequency and the truncation of wavenumbers on near-fault fling-steps displacements.
For the first one, it advantages that a complex frequency with a small positive imaginary part is introduced in Bouchon (Bouchon, 1979) to solve the problem of integrand becomes zero when obtaining the near-fault ground motions. The determination and effects of the imaginary part of the complex frequency as defined by $\omega_c=\omega-\lambda i$, the values of λ in the range of $\lambda=[\pi/2T\omega,\ \pi/T\omega]$ recommended by Bouchon (2003) is still not clear. Therefore, in order to obtain more accuracy displacement waveforms, trail and errors have been conducted on near-fault fling-steps displacements under various point source models and it resulted that, $\lambda=2\pi/T\omega$ rather than $\lambda=\pi/T\omega$ can be recommended, (the displacement waveforms of dip-slip case under various could be obtained in Figure 1 below).
In terms of the second parameter, since for the near-fault displacements, in which seismic source and stations are located at a nearly same depth or at very low frequency range, the convergence of integration or summation over wavenumbers becomes very slow, the truncation of wavenumbers in such a case should be determined carefully. The use of $k_{max}=4k_{\alpha}$ was recommended (Bouchon and Aki, 1977), where $k_{\alpha}=\omega/\alpha$ and α stands for the P wave velocity. And the pioneering work of Honda and Yomogida (2003) addressed the issue of appropriately setting this parameter for the simulation of fling-step displacements by testing the accuracy of the fling-step displacements calculated through the DWN method by comparing the results with the analytical solutions for the static displacements (Okada, 1985) and proposed to use $k_{max}=4\ km^{-1}$ in the low frequency range. However, their study was focused on cases where a large amount of seismic moment is released at several kilometers under the surface. In this research, aimed at establishing a criteria for the k_{max} value applicable even for the shallow slip cases, based on the solutions in complete elastic wavefield, the truncation wavenumber was deduced related to the source depth dependent theoretically. And $k_{max}=5\pi/Z_s$ was recommended, where Zs is the depth of the source. The criteria for k_{max} was fully verified in the various point source model and the resultant displacements showed good agreements with analytical solutions (Okada (1985), which are illustrated in the following Figure 2).

Extension of characterized source model for long-period strong motions near surface-rupture-earthquakes

*Kojiro Irikura[1], Susumu Kurahashi[1], Yasuhiro Matsumoto[2]

1. Aichi Institute of Technology, 2. KOZO_KEIKAKU Engineering, Inc.

Introduction: Strong ground motions from the 2016 Kumamoto earthquake (Japan) were well simulated based on the characterized source model consisting of strong-motion-generation-areas (SMGAs) with high stress drop and a background area with low stress drop except very-near fault stations (Irikura et al., 2017). Strong ground motions observed at very-near-fault stations less than 3 km away from the surface traces along the Futagawa fault zone have specific long-period motions including maximum permanent displacements beyond 2 m. To reproduce long-period ground motions at those very-near-fault stations, we need not only to put SMGAs but also to add long-period motion generation areas (LMGAs) in surface layers from fault surface to a certain depth above the seismogenic zone. During the 2010 Mw7.1 Darfield earthquake (New Zealand), surface breaks caused by the mainshock were found associated with active faults by field surveys. Strong ground motions from the 2010 Darfield earthquake were also simulated well using the conventional characterized source model except ground motions at very-near fault stations. Reproduction of very-near-fault motions with permanent components for the 2010 Darfield earthquake are also needed to take into account LMGAs in surface layers. The same phenomena have been observed in the 2011 Nagano-ken Hokubu earthquake (Mw 6.2), the 1999 Chi-Chi earthquake (Mw 7.6), and other surface-rupture earthquakes as long-period motions and permanent displacements seen in the 2016 Kumamoto and 2010 Darfield earthquakes Then, we propose the extension of the characterized source model adding long-period motion generation areas (LMGAs) from fault surface to a certain depth above the seismogenic zone. The parameters for SMGAs are given following the recipe by Irikura and Miyake (2010). The parameters of LMGAs are discussed in relation to scaling relationships of surface-rupture earthquakes.

Extension of characterized source model: Long-period motions with permanent displacements at the very-near-fault stations during the 2016 Kumamoto earthquake are not well simulated based on the conventional characterized source model. SMGAs in the conventional characterized model were determined inside the seismogenic zone deeper than 3 km. To generate long-period motions near the fault traces, long-period motion generation areas (LMGAs) are deployed in surface layers from fault traces down to a certain depth. Similar studies have been made by several authors (e.g. Ikutama et al. 2017; Tanaka et al., 2018; Satoh, 2018; Iwaki et al., 2018). Ground motions more than 2 s observed at very-near-fault-distance stations such as 93048 (Nishihara Village Hall), 93051 (Mashiki Town Hall), KMMH16 (Mashiki-KiK-net station) in the 2016 Kumamoto earthquake are well reproduced adding long-period motion generation areas (LMGAs). During the 2010 Mw7.1 Darfield (New Zealand), surface breaks caused by the mainshock were found associated with active faults by field surveys. Strong ground motions from the 2010 Darfield earthquake were also simulated well using the conventional characterized source model except ground motions at very-near fault stations. Reproduction of very-near-fault motions with permanent components for the 2010 Darfield earthquake are also needed to take into account LMGAs in surface layers. To determine the extended characterized source model for strong motion prediction of target earthquakes, first the procedures for estimating the outer and inner fault parameters are preserved for the SMGAs. Next, to set LMGAs for the target earthquake, L_b (Length of LMGA), W_b (Width of LMGA), D_b (Maximum slip of LMGA), T_b (rise time of slip velocity time, function) are systematically given, following scaling relationships for surface-rupture earthquakes.

A Study for the cause of earthquake damages by the 2014 Nakagano-ken Hokubu earthquake (M_J 6.7) –consideration using the strong motion simulation –

*Kazuhito Hikima[1], Ryoichi Nakamura[2], Tomiichi Uetake[1]

1. Tokyo Electric Power Company Holdings, Inc., 2. Earthquake Research Institute, Univ. of Tokyo

- INTRODUCTION -

During the 2014 Nagano-ken Hokubu earthquake, distinct surface ruptures were observed along the known Kamishiro fault, so it suggests that fault slip was occurred near the shallow parts on the fault plane. However, the damage caused by strong motion was not so heavy near Shiojima district, where the most distinct surface rupture was observed, and the fatal damage befall around Horinouchi district, where locate at 7 to 8 km south from Shiojima. To study the reason of the discrepancy among these damages and the fault slip is important for understanding the cause of strong motions.
In previous study (Hikima *et al.*, 2015: SSJ, 2018:JpGU), we carried out source process inversion using strong ground motion records. In this study, we performed the strong motion simulation using the derived source model and the 3D structure model and discussed the cause of the strong ground motions and the damages.

- SOURCE MODEL -

The outline of the source model by Hikima *et al.* (2018) is as follows.
Basically, the waveforms of KiK-net borehole stations (by NIED) within about 50 km from the source area were used for the analysis. The acceleration waveforms were filtered between 0.03 and 0.8 Hz, and were integrated to velocity waveforms for the inversion analysis. In addition, two displacement waveforms at K-NET Hakuba (NGN005) and KiK-net Hakuba (NGNH36), which were adequately integrated from acceleration waveforms (Nakamura *et al.*, 2015:SSJ), were also incorporated to the analysis.
The source process was inverted by the multi time window analysis (Yoshida *et al.*, 1996, Hikima, 2012). We calculated the Green's functions by 3D finite difference method using a 3D velocity structure model. The 3D velocity structure was taken from the model constructed for the long period ground motion prediction map by the HERP.
The parameters of the hypocenter were taken from Sakai *et al.* (2015). Although the strike of the fault plane was set as 25 degree in Hikima *et al.* (2018), we also consider other strike angles in this study. The dip angle was varied according to depth, and the values were 60 and 50 degree for deep and shallow part, respectively. The fault size was 19 km for length and 15 km for width. The subfault size was 1.0km. Some large slip areas were estimated on the fault plane. One was slightly deeper from the hypocenter and the other one was on the shallow and small part of the fault plane. Although the amount of final slip was similar on these area, the time functions on shallow part were broader than those on deeper part, so it suggests that the strong motions from the shallow portion relatively lack high frequency components than those from deeper parts. Furthermore, large slip was not estimated on the fault plane near Horinouchi district.

- STRONG MOTION SIMULATION -

The strong motion simulation was performed by 3D finite difference method using the inverted source model and the 3D velocity structure. We used finer grid spacing than the calculation for the Green's function to consider higher frequency.

©2019. Japan Geoscience Union. All Right Reserved.

Although large PGV values were calculated near the region where the surface rupture was emerged, almost same level strong motions were estimated also near the Horinouchi. To survey the reason of these strong motions, we checked the snap shots and found that the directivity effect from the large slip which lies on the shallow part of the fault. Furthermore, when the amplification by the surface geology was also considered, the amplitude around Horinouchi became larger than the region near Shiojima and so on. It seems that the results correspond to the observed damage distribution in the source region. From these results, we think that the causes of the strong ground motion around Horinouchi are the source process (directivity effect) and the amplification by the surface geology.

Strong ground motion simulation of the Northern Osaka earthquake of June 18, 2018

*Yosuke Nagasaka[1], Atsushi Nozu[1]

1. Port and Airport Research Institute

Strong ground motion simulation with point source model is simpler than the model with rectangular asperities. On the other hand, if the point source model ignores spacio-temporal extension of the fault, this can cause discrepancy between observation and synthetics. We have examined the applicability of the pseudo point-source model (Nozu, 2012) for intraslab earthquakes and so on and the results showed good agreement with observation records. However, validation of the method for crustal earthquakes is not enough. In this study, we conducted strong ground motion simulation for the June 18, 2018 Northern Osaka earthquake (M_J6.0) as an example of crustal earthquake.

First we assumed two fault planes based on moment tensor solution and aftershock distribution. These two fault planes have the mechanism of reverse fault and right-lateral slip fault, respectively. Then we estimated slip distribution by general inversion technique using empirical Green's functions. The result was that the reverse fault first ruptured and the right-lateral fault ruptured after a while, larger slip was seen on the reverse fault.

We then conducted strong ground motion simulation with the pseudo point-source model. In the method, we regard one asperity as one point source that follows omega-square model. We get the synthetic waveforms by combining the omega-square model with path spectrum, empirical site amplification factor, and site phase characteristics for each target station. We assumed only one point source in the first case. We put the point source on the hypocenter, and determined seismic moment (1.7×10^{17} Nm) and corner frequency (0.65 Hz) so that the synthetic Fourier spectra explain observed spectra the best. For phase characteristics, we chose the earthquake of June 19, 2018 occurred at 4:53 (M_J3.9). This small earthquake has the mechanism of reverse-fault, which explained the observed phase characteristics better than the phase of right-lateral earthquake. The result with one point source showed good agreement with observations in terms of amplification and phase characteristics. However, the result underestimated at OSK002, the closest station from the epicenter.

In order to improve this problem, we then conducted the simulation with two point sources, which can better consider the effect of the rupture propagation than the case of one point source. The location of the second point source is about 0.3km above the first point source. The relative rupture time is 0.41s. We used the same small earthquake for phase characteristics for both point sources. The seismic moments and corner frequencies were determined in the same manner as the case of one point source as M1=0.7×10^{17}Nm, fc1=0.6Hz, M2=1.1×10^{17}Nm, fc2=0.9Hz. As a result, the amplification at OSK002 was improved and the characteristics of the Fourier spectra were also improved compared to the one point source case.

Strong Motion of the 2018 Mw 6.4 Hualien, Taiwan Earthquake and Its Impact on Seismic Design Code in Taiwan

*Chun-Hsiang Kuo[1], Jyun-Yan Huang[1], Che-Min Lin[1], Kuo-Liang Wen[2]

1. NCREE National Center for Research on Earthquake Engineering of Taiwan, 2. NCU National Central University

The maximum observed PGA and PGV at various stations during the 2018 Hualien, Taiwan earthquake were 594 Gal and 146 cm/s, respectively. Pulse-like velocities were observed at all stations within a distance of 4 km from the Milun fault. The horizontal spectral accelerations of the pulse-like records indicated two obvious amplifications at periods of roughly 1 s and 2 s. Natural frequencies of 0.8 to 1.5 Hz were observed in the region near the Milun fault using microtremor measurements. The spectral acceleration peak at periods of roughly 2 s is mostly seen in the east-west direction, indicating a typical fault-normal seismic radiation from the fault rupture. Consequently, we contend that the amplifications of spectral acceleration at approximately 1 and 2 s were caused by site amplification and the rupture front, respectively. The site amplification at the period of approximately 1 s may have been one reason for the collapse of medium-rise buildings during this earthquake. Evident soil nonlinearity resulted in smaller horizontal than vertical PGA at many stations in the near-fault region. Return period of the Milun Fault is believed to be about 67 years (1951 and 2018) and thus it is a 53% probability of being exceeded in a 50-yr mean recurrence interval. The demand of seismic design in the Hualien City will have to be increased especially in the long-period according to the observed ground motions during this earthquake.

Simulation of Rupture Directivity Effect for the February 6, 2018 Hualien, Taiwan Earthquake

*Cheng-Feng Wu[1], Huey-Chu Huang[1]

1. Department of Earth and Environmental Sciences, National Chung Cheng University

The Hualien earthquake (M_W 6.4) occurred off Taiwan’s eastern coast on February 6, 2018. This earthquake has struck the eastern Taiwan and also caused several houses collapsed and casualties. From the observed strong motion data at the disaster sites, an obvious directivity pulse appears in the velocity waveform and the peak ground velocity (PGV) exceeds 50 cm/s. In order to further investigate the strong ground motion characteristics of this earthquake, we perform the broadband (0.1-10 Hz) strong ground motion simulation using the stochastic Green's function method. About the source parameters, we adopt the empirical formulas. Besides, the slip distribution on the fault plane is calculated by using the hybrid k-squared slip model. By comparing the simulation results with the observed data, we get the best slip model from the hypothetical slip models. Moreover, we effectively simulate the directivity pulses at several stations at the south of the earthquake. The disaster areas are located near and above the asperity of the fault plane. According to simulation results of different velocity structures, the addition of the shallow velocity structure makes the synthetic waveforms more similar to the observed data at most stations. The amplifications of the PGVs are about a factor of 2.0 at the stations near the disaster areas. Therefore, the disasters of the Hualien earthquake could be caused by the forward-directivity and site amplification effects.

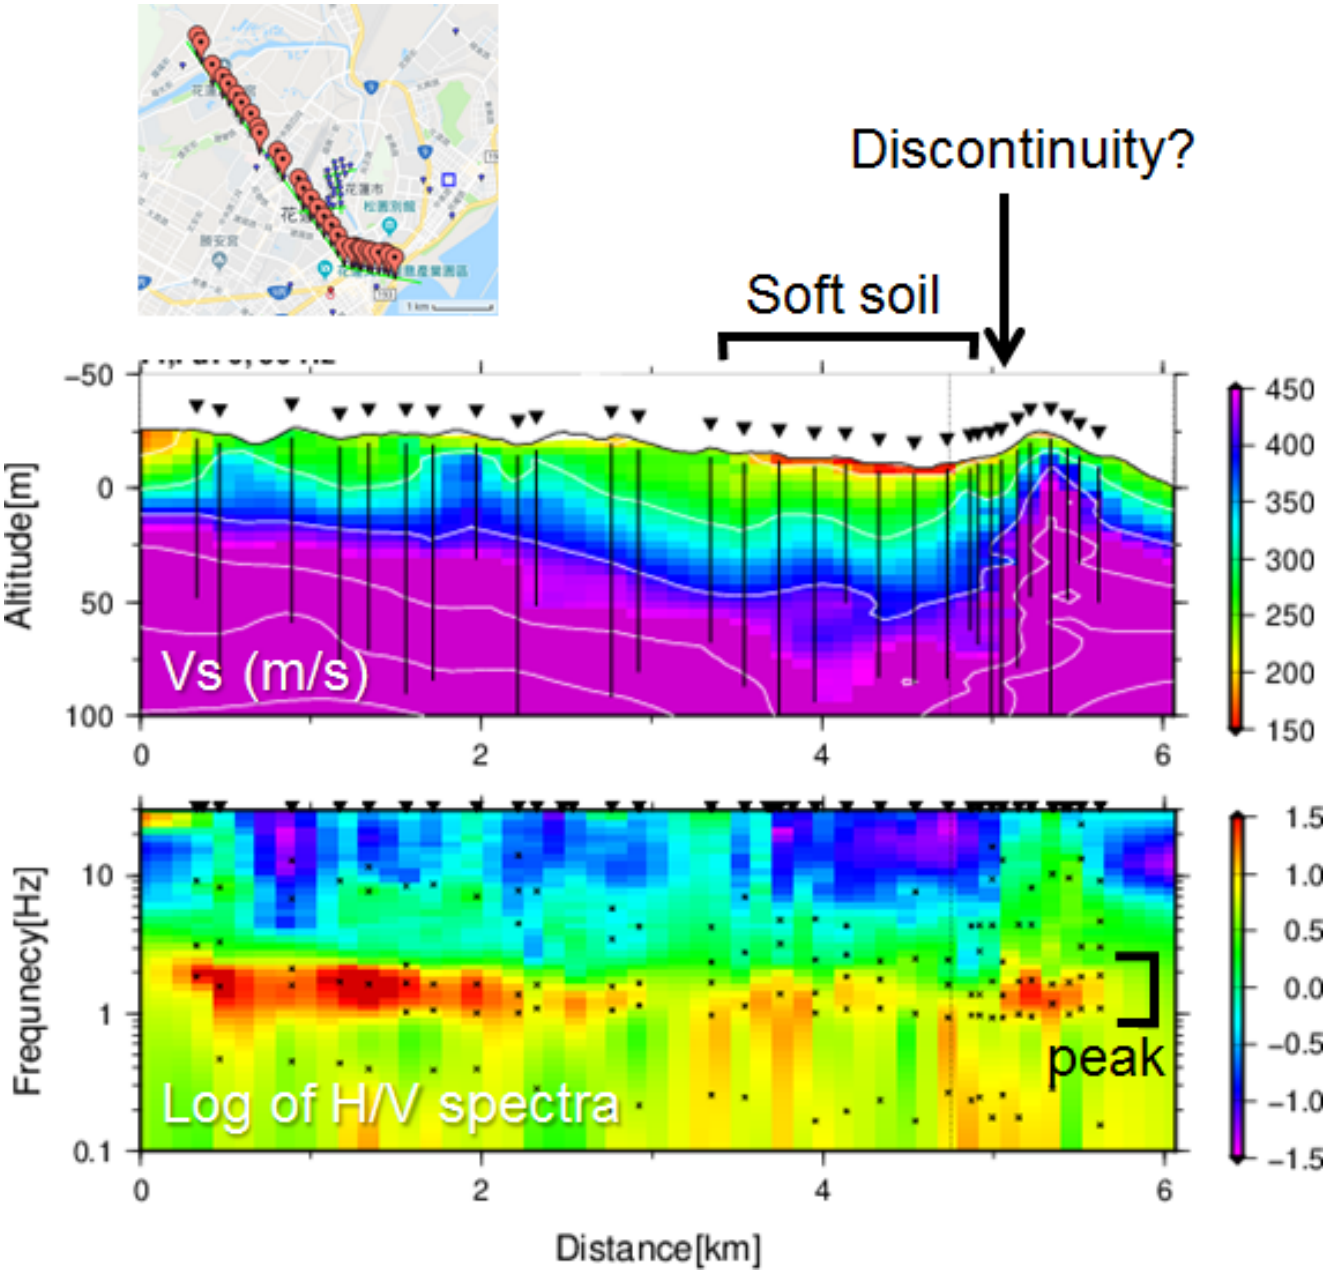
Geo-Research Institute, 5. Building Research Institute, 6. Kozo Keikaku Engineering, 7. Sinotech Engineering Consultants, 8. Kaohsiung university of Science and Technology

The 2018 Hualien earthquake occurred around 23:50, February 6, 2018 (local time). The depth of the event was about 10 km and the moment magnitude was 6.4 (USGS). Crustal deformation in the Hualien basin was clearly observed in the InSAR image (e.g., GSI 2018, Hashimoto 2018). The rupture propagated along the Milun fault from north to south and the northern part of the Longitudinal Valley fault was also ruptured. Particularly, the discontinuity of the interference fringes at the Milun fault was clear on the InSAR image.



In Hualien city, the middle-rise four buildings collapsed during the earthquake, due to the collapse of the pillars at the first floor. They were located at the place where discontinuous fringes were observed in the InSAR images. There is a possibility that the discontinuous displacements or ground motions in the vicinity of the fault affect on the damage of the buildings (NARlabs 2018).

In order to understand the cause of building damage in Hualien city and the heterogeneous subsurface soil structure in the Hualien basin, we performed microtremor array measurement on October 20-26, 2018. We performed the measurement at every 100-200 m along the EW section of the basin. At each measurement point, we used 5 seismometers to obtain the phase-velocity dispersion curves at the shallow subsurface structure. In total, we measured microtremors at 64 observation points and obtained the phase-velocity dispersion curves and H/V spectra.

Our profile shows that the peak of the H/V spectra is about 1-2 Hz along the measurement line, which probably corresponds to the basement at the depth of 50-100m. The average Vs at the depth of 10-30m is about 200-400 m/s. There is a clear difference between the east and west side of the Milun fault: at the west side of the fault, there is a soft soil deposit on the shallow surface (10m) with the average Vs less than 200m/s. At the east side of the fault, the soft layer with the Vs<400m/s is very thin. Therefore, we estimated the engineering bedrock of the west side of the Milun fault is deeper than the east side. This difference of the basin thickness is consistent with the movement of the Milun fault during the 2018 Hualien earthquake estimated from the InSAR image.

Effect of Near Surface Geology on the Recorded Ground Motion of the Nepal Earthquake in Kumaon Himalaya

*SOHAN LAL[1], Anand Joshi[1], M.L. Sharma[1]

1. Indian Institute of Technology Roorkee

An earthquake has been devastated the Nepal on 25 April 2015. The earthquake experienced the low frequency amplification. The subsurface structure alters the seismic wave through which they propagate and can amplify or de-amplify the amplitude of the coming wave from the source for the frequency ranges. The Nepal earthquake was been recorded at the Kumaon Himalaya region at the western side from the epicenter. The present paper highlights the effect of local geology on the recorded ground motion and calculation the shallow subsurface velocity model using the joint fit of the surface wave dispersion curve and HVSR ratio. The theoretical transfer function generated which satisfy both the dispersion curve and the HVSR ratio is directly convolve with the hard rock simulated time series to calculate the surface simulation. The simulation of the Nepal earthquake was done using the semi- empirical technique.

Broadband Source Modeling for the Himalayan Collision Zone

*Hiroe Miyake[1], Babita Sharma[2], Kazuki Koketsu[1], Soma Nath Sapkota[3]

1. Earthquake Research Institute, University of Tokyo, 2. National Centre for Seismology, Ministry of Earth Sciences, India, 3. Department of Mine and Geology, Nepal

The Himalayan collision zone is characterized by the significant tectonic setting. There are earthquakes with low-angle thrust faulting as well as continental outerrise earthquakes. Recently several historical earthquakes have been identified by active fault surveys [e.g., Sapkota et al., 2013]. We here investigate source scaling for the Himalayan collision zone as a fundamental factor to construct source models toward seismic hazard assessment. As for the source scaling for collision zones, Yen and Ma [2011] reported the subduction-zone source scaling in Taiwan, and pointed out the non-self-similar scaling due to the finite crustal thickness. On the other hand, current global analyses of stress drop do not show abnormal values for the continental collision zones [e.g., Allmann and Shearer, 2009]. Based on the compiled profiling of finite thickness of the curst and dip angle variations, we discuss whether the bending exists for the Himalayan source scaling and implications on stress drop that will control strong ground motions. Due to quite low-angle dip faulting, recent earthquakes in the Himalayan collision zone fit the upper bound of the current source scaling of rupture area vs. seismic moment (< Mw 8.0), and do not show significant bending of the source scaling. Toward broadband source modeling for ground motion prediction, we perform empirical Green’s function simulations for the 2009 Bhutan and 2015 Gorkha earthquake sequence to quantify both long- and short-period source spectral levels [e.g., Miyake et al., 2017; Sharma et al., 2018].

Recent Himalayan events showed the upper bound of the current source scaling of rupture area vs. seismic moment (< Mw 8.0), and current plots well match with Somerville et al. (1999) without bending. However, re-estimates of maximum fault width may change the source scaling. We also found that Himalayan events less than M6-class follow crustal earthquake scalings for short-period ground motion generation. If M7-class sources are modeled to follow crustal earthquake scalings, simulated ground motions tend to be larger than GMPEs on rock. Short-period ground motion saturation will be validated after broadband ground motion modeling for more events (e.g., Gorkha aftershocks).

Development of New GEONET Analysis Strategy

*yasuaki kakiage[1], satoshi abe[1], kazuyuki ohashi[1], hideo hamazaki[1], kazuyuki tanaka[1], satoshi kawamoto[1], yuki hatanaka[1]

1. GSI of Japan

Geospatial Information Authority of Japan (GSI) has been operating GEONET (GNSS Earth Observation Network System), which involves over 1,300 GNSS stations, since 1996. The daily coordinates for each station are estimated by Bernese GNSS software to monitor the crustal deformation in Japan. The analysis strategy was updated four times. Current version is the fourth generation (4G) analysis, which was developed in 2009. We are now developing a new strategy (5G) because the software, reference frame, and other physical models used in 4G analysis have been obsolete. Major features of 5G analysis are: 1. Update of reference frame, 2. GPS and GLONASS integration, 3. Improvement of the troposphere model, 4. More stable daily coordinates of the reference station (TSUKUBA-1) for analysis. GSI developed 5G prototype in 2017.
The 5G prototype firstly conducts “fix-point analysis” to estimate daily coordinates of TSUKUBA-1. Then all other stations are estimated using GPS and GLONASS data individually. Finally, the GPS and GLONASS solutions are integrated.
The daily coordinates of the TSUKUBA-1 is estimated by a global analysis using worldwide IGS stations under No-Net-Translation constraint. But, we analyzed the data from 1996 to 2004 constraining IGS stations coordinates(SINEX results) directly.
In case of all other GEONET analysis, there is limiting condition to solve combined solution. So we evaluate the combined solutions with respect to limiting condition.
We will show the in detail of fix point analysis and 5G analysis, especially combine solution.

Relationship between deformation of the forearc wedge of Southwest Japan and the 1707 Hoei earthquake

*Yukinobu Okamura[1], Masanobu Shishikura[1]

1. Research Institute of Earthquake and Vocano Geology, National Institute of Advanced Industrial Science and Technology

We propose a hypothesis that the deformation of the forearc wedge of Southwest Japan and wide varieties of plate boundary earthquakes along the Nankai Trough have been caused by oblique subduction of the undulating Philippine Sea Plate (PSP). Interseismic and coseismic deformations of the forearc wedge of Southwest Japan have been observed by geodetic measurements, however, these deformations have not been accumulating. In contrast, N-S trending uplift zones, namely the Akaishi and Kii mountains, have been growing during the Quaternary periods. The mountains correspond to the zones of PSP trending in NE-SW and the subsiding areas of the Kii strait and Ise Bay to Nobi plain are located above the NW-SE to E-W trending PSP. If the axes of undulations of the subducting slab have been fixed to the PSP, the depth of the PSP trending in NE-SW have been decreasing and that of the PSP trending in NW-SE to E-W have been increasing. The uplifting and subsiding zones correspond to the area of plate depth decrease and increase respectively, thus we infer that the vertical movements of the forearc wedge have been caused by the change of the plate depth. Relative sea level change shown by uplifted sessile assemblage have indicated that uplift during the 1707 Hoei earthquake has been accumulated while those of 1854, 1944 and 1946 plate-boundary earthquakes have not. This fact strongly suggests that there is a strong coupling zone lasting for several hundred years under the Kii Peninsula, and that the break of the coupling triggers the Hoei-type earthquake that ruptured the entire plate boundary. We also point out the possibility that there is another coupling zone under the Akaishi Mountains. The deformation of the forearc wedges of the Southwest Japan and differences of rupture patterns of the plate boundary along the Nankai Trough can be attributed to the change of the depth of the PSP.

A possible slow slip event beneath the Kii Peninsula inferred from historical tilt records in 1970’s

*Masayuki Kano[1], Yasuyuki Kano[2]

1. Graduate school of science, Tohoku University, 2. Earthquake Research Institute, The University of Tokyo

Slow slip events (SSEs) have been often observed prior to large earthquakes such as the 2011 Tohoku-oki earthquake and the 2014 Iquique earthquake (e.g., Kato et al., 2012; Mavrommatis et al., 2014; Ruiz et al., 2014). In addition, numerical studies demonstrated that intervals of SSEs became shorter in the latter half of the interseismic period (e.g., Matsuzawa et al., 2010). Therefore, activities and variations of SSEs in time and space provide important clues to anticipated large earthquakes.

Many studies have investigated activities of SSEs based on dense geodetic observation networks established in the early 2000’s (e.g., Sekine et al. 2010; Nishimura et al. 2013). On the other hand, there are few reports before the establishment of such dense networks (Kimata et al., 2001; Kobayashi and Yamamoto, 2011). Here, we report a possible SSE beneath the Kii Peninsula based on historical tilt records in 1970’s.

We used tilt data recorded in Kishu observatory in the Mie Prefecture operated by Kyoto University. Horizontal-pendulum tiltmeters were installed in directions of N57W and N33E. The original tilt data was drawn on bromide (light-sensitive) papers, each of which consists of tilt records for about one week. We have digitized bromide records in 1970’s and connected to a single continuous record.

In the late November in 1973, there was a slow tilt change of >0.5 μrad down to the northeast that lasted for a few days. Assuming that this crustal deformation was due to an SSE along the plate boundary, we have constructed a possible model of SSE. Because it is difficult to constrain fault parameters from a single station record, we conducted a forward modeling assuming already known SSE models beneath the Kii Peninsula obtained by Nishimura et al. (2013). Among 42 template fault models from 1996 to 2012, 3 models were able to qualitatively explain the direction of tilt changes. The centroids of these fault models locate ~30-50 km western side of the observatory. However, the calculated tilt change was about one order smaller than the observed one. Therefore, it is possible that the amount of slip was greater than the template models or the location of SSE was closer to the observatory.

Around the source area, relatively large (magnitude 5.9) earthquake and the following magnitude 5.4 earthquake occurred near the plate boundary on November 25, just before the initiation of the tilt change. The seismicity in this area was usually low, and thus these earthquakes may relate to a possible SSE.

The Kishu observatory have recorded tilt changes since 1947, soon after the 1946 Nankai earthquake. Therefore, further detection of possible SSEs in the latter half of the 20th century will reveal how SSEs behave after large earthquakes.

The effect of the steady plate subduction in the case of southwest Japan

*Yuto Iwase[1], Takeo Ito[1]

1. Graduate School of Environmental Science, Nagoya University

The deformation of the subduction zone expresses the superposition of the elastic coupling and the steady plate subduction. In the former, the elastic coupling on the plate interface corresponds to stress accumulation for the next earthquake. Thus, the earthquake releases the accumulated stress on the plate interface due to the elastic coupling. The accumulated stress due to elastic coupling is not accumulating over the earthquake cycle. In the latter, the steady plate subduction expresses the creeping on the plate interface. Hence, the shear stress on the plate interface does not accumulate within the earthquake cycle. However, the steady plate subduction effect the long-term deformation over the earthquake cycle. In order to understand the process of the subduction zone, the steady plate subduction is essential not only in seismology but also in geomorphology and geology.

In order to evaluate and understand the effect of steady plate subduction, we introduce a three-dimensional finite element (FE) method. Our target area is southwest Japan. We make a FE model that the size of a model region is 1460km×1400km×700km, where southwestern and northeastern corners of the FE model are corresponding to Amami Island and Tohoku region, respectively. The FE model considers the topography, the three-dimensional shape of the Philippine Sea plate and the complex underground structure that the Philippine Sea plate is subducting in the asthenosphere. The FE model consists of four blocks, such as the Philippine Sea plate, oceanic mantle, continental mantle, and crust. The material of mantle assumes a viscoelastic medium. The crust and the Philippine Sea plate assume an elastic medium. To realize the subducting Philippine sea plate, we set up the boundary condition. The kinematic expression of the Philippine Sea plate is the relative plate motion along the plate interfaces, which are both upper and bottom surfaces of the Philippine Sea plate. In this study, the relative plate motion at each point is expressed by the Euler pole.

As a result, the simulated long-term vertical deformation correlates with topography. The feature of large scale topography, such as the Seto Inland Sea, Kii mountain, Hyuganada and so on, are well reproduced. For the shear stress on the plate interface, The depth-dependent variation is available. There is small shear stress on the plate interface at deeper than Moho depth because of shear stress relaxed by a viscoelastic medium. At shallower than the Moho depth, although the shear stress is available, the direction of shear stress is different from the direction of the Philippine Sea plate because the three-dimensional shape of the Philippine sea plate produces the shear stress on the plate interface. For normal stress on the plate interface, the normal stress on the plate interface is more significant than shear stress. The normal stress produces long-term vertical deformation and tectonic stress distribution. Hence, the tectonic stress around subduction zone produced by dominantly normal stress. The normal stress on the plate interface does not relate with the curvature of the plate interface but is due to the curvature changing rate.

Development of Mechanical Coupling Model on Subducting Plate Interfaces

*Hiroshi Kimura[1], Takeo Ito[1], Keiichi Tadokoro[1], Ryohei Sasajima[2]

1. Department of Earth and Planetary Sciences, Nagoya University, 2. Research Center For Earthquake Prediction, Disaster Prevention Research Institute, Kyoto University

Introduction

Interplate earthquakes occur at regions where the interplate strain has been accumulated by plate convergence. To evaluate the interplate seismic potential, many previous studies have tried to estimate the spatial distribution of interplate "coupling" [e.g., Loveless and Meade (2010); Yokota et al. (2016); Nishimura et al. (2018); Kimura et al. (in prep.)]. In their models, "coupling" is defined as the ratio between slip deficit rate and convergence rate, based on the kinematic concept. However, the actual situation of plate interface should be treated as mechanical "locking" (sometimes called as asperities) or "creeping". It is considered that the seismic ruptures at asperities can generate the strong-motion that gives constructions serious damages. Thus, it is essential to comprehend the spatial distribution of the mechanical "locking" region on the plate interface. We then introduce the two kinds of back-slips to develop the mechanical coupling model on the basis of the geodetic observation data. Using this model, we test several scenarios of mechanical coupling distributions along the Nankai Trough for forward simulation.

Modeling of Mechanical Coupling

The mechanical coupling model we developed in this study is similar to the "pinned asperities" model presented by Bürgmann et al. (2005). We consider two kinds of back-slip on the plate interface: active back-slip and passive back-slip. The first one is applied on the mechanical coupling region, that is the mechanically locked region to the plate interface between subducting and overriding plate. We calculate the active back-slip rate from the relative block motion rate based on the Euler vectors of each block. The second one is the slip around the mechanical coupling region generated to completely relieve the along-dip and along-strike shear strain due to the active back-slip. We model the relationship between shear strain concentration $\boldsymbol{\varepsilon}$ and passive back-slip rate $\boldsymbol{v}$ around the mechanical coupling region with a linear equation $\boldsymbol{\varepsilon} = G\boldsymbol{v}$, where G is the Green's function matrix. To estimate the passive back-slip, we first calculate the shear strain due to the given active back-slip on the mechanical coupling region. Then, we inverse the passive back-slip rate using the linear equation above. We repeat these two procedures until the shear strain concentration becomes zero. We call the region where the active or passive back-slip is observed as kinematic coupling region. The elastic component of crustal displacement at the surface can be calculated from the total back-slip on the kinematic coupling region.

Forward Simulation

We conduct the forward simulation using our mechanical coupling model for some scenarios of mechanical coupling distributions along the Nankai Trough. We divide the test region into 12 rigid blocks and calculate the active back-slip rate on mechanical coupling regions using the Euler vectors referring to Kimura et al. (in prep.). Figure 1 shows one example of (a) given mechanical coupling distribution and (b) spatial distribution of the simulated passive back-slip rate. Blue lines mean the edges of mechanical coupling regions. Because the relative block motion rate is about two times faster in the western region than that in the eastern region, the passive back-slip area is larger around the western mechanical coupling region, extending down to ~50 km in depths. In this presentation, we discuss for the other cases

©2019. Japan Geoscience Union. All Right Reserved.

of mechanical distributions. In this study, we give the mechanical coupling distributions and Euler vectors for forward simulation. Because of this, the estimated passive back-slip rate depends on the given distribution, and we could not know other scenarios of mechanical coupling distributions. To resolve this problem, we will estimate the spatial distributions of mechanical coupling and Euler vectors simultaneously as a non-linear problem in future studies.

Monitoring vertical deformation with optical lattice clock –an application of relativistic geodesy

*Yoshiyuki Tanaka[1], Yuichi Imanishi[2], Yoshiaki Tamura[3]

1. Earth and Planetary Science, The University of Tokyo, 2. Earthquake Research Institute, The University of Tokyo, 3. Mizusawa VLBI Observatory, National Astronomical Observatory of Japan

Crustal deformations due to earthquake and volcano activities have been detected by geodetic observation methods. The obtained deformations have been analyzed together with horizontal components and physical mechanisms (e.g., fault slip) to cause such deformations have been investigated. Representative methods to observe vertical deformation are leveling survey as a terrestrial method and the Global Navigation Satellite System (GNSS) as a space geodetic technique. The latter includes the Global Positioning System (GPS). Leveling has a long history (>100 years) and is still the most precise method to measure the height difference between relatively near two sites (e.g., <5 mm for 4 km). However, measurement errors increase with longer survey routes and it needs considerable time to complete the survey when the network is larger (about 2 km/day). GNSS, having a shorter history (<30 years), can measure the height difference over a long distance more precisely than levelling (plus-minus 1 cm for 24-hour average for \sim 100 km baseline). The spatial resolution is also better than levelling, thanks to the dense observation network such as GEONET in Japan. However, GNSS suffers from serious atmospheric noises. The precisions to detect vertical deformations in time scales shorter than 24 hours degrade (e.g., plus-minus 3 cm for 3-hour average) due to insufficient measurement time for canceling out the atmospheric noises. Seasonal time-scale crustal deformations are also hard to discriminate from the effects of atmospheric water vapor.Recently, precisions of atomic clocks have become better and better. In particular, optical lattice clock proposed in Japan (Katori 2002; 2017) achieved a relative precision of 5 x 10^-19 in three hours, which is approximately 3 orders of magnitude better than Cesium atomic clocks used to determine 1 second of International System of Units (SI). By the general relativity, the length of 1 second measured by an atomic clock changes according to the variation in the local gravitty potential (gravitational red shift). In general, the length of 1 second becomes shorter at higher altitude with smaller gravity potential energies. Fiber linked two optical lattice clocks can measure the relative potential difference between the two sites. The precision of 5 x 10^-19 corresponds to the height difference of 5 mm. Tectonic gravity potential changes in geodetic time scales are negligible in most cases since even an M-9 earthquake causes a geoid height change by only a few cm at maximum. This means that most part of the temporal variation in the measured gravity potential difference reflects the temporal change in height. The above-mentioned measurement precision and time by optical lattice clock is superior to GNSS, implying that optical lattice clock can replace GNSS as for monitoring of vertical deformation. Since November 2018, Japan Science and Technology (JST) has begun a new project regarding optical lattice clock, consisting of developers of optical lattice clock and geodesists. In this presentation, we will introduce this new project and the goal of the "relativistic geodesy" group. We discuss possible applications of optical lattice clock to crustal deformation monitoring.

Discussion

Surface Deformation before and after the 2016 Kumamoto Earthquake Detected by SAR

*Manabu Hashimoto[1]

1. Disaster Prevention Research Institute, Kyoto University

We analyzed SAR images acquired by ALOS-1/2 and Sentinel-1 before after the Kumamoto earthquake in 2016 and detected preseismic and postseismic surface deformation.

We applied time series analysis to ALOS-1 images during 2007 - 2011 with StaMPS. However, we could not detect significant deformation around the Futagawa-Hinagu faults and in the Kumamoto plain.

For the purpose of study of postseismic deformation, we collected ALOS-2 and Sentinel-1 images that were acquired from both descending and ascending orbits till the end of 2018, and analyzed them with Gamma(R) software. We detect at least 6 spots of increase of Line of sight (LOS) in and around the active fault traces in ALOS-2 descending interferograms. Three of them are located close to surface traces of the Futagawa-Hinagu faults or their extension. The maximum LOS change exceeds 10 cm till August 2018. This deformation is much larger than postseismic ddisplacements observed with GNSS after other inland earthquakes in Japan. Converting LOS changes into quasi-EW and vertical components, we found that westward movement is dominant on the SE side of the Futagawa-Hinagu faults.

We also notice a zone of LOS increase of 6 cm or more that extends NW-ward in the Kumamoto city from the junction of Futagawa and Hinagu faults. We observed coseismic subsidence in the same area in coseismic interferograms and there are several reports of small surface ruptures. Considering the location and timing, this off-fault LOS increase may be related to stress release by this event. The fifth one is in northern part of the Aso caldera, which also exceeds 6 cm. The last is found in the Kikuchi city, more than 10 km north of the Futagawa fault. This zone is extended in the direction of WNW-ESE along a channel.

Sentinel-1 interferograms also show similar distribution of displacements in spite of low coherence.

Changes in LOS increase across the surface fault traces are so sharp and nonsymmetrical. It may be difficult to explain all these deformations with not only afterslip on a couple of faults. This area is covered with thick pyroclastic flow and marine or non-marine deposits. Because there may be a weak correlation between the distribution of these deposits and postseismic deformation, subsurface heterogeneous structure may affect spatial distribution of postseismic deformation.

Co- and post-seismic crustal deformations associated with the 2016 Kumamoto earthquake sequence using ALOS-2/PALSAR-2 data

*Yuji Himematsu[1], Masato Furuya[1]

1. Graduate School of Science, Hokkaido University

The 2016 Kumamoto earthquake sequence started to occur at 21:26 on 14 April 2016 (JST: Japan Standard Time) with Mw 6.2 earthquake at the southwestern part of the Beppu-Shimabara graben, one of the tectonic lines across the central Kyushu island. It was followed by moment magnitude (Mw) 7.0 mainshock on 16 April at 01:25. Japan Meteorological Agency catalog reported that the mainshock focal mechanism was dominated by strike-slip components with north-south extensional axis. Geodetic measurements by Global Navigation Satellite System (GNSS) and satellite synthetic aperture radar revealed not only right-lateral displacement as the focal mechanism showed, but also greater than 1 m of subsidence at the northwest side of the Futagawa fault. In particular, PALSAR-2 pixel tracking data depicted phase discontinuities across the northeast-southwest direction. Some urgent field surveys were also conducted, and reported the locations and dislocation amounts of surface ruptures due to the earthquakes (e.g., Shirahama et al., 2016). We compare displacements along the surface rupture that were derived from the PALSAR-2 pixel tracking data and the previous field surveys. Measuring displacements along the surface ruptures in detail is important for evaluating rupture processes and propagation features along the faults during the earthquake event.

We also report the post-seismic deformations following the 2016 Kumamoto earthquake using PALSAR-2 data, and discuss the difference of spatial characteristic in the co- and post-seismic deformations. Although some papers have also reported post-seismic deformations observed by GNSS measurements and Sentinel-1 InSAR data for estimating viscoelastic structures beneath the central Kyushu island, near-fault post-seismic deformations are still poorly understood. We employed the conventional InSAR stacking for extracting long-lasting small deformations and mitigating artificial noise. We also performed the 2.5-dimensional analysis for depicting quasi-eastwest and quasi-vertical displacements using the stacked interferograms. To identify the small deformation signals, two independent quasi-displacement fields are generated. Although multiple aperture interferometry (MAI) allow us to detect along-track horizontal movements, we could not identify actual post-seismic deformation signals due to strong ionospheric artifact noises in most of MAI data.

GNSS time series analysis of postseismic deformation induced by 2016 Kumamoto earthquake (M7.3)

*Satoshi Fuwa[1], Mako Ohzono[1]

1. Hokkaido University

In order to investigate the afterslip and the viscoelastic relaxation mechanisms induced by the 2016 Kumamoto earthquake (M7.3), which occurred on 16 April 2016 in Kyushu Island, Japan, we conducted times series analysis of GNSS data. Although there are several models for this postseismic deformation, they treat early postseismic period with only velocity or displacement data. Several time series analysis for other large earthquakes is also proposed, but there has been little consideration about whether it reflects their mechanisms. We use 48 sites around the focal area of daily coordinates (F3 solutions) provided by the Geospatial Information of Japan (GSI) for two years from the earthquake. Because most of the afterslip is thought to be finished during the first 0.25 years in postseismic period, we fitted logarithmic decay function assuming the afterslip to 90-days postseismic time series data using weighted nonlinear least squares method and estimated their time constants. Then, we re-fitted both of logarithmic decay function and exponential decay function, which assuming viscoelastic relaxation, together to whole two years postseismic time series fixing the time constant of logarithmic decay function. As a result of this time series analysis, each afterslip and viscoelastic time evolution are estimated at each GNSS site. Using the cumulative deformation field of logarithmic decay function, afterslip distribution is estimated. The afterslip is located around the coseismic fault, and major slip area is assumed complementary to the coseismic slip area. Cumulative viscoelastic deformation signal is also used for rheological parameter estimation. We set stratified rheological structure, which composed of upper elastic layer and lower Maxwell viscoelastic layer, and searched appropriate thickness of elastic layer and viscosity of the viscoelastic layer. As a result, we found the elastic thickness with 20 km and viscosity of viscoelastic layer with 1×10^{19} Pa s. These estimated values roughly correspond to the results of previous studies. There are several remaining issues, such as the dependency of fitting period of the logarithmic time decay function, and application for the complicated fault geometry and rheological structure for modeling. However, this time series analysis and estimation of each mechanism using those results are effective to the interpretation for the postseismic deformation after this earthquake.

The viscoelastic crustal response to the magma discharge/recharge in the upper crust: implications for the uplift of the Aira caldera before and after the 1914 eruption of the Sakurajima volcano

*Tadashi Yamasaki[1], Freysteinn Sigmundsson[2], Masato Iguchi[3]

1. Geological Survey of Japan, AIST, 2. Nordic Volcanological Center, University of Iceland, 3. DPRI, Kyoto University

Volcano deformation has often been analysed in terms of crustal elasticity, where the temporal volume change of the deformation source is required to explain any transient behaviour of ground displacement. However, the response of viscoelastic crust, both to magma discharge and eventual subsequent recharge, is not negligible because the effective crustal viscosity is expected to be lowered by higher geothermal gradient at volcanoes. The present study, using a 3-D finite element model with a linear elastic layer underlain by a linear Maxwell viscoelastic layer with spatially uniform viscosity, examines the viscoelastic crustal response to both magma discharge and recharge into the upper crust. The model considers a sill-like magma chamber emplaced at the bottom of the elastic layer inflating at a constant rate, during which the magma discharge due to an eruption occurs instantaneously all at once. Numerical experiments have revealed that the viscoelasticity in response to magma discharge promotes surface uplift. The uplift depends on how long the pre-eruptive magma charge lasted, that is, how much viscoelastic relaxation in response to the magma charge occurred in pre-eruption period. If the relaxation was significant, the uplift due to viscoelastic relaxation is greater than that due to magma recharge earlier in post-eruption period. On the contrary, at later times, the uplift due to magma recharge exceeds the relaxation-derived one. However, since the viscoelastic response to magma recharge detracts the uplift, the post-eruptive magma volume is recovered before the surface elevation is recovered. This viscoelastic model behaviour is then adopted for the geodetic data in the Aira caldera, southern Kyushu, Japan, giving important constraints on the model parameters. A model with constant magma supply rate explains the observed exponential-like recovery of the surface elevation after the 1914 eruption if the following conditions are satisfied: (1) the effective crustal viscosity is ~5x10^18 Pa s, and (2) magma emplacement at a depth of ~10-15 km is initiated ~50 years before the eruption, with a constant supply rate of at least ~0.01-0.02 km^3/yr. The constrained model predicts that the accumulated volume of magma during the first 50 years in the post-eruption period is lower than that estimated by elastic model, but is on the contrary larger thereafter. In addition, the surface uplift immediately before the 1914 eruption is predicted to be ~3 times lower than that supposed in previous studies. Our results suggest that geodetic signals observed before and after the magma discharge due to an eruption need to be revisited with respect to the crustal viscoelasticity.

Factors controlling annual changes in groundwater migration in the fault fracture zone of Manpukuji fault

*Atsushi Mukai[1], Shigeaki Otsuka[2], Yoichi Fukuda[3]

1. Faculty of Urban Management, Fukuyama City University, 2. Kobe Gakuin University, 3. Graduate School of Science, Kyoto Univ.

Rokko-Takao station in the southern area of Hyogo prefecture crosses Manpukuji fault, and the groundwater discharge can be observed all the time about the fault fracture zone. The groundwater discharge and pore pressure observed at the station usually contain annual changes which have the minimum value in spring and the maximum one in autumn. However, the scale of the annual changes depends on year. In 2017, we could not see any definite annual changes in the groundwater discharge and pore pressure. In this study, we investigated some factors controlling the annual changes in groundwater migration and report about the effects of regional crustal movements, precipitation and seismic motions on them.

We have been performing the continuous observation of groundwater migration nearby the fault fracture zone with the groundwater discharge meter and the pore pressure meters, as well as crustal movements with strainmeters, extensometers and water-tube tiltmeters. We calculated the tidal amplitudes and phases in the groundwater discharge and pore pressure by applying the tidal analysis program ‘BAYTAP-G’ to the observational data, and compared them with the theoretical ones obtained by ‘GOTIC2’; the program for computation of oceanic tidal loading effect. The observed phases in major constituents O1 and M2 almost agreed with the theoretical ones for every observed groundwater migrations. This shows that the groundwater discharge and pore pressure changes at the station have similar response to tidal stress.

The groundwater discharge and pore pressure changes in 2017 showed just slight annual changes, the amplitudes of which were at least 10% of the annual averages, while the amplitudes of the annual changes were a few 10% or more of the annual averages in other years from 2015. When we investigated the observational data of groundwater discharge that started to be observed before 2000, the annual changes were diminished definitely in 2005 and 2012 as well. It was considered that the variations in the amplitudes of annual changes might be caused by regional crustal movements, precipitation, seismic motions and so on.

We calculated the dilatation changes as regional crustal movements by using GSI’s GEONET data. The dilatation showed significant annual changes even in 2005, 2012 and 2017, so that the diminished annual changes were considered not to be caused by the regional crustal movements. Second, we investigated the effect of annual precipitation. The annual precipitation were unusually small just before 2005, 2012 and 2017, so that it seems that small precipitation might cause decreasing of groundwater and small annual changes in groundwater migrations. However, this idea does not agree with the observed result that the pore pressure had kept to be high level all through 2017.
Permeability in the fracture zone of Manpukuji fault was observed to be reduced over one year after 2011 Tohoku Earthquake (Mukai and Otsuka, 2014). Similar permeability changes occurred just after 2016 Kumamoto Earthquake and 2016 Central Tottori Earthquake as well (Mukai et al., 2017). The diminishment of annual changes in groundwater migrations were observed just after such large earthquakes. This might suggest that temporal decrease of permeability due to the large earthquakes

prevented groundwater migration and propagation of pore pressure, and resulted in the small annual changes.

Discussion

Rapid uplift in SW Taiwan caused by fold growth

*Yoshiki Takei[1], Youichiro Takada[2]

1. Department of Natural History Sciences, Graduate School of Science, Hokkaido University, 2. Hokkaido University

The Taiwan orogeny is result of the continental collision between the Luzon arc on the Philippine Sea plate and the Eurasian continental margin. GNSS velocity field indicates rapid and on-going east-west compression (e.g., Yu et al., 1997; Tsai et al., 2015). Due to such background compression, very rapid uplift up to 37 mm/yr has been aseismically proceeding in the southwestern part of Taiwan, which is detected by levelling and InSAR measurements (Ching et al., 2016; Tsukahara and Takada, 2018). Tsukahara and Takada (2018) showed that such rapid uplift cannot be explained solely by fault motion, and they concluded that a fold growth would contribute to the uplift motion as suggested by Ching et al. (2016). Actually, mud diapirs are widely distributed from South China Sea to the coastal area of Southwest Taiwan, and some of those are observed as mud volcanoes on land (e.g., Lin et al., 2009; Hsu et al., 2013; Doo et al., 2015). From physical point of view, mud diapirism can be regarded as a fold growth with buoyancy under strong horizontal compression. There is no previous study, however, that quantitatively estimates the possibility of fold growth in SW Taiwan. In this study, we quantitatively examined the fold growth rate in SW Taiwan on the basis of continuum mechanics. First, we modeled the earth’ s crust as non-linear viscous fluid following power-law creep. Next, considering that the background stress is much larger than the stress perturbation caused by the fold growth, we linearized the governing equations and analytically calculated the fold growth rate following the conventional method (Smith, 1977; Fletcher and Hallett, 1983). So far, this approach has been applied to foldings periodic in space, while the folds in SW Taiwan (on land) are not periodic but rather isolated. Following Bassi and Bonnin (1988) formulation, therefore, we assumed a Gaussian shaped fold at initial stage, and calculated its growth rate under various conditions. The medium consists of a substratum (mud) and a brittle surface layer. The power exponent is set as one for the substratum (Newtonian) and a thousand for the surface layer. In addition, we considered surface erosion and sedimentation that modify the effect of gravity as pointed out by Martinod and Molnar (1995).
The result of calculation shows that the Gaussian shaped perturbation can grow up for a certain combination of model parameters consistent with observations. Also, we found that surface erosion and sedimentation prompt the fold growth. The surface uplift and subsidence rates associated with the Gaussian shaped fold growth are roughly consistent with levelling and InSAR measurements. Among all, the subsidence pattern is well explained by the folding, which could not be explained by the elastic dislocation model (Okada, 1992). On the other hand, the largest uplift rate in the numerical simulation is about 10 mm/yr smaller than the ones given by InSAR and levelling surveys, which indicates that large displacement gradient in the observed result was not well reproduced by the simulation. The actual folding in SW Taiwan might associate brittle failures as well as viscous deformation. We will combine both fault motion and fold growth to explain the mechanisms of rapid aseismic deformation in SW Taiwan in the future.

Construction of GNSS monitoring system in Nepal for the earthquake potential evaluation in the Himalayan Frontal Zone

*Takao Tabei[1], Mako Ohzono[2], Kazuki Koketsu[3], Hiroe Miyake[3], Rajendra Bhandari[4], Janak B. Chand[4], Bishow R. Silwal[4], Soma N. Sapkota[4]

1. Department of Global Environment and Disaster Prevention, Faculty of Science and Technology, Kochi University, 2. Institute of Seismology and Volcanology, Graduate School of Science, Hokkaido University, 3. Earthquake Researech Institute, University of Tokyo, 4. Department of Mines and Geology, Nepal

We have deployed 10 continuous GNSS stations in central Nepal since 2016 under the SATREPS project of “Integrated Research on Great Earthquakes and Disaster Mitigation in Nepal Himalaya (NERDiM)” (2016-2021). The main purpose of the GNSS observation is to monitor ongoing crustal deformation for estimating earthquake generation potential in the Indian-Eurasian plate boundary zone. We focus especially on the crustal activity of the “Central Seismic Gap” located just west of the source region of the 2015 Gorkha earthquake (Mw 7.8), where no destructive event has been recorded since 1505. Prior to our project there were about 50 continuous GPS stations distributed over the whole of Nepal, most of which were constructed and maintained by universities and institutions in USA and France. We determined station deployment so as to reinforce such pre-existing networks. One-second and 30-second interval data collected at each station are automatically transmitted on a semi-daily basis to a data server at Kathmandu via domestic cell phone network. In addition, we have already introduced a high-performance machine that has the ability of automated GNSS data processing and archiving. Soon we will start daily baseline processing using GNSS data from the SATREPS NERDiM stations and also from the pre-existing domestic and international networks.

In paralle to the station construction, we collect all available GNSS data in Nepal and process them using PPP-AR method of GIPSY/OASIS II ver.6.4. Total number of stations is less than 10 as of 2004 and gradually increased year by year. Since the 2015 Gorkha earthquake, many stations have been added in and around the Kathmandu Valley. However, the number of stations where stable data collection is still ongoing may be less than 30. The result shows that roughly N-S contraction of about 0.1 ppm/yr is significant over the whole of the country, implying that about half of the relative Indian-Eurasian plate motion (36-37 mm/yr) is taken up in crustal shortening of the Himalayan frontal zone due to strong coupling on the plate boundary. Occurrence of the 2015 Gorkha earthquake disturbs deformation field in the source region in central Nepal but does not seem to affect further west. It means that large amount of strain has remained unreleased in “Central Seismic Gap”. We need to cope with high potential of earthquake generation in this region in the near future. New SATREPS NERDiM GNSS stations will contribute to enhance spatio-temporal resolution of the deformation field in the region concerned.

The kinematic model along the Sumatran fault using a new dense GNSS observation (AGNeSS+) in Banda Aceh

*Takeo Ito[1], Takao Tabei[2], Fumiaki Kimata[3], Makoto OKUBO[2], Tadashi Yamashina[2], Cecep Pratama[4], Didik Sugiyanto[5], Mukusin Umar[5], Nazli Ismail[5], Irwandi Nurdin[5]

The 2004 Sumatra-Andaman earthquake (Mw 9.2) has occurred along the Sunda trench. In Banda Aceh district, evaluation of the earthquake generation potential along the Sumatran fault is highly urgent because of a large fault slip rate, the lack of major earthquakes for more than 100 years and recent Coulomb stress increase on the fault due to the 2004 event. After the 2004 event, we have deployed the Aceh GNSS Network for the Sumatran fault System (AGNeSS), which consists of 24 GNSS sites. AGNeSS have releveled the along-strike variations of elastic coupling and creeping along the Sumatran fault system (Ito et al.,2012). Recently, seismic activity is increasing around the Seulimeum fault. So, we try to evaluate the earthquake potential around the Seulimeum fault.

However, AGNeSS have already passed a decade since developed, and the site condition of GNSS sites is disintegrating. So, we extend AGNeSS, which consists of new dense 25 GNSS site (we call the AGNeSS+). We developed the new GNSS site in 2016. The AGNeSS+ aims to evaluate the seismic potential along the Seulimeum fault, where is close to urban of Banda Aceh province. The new dense GNSS site has two profiles crossing the Seulimeum fault. The length and the average interval of the profile are about 30km and about 3km, respectively. Also, an interval of GNSS site near the Seulimeum fault is shorter.

In this study, we show the first result of AGNeSS+, and a block motion model around the Banda Aceh area base on AGNeSS+. We developed the block motion model based on geological information. The Banda Aceh city locates between two fault segments, which is Aceh and Seulimeum segments. The block motion model considers these block boundary. In this presentation, we show the first results of slip deficit along Seulimeum segments and kinematic block motion.

Mechanical modeling of interseismic deformation in the Central Andes: implications for back-arc shortening

*Shaoyang Li[1,2], Fuqiang Shi[3], Marcos Moreno[4], Jun'ichi Fukuda[1]

1. Earthquake Research Institute, University of Tokyo, Tokyo, Japan, 2. Department of Earth and Environmental Sciences, The University of Iowa, Iowa City, IA, USA, 3. Shaanxi Earthquake Agency, Xi' an, China, 4. Departamento de Geofísica, Facultad de Ciencias Físicas y Matemáticas, Universidad de Concepción, Concepción, Chile

Coupling in the plate interface is considered the primary mechanical process transferring tectonic forces into interseismic deformation at subduction zones. Given that interseismic deformation affects the whole volume of the margin, the spreading of the deformation field across the continental plate not only depends on the pure-plate coupling deformation but is also affected by the rheological properties and active continental faulting. Here, we use numerical mechanical models, including viscoelastic mantle wedge and frictional back-arc fault, to investigate the interseismic GPS-derived velocity field in both horizontal and vertical directions in the Central Andes. In this region, GPS observations show a slow decrease of velocities over a significantly far-reaching area from the trench, with a sharp localized shortening gradient across a major back-arc fault at the trench distance > 800 km. These signals cannot be explained only by modeling plate locking and back-arc shortening. We first implement a grid-searching method to test the contribution and interaction of subduction locking and viscous mantle flow in the velocity field. Our simulation results show that these two processes produce similar horizontal deformation patterns, while the vertical deformation is particularly sensitive to the locking depth. We further perform mechanical viscoelastic models with a frictional back-arc fault and examine the effects of subduction locking, viscous mantle flow, and frictional strength of the back-arc fault on the activation of the back-arc fault (attached Figure). We find that the back-arc fault should be remarkably weak and is active only under considerable viscous mantle flow to reproduce the observed sharp localized shortening across the back-arc fault. Our results, therefore, suggest that the preexisting weakness of the crust plays an important role on the distribution of interseismic deformation and shortening the continental crust, highlighting a generic feedback between long-term mantle structure and present-day deformation.

Inferring regional stress field based on SAR analysis and dynamic simulation of the 2018 Palu earthquake

*Takafumi Yokota[1], Ryosuke Ando[1], Yosuke Aoki[2]

1. Graduate School of Science, University of Tokyo , 2. Earthquake Research Institute, University of Tokyo

The 2018 Palu, Indonesia, earthquake occurred along the Palu-Koro fault in the Sulawesi Island on 28th September. The Palu-Koro fault defines the boundary of the microplates, North Sula block and Makassar block. The information of the stress field around the Palu-Koro fault is necessary to understand the complicated tectonic system consisting of several micro-plates nearby Sulawesi Island as well as the basic mechanism underlying this earthquake event. Little, however, has been reported on the stress field probably due to relatively small seismic activity of this area. This study aims to estimate the stress field around the Palu-Koro fault based on the observed surface displacement and the fault slip pattern of 2018 Palu earthquake.

First, we compared SAR images taken before and after the earthquake by the pixel offset method to obtain the data of the surface displacement. The overall left-lateral displacement was observed with local variations in the geometry of the surface offsets. Then, we constructed the model of the Palu-Koro fault based on the surface displacement data and the previously-obtained geomorphological data. Finally, we simulate the surface displacement caused by dynamic rupture of the model of the Palu-Koro fault under given stressing conditions, and compare the result with the observation to infer the causative regional stress field.

The simulation is FDP-BIEM(fast domain partitioning - boundary integral equation method) [1]. The numerical cost of the original BIEM is in proportion to the cube of the total time steps. In contrast, that of FDP-BIEMis in proportion to the square of the total time steps. The simulation was performed on the physical assumption that one of the axes of principal stress is vertical, that the vertical principal stress equals to lithostatic pressure, and that the initial principal stress ratios are constant spatially. There are 3 free parameters. One is the azimuth of the axis of the maximum horizontal principal stress, and the others are the principal stress ratios.

This study constrains the azimuth of the axis of the maximum horizontal principal stress is within a certain range of about 25 degrees by considering the condition necessarily to explain the overall fault ruptures exhibiting left-laterally. If the azimuths of the horizontal principal stress axes are determined by independent observation such as the stress tensor inversions using focal mechanism solutions, this technique can also estimate principal stress ratios. More detailed modeling of the dynamic rupture process may also constrain the stress state around this fault zone.

Sun. May 26, 2019 9:00 AM - 10:30 AM JST | Sun. May 26, 2019 12:00 AM - 1:30 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[S-EM18] Geomagnetism, paleomagnetism and rock magnetism

convener:Hisayoshi Shimizu(Earthquake Research Institute, University of Tokyo), Masahiko Sato(Department of Earth and Planetary Science, The University of Tokyo), Chairperson:Masahiko Sato(Department of Earth and Planetary Science, University of Tokyo), Akira Baba(山梨県富士山科学研究所)

We are going to discuss the issues on the magnetic fields of the Earth and planets, paleomagnetism, rock-magnetism, and their applications. This session includes following topics: (1) observation and analysis of the magnetic fields of the Earth and planets, (2) paleomagnetic field variations obtained from natural and archaeological materials, (3) numerical simulations on the magnetic fields of the Earth and planets, (4) measurements and theories of magnetic properties of rocks, minerals, meteorites, and other materials, (5) climate changes and surface tectonics based on the paleomagnetic measurements of rocks and sediments, (6) observations of the magnetic anomalies and the crustal magnetization models of the Earth, planets, and satellites, and (7) developments of the measurement method and data analysis. The presentation and discussion will be made in Japanese or English in this session.
This session contributes toward development of the SEDI-Japan community.

On the formation process of the Mt.Hoei, Fuji volcano. A scenario based on the emplacement temperature inferred from paleomagnetic method.

*Akira Baba[1], Hidetoshi Shibuya[2], Toshitsugu Fujii[1], Tatsuro Chiba[3]

1. Mount Fuji Research Institute, 2. Department of Earth and Environmental Sciences, Faculty of Advanced Science and Technology, Kumamoto University, 3. Asia Air Survey Co., Ltd.

Mt. Hoei (Hoei-san) is located at the southeastern flank of Fuji volcano, and composed mostly of angular rock-fragments which are quite different in petrographic features from the coeval basaltic ejecta of 1707 A.D (Tsuya,1955). It's edifice was formed by a single eruption, the Hoei eruption, according to historical literatures documenting the eruption (e.g. Miyaji and Koyama, 2007). Miyaji et al.,(2011) classified 17 units of the Hoei eruption into 3 stage on the basis of the patterns of the eruptive pulses, and proposed that Mt. Hoei was formed by lateral intrusion of degassed basaltic magma in stage 2. However, detailed geological study of the Mt. Hoei has not been made after Tsuya(1955). Here we report paleomagnetic results of volcanic ejecta of the Mt. Hoei.

Samples for paleomagnetic measurements were collected from 3 sites, the spatter cone in the 1st crater, the ridge of Mt. Hoei and the erosion valley of Gotenniwa. They were oriented by a sun compass to eliminate the influence of local magnetic anomalies. At each site, we collected 20 to 24 samples using an engine powered core picker. Samples were measured using a spinner magnetometer, and were subjected to progressive alternating field (AFD) and thermal demagnetization (ThD).

The mean magnetic directions of each sites show remarkably unanimous. They agree with the eruption age of 1707 A.D., based on similarity to the paleomagnetic secular variation model (JRFM2K.1). The results of ThD indicate that the magnetic minerals are titanomagnetite as the highest blocking temperature is 500-580 degrees C. In the erosion valley of Gotenniwa, the NRM of the accessory materials have high and low temperature components bounded at 340 degrees C or more. It is clear that the low temperature component coincides with the directions of the essential materials of Hoei eruption, so that it was heated by the eruption and cooled after the emplacement. Furthermore, some of the accessory materials in the ridge of Mt. Hoei show magnetic directions different from those of the spatters, so that it was not or weak heated. Mt. Hoei is composed not only abundant various accessory materials but also spatters and pyroclastic deposits of the Hoei basalt which can be corelated to the Ho-III tephra (Miyaji et al.,2011) by petrography. Our findings suggest that paleomagnetic method can clarify the simultaneity of volcanic ejecta, and the Mt. Hoei was rapidly formed by ultraproximal fall or surge deposits of the Hoei eruption in 1707 A.D.

Reconstruction of paleointensity during 5 to 9 th century from Mt. Fuji lavas

Hiromichi Komatsu[2], *Tadahiro Hatakeyama[1,4], Akira Baba[3]

1. Information Processing Center, Okayama University of Science, 2. Faculty of Biosphere-Geosphere Science, Okayama University of Science, 3. Mount Fuji Research Institute, Yamanashi Prefecture, 4. Graduate School of Biosphere-Geosphere Science, Okayama University of Science

The origin of the Earth's magnetic field is due to the electromagnetic fluid motion in the Earth' core by self-exciting dynamo. Therefore, the geomagnetic field varies each place, and it is changing over time. Observation of the changing geomagnetic field in each place is indispensable for the development of the global geomagnetic field model.

In Japan, measurements of paleointensity since the dawn of history are made using archeological materials that is well known age. On the other hand, in this study, we measured the paleointensity of the samples taken from 16 sites of basaltic lava flows showing the secular variation of geomagnetic field direction in the 5th - 9th century erupted from Mt. Fuji where geologic stratigraphy was described in more detail in recent years. The obtained paleointensity was compared with the archaeo- and paleointensity measured by the old methods and with the recent archeointensity work derived from the floor surface of the old kiln.

In this study, we used the latest, Tsunakawa-Shaw method (Tsunakawa and Shaw, 1994). We obtained successful results from 39 specimens out of 62 specimens taken from 16 sites, and we could calculate the mean and variance from 9 sites where more than 3 acceptable samples were obtained. From these results, it was concluded that the basaltic lavas from Mt. Fuji is suitable to restore the paleointensity.

Many of the old works done in the last century using old methods(Thellier and Thellier, 1959) indicated high paleointensity around 60 μT in this time window, while, paleointensity by modern methods, IZZI Thellier method (Tauxe and Studigel, 2004) and Tsunakawa-Shaw method, indicated lower values of intensities (Kitahara, 2018). The palaeointensities obtained in this study are consistent with the latter with similar trends of the field fluctuation. In addition, the results of this study inter- and extrapolated the paleointensity of the age of the recent work and the geomagnetic field variation in Japan becomes clear.

Paleomagnetic information reconstructed from archaeological materials is used to estimate the archaeological age of excavated relics, in addition to revealing the geomagnetic secular variation and core dynamics. The direction and intensity of the Earth’ s magnetic field (archaeodirection and archaeointensity) have been estimated using different methods, many of which have been proposed over the past decades. Among them a new experimental technique for archaeointensity estimate is the Tsunakawa-Shaw method.

This study carried out the reconstruction of the archaeointensity using the Tsunakawa-Shaw method for a large number of samples of baked clay belonging to different ages from archaeological relics in Osaka Prefecture mainly, and constructs a dataset and the reference curve of archaeointensity in Japan (East Asia).

As the result, we estimated archaeointensities from 98 specimens belonging to 39 relics. We screened these data, compiled them for each pottery sequence, and finally obtained 10 mean intensity values of the pottery sequence level. All of the mean intensity values satisfy the selection criteria, which indicates that they have sufficient reliability. It is notable that these newly estimated archaeointensity values are lower than those in previous studies in Japan. On the other hand, new archaeointensity values show a harmonic trend in the archaeointensity data set obtained by the IZZI-Thellier method reported recently in Korea. We combined the dataset of Japan newly obtained in this study and the dataset in Korea, and drew an interpolation curve to construct an archaeointensity reference curve covering from around 200 CE to around 1100 CE in East Asia. This reference curve includes events of decrease and increase of archaeointensity occurred at around 600 CE and around 950 CE. The trends of rapid decrease and increase in intensity are a characteristic pattern of the intensity variation found for the first time in this study.

A high resolution paleomagnetic record across and around the Matuyama-Brunhes polarity transition from the Chiba composite section

*Makoto Okada[1], Yuki Haneda[2], Yusuke Suganuma[3,4]

1. Department of Earth Sciences, Faculty of Science, Ibaraki University, 2. Graduate School of Scinece and Engineering, Ibaraki Univeristy, 3. National Institute of Polar Research, 4. Graduate University for Advanced Studies

We report a high-resolution paleomagnetic direction and relative paleointensity records from a continuous marine succession, consisting of 80 meters in thickness, exposed on the Chiba composite section of the Kokumoto Formation, Kazusa Group, Japan. The Chiba composite section is a candidate for the Lower-Middle Pleistocene boundary GSSP. Our records provide detailed behaviors of the virtual geomagnetic poles (VGPs) and relative paleointensity changes during and after the Matuyama-Brunhes (M-B) polarity transition. The resultant relative paleointensity and VGP records show a significant paleointensity minimum near the M-B boundary, which is accompanied by a clear “polarity switch” like change in terms of the paleomagnetic direction. The relative paleointensity seems to keep in a low level for more than 10 thousand years associated with an unstable normal polarity. A high-resolution oxygen isotope chronology for the Chiba composite section indicates that the M-B boundary is located in the middle of Marine Isotope Stage (MIS) 19 and yields an age of 772.9 ka for the boundary. This age is consistent with those based on the latest astronomically tuned marine and ice core records and with the recalculated age of 771.7 ±7.3 ka deduced from the U-Pb zircon age of the Byk-E tephra. Moreover, our relative paleointensity record exhibits a consistent variation with other paleointensity records including Be10 derived intensity proxy from deep sea and ice cores. Our paleomagnetic data especially for the relative paleointensity represent one of the most detailed records on this geomagnetic field reversal so far obtained from marine sediments and will therefore be key for understanding the dynamics of the geomagnetic dynamo and for calibrating the geological time scale.

Brunhes-Matuyama contact aureole surrounding the Kurobegawa Granite

*Koji Fukuma[1], Hisatoshi Ito[2], Mami Takehara[3], Ryuji Yamada[4], Takashi Kubo[5]

1. Department of Environmental System Science, Faculty of Science and Engineering, Doshisha University, 2. Central Research Institute of Electric Power Industry, 3. National Institute of Polar Research, 4. National Research Institute for Earth Science and Disaster Prevention, 5. MAIBUNKAN

Contact test is most powerful paleomagnetic field test to give tight constraints on the timing of magnetization acquisition for both country and intrusive rocks. Especially when the country rock is normally magnetized and later thermally metamorphosed during a reversed polarity chron and vice versa, totally or partially remagnetized zones in the country rock can be unequivocally identified as a function of distance from the contact. Here we show an example of contact test for a youngest pair of country and intrusive rocks emplaced during the Matuyama and Brunhes chron respectively. The Quaternary Kurobegawa Granite, which is the youngest granite with U-Pb ages of about 0.8 Ma, forms a volcanic-plutonic complex with the Jiigatake Volcanic Rocks dated about 1.6 Ma by several geochronological methods. Paleomagnetic analyses including contact test for the volcanic-plutonic complex contribute to elucidate the emplacement and deformation processes related to the building of the Hide Mountains. We collected oriented blocks at 14 sites of the Kurobegawa Granite and 6 sites of the Jiigatake Volcanic Rocks. As we expected multidomain grains carry significant portions of natural remanent magnetization, we applied low temperature demagnetization with liquid nitrogen and then performed thermal demagnetization at every 25 degC step from room temperature up to 600 degC with the automated magnetometer-demagnetizer system Tspin. Low temperature demagnetization effectively erased 10-75% of initial magnetization and the middle to high temperature characteristic remanent magnetizations were retrieved at most sites except for some samples struck by lightning. Characteristic remanence directions from a single site are well clustered and the site-mean directions are of normal polarity without exception for the Kurobegawa Granite. The primary magnetizations postdated the age ~0.8 Ma of U-Pb geochronology of a closure temperature 900 degC and are presumed to be acquired during the Brunhes chron (< 0.77 Ma). In the contact aureole of the Jiigatake Volcanic Rocks metamorphosed by the Kurobegawa Granite, we found one totally remagnetized normal-polarity site and two partially remagnetized sites having hybrid normal and reversed magnetizations. This positive contact test suggests that the characteristic magnetization of the Kurobegawa Granite is not of recent viscous origin although the direction is not distinguishable from that of the present geomagnetic field. Neither large-scale tilting nor deformation was found out from the site-mean directions of the Kurobegawa Granite.

Paleomagnetic study of the IODP Site U1335 sediments in the eastern equatorial Pacific - relative paleointensity and inclination anomaly over the last 8 Myr

*Yuhji Yamamoto[1], Toshitsugu Yamazaki[2]

1. Center for Advanced Marine Core Research, Kochi University, 2. Atmosphere and Ocean Research Institute, University of Tokyo

Obtaining continuous records of relative paleointensity (RPI) and inclination anomaly (ΔI) is inevitable to understand the fundamentals of the geodynamo, but available records older than ~3 Ma are still very limited in time and space. We performed a paleomagnetic study of the Integrated Ocean Drilling Program (IODP) Site U1335 sediments in the eastern equatorial Pacific to obtain continuous RPI and ΔI records since ~8 Ma. Slow deposition, ~8.4 m/Myr or less, limits the resolution of the records but did allow for determination of long-term variations. Rock-magnetic measurements showed that biogenic magnetite dominates the magnetic mineral assemblages, and the proportion of biogenic to terrigenous magnetic minerals increases prior to ~4 Ma. The average paleointensity between ~4 and 8 Ma is approximately 30% lower than that from 0 to ~4 Ma. The apparent reduction of RPI at ~4 Ma reaches approximately ~50%, but ~20% of this is estimated to be artificial, induced by the increase in the proportion of biogenic magnetite. No relation between paleointensity and polarity length is recognized for the last ~8 Myr. The magnitude of ΔI is slightly larger during reversed polarity chrons (4.43° ±1.47°) than normal polarity chrons (0.69° ± 2.98°) over the last ~5 Myr, which agrees with the available TAF models of this time span. Prior to ~6 Ma, the sign of ΔI during the normal chrons might have switched to positive, and ΔI during reversed chrons might have been slightly larger than that after ~5 Ma.

[J] Oral | S (Solid Earth Sciences)：S-EM Earth's Electromagnetism

Sun. May 26, 2019 10:45 AM - 12:15 PM JST | Sun. May 26, 2019 1:45 AM - 3:15 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[S-EM18] Geomagnetism, paleomagnetism and rock magnetism

convener:Hisayoshi Shimizu(Earthquake Research Institute, University of Tokyo), Masahiko Sato(Department of Earth and Planetary Science, The University of Tokyo), Chairperson:Yu Kitahara(Graduate School of Social and Cultual Studies, Kyushu University), Hisayoshi Shimizu(The University of Tokyo)

We are going to discuss the issues on the magnetic fields of the Earth and planets, paleomagnetism, rock-magnetism, and their applications. This session includes following topics: (1) observation and analysis of the magnetic fields of the Earth and planets, (2) paleomagnetic field variations obtained from natural and archaeological materials, (3) numerical simulations on the magnetic fields of the Earth and planets, (4) measurements and theories of magnetic properties of rocks, minerals, meteorites, and other materials, (5) climate changes and surface tectonics based on the paleomagnetic measurements of rocks and sediments, (6) observations of the magnetic anomalies and the crustal magnetization models of the Earth, planets, and satellites, and (7) developments of the measurement method and data analysis. The presentation and discussion will be made in Japanese or English in this session.
This session contributes toward development of the SEDI-Japan community.

Sensor Response Estimate and Calibration of Superconducting Rock Magnetometers

*Hirokuni Oda[1], Chuang Xuan[2]

1. Institute of Geology and Geoinformation, Geological Survey of Japan, AIST, 2. University of Southampton

Pass-through superconducting rock magnetometers (SRM) offer rapid and high-precision remanence measurements for continuous sediment samples that are essential for modern researches on paleomagnetism and environmental magnetism. However, continuous SRM measurements are smoothed and distorted due to the convolution effect of SRM sensor response. Thus, deconvolution is necessary to restore accurate magnetization from pass-through SRM data, and robust deconvolution requires reliable estimate of SRM sensor response. In the presentation, we present a new software tool ‘uresponse’ developed for the purpose of evaluation and optimization of SRM sensor response. The example sensor responses were acquired for two SRMs at University of Southampton; i.e. liquid He-operated (old) and liquid He-free (new) ones. Precise point source held in the center of 5×5×5mm plastic cube was used for the measurement with a magnetization pointing to one of the faces together with a gridded measurement block. With the software, each tensor components of sensor response for magnetization in X-, Y-, Z-axes to a pick-up coil in X-, Y-, and Z-axes acquired for the measurement grids are smoothed, interpolated and integrated over the cross-sectional area of a measured u-channel sample. In addition, absolute magnetization of the point source was estimated by cross calibration with a palladium standard using MPMS at National Institute of Advanced Industrial Science and Technology. By comparing repeated measurements of a u-channel sample containing geomagnetic reversal on the two SRMs before and after deconvolution, we demonstrate the significant differences in measurements caused by different sensor responses of the two types of magnetometers, and show how deconvolution with well-constrained response functions can help to largely overcome the convolution effects and distortion for measurements on both SRMs.

Magnetic separation of ordinary solid particles using a pokcet size magnetic circuit

*Chiaki Uyeda[1]

1. Institute of earth and Space Science Graduate School of Science Osaka University

An ensemble of heterogeneous solid particles, composed namely of bismuth, enstatite (Myanmar), olivine (San Carlos), gold and graphite, are separated into fractions of different materials by small magnetic circuit composed of two NdFeB plates (4.0×4.0×1.0cm).[1] The abovementioned separation & identification followed a recently-reported principle [2][3] that acceleration of a particle, induced by magnetic volume force in an area of field gradient, is uniquely determined by intrinsic susceptibility of material, and its acceleration was independent to mass of particle. The small magnetic circuit produced a field distribution that monotonically decreased along a x-axis that was located between the two plates (0.4 cm in width [1]. The mixture of the particles was maintained at the bottom of a half-piped scape (0.2 cm in depth). An orifice (diameter: 0.07 cm) was located at the bottom of the halfpipe, which was set just above the circuit gap. An area with a height of 4cm was located below the circuit, and a cross-sectional paper was horizontally set at the bottom of this area to collect the translating particles. The horizontal separation, *x*, of the individual particles with respect to the position of the orifice were measured after they were collected on the plate. The particles were manually pushed towards the orifice position one by one using a thin copper wire and were dropped from the orifice with small initial velocity. Among the separated materials, graphite is known to have the smallest diamagnetic susceptibility of popular materials; whereas, the paramagnetic susceptibility observed in many of the rock forming minerals are smaller than that of San Carlos Olivine. Accordingly, the susceptibilities reported for the most existing materials in nature overlap with the values of the abovementioned five materials.

The efficiency of the proposed material separation is improved by increasing the variance of horizontal velocity between the two particles, because it directly increases the separation of the particles observed on collecting plate. The velocity can be enhanced by increasing the field-gradient of the magnetic circuit. A circuit having a compact size suitable for on-site researches (edge length: ~10 cm, weight: ~1.5 x10^3g) was previously designed and developed. The field gradient produced by the circuit was as large as 6250 G/cm, which could increase the field-induced velocity of particle by an order of magnitude.

It is presently considered that most solid particles, composed of diamagnetic or weak paramagnetic materials, are magnetically inert; the conventional magnetic separators were not used to extract these materials. Hence the new method proposed in the present study may extend to an effective technique of pre-treatment in analysing aggregates, because such technique is desired in various research fields of science; it may play a role of a “chromatography technique” conventionally used in the analysis of organic molecules. The portable and low-cost system may provide a breakthrough for on-site research in industrial and medical fields as well as in resource explorations in nature.

Experimental evaluation of remanence carriers in coercivity-blocking temperature diagram

*Masahiko Sato[1], Takuma Terada[2], Nobutatsu Mochizuki[3], Ayako Ito[2], Hideo Tsunakawa[2]

1. The University of Tokyo, 2. Tokyo Institute of Technology, 3. Kumamoto University

Knowledge of the remanence carrier in recording media is crucial for obtaining reliable paleomagnetic data. Here we report newly developed technique to evaluate the remanence carrier of natural rock samples using anhysteretic remanent magnetization (ARM) spectra in coercivity (H_c) and blocking temperature (T_B) plane (hereafter referred to as H_c-$T_B$diagram). Experimental procedures are as follows: (1) imparting ARM at 50 μT DC field and 140 mT AC field, (2) thermal demagnetization (THD) for the ARM at a certain temperature, (3) stepwise alternating field demagnetization (AFD) for the remaining ARM, (4) repeating steps 1–3 with THD treatment at a higher temperature, and (5) calculating second derivative of ARM on the H_c-$T_B$plane. Samples from three basaltic lavas and two welded tuffs were used for H_c-T_B diagram experiments. The basaltic lava samples consist of HW95 from Hawaiian 1995 lava flow of pahoehoe, OS86 from Izu-Oshima 1986 lava flow at the northwest flank of Mihara Volcano (Japan), and UN01 from Kiso-ontake lava flow (called Ueno basaltic rocks) in Nagano (Japan), which extruded during the Matuyama chron. The welded tuff samples were KM01 from Komagatake welded tuff and SK03 from Shikotsu welded tuff, both of which extruded 30-35 ka in Japan. In the cases of HW95, UN01, and KM01 samples, remanence carriers are composed mainly of a single phase in the H_c-$T_B$diagram. The OS86 sample showed two phases in the H_c-$T_B$diagram which can be distinguished from each other by AFD treatment but not THD treatment because of similar $T_B$spectra. In the case of SK03 sample, second derivatives of ARM showed not only positive values but also negative values in the H_c-$T_B$diagram. The negative value implies significant effects of thermal alteration due to laboratory heating. On the basis of H_c -$T_B$diagrams, we will further discuss remanence carriers in the measured samples.

Mineralogical study on magnetite exsolution and host plagioclase crystal

*Yujiro Tamura[1], Ryoichi Nakada[2], Masahiko Sato[3], Shinji Yamamoto[4]

1. Graduate schoole of Environment and Information Sciences, Departmennt of Natural Environment, Yokohama National University, 2. Kochi Institute of Core Sample Reserch, Japan Agency for Marine-Earth Science and Technology, 3. Department of Earth and Planetary Science, The University of Tokyo, 4. Graduate schoole of Environment and Information Sciences, Yokohama National University

Since natural plagioclase crystal sometimes contains fine-grained magnetite as an exsolution lamellae, single plagioclase crystals are used for recent paleointensity study (e.g. Kato et al., 2018). Especially, plagioclase in plutonic rocks can record average paleointensity due to their long cooling time scale (Tunakawa et al., 2009). However, such magnetite esxolution in plagioclase does not always observed in plutonic rocks. Moreover, magnetite exsolution in plagioclase sometime shows heterogeneous distribution in each plagioclase crystals. Because maximum solubility in plagioclase decreases during cooling, magnetite lamellae formation is restricted by chemical composition of whole rock and plagioclase. Furthermore, its formation is restricted by valence state of iron in each crystal, because divalent and trivalent iron are required for magnetite crystallization.

The sample investigated in this study was collected from the Doshi gabbro, northwest of Tanzawa tonalitic complex. Plagioclase crystals in the gabbro show that magnetite lamellae exsolve along oscillatory zoning in plagioclase. To describe fine exsolution lamellae, thin sections with double-side polished were made. Afterward we observed the sample by polarizing microscope and electron microscope and analyzed composition of plagioclase by Electron-Probe-Micro-Analyzer. We obtained high resolution X-ray fluorescence mapping of Fe and Ca followed by Fe K-edge X-ray absorption near-edge structure (XANES) analysis at the BL37XU of SPring-8.

In polarizing microscope observation, magnetite exsolutions with grain size up to a few microns show parallel orientations and most of them appear prolate spheroid morphology. In element mapping of Ca, plagioclase crystals have multiple oscillatory zonations and magnetites are exsolved at the area of lower anorthite content. Distribution of iron in plagioclase is almost uniform except for the rim. In XANES analysis, valence state of iron in plagioclase vary in from 2.47 to 2.55, and correlated with anorthite content.

Oscillatory zoning of plagioclase generally reflects their crystallization process, and anorthite rich plagioclase is usually crystallized in the early stage of crystallization. It is known that trivalent iron is easier to be distributed to plagioclase than divalent iron form melt (Lundgaard & Tegner 2004). According to the correlation between anorthite content and valence state of iron, trivalent iron is distributed to higher anorthite content area. In other words, during a process of plagioclase crystallization, divalent iron is distributed to lower anorthite content area. In another aspect, partition coefficient of iron to plagioclase depends on oxygen fugacity in magma chamber. Mineralogical features of magnetite exsolution and host plagioclase crystal suggest that there are multiple origins of the magnetite exsolutions in plagioclase even in single crystal.

Numerous nano-sized magnetite and hematite inclusions in muscovite in loess

*Masayuki Hyodo[1], Takuro Sano[2], Megumi Matsumoto[3], Yusuke Seto[2], Kota Suzuki[2], Tianshui Yang[4]

1. Research Center for Inland Seas, Kobe University, 2. Graduate School of Science, Kobe University, 3. Graduate School of Science, Tohoku University, 4. China University of Geosciences

Magnetic enhancement of Chinese loess–paleosol sequences has been used extensively as a proxy for the East Asian summer monsoon. This magnetic enhancement occurs due to neoformation of pedogenic ferrimagnets. However, these ferrimagnets are difficult to extract; consequently, how they are formed is not well understood. Here, we show the shape of the crystals and the presence of nano-sized pedogenic magnetic particles using electron microscopy, a synchrotron radiation X-ray diffraction technique, and rock magnetic methods. The magnetic particles comprise pedogenic magnetites, detrital magnetites with maghemite shells, and detrital/pedogenic hematites. Among the fraction samples, the medium grain-size (1–10 μm) fraction was responsible for most of the magnetic enhancement of the paleosols. Magnetic extraction experiments revealed that muscovites and chlorites in the paleosol samples showed weak spontaneous magnetization. In the medium grain-size paleosol fraction, we found a weathered muscovite grain that included many hundreds of nanometer-sized magnetite and hematite particles in aggregates with biotites, which are Fe-bearing silicates. There were similar aggregates surrounding muscovite and chlorite fragments. The concentration of pedogenic magnetite/hematite inclusions was much higher in this muscovite grain than in the submicron-sized iron oxides found on the silicate surfaces. The nano-sized magnetite/hematite inclusions must be responsible for the weak spontaneous magnetization of the muscovites and chlorites, significantly contributing to the magnetic enhancement of the mature paleosols. These magnetite inclusions are mainly responsible for the paleosol pseudo-single-domain magnetic properties extensively observed across the Chinese Loess Plateau. The protective silicates account for the low extraction efficiency and the near absence of oxidation by surrounding air.

Density separation and magnetic measurements of magnetotactic bacteria *Magnetospirillum magnetotacticum* MS-1

*Kohei Masaoka[1], Yuki Morono[2], Naotaka Tomioka[2], Go-Ichiro Uramoto[1], Yuhji Yamamoto[1]

1. Kochi University, 2. Kochi Institute for Core Sample Research, Japan Agency for Marine-Earth Science and Technology

Variation of the past geomagnetic field is recorded in marine sediments as a fossil magnetization, called natural remanent magnetization (NRM). NRM is carried not only by detrital and eaolian magnetic grains but also by biogenic magnetic grains originated from magnetotactic bacteria. To investigate characters of NRM carried by biogenic magnetic grains we have cultured the microaerobic bacteria *Magnetospirillum magnetotacticum* MS-1 (here under, MS-1) in laboratory and made sample using them for remanent magnetization measurements by simulating a very early process of sediment formation.

Preliminary reports on properties and characters of the remanent magnetization carried by the samples have been presented in Masaoka et al (2018JpGU; 2018SGEPSS), but MS-1 cells used for making samples rarely contain magnetite grains in these cells (3 percent of the total cells). To try to increase number of the cells containing magnetite grains, we have tested a density separation method using different density gradient centrifugation and made samples for magnetic measurements using these cells. We will report these results including observations under transmission electron microscope.

[J] Oral | S (Solid Earth Sciences)：S-EM Earth's Electromagnetism

Sun. May 26, 2019 1:45 PM - 3:15 PM JST | Sun. May 26, 2019 4:45 AM - 6:15 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[S-EM18] Geomagnetism, paleomagnetism and rock magnetism

convener:Hisayoshi Shimizu(Earthquake Research Institute, University of Tokyo), Masahiko Sato(Department of Earth and Planetary Science, The University of Tokyo), Chairperson:Masahiko Sato(Department of Earth and Planetary Science, University of Tokyo), Hisayoshi Shimizu(The University of Tokyo)

We are going to discuss the issues on the magnetic fields of the Earth and planets, paleomagnetism, rock-magnetism, and their applications. This session includes following topics: (1) observation and analysis of the magnetic fields of the Earth and planets, (2) paleomagnetic field variations obtained from natural and archaeological materials, (3) numerical simulations on the magnetic fields of the Earth and planets, (4) measurements and theories of magnetic properties of rocks, minerals, meteorites, and other materials, (5) climate changes and surface tectonics based on the paleomagnetic measurements of rocks and sediments, (6) observations of the magnetic anomalies and the crustal magnetization models of the Earth, planets, and satellites, and (7) developments of the measurement method and data analysis. The presentation and discussion will be made in Japanese or English in this session.
This session contributes toward development of the SEDI-Japan community.

1:45 PM - 2:05 PM JST | 4:45 AM - 5:05 AM UTC

Mechanisms of atmosphere escape from Mars to space is one of important problems to understand drastic climate change in the ancient Mars. The geological studies suggest that the climate change occurred from 4 to 3.5 billion years (Ga) ago. It is known that the time period interestingly corresponds to the period just after the ancient Mars lost its global intrinsic field between 4 and 4.1 Ga ago. Observations by NASA's Mars Atmosphere and Volatile EvolutioN (MAVEN) have provided new insights about the atmospheric escape processes in operation at Mars. Among them, the cold ion escape is a promising candidate to enable a large number of heavy ions to escape from the ionosphere. In this study, we present an overview of the results of a statistical analysis of the ion composition measurements by MAVEN as well as global multi-species MHD simulations of solar wind-Mars interactions with a focus in effects of the intrinsic magnetic field. Based on these results, we will discuss the effects of the intrinsic magnetic field on the atmospheric escape from terrestrial planets.

Numerical modeling of a lunar dynamo and its long-term evolution

*Fumi Hyodo[1], Futoshi Takahashi[2], Satoshi Kaneshima[2], Hisayoshi Shimizu[3], Hideo Tsunakawa[4]

1. Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University, 2. Department of Earth and Planetary Sciences, Kyushu University, 3. Earthquake Research Institute, University of Tokyo, 4. Deparment of Earth and Planetary Sciences, Tokyo Institute of Technology

Now the Moon has no global magnetic field unlike the Earth, and there are only local crustal fields which are of approximately several hundred nT on the lunar surface [Tsunakawa et al., 2015]. However, lunar paleomagnetic studies indicate evidence for ancient lunar dynamo, and that the Moon had a global magnetic field of about 70 μT on the lunar surface at least between 4.2 and 3.56 Ga [e.g., Garrick-Bethell et al. 2009; Shea et al., 2012; Suavet et al., 2013]. In this study, we assume that the lunar dynamo is powered by compositional buoyancy due to inner core growth, which enabled the dynamo to work for such a long time interval. Based on the assumption, we perform a series of numerical simulations of MHD dynamo by varying the ratio of the inner core and outer core radii $\chi = r_i/r_o$ from *0.1* to 0.7 like Heimpel et al. [2005], where r_i and r_o are the inner core radius and the outer core radius, respectively. Long-term variations of the Rayleigh number *Ra* and the Ekman number *E*, which are key dimensionless parameters controlling the dynamo action, used in the dynamo simulations are calculated as functions of χ from a thermal history model of the lunar core. Then a relative core evolution curve is drawn, along which we perform a suite of dynamo runs with a given value of χ and with the values of *Ra* and *E* that are calibrated by scales of Ra_0*=4000,* 8000 and 10000, and $E_0 = O(10^{-4})$. We investigate features of lunar dynamo evolution in scenarios with different values of Ra_0. In summary, we find three types of dynamo regimes during the evolution of lunar core: self-sustaining regime, failing-dynamo regime with convection, and failing-dynamo regime without convection. From the results of the simulations, we find that dynamos cease under a low magnetic Reynolds number that causes the termination of convection because of slow inner core growth in a late phase. We also find that it is difficult to drive convection in the cases of thin shell (χ *=0.6* and 0.7) even with the highest Ra_0. This result might suggest a possible scenario in which the lunar dynamo driven by compositional convection shuts off.

Investigation of sub-grid scale (SGS) model in dynamo simulations with small Ekman and magnetic Prandtl numbers

*Hiroaki Matsui[1]

1. Dept. of Earth and Planetary Sciences, University of California, Davis

The flow in the Earth's outer core is expected to have vast length scale from the geometry of the outer core to the thickness of the boundary layer. Because of the limitation of the spatial resolution in the numerical simulations, sub-grid scale (SGS) modeling is required to model the effects of the unresolved field on the large-scale fields. We model the effects of sub-grid scale flow and magnetic field using a dynamic scale similarity model. Four terms are introduced for the momentum flux, heat flux, Lorentz force and magnetic induction. The model was previously used in the convection-driven dynamo in a rotating plane layer and spherical shell using the Finite Element Methods.

In the present study, we perform large eddy simulations (LES) using the dynamic scale similarity model. The scale similarity model is implement in Calypso, which is a numerical dynamo model using spherical harmonics expansion. To obtain the SGS terms, the spatial filtering in the horizontal directions is done by taking the convolution of a Gaussian filter expressed in terms of a spherical harmonic expansion, following Jekeli (1981). A gaussian field is also applied in the radial direction.

In the present study, we evaluate SGS terms from direct simulation (DNS) without using SGS model. The resolved DNS is performed on the truncation degree $L = 1023$ using the Ekman number $E = 1.0 \times 10^{-6}$. To investigate optimal size of spatial filtering and limit of spatial resolution for the present SGS model, we evaluate the SGS terms with L = 255, 342, and 511, and compare with the SGS terms directly evaluated on the original fine resolution.

The results show that the amplitude of SGS inertia terms is larger than the SGS Lorentz force in the all length scale in the momentum equation, because the magnetic field has larger length scale than the velocity. The inertia term obtained by the resolved field decreases with the coarser resolution in all horizontal length scales. The amplitude of the SGS inertia term is approximately 0.28 times of the inertia term obtained by resolved fields.

Growth rates of kinematic dynamos in a finite domain

*Ataru Sakuraba[1]

1. Department of Earth and Planetary Science, University of Tokyo

Kinematic dynamos have been intensively studied since 1950s to get an insight into generation mechanisms of planetary magnetic fields. Even today when computer simulations of geophysically realistic dynamo models are possible, importance of that classical problem cannot be neglected because of its use in understanding basic dynamo processes. For example, a linear growth rate of a kinematic dynamo model can be an important measure to estimate a timescale of geomagnetic field recovery from a weak-field state in a reversal transition, and to understand energy transfers from fluid flow to magnetic fields and dissipation. Most of previous studies on growth rates of kinematic dynamos have assumed fluid flows extending infinitely in space such as three-dimensionally periodic ABC flows (see a review by A. Soward, Fast dynamos, in Lectures on Solar and Planetary Physics, Cambridge Univ. Press, 1994). Here we consider a cylindrical annulus model of kinematic dynamo. The flow is periodic along the azimuthal direction but finite in the radial and axial directions. The magnetic field satisfies a pseudo-vacuum boundary condition for the sake of computational simplicity. The induction equation is integrated in time from a random field and a linear growth rate is estimated after calculation of several magnetic diffusion times. A background flow is chosen so that the flow component can be represented as a few terms of trigonometric functions in the cylindrical coordinates and the kinetic helicity is antisymmetric about the equator. The growth rate can be summarized as a function of the magnetic Reynolds number, R, and the azimuthal wavenumber, m, of the background flow. In a parameter domain of $R < 1000$, we observed an increase of the growth rate as mR to the power of 2/3.

Detection of jerk-like magnetic field variation in a numerical dynamo model using wavelet analysis

*Futoshi Takahashi[1], Yoshiki Manabe[2]

1. Faculty of Sciences, Kyushu University, 2. Department of Earth and Planetary Sciences, Kyushu University

Geomagnetic jerk is known as a sudden change in the trend of geomagnetic secular variation, which typically occurs in annual timescale. A conventional and direct way to identify jerks is by looking for V- or \Lambda-shaped changes in the slope of the secular variation of a field component at observatories. Instead, to find geomagnetic jerks, Alexandrescu et al. (1995) applied wavelet analysis to geomagnetic field data obtained at ground observatories in Europe. They detected geomagnetic jerks in 1901, 1913, 1925, 1969 and 1978, and showed that regularity of the magnetic field variation is about 1.5 rather than 2.

Although dynamo action in the Earth’ s core should generate such a singular variation, physical mechanisms responsible for jerks are still unknown. In this respect, numerical dynamo modeling could be useful, because all information within the core relating magnetic field variations can be obtained. However, magnetic field variation in dynamo models occurs more slowly compared with the geomagnetic secular variation probably due to assumed values of the fluid viscosity very far from that in the Earth’ s core. Therefore, it is not evident that any jerk-like fast magnetic field variation can be observed in numerical dynamo models. In this study, we report results of our attempt to detect jerk-like magnetic field variation in a numerical dynamo model using wavelet analysis. The Ekman number of the model is 3×10^{-5}, which is not the state-of-the-art but comparatively small, giving a good starting point.

Brief summary of the results is as follows: (1) Jerk-like magnetic field variation is detected in all of the three components; (2) Regularity of such variations is typically larger than 2; (3) Jerk-like variation occurs both globally and locally. Relevance of the present results to the geomagnetic jerk and relation to the internal dynamics are discussed based on these findings.

[S-VC36] Volcanic and igneous activities, and these long-term forecasting

convener:Teruki Oikawa(GSJ, National Institute of Advanced Industrial Science and Technology), Takeshi Hasegawa(Department of Earth Sciences, College of Science, Ibaraki University), Daisuke MIURA(Department of Physical Science, Graduate School of Science, Osaka Prefecture University), Nobuo Geshi(Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology), Chairperson:Daisuke Miura, Nobuo Geshi(GSJ/AIST)

This session focuses on generation and accumulation processes of magmas, magma-crust interaction and degassing, and modes of eruption, long-term forecast of eruption, dispersal and emplacement of the volcanic products. The discussion spans petrological, geochemical, geophysical, and geological processes related with volcanic activity and products in the past, the present and the future.

The entire magmatic history of the Toba Caldera Complex that influenced human evolution, northern Sumatra, inferred from zircon U-Pb geochronology

*Hisatoshi Ito[1]

1. Central Research Institute of Electric Power Industry

The entire magmatic history of the Toba Caldera Complex (TCC), which involves the climactic Youngest Toba Tuff (YTT) super-eruption at ~74 ka, was investigated using zircons from the Oldest Toba Tuff, a post-caldera lava dome and detrital zircons from Toba lake sediments (whitish tuffaceous fine sand) deposited after the YTT activity. It was reconfirmed by U-Pb method that magmatic activity of the TCC started at ~1.3 Ma and it was newly found that the zircon-forming magmatic activity of TCC culminated at ~0.3 Ma, well before the ~0.07 Ma YTT eruption. Therefore, the climatic YTT eruption was not triggered by intensive/rapid magma supply at the time of eruption. The trigger should have been a small magmatic input or some other mechanisms (such as mechanical roof failure and roof subsidence into the magma reservoir). The TCC magma was stored incrementally over 1 million years as cold storage and finally it vented voluminous tephras at ~0.07 Ma. The remarkable accordance of zircon U-Pb age distribution between YTT and a post YTT lava dome (Tuk Tuk lava dome) indicates that post-caldera magmatic activity/resurgence occurred using essentially the same magma with YTT.

Pre-eruptive magmatic processes of "Hakone Tokyo Pumice eruption"

*Ryo Tsujihara[1,2], Tetsu Kogiso[1], Takashi Sano[3], Hidemi Ishibashi[4]

1. Graduate School of Human and Environmental Studies, Kyoto University, 2. Asia Air Survey Co., Ltd., 3. National Museum of Nature and Science, 4. Faculty of Science, Shizuoka University

Hakone volcano is an active volcano located at the closest from the Tokyo metropolitan area, and had repeated caldera-forming eruption several times. The largest-ever eruption of Hakone volcano is the latest caldera-forming eruption that occurred at ~60 ka (VEI 6), and formed caldera structure at Gora area. This eruption started with a plinian phase, and followed by a pyroclastic flow phase. The plinian fall pumice, called Hakone Tokyo Pumice (HTP), covered all over Kanto area, and the pyroclastic flow reached about 50 km away from the eruptive center (Kasama and Yamashita, 2008). It is very important to investigate the pre-eruptive magmatic processes of this eruption, hereafter called "Hakone Tokyo Pumice eruption", in detail to evaluate the risk that an eruption of the same magnitude will occur in the future. Therefore, in this study, we clarified the pre-eruptive processes of the Hakone Tokyo Pumice eruption.

Samples were collected at Ashinoyu, Kanagawa prefecture. Pumice and scoria were found as essential clasts, and pumice with mafic enclaves was also observed. We analyzed whole-rock compositions using XRF (National Museum of Nature and Science), carried out the petrographic structure analysis using polarization microscope and SEM (Kyoto Univ.), and analyzed the major element compositions using EPMA (Kyoto Univ.).

Pumice was rhyolite from dacite (SiO_2 = 64-71 wt.%) with plagioclase, clinopyroxene, orthopyroxene, magnetite, ilmenite, apatite and olivine phenocrysts. Scoria was andesite (SiO_2 = 58-60 wt.%) with plagioclase, clinopyroxene, orthopyroxene, magnetite, apatite and olivine phenocrysts. Mafic enclaves were basalt to basaltic andesite (SiO_2 ~52 wt.%) with plagioclase, magnetite and olivine phenocrysts. The chemical compositions of the glass and phenocryst minerals suggest that four types of melts coexisted, and it is considered that there were four types of chemically different magmas in the magma chamber before the eruption. Whole rock compositions of SiO_2 > ~67 wt.% and SiO_2 < ~67 wt.% show different trends. According to the whole rock compositional trends at SiO_2 > ~ 67 wt.% and chemical zoning of plagioclase phenocrysts, it is suggested that the crystal differentiation occurred in the most silicic magma. According to the whole rock compositional trends at SiO_2 < ~ 67 wt.% and chemical zoning of plagioclase and olivine phenocrysts, it is suggested that magma mixing occurred in the magma chamber. Pre-eruptive temperature are estimated by using Fe-Ti oxides geothermometer to be 820-880 ℃. Pre-eruptive melt water content is estimated by using melt-plagioclase geothermo-hygrometers to be 4.2-7.2wt.%. These estimations indicate that the magma chamber was located at the depth of 5.5-10.5 km assuming that silicic melt was saturated with water. Timescale from the last magma mixing to the eruption was estimated to be 30 days to 1 year on the basis of the Fe-Mg diffusion modeling of an olivine phenocryst.

These observations suggest that the pre-eruptive processes of the Hakone Tokyo Pumice eruption progressed as follows: first a differentiated silicic magma existed in the magma chamber existed at depth $\geq$5.5-10.5 km, there mafic magma intruded and mixed, and the eruption began after about 30 days to 1 year from the last magma mixing.

The depth of the magma chamber at the Hakone Tokyo Pumice eruption roughly agrees with the depth of the current magma chamber estimated based on geophysical observations (~10 km: Yukutake et al.,

©2019. Japan Geoscience Union. All Right Reserved.

2015). In order to accurately evaluate the risk of the future eruption, it is necessary to clarify the details of the pre-eruptive processes after Hakone Tokyo Pumice eruption.

Transition of magma plumbing system deduced from the melt inclusions contained in tephra minerals originated from Aso central cones.

*ryota nagaishi[1], Toshiaki Hasenaka[2], Masayuki Torii[2], ATSUSHI YASUDA[3], Natsumi Hokanishi[3]

1. Graduate of Science and Technology, Kumamoto University, 2. Center for water cycle, marin environment and disaster management , 3. Earthquake Reserach Institute, The University of Tokyo

Aso central cones produced basaltic to rhyolitic lavas and tephras after four gigantic pyroclastic eruptions, i.e. Aso-1, Aso-2, Aso-3, and Aso-4. Aso central cone pumice 1 ~ 6 (ACP1 ~ 6; Takada, 1989) represent voluminous volcanic products in post-caldera stage, and become key beds in Aso area. In the course of this study we found olivine-rich tephra between ACP4 and ACP3 (We call this as ACP3/4 scoria). In this study, we analyzed minerals, melt inclusions contained in tephra minerals, and volcanic glasses contained in ACP4, ACP3/4 scoria, ACP3, and ACP2 in order to compare with their result with ACP1 (Brouillet et al., 2018), Holocene scoria (Kishimadake, Ojodake, Kamikomezuka, and Nakadake) (Kawaguchi, 2018, personal communications), Aso-3 and Aso-4 (Kaneko et al., 2007, 2015), and deduce magma plumbing system of post-caldera stage of Aso volcano. The peak plagioclase composition contained in ACP4 ~ ACP1 is An# = 60~70, which is different from that of Aso-3 and Aso-4. The composition of melt inclusions in ACP2 and ACP4 does not change irrespective of host minerals and is almost the same as that of matrix glass. On the other hand, melt inclusions in ACP3/4 scoria show different compositions depending on host minerals. The composition of melt inclusions in ACP3 pyroxene is completely different from matrix glass. The maximum water content of melt inclusions in ACP4, ACP3/4 scoria, ACP2 is 1.3 wt.%, 3.8 wt.%, 3.0 wt.%, respectively. The P-T conditions of magma reservoirs of ACP2 and ACP4 are estimated as ACP2 : 890 ~ 920 ℃, 2 kbar, ACP4 : 900 ~ 920 ℃ (P = 2 kbar) from the composition of minerals and melt inclusions, and water content of melt inclusions.

Pre-eruptive magma dynamics of the climactic 110ka eruption of Toya caldera, Japan

*Akihiko Tomiya[1], Yoshihiko Goto[2], Tohru Danhara[3], Shanaka L de Silva[4]

1. Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology, 2. Muroran Institute of Technology, 3. Kyoto Fission-Track Co., Ltd., 4. Oregon State University, College of Earth, Ocean and Atmospheric Sciences

[Introduction & Methods] Caldera-forming eruptions are among the most hazardous of natural events and need to be properly predicted. An important part of this effort is to elucidate the pre-eruptive history of the magma systems through detailed petrological studies. Toya caldera, Japan, is an ideal laboratory for this purpose because of its youth and excellent preservation. It has two post-caldera volcanoes, Nakajima and Usu, the latter of which is one of the most active volcanoes in Japan.
According to previous studies (e.g., Suzuki et al, 1970; Ikeda & Katsui, 1986; Machida et al., 1987; Feebrey, 1995; Lee, 1996; Machida & Yamagata, 1996), a catastrophic eruption occurred at ca. 110 ka, producing large-scale pyroclastic flows and a wide-spread co-ignimbrite ash (>150km^3), and the magma was mainly a homogeneous high-silica rhyolite. The eruption sequence and pre-eruptive magma processes are, however, not yet well understood because the stratigraphic units differ between different researchers and previous petrological interpretations includes some errors. Therefore, we have conducted new geological and petrological studies, including analyses of bulk-rock compositions (XRF) and volcanic glass and mineral compositions (EPMA, LA-ICP-MS). Part of the geological studies has been published by Goto et al. (2018).

[Results] We divided the eruptive product into units 1 to 6 [see Goto et al. (2018) for detail]. Unit 1 is an ash-fall deposit consisting of glass shards. Units 2, 4, 5, and 6 are pyroclastic surge and flow deposits. Unit 3 consists of base surge and ash-fall deposits. Large lithic clasts occur in unit 4 and the lower parts of units 5 and 6.
Most pumice clasts are homogeneous white pumice (SiO_2=ca.77%, K_2O=ca.2.8-3.2%; similar to the opx-HSR of Feebrey(1995)). Half of pumice clasts in unit 6 are banded and gray pumice, showing two types of chemical variations. One (hb-LSR, ibid) trends toward the Nakajima andesite, and the other (cum-HSR, ibid) toward the Usu rhyolite.
Glass and mineral compositions also have variations in unit 6. For plagioclase, we identified 3 types (A, B, and C). Type A (An=ca.12) is dominant. Type B is anorthitic (An>=90) with a sub-type B' (An=ca.80). Type C is subdivided into C1 (An=ca.20), C2 (ca.35), and C3 (ca.55). Types C2 and C3 show dissolved textures. Orthopyroxene and magnetite also have similar variations, whereas quartz is type A, clinopyroxene is type B', and both hornblende and ilmenite are types C2 and C3. Magma A, from which type-A phenocrysts derived (the same hereafter), is the high-silica rhyolite. Magma B is a mafic magma. Others are intermediate magmas. Temperatures, estimated with geothermometers by Putirka (2008) and Andersen & Lindsley (1985), are <=800 C for magma A, 800-890 C for C1, C2, C3, and B', and >=900 C for B. Trace element concentrations and zoning profiles of phenocrysts reveal that C2, C3, and B' were closely related to each other but were not in contact with A and C1 until just prior to the eruption, that B' was derived from B, and that C1 interacted with A before eruption.
Type-A phenocrysts do not show significant reverse zonings. Diffusion times estimated for magnetite are < days. On the other hand, type-B phenocrysts show significant diffusion (e.g., Mg in plagioclase), indicating hundreds of years between the injection of magma B and the eruption.

[Inferred magma processes] The Toya eruption commenced with a phreato-Plinian eruption (unit 1), followed by a large-scale pyroclastic surge eruption (unit 2). The eruption once decreased in intensity and changed into small-scale phreatomagmatic eruptions (unit 3). Shortly after that, the caldera-collapse began (unit 4), resulted in a large-scale pyroclastic flow eruption (units 5 and 6). The caldera collapse, following the temporary decrease in intensity, was probably caused by underpressure in the magma chamber due to the evacuation of unit 2.
Just prior to the eruption, there was a large main chamber of magma A with subordinate magma pockets C1, C2, C3, B', and B. Magma A was probably produced by extraction from a crystal mush (e.g., Wolff et al., 2015). Mafic magma (B) injected hundreds of years before the eruption, remelted the mush, producing magmas C2, C3, and B'. Magma A was not disturbed by the mafic magma until just prior to the eruption. Magma mixing occurred during the eruption probably by suction due to the decrease in chamber pressure. The eruption trigger was probably not a mafic injection but an external cause, such as fault movement (e.g., Gregg et al., 2015). The compositional variation in unit 6 indicates a close relationship with Nakajima and Usu magmas, and requires a further examination.

Voluminous silicic magma formation for the 30 ka Aira catastrophic caldera-forming eruption: contributions of crust-derived mafic and felsic magmas

*Ayumu Nishihara[1], Yoshiyuki Tatsumi[2,1], Keiko Suzuki-Kamata[2,1], Katsuya Kaneko[1,2], Jun-Ichi Kimura[3], Qing Chang[3], Hironobu Hinata[4], Takashi Miyazaki[3], Bogdan Stefanov Vaglarov[3]

1. Department of Planetology, Graduate School of Science , Kobe University, 2. Kobe Ocean-Bottom Exploration Center, 3. Department of Solid Earth Geochemistry, Japan Agency for Marine-Earth Science and Technology, 4. Kobe Municipal Tarumi Junior High School

Aira catastrophic caldera-forming (CCF) eruption occurred at 30 ka and discharged voluminous silicic magma with a small amount of less silicic magma. In order to understand the genesis of magmas in the Aira CCF eruption, petrological and geochemical characteristics of the juvenile clasts and plagioclase phenocrysts in them were investigated. Important petrological and geochemical features of the Aira ejecta and related rocks are described as follows:
1. Juvenile ejecta discharged by the Aira CCF eruption consist of three types of clasts; white pumice, dark pumice, and scoria clasts. Whole-rock chemical compositions of the dark pumices are less SiO_2 contents (67.5-75.7 wt.%) than those of the white pumices (74.3-77.2 wt.%). The scoria shows andesitic composition (SiO_2=59.0 wt.%).
2. In whole-rock characteristics, the SiO_2-poor juvenile clasts have higher $^{87}Sr/^{86}Sr$ (0.70856±0.00001 of the dark pumice and 0.70738±0.00001 of the scoria) than the white pumice (0.70597±0.00001).
3. An-contents of plagioclase cores in the white and dark pumices show bimodal distributions with peaks of An_{45} and An_{80}, while the scoria contains solely high-An (>An_{65}) plagioclase.
4. In plagioclase phenocrysts of the Aira juvenile clasts, Sr isotopic ratios of the high- and low-An plagioclase cores are different (0.70680±0.00117 and 0.70575±0.00040, respectively).
5. Basement rocks beneath the Aira caldera consist of Shimanto sediments and Miocene granites. These materials have much higher $^{87}Sr/^{86}Sr$ (Shimanto sediments: >0.70965; Miocene granites: >0.70885) than the Aira juvenile clasts.
6. Pre-caldera basaltic lavas, which are the most SiO_2-poor ejecta around the Aira caldera, have lower $^{87}Sr/^{86}Sr$ (0.70425-0.70469) than the Aira juvenile clasts.
The above features suggest that voluminous silicic magma bearing the white pumices in the Aira CCF eruption was produced by mixing between low-$^{87}Sr/^{86}Sr$ felsic and high-$^{87}Sr/^{86}Sr$ mafic magmas, crystallizing the low- and high-An plagioclase, respectively. The low-$^{87}Sr/^{86}Sr$ felsic magma was distinguished from both the upper crust and pre-caldera basaltic materials in $^{87}Sr/^{86}Sr$ characteristics. If the basaltic materials show the mantle signature, the low-$^{87}Sr/^{86}Sr$ felsic magma was derived from a lower crust material. The geochemical signature of the high-$^{87}Sr/^{86}Sr$ mafic magma can be explained by assimilation of high $^{87}Sr/^{86}Sr$ upper crust materials. The lowest $^{87}Sr/^{86}Sr$ recorded in the high-An plagioclase is higher than the whole-rock $^{87}Sr/^{86}Sr$ of the pre-caldera basalts, suggesting the mafic end-member magma for the Aira CCF eruption was the lower crust origin. A frequency ratio of the low- to high-An plagioclase in the white pumice proposed that the mixing ratio of the felsic and mafic magmas was estimated at a ratio of ~8:2, which is consistent with whole-rock $^{87}Sr/^{86}Sr$ variations of the white pumice. In conclusion, the crust-derived low-$^{87}Sr/^{86}Sr$ felsic and high-$^{87}Sr/^{86}Sr$ mafic magmas had contributed to the formation of voluminous magma discharged by the Aira CCF eruption.

Stratigraphy and petrological relations of pre-Aso volcanic rocks in Tateno district, Minami-Aso village

*Shota Togawa[1], Toshiaki Hasenaka[2], Masayuki Torii[2], Yasushi Mori[3]

1. Graduate school of science and technology, 2. Center for Water Cycle, Marine Environment and Disaster management, Kumamoto University, 3. Kitakyushu Museum of Natural History and Human History

Petrological study of pre-caldera volcanic products is important in order to understand precursory phenomena of catastrophic caldera- forming eruptions. Volcanic activity of Aso pre-caldera stage is characterized by dominant lava flows. We report the petrography and chemical compositions of Aso pre-caldera stage lavas.
At least twelve lava flows are seen in Tateno district and they have maximum layer thickness of 20 m. They are characterized by platy joints and the top of the lava. Each lava flow interposed tuff breccia and red soil. Tuff breccia is composed of red soil, lithic fragments and weathered pumice. We made columnar section of each route and confirmed the stratigraphic relation in each.
Almost samples are olivine-two pyroxene andesite (17 samples) or olivine-hornblende-two pyroxene andesite (7 samples). And we confirmed minor types, olivine-clinopyroxene andesite (1 sample) and two pyroxene potassium-rich latite (1 sample). We realized two group lava flows. Group 1 includes three samples and group 2 does two samples. Other samples do not have the correspondence because they are different from content of major elements. The result of K-Ar age is also suggested that group 2 samples are same flow unit.
Although K-Ar age of pre-Aso lavas distributed at an altitude of 665-690m are 0.66±0.34 (Ma) and 0.78± 0.19 (Ma), the result of group 2 lava located at a height of 500m are 0.45±0.04 (Ma) and 0.48±0.03 (Ma). It is suggested that the sources of each lava were different and that the younger source was located lower in altitude than the older source. In the present Tateno Valley, Akase lava (3 ka) has a relationship sticking to the lower position of the Tateno lava (5.5 ka). It has possibility that the same relation existed in the pre-caldera stage, and that the valley may have formed due to exercise of fault or the like.

Caldera structure delineated by airborne gravity gradiometry

*Atusi NINOMIYA[1], Hiromasa ISHIKAWA[1], Shunsuke NOGAMI[1], Yoshio NAKASATO[1]

1. Sumiko Resources Exploration and Development Co., Ltd.

The airborne gravity gradiometry (e.g., JOGMEC, 2017) revealed that collapsed caldera shows a polygonal structure consisting of a combination of fractures in the direction along the caldera contour and radial fractures cutting through them. This structure is commonly found in the Quaternary calderas such as Kutcharo caldera, Teshikaga caldera, Sen-Yakeyama caldera, Sanzugawa caldera, Southern Kurikoma volcano caldera, Onikobe caldera, Hanayama caldera, Shiobara caldera, Shishimuta caldera, and Aso caldera.
Three-dimensional inversion of the airborne gravity gradiometry data enables to stereoscopically visualize the caldera structure.

The initial fine ash deposit of the Shikotsu caldera-forming eruption at ca. 45 ka

*Chiharu Tomijima[1], Daisuke MIURA[1], Shimpei Uesawa[2], Mizuho Amma-Miyasaka[3]

1. Department of Physical Science, Graduate School of Science, Osaka Prefecture University, 2. Central Research Institute of Electric Power Industry, 3. Graduate School of Sciences, Hokkaido University

We have studied a thin and fine-grained ash deposit that occurs at the bottom of a massive plinian fall unit from Shikotsu caldera, southwest Hokkaido, Japan. This fine ash deposit could be a sign of the initial stage for a catastrophic caldera-forming eruption. The ash is extensively observed at the large number of outcrops for the Shikotsu plinian fall deposit. It is believed that the Shikotsu caldera-forming eruption (SCFE) took place at ca. 42–45 ka.
The lowermost part of the fall unit is divided into two units, A1 and A2. The unit A1 is a well-sorted, thin and fine-grained ash deposit, whereas the unit A2 is constituted by four layers with the alternation of ash and pumice fall deposits. The unit A1 further comprises two sub-layers: the lower layer is a thin (~4 mm thick) and very fine-grained ash layer with sheet-like carbide and the upper one is a crystal rich fine ash layer (~30 mm thick). While the total thickness of A2 is gradually decreasing as far from the source caldera, the thickness of A1 was almost constant everywhere, which extends throughout a distance up to 70 km from the source caldera.
Dry sieve analyses at 0,5 interval between -1 and +4 in ϕ scale were carried out on 8 samples of A1 deposit. The results of grain-size distribution show a bit of change between 1.26 and 2.25 in Mdϕ and between 0.38 and 0.83 in $\sigma\phi$. These changes of Md ϕ and $\sigma\phi$ correspond to distance from 11 km to 70 km, indicating that A1 is quite well sorted and homogeneous grain-sized deposit in its long-distance transportation. These findings suggest that the unit A1 is a well-sorted, widely dispersed and high temperature dilute flow deposit. It seems to be different from the normal pyroclastic surge deposits and may be resulted from a kind of critical mode of eruption just prior to the caldera-forming plinian eruption.

Characterization of the Small-volume Pyroclastic Flows from the Kuchinoerabu-jima Volcano during 2018-2019, Southwest Japan

*Ryuta FURUKAWA[1], Teruki Oikawa[1], Nobuo Geshi[1]

1. Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology

A small-scale pyroclastic flow which flows several hundreds meters to several kilometers is a frequent phenomenon in volcanic eruptions. However, since pyroclastic flow often appears in short period of time, there are not many reports of direct detailed observation. Such the small-scale pyroclastic flows occurred at Kuchinoerabu-jima volcano on 18 December 2018, 17 and 29 January 2019. Images by JMA monitoring camera and aerial observation allow us to analyze these pyroclastic flows in view of aerial extents, depositional feature and flow velocity.
For the pyroclastic flows occurred at Kuchinoerabu-jima volcano at 18 December 2018 and 17 January 2019, partial collapse of eruption column resulted in pyroclastic flow just after the onset of these eruptions. The pyroclastic flow on December 18, 2018 ranged from the Shin-dake Crater (center) to 1.1 km northwest, 0.9 km southwest and 0.9 km east. The pyroclastic flow had flowed downward around the crater and descended to the foot of the volcano, lobate topography along the valley was observed. There were no signs of burning nor falling down trees due to pyroclastic flow passage. The pyroclastic flow on January 17, 2019 extends 1.9 km northwest, 1.5 km southwest and 1 km(+) east side. Pyroclastic flow extent can be identified with 3 regions: area of thick accumulated pyroclastics, thinly deposited pyroclastics with abundant collapsed trees and thin pyroclatics recognized by vegetation discoloring. The second and third regions occasionally have white smoke by forest fires as the result of hot pyroclastic material. For the pyroclastic flow of January 29, 2019, it can be identified up to about 600 m to the west from the Shin-dake Crater and there is no observation on the east side of the crater. These pyroclastic flows show similar or smaller extents compared with them of the distribution of pyroclastic flows occurred in 2014 to 2015. Most of the pyroclastic flows flowed down to the west side of Shin-dake Crater. Detailed examination of pyroclastic flow deposits in the field is expected.
Analyses of volcano-monitoring camera images of the Japan Meteorological Agency may measure the flow velocity of the pyroclastic flow occurred between 2015 and 2019. The average flow velocity of the pyroclastic flow ranges of 5 - 47 m/s and mean values of about 20 - 30 m/s. The pyroclastic flow of May 29, 2015 which flowed the furthest, was the fastest and the shortest distance was January 29, 2019 is the latest. In general, the pyroclastic flow with higher speed tends to have a longer travel distance. The pyroclastic flow that occurred on May 29, 2015, December 18, 2018, January 17, 2019 occurred by partial column collapse immediately after the eruption. The pyroclastic flow on January 29, 2019 occurred by overflow from the crater suggesting different mechanisms of generation. Multiple mechanisms of generation and flowage can be help us to understand small-scale pyroclastic flows.
Acknowledgments: The Japan Meteorological Agency, Fukuoka District Meteorological Observatory, Volcano Monitoring and Warning Center and the Kagoshima Local Meteorological Observatory provided valuable images of the eruptions.

Keywords: Kuchinoerabu, pyroclastic flow, eruption

An explanation of size and position of Mt. Fuji

*Yasushi Harada[1], Miyu Takahashi[1]

1. School of Marine Science and Technology, Tokai University

On Mt. Fuji, there are three unsolved features. First, the volume is so large (1400km^3) as typical volume of Japanese volcano is less than 100km^3 . Second, There is a big gap(200km) between the Nasu volcanic zone and Fuji volcanic zone on which the Mt. Fuji exists at northern end. Third, the Mt. Fuji is on 150km isodepth position of the Pacific Plate surface, whereas the average depth of the Nasu volcanic front is 100km. On the other hand, we created a VRML file for 3D plate boundaries, 3D volcano position with conduits, and positions of hypocenters around Japan, and we noted that there is a convex shape of the Philippine sea plate below the Mt. Fuji position. We performed a simple 3D simulation for magma conduits originated from 100km isodepth of the Pacific plate surface. Those conduits are blocked by the Philippine sea plate and deflected to the position of Mt. Fuji. Thus, we conclude that the shape of the Philippine sea plate well explains the size, position and depth of Mt. Fuji magma.

R & D Center for Ocean Drilling Science, Japan Agency for Marine-Earth Science and Technology, 11. Earthquake Research Institute, The University of Tokyo

Marginal parts of a subducting slab and plate can play important roles in geodynamics. For example, the strength for plate boundaries affects the driving stress of the plates and especially spin motion of relatively small plate without slabs (Matsuyama and Iwamori, 2016), slab-derived fluid from subducted aseismic slab edge is distributed beyond the seismically determined edge and contributes the arc magmatism (Nakamura et al., 2018), and mantle flow around slab edge and corner flow in a mantle wedge could generate toroidal and poloidal components in the mantle convection (Yogodzinsky et al., 2001). The northwestern edge of Pacific (PAC) Plate, the largest oceanic plate on Earth, is subducting beneath Kamchatka, which forms a massive volcanic arc consisting of three subparallel volcanic belts: the Eastern Volcanic Front (EVF), the Central Kamchatka Depression (CKD) and the Sredinny Range (SR). The northwestern edge of PAC Plate has great influences on the geodynamics of Kamchatka-Aleutian junction but many parts of this region remain unexplained. Examples include arc magmatism in the north beyond the junction and inconsistency between petrological determined thermal structure of the wedge mantle and tectonically determined mantle flow direction (e.g., Yogodzinski et al., 2001; Portnyagin et al., 2005; Portnaygin and Manea, 2008).

We investigated the northern part of SR (N-SR) from N58°05’ and up to N58°38’ located north beyond the seismically determined PAC slab edge and found several the Quaternary-age fresh lava flows, young monogenetic cones and stratovolcanoes formed on the old basement rocks of plateau lavas. The N-SR lavas are classified as medium-K series basalt to andesite and show typical arc signatures with strong but variable LILE and LREE and low HFSE concentration, which indicates that fluid components have been supplied to the area where a subducted slab is not detected seismically. The fluid components could have been derived from the lower crust and/or lithospheric mantle or aseismic subducted slab (e.g., Volynets et al., 2010; Nekrylov et al., 2018). Compared with the volcanic front lavas of EVF and the Klyuchevskoy Volcanic Group located in CKD, the N-SR lavas have relatively high Nb and Ta contents. Such arc lavas with high Nb and Ta contents have also been reported from the Quaternary southern part of SR (S-SR) (e.g., Volynets et al., 2010; Nekrylov et al., 2018) and Nachikinsky and Hailula volcanoes in the northernmost part of CKD (N-CKD) (Portnyagin et al., 2005), where have the common point that an active Wadati-Benioff zone of the PAC slab is not observed underneath (Gorbatov et al., 1997).

On the other hand, we found a left-lateral strike-slip fault crossing N-SR in NW-SE direction and also found several similar faults in the south side of N-SR. These faults seem to have formed when southeastward trench retreat accompanied with slab rollback occurred due to a recent collision of the “Kronotski Arc terrain” with Kamchatka during 7 to 2 Ma, which extinguished the northern part of the older subduction zone and formed the modern subduction structure (Lander and Shaprio, 2007; Volynets

©2019. Japan Geoscience Union. All Right Reserved.

et al., 2010). However, according to the focal mechanisms of the earthquakes that occurred at the northern continental boundary of the Bering (BER) Plate, the BER Plate rotates clockwise about the rotation pole located at 67˚N, 176˚E (Gordeev et al., 2015). This model suggests that the BER Plate is still subducting from the northern old trench and its convergence rate decreases toward the north, which is consistent with the observation that the number of young (Quaternary) volcanoes in N-SR decreases toward the north. Therefore, the subducted aseismic BER slab beneath N-SR supplied the fluid components to the mantle wedge and caused the arc magmatism in the north beyond the seismically determined PAC slab edge. Two processes can be responsible for supplying a fertile mantle component with high Nb and Ta contents to the northernmost part and backarc area of Kamchatka: 1) a toroidal flow around the northern PAC slab edge and 2) mantle flow from the NW due to the slab rollback in SE direction.

Redox state of magma in the deep crust beneath NE Japan arc: constraints from cumulate xenoliths from Ichinomegata Maar

*Naoya Tsushima[1], Michihiko Nakamura[1], Yasuhiro Yanagida, Takeyoshi Yoshida[1]

1. Division of Earth and Planetary Materials Science, Department of Earth Science, Graduate School of Science, Tohoku University

Significant number of previous studies suggest that arc magmas have relatively higher fO_2 than that of mid ocean ridge basalt (MORB) or oceanic island basalt. It has been a matter of debate whether the oxidized nature of subduction zone magmas is derived from the mantle source or acquired through their differentiation in the crust. Behavior of sulfide and sulfate is sensitive to and thus can be a tracer of the redox state (or oxygen fugacity, fO_2) of magmas, because the valence state of sulfur in the magma changes from -2 to +6 through oxidation. The arc's lower crust in the subduction zones has been recently attracting many attentions as a region where magmas may change their chemical compositions significantly. The Ichinomegata maar, located in the back arc of NE Japan, is known for the rare occurrence of deep-crustal xenoliths in subduction zones. A recent petrographic study revealed that mafic xenoliths are fractionated cumulates of the calc-alkaline host magmas (Yanagida et al., 2018). Those cumulates are, therefore, the best samples to investigate the differentiation conditions of arc magmas.

In this study, we found both pyrrhotite and anhydrite from the deep crustal mafic xenoliths from the Ichinomegata maar. Almost all the pyrrhotite grains occur as small rounded inclusions whereas some as relatively large irregular shaped interstitial phases. Pyrrhotite inclusions are mainly in hornblende and some inclusions are in clinopyroxene and plagioclase. Magmatic pyrrhotite shows approximately constant non-stoichiometoric compositions (Fe+Ni+Cu/S) and a trend from Ni-rich to Cu-rich metal composition. Anhydrite occurs as inclusions in plagioclase. The occurrence of anhydrite and the fO_2 calculated from the pyrrhotite non-stoichiometry show fO_2 of +1 log unit above Ni-NiO buffer, which is almost the same as the average value of arc magmas and clearly higher than that of MORB. This study shows that the oxidized nature of the magmas of the Ichinomegata-maar was already achieved in the deep crust and the shallow oxidation model should be discarded.

High-viscosity rhyolite lava may have a vertical lithofacies variation with more than one hundred meter thickness. Because the interior is kept warm by its thickness and the breccia on the surface during flowing, the internal fluid lava penetrates the tip (breakout) after the flow stopped Breakout of such a time difference may be developed into a disaster. Therefore, it is necessary to understand the rheological characteristics of the rhyolite lava; however, rhyolite lava eruption has few opportunities to be observed directly. In this study, we aimed to clarify the made of lava advancing during cooling by conducting a magnetic study on Kozushima sandbank lava which is thought to have been erupted several thousands of years ago.
Paleomagnetic samples were taken from 4 pumice sites (29 samples) and an obsidian site (10 samples) in the upper glassy part. In addition, crystalline rhyolite (7 samples) and obsidian overlying the clastic layer (4 samples) were sampled. We call obsidian and pumice sites as glassy part. Analysis of thermoremanent magnetization (TRM) of the inner crystalline part and obsidian overlying the clastic layer shows a single TRM component in the orthogonal diagrams. The TRM results of the 3 pumice sites and an obsidian site shows up to two sharp demarcations in remanence directions in the orthogonal diagrams. The remaining pumice site did not provide interpretable remanence magnetization component during thermal demagnetization. The glassy part is, therefore, considered to have been deformed at least two times below 580 C due to the advance of the inner part. The sampling sites located at greater altitudes show lower temperatures at which components are demarcated. Since this is interpreted as the temperature difference inside the lava, each deformation occurred simultaneously .Mode of each deflection seems to be similar among 3 pumice sites; however, this is not the case for the obsidian site. The deformation of the thick glassy part of the rhyolite lava is not completely uniformly distributed. The obsidian site overlying the clastic layer gave a single TRM component, likely due to thermal annealing associated with abundant spherulite formation in the clastic layer.

Evolution of magmatic chemistry for the Asama-Maekake volcano since 10ka revealed by whole-rock chemical analysis of pumice obtained by the trenching of air-fall tephra deposits

*Masaki Takahashi[1], Maya Yasui[1], Tatsuo Kanamaru[1]

1. Department of Earth and Environmental Sciences, College of Humanities and Sciences, Nihon University

The high-resolution stratigraphy of pumice deposits, which were formed by the pumice eruptions of Asama-Maekake volcano, is revealed by the trenching. It is clarified that the pumice beds consist of twenty-three units from As1 to As23 and the eruptive history comprises three active stages (I (9.5 to 8.3ka), II (6.5 to 4.7ka) and III (1.8ka>)) and two dormant stages (1 (8.3 to 6.5ka) and 2 (4.7 to 1.8ka)). The major element chemistry for pumice clasts of each pumice bed are analyzed by XRF. The pumice of the active stage I and II are enriched in Al_2O_3 and depleted in CaO, suggesting that both suffered chemical weathering. The pumice clast of the active stage III with high MgO, which is free from chemical weathering, are also high in FeO* and MnO, and depleted in TiO_2, P_2O_5 and Na_2O. The pumice in the active stage I and II shows also the similar tendency. The SiO_2 contents for most pumices of As15 to As22 are less than 60wt% and mafic andesite, while those of As1 to As13 are more than 60wt% and felsic andesite to dacite. The MgO content at 58wt%SiO_2 (Mg_{58}) of pumice of each pumice bed repeats the increase and decrease with time, but it appeares to increase temporally as a whole. It means that the MgO content of mafic end -member magma fed to the magma chamber filled with felsic end-member magma changes with time, because the pumice of Asama-Maekake volcano is produced by the magma mixing between mafic end-member magma with various MgO contents and felsic end-member magma with similar SiO_2 and MgO contents.

Late Pleistocene–Holocene tephra ejecta in the trench log at the southern apron of Esan volcanic complex, Japan

*Daisuke MIURA[1], Ryuta FURUKAWA[2], Kenichi Arai[3]

1. Graduate School of Science, Osaka Prefecture University, 2. Institute of Earthquake and Volcano Geology, GSJ/AIST, 3. Asia Air Survey

In the Esan volcanic complex (EVC), northern Japan, large number of phreatic ejecta are found at around the volcanic aprons, and could be threaten to the local residences due to the close proximity. Our trench excavation study has been performed at two digging sites, and 11 samples of the black paleo soils and the charcoal for ^{14}C dating have been measured there. A source explosion crater is inferred at 2.6 and 2.2 km far from the site A and B, respectively. This close proximity between the crater and trench sites indicates that the most of deposit exposed in the trench logs are the proximal facies. At least eleven and twelve units of volcaniclastic deposits are identified at the sites A and B. The first phreatic deposit in Holocene is newly identified just prior to the EsMP episode, and it had erupted in ca. 11 ka (Es-0). Holocene phreatic episodes of Es-1 and 3 can be divided into three and five subunits. The pyroclastic surge deposit in Es-1 and 3 was confirmed, suggesting that the phreatic surge also could be threaten to the local residences. The sequence of Holocene eruptions at the EVC comprises at least 13 phreatic tephra events in 10 thousand years, implying that the cyclic phreatic eruption could manifest in every thousand years. With regards to the characteristics of phreatic explosions, it is expected that grain size plot for the phreatic deposit becomes scattering. Grain size analysis in comparison with the magmatic ejecta may not be better way to discriminate the phreatic depositional process. It is also pointed out that the deposited area of phreatic ejecta is largely constrained by a regional topography. Parts of this work was financially supported by MEXT “Integrated Program for Next Generation Volcano Research and Human Resource Development.

Transition of eruption sequence and magma plumbing system at the 1.4 ka Nakamachineshiri eruption of Me-Akandake volcano, eastern Hokkaido, Japan.

*Kosuke Ishige[1,2], Mitsuhiro Nakagawa[1]

1. Department of Natural History Sciences, Graduate School of Science, Hokkaido University, 2. Mitsubishi Materials Corporation

Me-Akandake volcano ,which was formed on the southwest wall of the Akan caldera, is a stratovolcano group composed of 8 volcanoes (Katsui, 1951). Nakamachineshiri is the volcanic body that occured the most explosive eruption in the Me-Akandake volcano and is an active volcano with continues fumarolic activity. Among its activities, especially the eruption approximately 14,000 years ago, was called the Nakamachineshiri Crater Activity Period 1 (NC - 1), and widely distributed pyroclastic flow and pyroclastic fall deposit from foot of the volcano to a distance.
However, detailed geological studies have not been carried out sufficiently and the details of the eruption sequence are still unclear. In addition, the petrological study of magma plumbing system associated with transition of eruption style has not been carried out sufficiently. We performed a detailed geological survey in order to clarify the eruption sequence and style of NC-1. In addition, we performed petrological study and component analysis of the volcanic deposit in order to investigate the developmental process of the conduit during eruption and magma plumbing system. As a result, detailed eruption transition of NC-1 and transition of mafic magma became clear.
NC-1 eruptive deposits can divide into 4 unit (unit 1-4) by the result of geological survey. Unit 1 compose of pyroclastic surge deposit at the vicinity of the crater and compose of closs layer of pyroclastic flow deposit and pyroclastic surge deposit contained accretionary lapilli above the silty volcanic tuff layer at the foot of the volcano. The characteristics of Unit 1 are that volcanic deposit have suffered alteration and contain a large amount of rock fragments. Unit 2 consists of pyroclastic surge deposits and pyroclastic flow deposits, which are distributed from the vicinity of the crater to the foot of the volcano and far away, but pyroclastic flow deposits dominate at the foot of the mountain. The pyroclastic flow sediment characteristically contains fresh andesite lava fragments. As a result of observation of thin sections, these lava fragments were found to be welded pyroclastic rocks. Unit 3 is mainly pyroclastic fall deposit composed of pumice and scoria. In the vicinity of the crater, it thickness thickly and the pyroclastic surge sediment is sandwiched between the pyroclastic fall deposit. This unit is the NaPS pyroclastic fall deposit described by Wada et al. (1988). Unit 4 is distributed only in the vicinity of the crater, it is composed of pyroclastic surge deposits and the composition is characterized by many scoria and rock fragments. An erosion gap was observed between Unit 1 and Unit 2, and it is considered that there was a time gap.
The rocks of the ejecta of NC-1 are basaltic andesite to dacite. These rocks contain plagioclase, clinopyroxene, orthopyroxene and Ti-magnetite as phenocrysts, associated with minor amounts of olivine in some rocks. The whole-rock SiO_2 contents range from 62.5-64.7 wt.% for pumice and from 55.0-58.1 wt.% for scoria. Pumice and scoria tend to show different trends in many elements on the Harker diagram. Pumice exhibits little variation in petrological features through all the unit. In contrast, scoria is distinguishable according to unit by Sr and P_2O_5 contents.
From these results, based on the time gap, the volcanic activity can be divided into 2 stages. The transition of the eruption is as follows.
In stage 1 (: Unit 1) which is the first activity, magma rose and phreatomagmatic explosion occurred by the magma-aquifer interactions, and the crater was expanded by repeating the explosive eruption.

©2019. Japan Geoscience Union. All Right Reserved.

After the time gap, the mafic magma rose again and stage 2 (: Unit 2,3,4) activity began. The first activity of stage 2 is predominantly pyroclastic surge due to phreatomagmatic explosion, welded pyroclastic rock formed in or near the crater in Stage 1 were destroyed by explosive eruption. Moreover, several pyroclastic surge which flowed down the foot of the volcano became pyroclastic flow. When eruption rate rapidly increased in middle of stage 2, eruption style became sub-Plinian eruption and eruption column was formed by declining interaction of magma-water. After that, the eruption rate decreased and eruption style changed to phreatomagmatic explosion.
In NC-1 eruption, it is thought that eruption style was dominated by interaction of magma-water because aquifer was developed in volcano body. Hence, it is assumed that Nakamachineshiri edifice is a tuff cone or maar formed by repeated phreatomagmatic explosion.

Kilo-year-evolution of magma plumbing system with dominant modes of eruption at Suwanosejima volcano, Southwest Japan

*Taketo Shimano[1], ATSUSHI YASUDA[2]

1. Graduate School of Environment and Disaster Research, Tokoha University, 2. Earthquake Research Institute, University of Tokyo

Suwanosejima volcano is one of the most active volcanoes in Japan since at least 1950’s, but its eruption history had not been established well. In addition, the petrological knowledge of magma plumbing system has been accumulated only for a few decades (Shimano and Koyaguchi, 2001; Ishibashi and Saito, 2009). Shimano et al. (2013) established a rough history of the volcano, that Otake volcano, in the central part of the island, has been active for recent 60-70 kys. The dominant eruption style of Otake volcano was effusive in the first half period until ca. 30 ka, then explosive in the later half. This explosive period can be subdivided into two stages; Plinian pumice eruption stage until around 10 ka with long dormancy for each, and scoria eruption stage with intervening continuous ash emission until now. The mechanisms of such transitions in eruption styles and intervals, and products from pumice dominant to scoria dominant stage are substantially important for understanding long-term forecast of eruption. Thus this study summarizes the petrological features of eruptive materials of this explosive period to understand the magma plumbing system. Eruptive materials of 10 ka pumice eruption, 1813 subplinian scoria, and recent ash have been investigated in terms of EPMA and FTIR to discuss the history by estimating temperature and volatile content for these eruptions. We measured chemical compositions of phenocrysts, groundmass glass, and melt inclusions by EPMA, and glass water content of melt inclusions by FTIR.

The materials of 10 ka eruption are characterized by banded pumice that shows mingling of basaltic and dacitic magmas with wide compositional variation of phenocrysts. In contrast, the 1813 product is very homogeneous basaltic andesite but it also shows some evidence of mixing among similar basaltic andesite. The products of recent activity are a little bit different but rather similar to those of the 1813 but show much lower contrast among mixed magmas. Mineral assemblages are similar for all products with phenocrysts of plagioclase, two pyroxenes, and trace amount of olivine and oxide minerals. EPMA analyses revealed multi-modal characteristics of phenocryst compositions indicating mixing of some end-member components of magmas. On the other hand, the water content of melt inclusions shows that magmas of recent activity are degassed whereas those of 10ka and the 1813 are 2-3 wt.% H2O.

This study has been supported financially by ERI JURP 2018-G-3, and partly by the project “Integrated program for next generation volcano research and human resource development.”

Temporal variation of the magma compositions of the Miyakejima volcano during the last 2700 years

*Nobuo Geshi[1], Teruki Oikawa[1]

1. Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology

Evolution of the magma system of the Miyakejima Volcano between the last two caldera-forming eruptions, 2.6-2.7ka Hatchodaira eruption and the 2000 AD eruption, was reconstructed based on the new dataset of radiocarbon ages. The activity of Miyakejima during this period can be divided into three magmatic stages as follows; I) from the 6th century BC to the 2nd century AD, after the formation of the Hatchodaira caldera. This stage is characterized by the decreasing of the range and absolute value of whole-rock SiO2 concentration. II) from 7th century to 14th century after the Suoana-Kazahaya eruption in the northern slope. This stage is characterized by the gradual increasing of whole-rock SiO2 concentration from less-evolved basaltic andesite (52-53 wt% SiO2) to andesite with evolved composition. III) from the 16th century to the end of the 20th century, with gradual increasing of whole-rock SiO2 concentration from less-evolved basaltic andesite (52-53 wt% SiO2) to andesite with evolved composition. Presence of relatively large fissure eruptions with less-evolved basaltic andesite suggests the injection of less-evolved magma into the shallow magma system at the beginning of these compositional stage.

The Suoana-Kazahaya eruption in the 7th century is an eccentric activity during this period. This eruption is characterized by the eruption of andesite with highly-evolved composition (SiO2= 59-63 wt%). The aphyric andesite magma erupted at the beginning of the eruption. As the progress of the eruption, anorthosite and olivine megacryst were entrained into the andesitic magma and form porphyritic lavas. The whole-rock SiO2 of these megacryst-bearing lava ranges from 49 t- 60 wt% reflecting the abundance of the crystals. The eruption of strongly-evolved magma from the lateral fissure can be fed from the isolated small magma batch, as proposed for the plumbing system of the B and C fissures of the 1986 Izu-Oshima eruption.

[S-TT44] Airborne surveys and monitoring of the Earth

convener:Shigekazu Kusumoto(Graduate School of Science and Engineering for Research, University of Toyama), Takao Koyama(Earthquake Research Institute, University of Tokyo), Yuji Mitsuhata(AdvancedIndustrial Science and Technology), Shigeo Okuma(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST)), Chairperson:Shigekazu Kusumoto, Takao Koyama(東京大学 地震研究所 火山センター), Shigeo Okuma(産業技術総合研究所), Yuji Mitsuhata(国立研究開発法人　産業技術総合研究所)

Airborne surveys are useful to better understand the whole and/or the detailed structures of the Earth and their variations. They can be implemented from a traditional manned and newly-developed unmanned aircraft to efficiently map very large or remote areas with difficult access. We invite studies on theory, instrumentation, processing, modeling or inversion and applications of airborne surveys.

A Case Study on the Application of a Magnetic Survey Using Magnetometers Carried by Multicopter-type Drones

*Shiga Nobuhiko[1], Harada Haruo[1], Wada Kazushige[1]

1. Mitsui Mineral Development Engineering Co., Ltd.

Recently, large radio-controlled helicopters have been successfully used to take magnetic measurements of active volcanoes due to their long cruising distance and large payload. On the other hand, in mineral exploration, multicopter-type drones can conduct successful surveys in spite of their shorter cruising distance by repeating a number of short-distance flights. The drones can be used for faster and more extensive reconnaissance magnetic surveys compared with land magnetic surveys, by flying at about 50m above ground level, with 100m of flight separation. The drones can also provide high-resolution results that cannot be acquired easily by manned airplanes or helicopters.

Since 2017, magnetic measurements have been taken by a drone as reconnaissance for a domestic gold exploration project survey, with a total flying distance of 680km so far. This type of drone is commercially available, with 5.5kg of payload. It carries an optical pumping magnetometer, a 4K camera, and a circuit board for data processing and telecommunications, among other equipment. It also has a hanging magnetometer sensor that is suspended from a single 2.5m Kevlar cable.

The TMI data quality has mostly been good, and the data repeatability is always satisfactory. Usually, the discrepancies at the intersecting points between regular flight lines and tie-lines are small enough to be negligible. And no magnetic influence of the drone has been found, so there has been no need to compensate for drone airframe magnetism. However, the optical pumping magnetometer has a dead zone in the incident angle of the input magnetic field. Because the magnetic sensor is suspended from the drone, measurements can sometimes be interrupted if the sensor is strongly shaken or tilted by the wind or by an abrupt change in the cruising speed.

Since 2017, we have been conducting drone magnetic surveys at an existing gold mine and surrounding area. As a result, a low magnetic zone was found around an outcrop of silica sinter with strongly silicified rocks. The location of the low magnetic zone coincides with the peak of the horizontal gravitational gradient strength in this area. The peak was interpreted to show the locations of faults, and the low magnetic zone was derived from the thermal demagnetization by hydrothermal fluids came up throuh the fault, which brought about mineralization and the silica sinter. Since the silica sinter and strongly silicified rocks were mineralized (Au:1g/t-- Ag:16g/t), an epithermal gold-silver deposit is likely to exist beneath the sinter area.

(Acknowledgement)
We would like to express our deep appreciation to Irving Resources Inc. for their valuable assistance for this survey and for their permission to use materials from their surveys in this presentation.

Development for upgrading the generalization capability of the seismic damage detection of building based on the deep-learning utilizing aerial photographs

*Shohei Naito[1], Hiromitsu Tomozawa[2], Yuji Mori[2], Naokazu Monma[3], Hiromitsu Nakamura[1], Hiroyuki Fujiwara[1]

1. National Research Institute for Earth Science and Disaster Resilience, 2. Mizuho Information and Research Institute, Inc., 3. Pasco Corporation

NIED has been developing the real-time damage estimation and identification system for use in supporting decision-makings for emergency responses. In this study, we developed the immediate damage detection method of buildings utilizing remote sensing images, by sequentially updating the result of the real-time damage estimation system as a complementary.

The image consists from images of multiple ortho-rectified vertical aerial photos taken soon after the 2016 Kumamoto earthquake, the 1995 southern Hyogo Prefecture earthquake, and the 2011 off the Pacific coast of Tohoku earthquake. By combination of these images, we constructed training data and the damage discriminant model which have high generalization performance.

First, we classified building damages into four levels by means of the visual judgment; LEVEL1: No damage, LEVEL2: slight damage, LEVEL3: moderate damage, LEVEL4: collapsed. Then we divided building types as wooden and non-wooden based on the shape of roofs. And we organized these as GIS data, utilizing the building polygon provided by the Geospatial Information Authority of Japan.

Next, we normalized the resolution of each photographs as approximately 20 centimeters per pixel, and regularized brightness of images utilizing cumulative sum of luminance histograms.

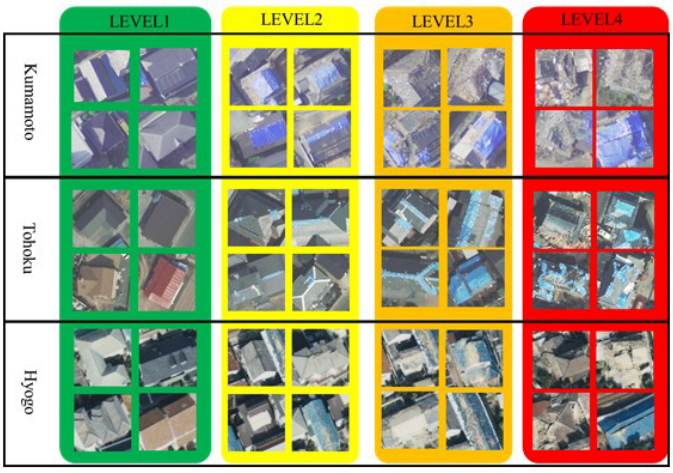
Subsequently, we acquired patch images of 80-pixels square which include the main part of a common residence from each photographs, then extracted total 311,281 patches including each building damage levels proportionally.

Furthermore, we developed the damage discriminant model based on the CNN referring the VGG, then trained this model with these patch images. By this model, a discrimination accuracy of validation data which extracted from 3 earthquakes except of training data indicates over 70% in each damage levels.

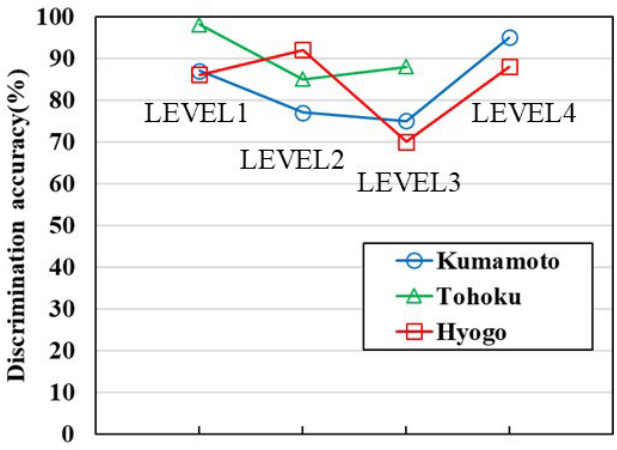
In this study, an output of discriminant result is produced as a 4 color image created by raster scanning as a unit of 80-pixels square and a stride width of 20-pixels. Then by overlapping of building polygons, we classify the damage level of each building based on the threshold value of area ratios. Additionally, we assumed the sum of LEVEL3 and LEVEL4 as the totally collapsed buildings, and the sum of LEVEL2 and LEVEL3 and LEVEL4 as the totally or partially collapsed buildings, on the basis of the comparison between the governmental inspection result and the visual judgment result with aerial photographs.

By these methods, the immediate damage detection of the extensive area with an aerial photograph is achieved. Besides, by application of the Bayesian updating method, the estimation result based on the distribution of ground motion can be updated into the higher precision.

©2019. Japan Geoscience Union. All Right Reserved.



For all these reasons, the automatic damage detection with an aerial photo can approve the accuracy of the damage estimation based on the ground motion, and it is possible to utilize for disaster responses. However, this method has difficult tasks such as the damage discrimination based on a vertical image sometimes under-estimates the building damage except of wooden building which have tiled roof, and survey with optical images by airplane is difficult to observe during the cloudy weather and the night-time.



In the future, by utilizing the image acquired by different platforms and different sensors, we are going to develop the damage detection methods which have more immediacy and higher accuracy, then we intend to utilize these methods not only the initial disaster response, but also the recovery and reconstruction stage.

The resistivity distribution under the ground on bedrock creep slopes in Kii mountain area by the airborne electromagnetic survey

*Atsuhiko Kinoshita[1,2], Yasutaka Tanaka[2], Wataru Sakurai[1], Taro Uchida[1], Koichiro Hayashi[3], Katsushi Kawato[4], Minoru Okumura[4]

1. National Institute for Land and Infrastructure Management, 2. Sediment Disaster Prevention Technology Center, Kinki Developing Regional Bureau, Ministry of Land, Infrastructure, Transport and Tourism , 3. OYO Corporation, 4. NIPPON ENGINEERING CONSULTANTS CO.,LTD.

In typhoon Talas of September 2011, numerous deep-seated landslides were occurred in the Kii Peninsula. In order to reduce the damage, it is necessary to grasp the dangerous slopes for landslides in advance. For the method to extract the dangerous slopes, there are a method using topography data such as the laser profiler, a method to judge from geology / topography, a method to judge from the amount of spring water at the end of slope and the quality of water. These methods have advantages and disadvantages, and there are insufficient aspects to estimate the degree of the danger and the scale of the dangerous slopes. Therefore, in order to complement these methods, we propose the method to estimate the risk and the landslide size based on the resistivity distribution of the ground obtained by the airborne electromagnetic survey. In this study, two bedrock creep slopes in the Akadani-west area were considered as the research fields and the validity of the estimation method was verified.
In this study, the vertical resistivity distributions of the slopes were created from the airborne electromagnetic survey obtained in the past. First, we calculated the average penetration depth from the frequency and the specific resistance of the ground. Next, the blank portion where data was not obtained was supplemented. Final, the smoothing processing was performed for the purpose of eliminating the noise. The vertical resistivity distribution of the ground is displayed in color, so it is easier to judge the danger level and estimate the slip surface. For this reason, we adopted the method of separating colors according to the frequency from all resistivity values obtained in the Akadani-west area.
In the slopes of the Akadani-west area, we have found that the resistivity value steeply changed in the vertical direction at the slip surface. For this reason, the degree of the landslide risk and the depth of the slip surface can be estimated from the resistivity distribution. In addition, we have found that the depth of the slip surface can be estimated in more detail by first differentiating the resistivity value in the vertical direction.

Study of UAV photogrammetry toward efficiently grasping volcanic landform

*Yuichi Iwasa[1], Takeshi Matsushima[2]

1. department of earth and planetary sciences, graduate school of sciences, Kyushu University, 2. SEVO, Kyushu Univ.

In this study, we conducted three-dimensional modeling of volcanic landform using photogrammetry by UAV aerial photography with the aim of efficiently grasp landform. This method, which has been spread in recent years, can grasp landform as not points but planes, and it is thought that this observation can be conducted inexpensively, quickly, and without high-risks. In this study, aiming to make UAV observation efficient, we investigated relation between some factors of UAV observation and the accuracy of 3D model created.

We conducted mission flight on March and August 2018 at Kirishima Iwo-yama located Ebino city, Miyazaki prefecture. Iwo-yama erupted on April 2018, and landform change has occurred. We were able to get photogrammetric data before and after eruption. The UAV used on this study is DJI Mavic pro. The flying altitude from take-off point was 50 m, and the resolution of the images was 1.5 cm/pix. The photographed area was about 0.26 km2, and we set frontlap: the overlap of image along flight route, to 90 %, and sidelap: the overlap of image between flight routes, to 60 %. The UAV flew 60 minutes, and we got 1379 images during each flight. In addition, we measured 16 points as Check points and Ground Control Points (GCP): the points used as standard of coordinates, by GNSS and Total station.

Using Agisoft’ s software Photoscan, we created a three-dimensional model before and after eruption from images taken. By increasing a number of measured points, we got more accurate model than that of similar observation in 2017, On the other hand, there were partial vacancy on the model after eruption. This is probably because image processing was not successful due to a lot of volcanic gasses in the photographed image. For solving this problem, at next observation, we photograph from oblique angle in addition to vertical angle only around fumarole.

According to the above data, comparing models, we grasp volcanic landform change due to eruption on April 2018. Furthermore, we investigate relation between particularly GCP and the accuracy of 3D model in order to make UAV observation efficient.

This work was partly supported by MEXT under Integrated Program for Next Generation Volcano Research and Human Resource Development, and under Earthquake and Volcano Hazards Observation and Research Program. Also it was supported by ERI, The University of Tokyo under Joint Usage Program.

Volcanic gas measurements using UAVs

*Takeshi Hashimoto[1], Akihiko Terada[2], Toshiya Mori[3], Ryo Tanaka[1]

1. Institute of Seismology and Volcanology, Graduate School of Science, Hokkaido University, 2. Volcanic Fluid Research Center, Tokyo Institute of Technology, 3. Geochemical Research Center, Graduate School of Science, The University of Tokyo

Volcanic gas is a mixture of volatile contents separated from magma and its composition may reflect the temperature and pressure conditions at a degassing depth, and the processes of phase change, interaction with rocks, and so on. In addition, since the ascent speed of volcanic gas is much larger than that of magma itself, it provides the earliest signals of subsurface processes such as the magma supply rate and/or the depth of the magma head. For this reason, volcanic gas composition is an important quantity to infer the current state of volcanic activity and to predict its transition in the future. In volcanic gas measurements, one of the conventional methods is the direct sampling and post-analyses in laboratory. However, such a direct sampling is often dangerous, especially when the volcano is erupting. In such a situation, measurements using UAVs are quite useful (Hashimoto et al., 2018). In this study, we review the recent progress in this research field, focusing on the case studies that we have been working on in these years.

Regarding the chemical composition, the Multi-GAS system is widely used, in which the sensors of some chemical species with a recording system are integrated into an apparatus and gas composition is directly measured on site. Recently, we made the apparatus smaller and lighter to mount on an unmanned aircraft. An electric-motor-type multi-rotor drone was used in the survey that was conducted two months after Mt. Ontake eruption in 2014 (Mori et al., 2016). This type of measurement can be done more easily in a field where we can use an engine-type compact unmanned helicopter that has much larger payload than small drones. In our experiment conducted in Noboribetsu, Hokkaido, we used the concentration meters of three gas species, which are relatively inexpensively available, and a thermo-hygrometer. We put them together in a net, hung it on an unmanned helicopter, and suspend it in the plume. The concentration ratios between CO_2, H_2S, SO_2, and H_2O were measured. At Kusatsu Shirane volcano, it has been proven that a trained researcher can perform similar operations with a drone.

With regard to gas emission rate, remote sensing of sulfur dioxide by an ultraviolet spectrometer is often used for volcano monitoring. The operation is normally performed on ground by driving a vehicle that mounts a measuring apparatus, looking the UV light in the sky. After the considerable miniaturization and weight reduction of the instruments in recent years, even an operation using a hobby-use drone has become possible (Tanaka and Mori, 2017).

In summary, volcanic gas measurements using UAVs are technically reaching a practical level. Further development in the research field is expected when the researchers acquire the operation skills of UAVs. We are also engaged in training and educational activities for improving such skills with the aid of the Next-generation Volcano Research and Human Resource Development Project by the MEXT.

Repeated Drone Magnetic Survey over Usu Volcano, Hokkaido Japan

*Shigeo Okuma[1], Masahiko Makino[2], Tadashi Nakatsuka[1], Ayumu Miyakawa[1], Makoto Yanagida[3], Minoru Okumura[4]

1. Institute of Geology and Geoinformation, Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST), 2. Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST), 3. Hanshin Consultants Co., Ltd., 4. Nippon Engineering Consultants Co., Ltd.

We have been developing a drone magnetic survey system using a portable magnetometer with a differential GNSS system (Okuma et al., 2018a). This time we employed a hexacopter with a diagonal axis distance of 995 mm and with a maximum payload of 5.7 kg (Okuma et al., 2018b). A main console of Geometrics G-858 Cs magnetometer, a NovAtel OEM615 GNSS receiver with its antenna and the GNSS data logger were attached to the drone. A Cs sensor was suspended from the drone by a string. We have tested flying attitudes and magnetic noise of the drone by changing a suspending length of the sensor cable. We concluded that an optimum cable length of our system was 0.85 m for surveys over rugged terrains because of the power of our drone. In this case, magnetic noise caused by the drone was estimated to be around 15 nT at the maximum by our experiments (Okuma et al., 2018b).

Using this drone magnetic survey system, we have conducted magnetic surveys over the Usu 2000 eruption area (Nishiyama craters area, Area A) and the southwestern flank of the main edifice of Usu volcano (Area B), Hokkaido Japan (Okuma et al., 2018b). In Area B, a curious magnetic anomaly had been observed by a previous helicopter-borne EM and magnetic survey in late 2000, which was flown at an altitude of 70–100 m above terrain along north–south survey lines and east–west tie lines, spaced 100 m and 1,000 m apart.

In May 2018, the drone surveys were flown at an altitude of 30 m above terrain along east–west survey lines (Area A) and north–south survey lines (area B), spaced 25 m apart. Total magnetic intensities were observed in every 0.1 seconds by the Cs magnetometer with GNSS positioning. According to data processing, the surveys were successful for mapping magnetic anomalies whose general pattern were well retrieved in the both areas, compared to known magnetic anomalies compiled from the 2000 survey.

Then, we applied the generalized mis-tie control method (Nakatsuka et al., 2009) to the magnetic anomalies of both 2000 and 2018 surveys in Area A and calculated temporal magnetic variations at crossover points. Although the survey specification of each survey was different, the result was successful to derive positive magnetic changes larger than 100 nT in and around intensive fumarolic areas of the 2000 eruption. The areas were characterized as apparent negative magnetic anomalies by the 2000 survey and are estimated to be underlain by Pleistocene volcanic rocks with reverse magnetization. Since the beginning of the eruption, the fumarolic activity gradually extended from the eruption center to the NNW along a ridge and lasted for several years. This implies that Pleistocene volcanic rocks constituting the area have been demagnetized by the strong fumarolic activity related to dyke intrusions at the 2000 eruption.

Based on the results above, it is concluded that drone magnetic survey is a promising method to derive long-term temporal magnetic changes and can play an important role to monitor volcanic activity.

[S-TT47] Creating future of solid Earth science with high performance computing (HPC)

convener:Takane Hori(R&D Center for Earthquake and Tsunami, Japan Agency for Marine-Earth Science and Technology), Yuji Yagi(Graduate School of Life and Environmental Sciences, University of Tsukuba, Tsukuba), Katsuhiko Shiomi(National Research Institute for Earth Science and Disaster Resilience), Chairperson:Takane Hori

Due to the development in computer science and computational science, large-scale or many times forward simulations and/or inversion analyses have become available recently. In solid Earth science, large-scale seismic wave propagation and crustal deformation with high fidelity models based on high resolution observation data have been demonstrated; uncertainty in crustal deformation caused by material properties and structures can be investigated based on many-time calculations for different material properties and structures; fault slip inversion analyses for non-Gaussian error distribution, etc. Thus, we will invite researchers who are applying HPC technology in forward simulations and inversion analyses and discuss how to improve more the collaboration between computer & computational sciences and solid Earth science. We are welcome submission by the researchers who are interested in this scope, especially students and young researchers.

Expectations to more realistic Green's function with modeling errorfor the real-time estimation of the coseismic fault model

*Yusaku Ohta[1]

1. Research Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University

Rapid understanding of the magnitude of large earthquakes and their associated fault dimensions are extremely important. Recently, Geospatial Information Authority of Japan (GSI) and Tohoku University are jointly developing the GEONET real-time analysis system (REGARD). REGARD system rapidly estimates two types of coseismic fault models, which are slip distribution along the plate interface and single rectangular fault model, using permanent displacement field based on the real-time GNSS time series. Currently, REGARD adopted the maximum likelihood approach to estimate the optimum model. The system, however, has problem to be improved. The current system is difficult to estimate the quantitative uncertainty estimation of the obtained result because of the estimated result should contain both of the observation error of the real time GNSS and modeling error caused by the model settings including uncertainty of the Green’ s function. Among them, the uncertainty of the Green’ s function is the most serious problem. Currently, REGARD adopted the simple elastic half-space model. It should cause the large estimation uncertainty in the coseismic slip fault model especially in offshore region whose structure is complex due to plate subduction. Thus, the more realistic Green’ s function with quantitative uncertainty will be needed. I will briefly introduce current development status of REGARD and show the expectations to more realistic Greens’ function with modeling error realized by Monte Carlo simulation using the HPC technology.

Development of high-performance low order unstructured implicit finite-element solvers for solid earth science problems

*Kohei Fujita[1], Tsuyoshi Ichimura[1], Takuma Yamaguchi[1]

1. Earthquake Research Institute, The University of Tokyo

Problems in solid earth science, such as crust deformation problems and earthquake wave propagation problems, involve large problem sizes with complex 3D geometry and heterogeneous material properties. Use of implicit low-order finite-element methods on high-performance computers are expected to enable such analyses; however, these methods are not straightforward to attain performance on modern computer architectures due to heterogeneity of the problem. Thus, we have been developing algorithms and implementations to improve performance of low-order finite-element methods targeting recent CPU and heterogeneous supercomputer systems. In this talk, we will introduce our development for the CPU based systems (e.g., K computer, Intel Xeon-Phi Knights Landing based Oakforest-PACS) as well as heterogeneous systems (e.g. NVIDIA GPU accelerated Piz Daint and Summit), and show some application examples using these high-performance computing enhanced methods.

Optimal spectral element method for elastic wave computation

*Kei Hasegawa[1], Nobuaki Fuji[2], Kensuke Konishi[3]

1. Earthquake Research Institute, University of Tokyo, 2. Institut de Physique du Globe de Paris, 3. Institute of Earth Sciences, Academia Sinica

We introduce new numerical integration operators which compose the mass and stiffness matrices of a modified spectral element method for simulation of elastic wave propagation. While these operators use the same quadrature nodes as does the original spectral element method, they are designed in order that their lower-order contributions to the numerical dispersion error cancel each other. As a result, the modified spectral element method yields two extra-orders of accuracy, and is comparable to the original method of one order higher. The theoretical results are confirmed by numerical dispersion analysis and examples of computation of waveforms using our operators. Replacing the ordinary operators by those proposed in this study could be a non-expensive solution to improve the accuracy.

Multi scale tsunami simulation from earthquake initiation to tsunami run-up into the coastal area and high performance particle simulator

*Mitsuteru Asai[1], Mikito Furuichi[2], Daisuke Nishiura[2]

1. Kyushu University, 2. JAMSTEC

Due to future tsunami disaster prevention planning, it is strongly desired a simulation tool that accurately predicts possible damage level for structures and human resources in the inundation area. For the tsunami run-up simulation, we must calculate the crustal deformation as an input of the initiation of tsunami wave around the seismic fault. A stagger elasticity theory, in which homogeneous and spatial infinity is assumed to formulate the theory, is applied in practical and conventional crustal deformation estimation. The elastic theory cannot consider the heterogeneous crustal structure in space and the fracture propagation in time. Therefore, there is no guarantee that the conventional tsunami simulation estimates the largest possible inundation. In this paper, we conducted a series of disasters simulation from earthquake scenario, crustal deformation and tsunami propagation sequentially in order to discuss the necessity of consideration of seismic fault rupture propagation in tsunami simulation.

When modeling the entire city with a high fidelity particle model, one must deal with an enormous number of degrees of freedom, and implementation of highly parallel calculation is indispensable. In this paper, we developed a computational algorithm with high parallelization efficiency for the liquid spreading phenomenon over a flat plane problem, for later apply on tsunami run-up simulation. In particular, we propose an expanding slice grid method with a dynamic load balancer to utilize maximum efficiency on memory utilization and computational speed.

At the end of this paper, high fidelity tsunami run-up simulation in Kochi City by the Expanding slice grid method were conducted, and the utility of the proposed method was discussed.

Digital-Ensemble Concept for Making Resilient Society against Natural Hazard

*Satoru Oishi[1]

1. RIKEN Center for Computational Science

In order to designing resilient society including developing or renovating cities, infrastructure management like making redundant route for not only transportation but also suppling water, energy as well as waste, we need digital-twin for simulating situations under catastrophic disasters. Digital-twin is a concept meaning “a virtual model of process, product or service and the paring of virtual and physical worlds allows analysis of data and monitoring of systems to head off problems before they even occur, prevent downtime, develop new opportunities and even plan for the future by using simulations”, according to Marr (2017). Previously, digital-twin concept was used for product manufacturing through computer aided engineering (CAE) to examining the performance and duration of target manufacture like rocket engine. Now, we are using the word for designing resilient society against natural hazard because designing resilient society requires paradigm shift of disaster mitigation strategy from “government saves public and it costs” to “private invests cities through market”. Private sectors require precise statistics of impacts of natural hazard for considering investment, however, we could not expect the quantitative impact without numerical simulation of large-scale disaster.

Large-scale disaster simulations consists of solvers and urban construction objects. Integrated Engineering System (IES) has both functions (Hori et al. 2018). There are several solvers for each kind of disasters like earthquake and tsunami. However, urban construction objects have been made one by one. Therefore, it is required to develop a tool that automatically generates the detailed construction objects of urban buildings for target cities. O-tani et al. (2014) have been developing such an automation tool, named Data Processing Platform (DPP), so that it can deal with multiple numerical simulations including tsunami inundation and evacuation, and seismic response analysis of ground and buildings. We have implemented a MPI-based parallelization of DPP, then it has generated objects of urban cities in the whole Japan which includes about sixty million buildings. Now, once given a certain appropriate ground property and motion, a simulation-based assessment of disasters can be achieved for the whole Japan.

Digital-twin of urban structures gives quantitative impacts of earthquake by putting expected seismic wave which has been calculated or monitored through the seismic simulation. Simulation of the earthquake impact by using the pair of the seismic wave and its probability revealed the risk of the society numerically. It changes the concept of fragility curve coming from extrapolation of experience to physics-based numerical simulation with multi-scenario. In other word, we assume digital-ensemble concept for numerically calculated risk of natural disaster which is required for our paradigm that private invests cities through market.

Expected Role of High Performance Computing to Promote Earthquake Research

*Naoshi Hirata[1]

1. Earthquake Research Institute, the University of Tokyo

Headquarters for Earthquake Research Promotion (HERP) has been led earthquake observation, measurement, surveys and research in Japan for 20 years since the first 10-year basic comprehensive policy for the promotion set in April 23, 1999. During this 20 years, nation-wide basic observation networks have been established such as MOWLAS and GEONET. The observation data from the networks provide us rich information beneath Japan and are used by world-wide researchers discovering new phenomena such as slow earthquakes. On the other hand, data analysis methods and models, which are assumed in the analyses, are rather simple and not enough to extract rich information from the data. The necessity of the 3D realistic structure model for the data analyses has become clearer recently because of the ocean bottom observation data, such as the postseismic deformation of the 2011 Tohoku earthquake. To construct realistic model for the complex subduction zone in Japan, where two plates are subducting, large scale high-fidelity models are required and high performance computing is necessary to calculate crustal deformation and/or seismic wave propagation with the realistic models. For the next 10 years, we expect that high-performance computing will play an intrinsic role to promote earthquake research through higher level data analyses with realistic 3D structure in and around Japan. This will lead us a new stage in earthquake science.

[S-CG56] Ocean Floor Geosciences

convener:Kyoko Okino(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:shuhei Totsuka, Ayanori Misawa

Most of Earth's volcanism and much of its tectonic activity occur on and beneath the seafloor. Various phenomena on the seafloor are closely linked to plate tectonics, Earth and atmosphere. Seafloor rocks and sediments record Earth's evolution and heat and material fluxes on the Earth. Ocean Floor Geosciences session covers a broad range of research on LIPs, crustal movement and structure etc. Any fields of research and approach are welcomed. The session aims to encourage discussion among scientists from different study fields and to integrate our understanding of ocean floor.
The session is co-chaired by K. Tadokoro (Nagoya Univ.), O. Ishizuka (AIST), T. Toki (Univ. Ryukyus), and N. Takahashi (JAMSTEC).

The restoration of precipitation record of iron hydroxide about seven years in Nagahama Bay, Satsuma Iwo-jima, Kagoshima.

*Naoya Sakamoto[1], Shoichi Kiyokawa[2]

1. Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University, 2. Department of Earth and Planetary Sciences, Faculty of Science, Kyushu University

Satsuma Iwo-jima, located 38km south of Kyusyu island, Japan, is volcanic island in the northwestern rim of Kikai caldera. In Nagahama Bay the acidic mineral-rich hot springs cause various tonal changes of seawater. And oxidation of Fe^{2+} ions discolors the seawater into a reddish brown (Shigaura and Tazaki,.2001). This Bay is a semi-closed environment, iron hydroxide precipitation and deposition are likely to occur and precipitation rate of 33 cm/year. (Kiyokawa and Ueshiba, 2015). We restored the depositional record from10 m diameter and 1 m long acrylic plastic cores (total 50 core) that collected in Nagahama Bay from 2009 to 2018 (about 9 years). In this study, we revealed that the relationships precipitation of iron hydroxide and weather and seafloor environment in Nagahama Bay. the following studies were conducted: (a) Observation of sediment trap (CT image and observation of sediments using polarizing microscope and electronic microscope). (b) Meteorological observation and a survey of typhoon records in the past in Nagahama Bay. (c) Seafloor observation (Temperature in sediments and water pressure). By combining the sediment records in traps (34 Traps) from seven years from 2011, the stratigraphy of the total layer thickness of 5 m 70 cm was restored. From the CT image, it is divided into a high-density layer (iron hydroxide layer containing sand particles: 35 layers), a low-density layer (iron hydroxide layer: 28 layers), a high-density low-density alternate layer (7 layers) Seven thick high density - low density layer - high density low density alternate cycle was seen. Also, from the observation of smear slides and SEM, in the high-density layer, there are a structure in which iron hydroxide particles of about 100 μm aggregate to several μm, a volcanic glass of several tens to 200 μm, diatoms, the low-density layer mainly contains 50 nm of the iron hydroxide particles agglomerated to several μm in size. 37 typhoons approached or passed near Satsuma Iwo-Jima from June 2011 to September 2018. 17 of them were huge typhoons (Under 960hPa, over 30m/s). From meteorological data in Nagahama Bay, there were six Typhoon approached or passed between April 2018 and September 2018. When the typhoon passes south or west side of Satsuma Iwo-jima, it becomes south wind. The thick white layer was precipitated by the influence of the typhoon. So, the April to October the thick fine-grained sand layers and iron hydroxide layer precipitated due to typhoon. It is considered that fine-grained sand iron hydroxide alternating layers precipitaed in November to March without the influence of typhoon. When the typhoon passes south or west side of Satsuma Iwo-jima, it becomes south wind, Thick fine sand layer containing about 20 to 70% quartz and volcanic ash. Observed trap sediments, Trap sediments are composed iron hydroxide particles, and we consider that it is a chemical precipitation. The low-density layer excluding the high-density layer and the thickness of the alternating layer are recorded as iron hydroxide as the formation layer, and its layer thickness is 220 cm. The iron hydroxide accumulated on the Nagahama Bay (about 6000 m^2) in 7 years and it reached 13,200 m^3. As the interstitial water of this sediment is about 80%, the dry weight of iron hydroxide has reached 8,976 tons in seven years. And about 1282 tons of iron hydroxide were recorded in the formation every year in this Bay.

Department of Earth Resources Engineering, Faculty of Engineering, Kyushu University

The Gondou field is located at the western flank of the Daisan-Kume Knoll, at a water depth of 1330-1470 mbsl (meters below sea level). Many hydrothermal spire and mound structures were recognized in an area of ca. 1400 m ×400 m (Minami and Ohara, 2017). Previous study (Ishikawa et al., 2016) reported high Cu content in hydrothermal deposits collected from the Gondou field. Scientific drilling was performed by J-MARES during the SIP Integrated Ocean Resource Surveying System JM17-04 Cruise from October to November, 2017. Sediment cores were obtained from 5 Sites in Southern area of the Gondou field using BMS (Benthic Multi-coring System) installed on *Shincho-maru*. Mineralogical and geochemical studies of sulfide minerals in the obtained cores were conducted by microscopic observations, electron probe microanalyzer (EPMA) analysis, and X-ray diffractometer (XRD) analysis.
Massive and disseminated sulfide layers were recognized at Site GDUC06, which was covered with silty clay sediment and underlaid by silicified volcaniclastics. Two distinctive types of massive sulfide were recognized; the upper one is composed of sphalerite, pyrite, galena and associated with barite, while the lower one is composed of pyrite, chalcopyrite and associated with quartz, illite and chlorite. The underlaid silicified volcaniclastics layer includes pyrite. It is notable that formation of sphalerite-rich massive sulfide and chalcopyrite-rich sulfide is comparable to the black ore and yellow ore found in Kuroko-type deposits.
Similarity to the Kuroko-type deposits can be found in chemical composition of sulfide minerals. Iron content in sphalerite from the Gondou field ranges from 0.22 to 5.72 atm%, which would be comparable to the reported value from 0.07 to 0.35 atm% for the Matsumine and the Shakanai deposits of the Hanaoka mine, one of typical Kuroko-type deposits in the Hokuroku district (Shimazaki and Horikoshi, 1990)). Tetrahedrite-tennantite series occurred in the sphalerite-rich massive sulfide exhibit high As/(As+Sb) and Zn/Fe ratios, which are close to the range found in massive sulfide from the Hanaoka mine (Shikazono and Kouda, 1979). Since chemical composition of sulfide minerals is considered to reflect chemical condition such as f_{S2} during the formation, these similarities would provide keys to understand the mineralization processes.

Strontium isotope study of sulfate minerals obtained by scientific drilling from seafloor hydrothermal fields in the Okinawa Trough

Akihi Tsutsumi[1], Naru Tsukamoto[1], Kazuhiko Shimada[1], *Jun-ichiro Ishibashi[1], Ryuichi Shinjo[2]

1. Department of Earth and Planetary Sciences, Kyushu University, 2. Faculty of Science, University of Ryukyus

Since hydrothermal fields in the Okinawa Trough develop within sediment-rich geologic setting of a backarc rifting in the continental margin, significant fluid mineral interactions and fluid migrations are expected to occur within the sediment layer. We have demonstrated that pore fluid chemistry in the vicinity of active vents in these hydrothermal fields were represented by two distinctive components; one is entrained-seawater component and the other is hydrothermal component which has the same origin as the vent fluid. Sulfate minerals such as barite and anhydrite are known to occur abundantly in and around the hydrothermal fields, because they form by precipitation caused by encounter of these two components. Isotope ratios of Sr incorporated in these sulfate minerals would provide key information to understand these processes.

We studied barite and anhydrite occurred in sediment cores obtained from three hydrothermal fields, Aki Site at the Iheya North Knoll, Hakurei field at the Izena Hole and Gondou field at the western flank of Dai-san Kume Knol, in the mid-Okinawa Trough. The sediment cores were obtained by scientific drilling campaigns conducted in 2014, 2016 and 2017 under the framework of the Next-Generation Technology for Ocean Resources Exploration Project. Determination of Sr isotope ratios was conducted employing LA-ICP-MC-MS (laser ablation inductively couple plasma multi-collector mass spectrometry) technique, which enabled multi-point measurement of a single mineral crystal or mineral aggregate using a polished section. Using the same polished section, Sr/Ba ratio of barite or Sr/Ca ratio of anhydrite was determined by EPMA (electron probe micro analyzer) analysis.

Strontium isotope ratios of anhydrite in all three fields were close to that of the present-day seawater with a few exceptions. Strontium isotope ratios of barite showed wider ranges biased from that of the seawater. Higher $^{87}Sr/^{86}Sr$ ratios are recognized in Hakurei field while lower $^{87}Sr/^{86}Sr$ ratios in Aki site and Gondou field. Difference in Sr isotope ratio between barite and anhydrite is attributed to that barite precipitates from mixture of the hydrothermal fluid and seawater while anhydrite precipitates from heated-seawater. As supportive evidence for this idea, we confirmed Sr isotope ratio in the sediment core from Hakurei field agreed with the reported value of barite in an inactive chimney-shape sulfide/sulfate breccia had been collected. Occurrence of barite in limited layers whereas common occurrence of anhydrite in the sediment core would be attributed to a result of subseafloor migration of the hydrothermal fluid.

Numerical modeling of seafloor hydrothermal system in the Izena Caldron, Okinawa Trough

*Shohei Albert Tomita[1], Katsuaki Koike[1], Tada-nori Goto[1], Katsuhiko Suzuki[2], Takafumi Kasaya[2]

1. Graduate School of Engineering, Kyoto University, 2. Japan Agency for Marine-Earth Science and Technology

Regional heat flow measurements in the Izena Caldron and detailed heat flow measurements in the Jade hydrothermal field situated on the NE slope of the Izena Caldron were conducted by Kinoshita et al. (1997). They clarified that an enormous heat flow variation (10^{-1} to 10^{2}W/m^2) in the Jade site. In addition, near the Jade black smoker, the heat flow varies from >30W/m^2 at a hydrothermally altered area to 1.7W/m² within 100m distance from it. From large-scale heat flow measurements, 500m-wide rectangular zone (hereinafter called “Corridor”) with high heat flow (>1W/m^2) along the NE suggests the existence of linear heat source under the Corridor. In the research cruise of CK16-05, drilling and temperature measurements using Thermo Label were conducted in the Hakurei site, hydrothermal area of southern part in the Izena Caldron, and high temperature over 290℃ was measured at C9026. Although many heat flow data were obtained in the Izena Caldron, no heat flow data was obtained in the Hakurei site. Therefore, in this study, we conducted dense heat flow survey at 11 points with 550m measurement length and 50m measurement interval along EW direction in the Hakurei site in the research cruise of KM18-08C in September 2018. Moreover, we conducted a numerical simulation of multi-phase fluid flow using TOUGH2 to reveal distribution of physical properties and hydrothermal fluid flow pattern in the seafloor hydrothermal systems in a back-arc basin.

Heat flow value is calculated as the product of temperature gradient and thermal conductivity. In this study, we obtained temperature gradient values on the seafloor using a stand-alone heat flow (SAHF) meter operated by ROV. In the simulation, the size of study area was defined as 4.8×5.6×1.7 km and the seafloor was set as the top boundary where the temperature and pressure were fixed at 4 ℃ and hydrostatic condition, respectively. As the initial condition, we assigned the hydrostatic pressure, the average thermal gradient 0.16 ℃/m around the Izena Cauldron except for the hydrothermal area, and physical rock properties by referring to the borehole data. The values of discharge rate, mass in rate, and permeability (k) were adjusted appropriately through trial and error. As the geologic settings, we set conduits with $k = 1.0\times10^{-13}$m^2 under the discharge area of Jade and Hakurei sites and fault with k=3.0×10^{-14}m^2 under the Corridor along the vertical direction from bottom to surface, to realize the vertical flow of hydrothermal fluids from the deep part. In addition, caprock with k= 1.0×10^{-16}m^2 was located near the surface to generate the lateral hydrothermal fluid flow. Other places were set as volcanic rock with k= 1.0×10^{-14}m^2. Under these conditions, we simulated a natural state condition.

From heat flow measurements, we clarified very high heat flow (76W/m^2) at a 150m west site covered by mud from C9027, which suggests an existence of hydrothermal fluid flow beneath the seafloor at shallow part. In other places, the heat flow was varied from 3 to 12W/m^2. Through the simulation, a plausible large-scale temperature distribution and flow pattern were obtained. In terms of heat flow, by comparing the calculated and measured values along the Corridor and Hakurei site, the calculated values were conformed to correspond well with the measured values. According to the sensitivity analysis, the importance of caprock and conduit in the seafloor hydrothermal system was revealed. By a model without the conduit, the hydrothermal fluids did not ascend to the seafloor along the vertical direction and the tendency of measured heat flux could not be reproduced. Furthermore, by a model without caprock, heat cannot be preserved because it flows in all directions and the calculated heat flux did not accord with the observed flux. Consequently, the location and physical properties of the conduit and caprock were identified as the critical control factors on the accuracy of hydrothermal fluid flow simulation.

Electrical conductivity and spectral IP characteristics in the rock samples obtained in seafloor hydrothermal area and interpretation of them

*Yusuke Ohta[1], Tada-nori Goto[1], Katsuaki Koike[1], Weiren Lin[1], Koki Kashiwaya[1], Tadai Osamu[3], Takafumi Kasaya[2], Toshiya Kanamatsu[2], Hidenori Kumagai[2], Hideaki Machiyama[2]

Various geophysical explorations have recently been conducted in the seafloor hydrothermal field to estimate the scale of the seafloor massive sulfide. However, information obtained from geophysical exploration is limited. Therefore, in order to interpret the geological information under the seafloor based on the results of the geophysical exploration, it is necessary that the detailed analysis is carried out on hard-rock and sediment samples obtained on the surface and the lower of the seafloor, for comparing their features with results of geophysical exploration. In this study, we obtained rock samples in several hydrothermal fields; then we measured various physical properties and analyzed the chemical compositions, and we also investigated their relationship. As for physical properties, in particular, electric conductivity and spectral IP characteristics were investigated in detail. In samples with high electrical conductivity, some sulfide minerals, known to have high conductivity, were found to be contained. In spectral IP, some samples having a plurality of frequencies causing a peak in the phase difference of the voltage across the sample was observed. It is thought that this is due to the mixture of a plurality of sulfide minerals having different average particle sizes. In fact, in this study, we succeeded in reproducing the frequency characteristics of the sample by the rock physics model we constructed, assuming such characteristics. In the future work, we will study the consistency of the phenomena observed in this research and our new rock physics model through experiments on artificial samples using plural sulfide minerals of different particle sizes and types.

Geological Survey of Japan (GSJ), AIST conducted the marine geological survey cruise around the Ishigaki-Jima, Ryukyu Islands using R/V Hakurei (Japan Oil, Gas and Metals National Corporation) in August 2018. This cruise deployed high-resolution Multi-Channel Seismic (MCS) reflection, Multi-Beam Echo Sounder (MBES) swath bathymetry, gravity observation, and magnetic field observation. This presentation shows the geological structure around the Ishigaki-Jima based on MCS profiles, MBES swath bathymetry, gravity anomaly, and magnetic anomaly data.

Two remarkable unconformities are recognized in the sedimentary sequence offshore northward Ishigaki-Jima, separating the sedimentary sequence in the slope region into three layers. In the offshore northward Ishigaki-Jima, northwestward-dipping normal faults are recognized at the NE-SW trending geomorphic lineament. Developments of normal faults suggest the involvement of the extensional stress associated with the back-arc lifting of the Okinawa Trough. Since one remarkable unconformity is recognized in the sedimentary sequence in the Okinawa Trough, separating the sedimentary sequence into two layers. West of the Ishigaki Knolls, many of ENE-WSW trending normal faults are recognized. These normal faults are appearing clearly on the seafloor and are identified as ENE-WSW trending lineaments. Along with the development of normal faults, the depression-like morphology is formed from the Ishigaki Knolls to westward in the Okinawa Trough. We consider that the depression-like morphology bounding the ENE-WSW trending normal faults are the most recent structural feature. In this presentation, we will show the latest results of 2018 survey cruise and discuss the origin of the depression-like morphology.

[S-CG56] Ocean Floor Geosciences

convener:Kyoko Okino(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:Keishiro Azami, Erika Tanaka

Most of Earth's volcanism and much of its tectonic activity occur on and beneath the seafloor. Various phenomena on the seafloor are closely linked to plate tectonics, Earth and atmosphere. Seafloor rocks and sediments record Earth's evolution and heat and material fluxes on the Earth. Ocean Floor Geosciences session covers a broad range of research on LIPs, crustal movement and structure etc. Any fields of research and approach are welcomed. The session aims to encourage discussion among scientists from different study fields and to integrate our understanding of ocean floor. The session is co-chaired by K. Tadokoro (Nagoya Univ.), O. Ishizuka (AIST), T. Toki (Univ. Ryukyus), and N. Takahashi (JAMSTEC).

A petit-spot monogenic volcano erupted on flexural part of lithosphere are reported from the world ocean [1]. Many of studies about petrology, geochemistry and geochronology of petit-spot volcanos had been done to understand their origin and nature of the asthenosphere. However, there has not been any studies about hydrothermal activity because nobody has ever observed in-situ eruption of petit-spot volcanos. As petit-spot volcanic activity ubiquitously occurs in the world ocean despite its small volume, the hydrothermal activity in petit-spot volcanos must be an important process for metal flux from seafloor to ocean.

During the cruise KS-18-9 of *R/V Shinsei-maru* in August 2018, we collected some ferromanganese oxides by dredge in offshore of Fukushima prefecture where simultaneously corrected basalts show youngest eruption in previously reported petit-spot volcanoes of NW Pacific (i.e. very few alteration of glass). The metal luster and massive texture of the ferromanganese oxides are typical features of hydrothermal origin. Hence, we defined geochemical and mineralogical features of the ferromanganese oxides using (μ)XRF, ICP-MS and XRD.

Based on the ternary plot of (Ce + Y + Zr) vs. (Ni + Cu) vs. (Mn + Fe), all samples are plotted into the area of hydrothermal origin[2]. REE patterns show negative Ce anomaly and low REE content which are character of hydrothermal origin[3] besides low La/Lu ratio as low temperature hydrothermal deposits rather than high temperature (~ 350 ℃) hydrothermal deposits. The samples contain 7 Åmanganate (birnessite), quartz, plagioclase and smectite. 7 Åmanganate indicates low temperature hydrothermal activity[4] as well. As the petit-spot volcanic activity is unique heat source for hydrothermal activity at the old oceanic plate (approximately 130 Ma). Otherwise, the hydrogenetic rim of some samples which are characterized by vernadite and enrichment of Cu and Ni implies cessation of the hydrothermal activity.

This is the first report of the presence of hydrothermal activity on an old oceanic plate in NW Pacific. The hydrothermal activity possibly occurred on the foot of petit-spot knolls because hydrothermal vents and mounds, and ferromanganese samples showing sign of hydrothermal have never been found during dives of submersible *SHINKAI 6500*[5], which explore along the slope of the knoll. Petit-spot volcanoes must be more simple hydrothermal system than others because of simple heat supply from a monogenetic eruption. Hence, it is the most suitable example to understand a complete process of single hydrothermal circulation. Detailed investigations by submersible *SHINKAI 6500* are highly required to define the hydrothermal system and the metal flux from petit-spot to ocean in the future.

X-ray computed tomography characterization of the distribution of biogenic apatite and sedimentary structures in pelagic clay around Minamitorishima Island, western North Pacific

*Yoichi Usui[1], Koichi Iijima[1], Hideaki Machiyama[1], Yuji Ichiyama[2,1], Erika Tanaka[3], Koichiro Fujinaga[4,3], Kazutaka Yasukawa[3,4]

1. Japan Agency for Marine-Earth Science and Technology, 2. Chiba University, 3. The University of Tokyo, 4. Chiba Institute of Technology

The apparent absence of visible sedimentary structures in pelagic clay often humpers their systematic classification into lithostratigraphy. On the other hand, large variation in biogenic apatite content in some pelagic clay has been recently recognized. Because the density of apatite is higher than the bulk of pelagic clay, the spatial distribution of apatite may be detected through physical properties to detect sedimentary structures. Biogenic apatite in pelagic clay hosts rare earth elements and yttrium (REY), so capturing their distribution is also important for resource exploration. Here we examine non-destructive X-ray computed tomography (CT) in comparison with chemical analysis of REY and P_2O_5 for piston cores obtained around Minamitorishima Island. The depth profile of CT-based density estimates matches well with the direct measurements of bulk density and gamma-ray attenuation data. The density profiles also show clear positive correlation with the REY and P_2O_5 profiles. Some deviation is attributed to the presence of micro Mn nodules, which show characteristic textural pattern on CT images and are easy to distinguish. Moreover, X-ray CT reveals the relationship between sedimentary structures and the distribution of biogenic apatite: biogenic apatite can be transported vertically by bioturbation (burrowing) for more than 30 cm, while there are thin (<10 cm) layers of high apatite content where burrowing is less severe. These features can be overlooked by visual inspections or conventional chemical analysis of discrete samples. Our results demonstrate X-ray CT as a rapid and complementary tool to study biogenic apatite apatite and REY distribution as well as sedimentary structures within pelagic clay.

In 2013, we discovered deep-sea sediment containing 400 –8,000 ppm of total rare-earth elements and yttrium (REY), which was termed “REY-rich mud”, within the Japanese exclusive economic zone (EEZ) around the Minamitorishima Island (Kato et al., 2013; Iijima et al., 2016; Fujinaga et al., 2016; Ohta et al., 2016; Nakamura et al., 2016; Takaya et al., 2018; Yasukawa et al., 2018). To clarify the mineralogical/chemical characteristics and distribution of the REY-rich mud in the Minamitorishima EEZ, we conducted nine research cruises over five years. During the KM17-14C cruise by *R/V KAIMEI* from December 16th, 2017 to January 7th, 2018, we investigated the distribution of the REY-rich mud in the eastern off the Takuyo-Daigo Seamount within the Minamitorishima EEZ, one of the most promising areas for REY-rich mud development. We collected five sediment cores by piston/gravity coring, and implemented bulk chemical analyses by using inductively coupled plasma quadrupole mass spectrometry (ICP-QMS) for trace and rare-earth elements, and X-ray fluorescence (XRF) for major elements. In this presentation, we report the sedimentological and geochemical features of the deep-sea sediments including REY-rich mud, and discuss the distribution of the REY-rich mud in the eastern off the Takuyo-Daigo Seamount.

Extended lateral correlation of deep-sea sediments around the Minamitorishima EEZ based on downhole variation of bulk chemical composition

*Erika Tanaka[1], Kentaro Nakamura[1], Kazutaka Yasukawa[1,2], Koichiro Fujinaga[2], Koichi Iijima[3], Shiki Machida[2], Yasuhiro Kato[1,2]

1. School of Engineering, The University of Tokyo, 2. ORCeNG, Chiba Institute of Technology, 3. JAMSTEC

Deep-sea sediments extremely enriched in rare-earth elements and yttrium (REY), showing up to 8,000 ppm of total REY concentration (ΣREY), exist within the Japanese exclusive economic zone (EEZ) near Minamitorishima Island in the western North Pacific Ocean [1, 2]. These deposits have stimulated interest as a new and highly promising mineral resource for REY. However, the number, occurrence depth and maximum ΣREY content of these REY-enriched layers appear to be quite variable, which makes it difficult to directly compare REY content peaks in different cores, and to investigate the geological factors controlling their formation and distribution.

Based on a careful consideration of a large geochemical dataset, we have recently recognized that deep-sea sediments within the Minamitorishima EEZ can be divided into nine types of stratigraphic layers, including three distinct REY peaks, with characteristic chemical compositions [3]. These layers deposited in a specific sequence and have lateral continuity in the Minamitorishima EEZ [3], which enables us to correlate the REY peaks in different cores.

In this study, we newly applied the chemostratigraphy to the piston core samples around the Minamitorishima EEZ collected by the MR16-07 cruise. The multi-elemental analysis suggests that the chemostratigraphy spreads out of the Minamitorishima EEZ and reaches at least ~500 km southeast of Minamitorishima Island.

Tectonics of the abyssal basins surrounding the Ontong Java Plateau

*Masao Nakanishi[1], Shoka Shimizu[2], Daisuke Suetsugu[3], Takashi Sano[4]

1. Department of Earth Sciences, Graduate School of Science, Chiba University, 2. Department of Earth Sciences, Graduate School of Science and Technology, Chiba University, 3. Department of Deep Earth Structure and Dynamics Research, Japan Agency for Marine-Earth Science and Technology, 4. Department of Geology and Paleontology, National Museum of Nature and Science

We present the tectonics of the abyssal basins that abut the Ontong Java Plateau using the resent geophysical investigations.

Ontong Java Plateau (OJP) is the largest of the major oceanic plateaus in the Pacific Ocean basin. OJP rises about 2 km above the surrounding deep ocean floor and has an area within the 4.5 km contour of about 1.8 x 10^6 km^2. A depth to the Moho discontinuity is more than 30 km (Gladczenko, 1994; Miura et al., 2004). The evidences from drilling samples indicate that most of the OJP formed rapidly about 122 Ma at mid-southern latitude in the Pacific Basin (Mahoney et al., 1993; Tejada et al., 1996, 2002). The widely accepted hypothesis of the formation of OJP is an emergence of a plume head (e.g., Coffin and Eldholm, 1993; Neal et al., 1997). The competing hypotheses are the mantle upwelling as the result of bolide impact (Ingle and Coffin, 2004) and the entrainment of dense fertile mantle by rapid seafloor spreading (Korenaga, 2005). Taylor (2006) proposed that the Ontong Java Plateau formed as a single large volcanic province together with the Manihiki and Hikurangi plateaus ca. 120 Ma, called Ontong Java Nui (Chandler et al., 2012). The OJP formation has been a major enduring problem of marine geology over the past more than 40 years. For settlement of the argument about the OJP formation, the tectonic setting of the abyssal basins around the OJP must be revealed.

Abyssal basins are contiguous withthe OJP: the Lyra Basin to the west, the East Mariana and Pigafetta basins to the north, the Nauru Basin to the northeast, and the Stewart and Ellice basins to the southeast. Tectonic histories of the Nauru, East Mariana, and Pigafetta basins, were revealed using the Mesozoic magnetic anomaly lineations (Nakanishi et al., 1992). Those of Lyra and Stewart basins are, however, still unknown because of lack of magnetic anomaly lineations.In at least three of these basins, the Nauru, East Mariana, and Pigafetta, Lower Cretaceous flood basalts overlie older oceanic crust (Abrams et al., 1993; Shipley et al., 1993; Nakanishi and Winterer, 1998).

To expose the tectonics of the abyssal basins around OJP, we conducted geophysical investigation in Nauru, Ellice, Stewart, and Lyra basins by R/Vs *Mirai*, *Kairei*, and *Hakuho-maru*. Our geomagnetic measurement western margin of Nauru Basin exposes the extension of magnetic anomaly lineations identified in Nauru Basin by Nakanishi et al. (1992). Our geophysical investigation in the Stewart Basin show the northeast-southwest rifting in the formation of the basin.

Priority Organization for Innovation and Excellence, Kumamoto University

The Cretaceous Normal Superchron (CNS) is a ~40 Myr-long period extending between Chrons M0 and 34 (~120-83 Ma) during which the geomagnetic field polarity remained normal, although the possibility of some short reversed-polarity events cannot be ruled out. Systematic variations of the geomagnetic paleointensity have been suggested based on a deep-tow magnetic profile acquired in the Central Atlantic Ocean and selected sea-surface magnetic profiles worldwide crossing the whole CNS (Granot et al., *Nat. Geo.*, 2012). According to these authors, three sub-periods separated by two ubiquitous markers, Q1 and Q2, show successively moderate (M0-Q2), very dynamic (Q2-Q1) and very smooth (Q1-C34) geomagnetic paleointensity fluctuations. Here, we extend this study by using two additional data sets: a deep-tow magnetic profile acquired across the central, most dynamic part of the CNS in the South-Western Indian Ocean, and a set of sea-surface magnetic anomalies collected across two parts of the CNS in the Northern Pacific Ocean. These data sets are complementary. The high resolution of the deep-tow profiles is hampered by their uniqueness, with the risk to interpret spurious local effects as paleointensity variations. To alleviate this risk, we try to assess the two-dimensional character of the magnetized sources by analyzing vector magnetic data acquired during the South-Western Indian Ocean deep-tow survey. The advantage of the sea-surface Northern Pacific Ocean survey is the multiple profiles that can be compared and eventually stacked for a better signal/noise ratio. Unfortunately, the oceanic crust created during the CNS in the Northern Pacific Ocean displays a lot of anomalous volcanic seamounts. Again, we assess the two-dimensional character of the magnetized sources by analyzing vector magnetic data to avoid the effect of these seamounts. Only sea-surface magnetic profiles in the Northern Pacific Ocean have been collected ~5 km above the magnetic basement that results in much lower spatial resolution to compare to the ~1 km of the deep-tow profiles in the other area. But, the half-spreading rate there is 60-70 km/Myr, whereas it is ~30 km/Myr in the South-Western Indian Ocean and ~20 km/Myr in the Central Atlantic Ocean. This means that the time resolution of the deep-tow profiles becomes only about twice better than that of these sea-surface profiles in the Northern Pacific Ocean. We combine these data to evaluate the previous hypothesis of three sub-periods with distinct paleointensity signature within the CNS, assess the existence of the Q1 and Q2 markers, and tentatively build a more reliable geomagnetic paleointensity variation of the CNS.

Offshore Postseismic Deformation of the 2011 Tohoku Earthquake Revisited: Application of an Improved GPS-Acoustic Positioning Method Considering Sloping Sound Speed Structure

*Chie Honsho[1], Motoyuki Kido[2], Fumiaki Tomita[3], Naoki Uchida[1]

One of the important issues on the GPS-acoustic (GPS-A) observation for sea bottom positioning is how to address the horizontal heterogeneity of the sound speed in oceans. We present an analysis method of GPS-A data in the presence of a sloping sound speed structure. By applying this method and revising the analysis scheme to make full use of existing data, we re-evaluated the horizontal postseismic deformations occurring ~1.5–5 years after the 2011 Tohoku earthquake. The revised horizontal movements have more uniform directions and rates between neighboring sites, suggesting enhancement of the array positioning accuracy. The revised displacement rate of the site on the incoming Pacific plate, located ~100 km northeast of the main rupture zone, was decreased significantly; it was only slightly, by 1.4 cm/year larger than the global motion of the Pacific plate, suggesting a relatively small effect of viscoelastic relaxation. The horizontal movements of the near-trench sites above the main rupture zone were generally landward and were significantly faster than the Pacific plate motion, indicating a viscoelastic relaxation of 5–10 cm/year. The distribution of the fast landward movements peaked near 38°N at an updip of the mainshock hypocenter and extended significantly farther to the north than to the south. This implies the existence of a secondary coseismic slip patch in the northern area in addition to a primary slip patch at ~38°N. The occurrence of episodic slow slip in early 2015 to the north of the main rupture zone was also verified from the GPS-A analyses.

Comprehensive analysis for the forearc structure and dynamics by using the S-net data

*Naoki Uchida[1], Ryosuke Azuma[1], Akira Ishigami[1], Tomomi Okada[1], Ryota Takagi[1], Genti Toyokuni[1], Norihito Umino[1], Yusaku Ohta[1], Makiko Sato[1], Syuichi Suzuki[1], Hidenobu Takahashi[1], Kazuya Tateiwa[1], Dapeng Zhao[1], Takashi NAKAYAMA[1], Akira Hasegawa[1], Ryota Hino[1], Satoshi Hirahara[1], Toru Matsuzawa[1], Keisuke Yoshida[1]

1. Research Center for Prediction of Earthquakes and Volcanic Eruptions Graduate School of Science, Tohoku University

The forearc area especially in the region under the Pacific Ocean is the frontier of the study on subduction zones. In this area, National Research Institute for Earth Science and Disaster Resilience (NIED) deployed the Seafloor Observation Network for Earthquakes and Tsunamis along the Japan Trench (S-net) which will open a new window to the Science on the structure and dynamics of the subduction zone. The 150 ocean-bottom cabled stations cover an offshore area of about 200 x 1000 km with a station separation of ~30 km perpendicular to the Japan and Kuril trenches and 50-60 km along the trenches. We obtained the continuous S-net velocity and acceleration seismograms from August 2016 to October 2018 which were made available by NIED in October 2018. We report first results of analysis that start with basic analysis of the data.

First, we estimated the direction of the three components of the sensors using the gravity and particle motion of teleseismic Rayleigh waves recorded by the accelerometers. The results show 1 degree or larger steps in the rotation about the axis of the cable for two earthquakes but stable for other periods. The directions of the axes were estimated with the uncertainty of 5 –10 degrees. The data was used to rotate waveforms of each station to N-S, E-W and U-D (Takagi et al., this meeting).

For the shallow structure, the thickness of sediments is estimated by using PS converted waves at the sedimentary basement. The PS-P traveltime difference shows a similar value of 1.3 to 1.5 s for most stations, which corresponds to a sediment thickness of 350-400 m. However, in the outer trench area of the Kuril –Japan trench junction and the inner trench area off Nemuro, thicker sediments are revealed (Azuma et al., this meeting). The cross-correlation analysis of ambient seismic noise suggests multiple velocities of ~1.5 km/s and ~0.3 km/s for 10 s or shorter periods. These two Rayleigh waves can be interpreted as the waves traveling in the sediments and Sea (Takagi et al., this meeting). The traveltime residuals of local earthquakes also suggest the effect of the shallow thin sediments. The P-wave travel time residuals for an existing 3-D velocity model exhibit variations of up to 2 seconds (Toyokuni et al. this meeting) and the residuals of near-shore earthquakes have up to 3 second for the outer trench areas (Okada et al. this meeting). These velocity structures are important for accurate hypocenter determinations (Okada et al. this meeting).

The deeper velocity structure is also investigated using the phase velocity of teleseismic and regional earthquakes. The teleseismic Rayleigh waves data result in a phase velocity of 3.6-3.9 km/s at periods of 20-50 s. The result shows relatively high wave speeds off Fukushima and Miyagi (Ishigami and Takagi, this meeting). The local earthquake tomography also shows a high P-wave speed in the overlying plate off Miyagi. The study also shows improvement of resolution in the offshore area by adding the S-net data (Toyokuni et al., this meeting). The cross-correlation analysis of ambient seismic noise has successfully extracted Rayleigh and Love waves at a period of as long as 30 s that travels among the S-net stations

©2019. Japan Geoscience Union. All Right Reserved.

(Takagi et al., this meeting). The anisotropy of velocity in the overlying plate was also examined by shear-wave splitting measurements. The result shows trench parallel fast direction of shear waves, which is similar to the fast directions in the land area (Uchida et al., this meeting).

For the plate boundary, the repeating earthquakes are identified by the S-net which may contribute to a better understandings of the interplate slip and plate geometry (Uchida et al., this meeting). The accelerometer data of S-net also might have potential to detect slow fault slip in the offshore area, because some of the stations seem to responds to the Earth tide (Takagi et al., this meeting).

Acknowledgements: We thank the NIED staff who deployed the S-net, maintained the network and opened the data to the public.

Shallow slow slip event inferred from GNSS-A seafloor geodesy

*Tadashi Ishikawa[1], Yusuke Yokota[2]

1. Hydrographic and Oceanographic Department, Japan Coast Guard, 2. Institute of Industrial Science, the University of Tokyo

In the subduction zone where mega thrust earthquakes occurs, many kind of slow earthquakes in deep plate boundary have been detected by terrestrial dense seismometer and GNSS monitoring networks. On the other hand, in the shallow part of the plate boundary, the investigation of slow earthquakes is limited because of the difficulty of observation at the ocean area. Due to recent development of observation technology, shallow slow earthquakes, such as LFE, VLFE and short-term SSE, have been detected by seafloor seismometers, ocean bottom pressure gauges and submarine borehole strainmeters (e.g., Yamashita et al.,2015; Wallace et al., 2016; Araki et al., 2017, Science).

Deep long-term SSE with duration over a few months is detected by terrestrial GNSS observation which is sensitive to long-term deformation. In this analogy, shallow long-term SSE can be detected by seafloor GNSS-A observation. However it was difficult to detect SSE with the capability of GNSS-A so far. Recently, we have been developing the GNSS-A technology to improve an observation frequency and precision (Yokota et al., 2017; Yokota et al., 2018). Then, the GNSS-A monitoring has a capability to reveals the occurrence situation of undersea SSE which could not be observed by the terrestrial GNSS.

However, because the accuracy is yet poor compared with GNSS, we have been investigating a method for detecting SSE from varying time series data. Nishimura et al. (2013) attempted to detect deep short-term SSE from GNSS data using AIC testing. We modified this method for GNSS-A data and attempted to detect shallow SSE. Then, we detected SSE signals from the GNSS-A data at off the Kii channel, Hyuga-nada and Kumano-nada which locate shallow side around the Nankai Trough historical seismogenic zone and strong coupling regions. There are various statistical method to detect transient variation from time series, and AIC is one example. It is necessary to consider further application of other statistical methods.

We also estimate the rectangle fault model using grid search that can explain displacements obtained from AIC method. Since the current observation sites are installed at 80 to 100 km intervals, displacements are detected only at 1 to 2 sites. Therefore, the estimated fault model has large uncertainty.

Assessing strike-slip motion at the Shionomisaki Canyon along the Nankai oblique subduction zone using acoustic ranging system

*Motoyuki Kido[1], Eiichiro Araki[2], Takeshi Tsuji[3], Ryusuke Yamamoto[4], Yoshifumi Kawada[1]

Nankai trough is known as an oblique subduction zone, and may have trench-parallel strike slip motion along the extent of the outer ridge at least in geological time scale. Tsuji et al. (2014) pointed out that the right-lateral strike slip motion at least in geological timescale is evident from the offset at the Shionomisaki Canyon truncating the trench-parallel linearment. We installed short baseline acoustic ranging system at this site to measure a possible offset to reveal whether such displacement is steady state phenomenon or episodic one. We deployed three acoustic units forming a triangle array with a dimension roughly equal to the depth (~3000m) in 2016 and just have recovered in 2019. The total observation period reached to ~2 years before the batteries were exhausted. The southern baseline of the array is on the same segment, while the northern baseline crossing the trench parallel linearment obliquely. If there were any strike skip motion during our observation period, shortening should be observed only for the northern baseline. All of the three units were recovered in Shinsei-maru cruise (KS19-02), and we confirmed that all data, acoustic traveltimes for ranging, temperature and pressure for sound speed correction, were available properly. Preliminary analysis shows no significant shortening for both the baseline. However scatter is still large to identify the real signal due to large temperature fluctuation beyond the usual correction. More complicated temperature correction considering the time-difference among the three temperature data have to be applied to remove the noise before we conclude the result.

Development of seafloor realtime observation network for crustal deformation in the Nankai Trough: tiltmeter installation

*Eiichiro Araki[1], Takashi Yokobiki[1], Toshinori Kimura[1], Shuhei Nishida[1], Yuya Machida[1], Shuichi Kodaira[1]

1. Japan Agency for Marine-Earth Science and Technology

Dense ocean-floor network for earthquake and tsunami in the Nankai Trough has been operational since 2010 monitoring earthquake and Tsunami activity in real-time in the seismogenic zone of Tonankai and Nankai earthquakes off Kii peninsula and off Shikoku Island of Japan.

The DONET observation system was designed so that new sensors may be added after deployment of the system, which is first utilized to connect deep borehole observatories deployed by IODP D/V Chikyu. The connection to the DONET enabled us to obtain continuous observation data and this led to discovery of repeating slow slip in the shallow part of the subducting plate (Araki et al., 2017). Currently, three such deep borehole observatories (C0002, C0010, C0006) are operational and providing borehole geodetic data in real-time. The sensitivity of the borehole to such slow slip events is significantly high and only these borehole can detect such repeating small slow slip events in the Nankai Trough. The distribution of the borehole observatories are not very suitable, though, to model area of observed slow slip, due to linear array of these three observatories. Wide spread of observatories sensitive enough to these slow slip events is crucial for such more detailed analysis of slow slip events.

Therefore, in addition to the deep borehole observatories, we plan to establish seafloor observatories that are sensitive to observe slow slip events, which can also be deployed and connected to DONET with lower cost. In our plan, the seafloor observatory (called seafloor observatory for crustal deformation) consists of tiltmeter deployed in shallow hole, fiber optic strainmeter, and seafloor pressure gauge.

We started construction of such seafloor observatories for crustal deformation in 2018. The first observatory is located east of the deep borehole observatory array (C0002, C0010, and C0006) near B-Node of DONET-1. We drilled 8.6 m borehole in October 2018 by R/V Kaimei and seafloor drill called BMS. We installed a Lily tiltmeter in February 2019 and connected the shallow hole tiltmeter to DONET via an interface box which will also be used to connect other sensors (seafloor fiber optic strainmeter and pressure gauge) in the future. The tiltmeter in the shallow hole was packed with sand to the top of the borehole to enhance stability of the tiltmeter in the hole. The initial data from the tiltmeter showed significant drift over 50 microradians a day, but appears to get stable gradually over a week period after the deployment. We analyze initial stabilization history of the shallow hole borehole tiltmeter to improve our installation technique in the future installation of tiltmeters in the seafloor.

We plan to complete installation of the observatory by adding fiber optic strainmeter and pressure gauge this year. Also, another observatory installation is planned in 2019 in DONET-2 area where JHD reported crustal deformation over a year in 2017-2018.

Calibration of the DONET pressure sensor network in the Nankai trough seismogenic zone using a mobile pressure gauge

*Yuya Machida[1], Shuhei Nishida[1], Toshinori Kimura[1], Eiichiro Araki[1]

1. Japan Agency for Marine-Earth Science and Technology

Monitoring of long-time seafloor displacements in a dense and wide area in a seismogenic zone are key to understand strength of plate coupling related to occurrence of large interplate earthquakes. Precise pressure measurements on the seafloor have been thought to be useful tools for detecting long-time vertical seafloor displacements. However a pressure sensor has inherent instrumental drift at a maximum rate of 10 hPa/year. Therefore we need to calibrate each pressure sensor absolutely on the seafloor using high accuracy pressure gauge. Machida et al. (2017) has laboratory evaluated dependencies of temperature and pressure condition of quartz pressure gauge assuming a transport condition between laboratory and seafloor. Based on their results, we have developed a mobile pressure gauge for calibration of the seafloor pressure sensor (Machida et al., 2018, Nishida et al., 2019). The gauge is designed to decrease uncertainties of the quartz pressure sensor proposed by the Machida et al. (2018), and enables us to calibrate seafloor pressure sensor at accuracy of less than 1 hPa. We performed an in situ calibration of the DONET pressure sensor which are installed in the stations of 2C-10 and 1B-8 in October 2018 and February 2019, respectively. And we plan to recalibrate the DONET pressure sensor in May 2019, and estimate each drift component of the DONET pressure sensor. In the presentation, we show a first light of the calibration of the DONET pressure sensors, and a future plan for calibration of the DONET pressure sensors in the Nankai trough seismogenic zone.

Analysis of GNSS/Acoustic geodetic data including the period of the transponder replacement

*Ikuta Ryoya[1], Koto Mizuno[1], Horng-Yue Chen[3], Masataka Ando[2], Takeru Komi[1]

1. Faculty of Science, Shizuoka University, 2. Center for Integrated Research and Education of Natural Hazards, Shizuoka University, 3. Institute of Earth Science, Academia Sinica

In this study, we analyzed GNSS/Acoustic geodetic data including the period of the transponder replacement. The data were obtained 60km off Yilan, north eastern coast of Taiwan from May 2009 to May 2016. The site is located just south to the rifting valley in the western end of the Okinawa Trough back-arc basin. The GNSS/Acoustic measurements were conducted for four times from May 2009 to August 2012 and eight times from July 2012 to May 2016. Although the seafloor crustal deformation of the latter eight epochs has been already reported by Chen et al. [2018, GRL], the geodetic data of the former four epochs haven not been analyzed. This is because of a replacement of the seafloor transponders due to the battery depletion between former four epochs and latter eight epochs. Although the last observation of the former four epochs (August 2011) used three transponders, two of them did not reply to the acoustic ranging in July 2012 and then three transponders were newly installed instead. Therefore, the common transponder is only one between the former and the latter epochs. Generally in GNSS/Acoustic measurement, the centroid of the transponder arrays is regarded as a benchmark position which represents the seafloor motion. Because the centroids of the transponder arrays differ greatly between the former and the latter epochs due to the replacement, we cannot recognize these epochs as a continuous series of the observation. Thus We developed a new solution method to deal with the epochs with only a few common transponders as a continuous observation series. The new method solves not the centroid but the motion of the common transponders between different epochs directly. Solving only one configuration of the transponder array from the whole measurement data, the relative motion can be solved more robustly than solving the centroid independently for each epoch. We applied this method to the data and verified the continuity of the estimated benchmark motion comparing with a simulation. The simulation was conducted given an artificial transponder replacement based on the real data. As a result, when enough data are provided in each epochs, we can consider the former and the latter epochs as a continuous series of the observation with an error within 10cm in horizontal component. However, the result of the real data analysis generated about 40cm discrepancy between the former and the latter epochs. From the additional simulation, it was suggested that significantly small number of the acoustic ranging in the observation just before the battery depletion would affect the continuity of the benchmark position as well as the small number of transponders in the former epochs which was three instead of the four in the latter epochs. However, simulation also suggested that the motion of the benchmark within each epoch group before and after the replacement can be solved well. The solved benchmark velocity which is assumed to be same between the former and the latter is identical to the velocity reported in Chen et al. [2018, GRL]. This result suggests that there was no back-arc opening evet during the former epochs.

IPR (Indirect Path Ranging): a new approach for long-distance acoustic ranging with a moored relay node

*Ryusuke Yamamoto[1], Ryota Hino[1], Motoyuki Kido[2]

1. Graduate School of Science, Tohoku University, 2. International Research Institute of Disaster Science, Tohoku University

Seafloor geodetic techniques such as GNSS-Acoustic measurement (GNSS-A), ocean bottom pressure-gauge (OBP) and direct path ranging (DPR) provide in-situ measurement of seafloor deformation. Especially, DPR is a specialized way to preciously measure relative horizontal motion continuously. It measures two-way travel time between a pair of acoustic transducers. The precision of DPR is typically 1–2 mm per 1 km baseline. Observation period is as long as ~3 years so far. However, difficulty in DPR is to ensure direct acoustic paths among transducers not interfered with seafloor as the distance being longer; e.g., an acoustic path bends downward by 142 m for 10 km baseline in a typical sound speed gradient. Unrevealed local topographic bump around the transducer often hinders paths, too.
In extricating such obstacles, we employed a new approach that uses an acoustic relay node, called interrogator, at the halfway of a baseline to reliably pass acoustic paths; we call it “Indirect Path Ranging (IPR)”. Sweeney et al. (2005, *Mar. Geod.*) introduced a ship-hanging interrogator ~500 m above the seafloor and reported that baseline length of 5 km can be measured with several centimeters precision. On the other hand, we moored the interrogator at midwater for long-term continuous observation. A moored interrogator is much advantageous than hanging type, which pumps according to ship's heave; displacement of the interrogator during individual ranging degrades the measuring accuracy.
IPR/DPR observation was conducted during October 2017–August 2018 off Fukushima region, where massive postseismic slip seems to be occurred in the shallow subduction zone (e.g., Iinuma et al., 2016, *Nature Comm.*). We installed five seafloor transponders at trench slope and moored an interrogator at the center of them (i.e., close to the trench axis). All the five baselines for IPR were available, while only one was available for DPR combination due to long distance. We confirmed that rangings were properly carried out over 80% of total period for IPR even the longest beseline of 9180 m.
As the first step, we estimate the 3-D position of the interrogator using four seafloor stations that can be simultaneously called from the interrogator. The interrogator was in motion within the radius of 50 m during most of the period, while it excursed by 300 m at the longest. Traveltime residuals were in order of ~10 cm in terms of distance. Since the acoustic paths were almost horizontal, vertical motion of interrogator may be poorly resolved. Therefore, the vertical motion should be determined form pressure data rather than being solved as an unknown. Anyway, uncertainty of the vertical position of the interrogator has less contribution in total ranging accuracy for its geometry. In the next step, we plan to evaluate interrogated baseline length changes with more precise interrogator position by applying sound velocity correction.

Development of a kinematic GNSS-A positioning method using the extended Kalman-filter to detect precise vertical displacement

*Fumiaki Tomita[1], Motoyuki Kido[2], Chie Honsho[3], Ryo Matsui[3]

1. Graduate School of Science, Hokkaido University, 2. International Research Institute of Disaster Science, Tohoku University, 3. Graduate School of Science, Tohoku University

1. Background

GNSS-Acoustic (GNSS-A) seafloor geodetic observations have provided many observation results from campaign surveys using a research vessel (e.g., Tomita et al., 2017), and continuous surveys using a moored buoy has been tried recently (e.g., Kido et al., 2018). The classic GNSS-A positioning methods (e.g., Spiess et al., 1998; Kido et al., 2006) can provide a position for each ping simultaneously transmitted to all seafloor transponders; therefore, it is possible to perform real-time positioning. However, the classic method has been developed to detect horizontal motions, and it has not been well investigated to detect precise vertical motions. Meanwhile, Tomita et al. (2018) developed a kinematic GNSS-A positioning method using the extended Kalman-filter (EKF-based GNSS-A positioning method), and they demonstrated that vertical solutions could be improved. However, they has not been well investigated its improvement.

2. Numerical tests

We applied the EKF-based GNSS-A positioning method (Tomita et al., 2018) to simulation data. Here, we created simulation data based on three types of synthetic seafloor transponder arrangements, and we then investigated difference of precision of vertical solutions due to the transponder arrangements. As a result, for the transponder arrangements having diversity of shot angles from center of the array (multi-angled transponder arrangement), vertical positions can be solved even by the classic positioning method. Furthermore, the positioning precision can be improved by applying EKF.

3. Application to actual observation data

We applied the EKF-based positioning method to the actual observation data obtained by campaign surveys at sites with the multi-angled transponder arrangement in the off-Tohoku region (Tomita et al., 2017). Although vertical positions should not be changed with time during each campaign, the results showed long-term variation (~10 cm of standard deviation) by both the classic and the EKF-based GNSS-A positioning method. Since such long-term variations were similar to errors of the onboard kinematic GNSS positioning estimated by the means of Fujita & Yabuki (2003), it is expected that the GNSS-A positioning for the vertical component would be improved by improvement of the kinematic GNSS positioning. Meanwhile, we found that short-term temporal variation was improved by EKF. We calculated differential time-series of the solutions to remove the long-term errors, and we then calculated standard deviations of the differential solutions: ~10 cm and ~5 cm for the classic and the EKF-based positioning methods, respectively. Although we still have uncertainty in the long-term variation of the vertical solutions, precision for each acoustic ping can be greatly improved by EKF.

4. Investigation for real-time positioning

In order to implement EKF, we have to provide the appropriate process noise value. As we investigated the optimal process noise based on likelihood using the actual observation data of various campaigns, their values were similar each other; therefore, the appropriate process noise value can be fixed. The computation cost of the EKF-based positioning method is relatively low when the process noise value if

©2019. Japan Geoscience Union. All Right Reserved.

fixed. Such low computation cost is plausible for the continuous survey using a moored buoy. Meanwhile, for the continuous survey, sampling frequency of the acoustic ranging is limited to save electricity of systems on the moored buoy and battery of the seafloor transponders. Then, we investigated effects of the sampling interval to the precision by re-sampling the observation data, and we found that difference of the precision between the classic and the EKF-based positioning methods was small for the sampling intervals longer than 30 minutes. Thus, to take advantage of the EKF-based positioning method, the sampling interval should be shorter than 30 minutes at least although much shorter sampling interval is plausible for precise positioning.

DOP-based accuracy evaluation of GNSS-A positioning on a drifting moored buoy quantified using sea trial observation data

*Misae Imano[1], Motoyuki Kido[2,3], Chie Honsho[3], Yusaku Ohta[3], Ryota Hino[3]

1. Graduate School of Science, Tohoku University, 2. nternational Research Institute for Disaster Science, Tohoku University, 3. Reserch Center for Prediction of Earthquakes and Volcanic Eruptions Graduate School of Science, Tohoku University

We have developed an offshore monitoring system of seafloor movement using a multi-purpose moored buoy, which realizes regular and on-demand GNSS-Acoustic (GNSS-A) measurements (Takahashi et al., 2014). The target accuracy of horizontal array position was set to 1 m, aiming to detect coseismic displacement accompanied with a huge earthquake (>M8). To endure the strong current around Japan, the system needs a slackly mooring technique for smaller tension (Ishihara et al., 2012) using a much longer tether line than the water depth. Because the moored buoy usually drifts by wind and current around a seafloor array, GNSS-A measurement is likely to be carried out far from the array center. However, the positioning accuracy significantly degrades when the observing point is positioned outside the array, due to a bad geometry between an observing point and transponders (Kido, 2007). Therefore, measurements using a moored buoy are generally carried out under worse conditions than those using a vessel. Our previous studies showed that the horizontal positioning accuracy (2 σ) with a single ranging was 46 cm when the buoy was inside the array, while it degraded to 97 cm when the buoy was outside the array, through a year-long sea trial near Nankai Trough (Imano et al., 2017; Kido et al., 2018). Besides the degradation depending on the distance from an observing point to the array center, we found a directivity of the positioning accuracy depending on the geometry between an observing point and seafloor transponders (Imano et al., 2018). In this study, we propose a method to evaluate the positioning accuracy at an arbitrary observing point based on the above characteristics of GNSS-A positioning using the system.

To interpret the accuracy degradation and directivity in relation to the position of observing points, we introduced Dilution of Precision (DOP: Langley, 1999) for GNSS-A positioning, which represents the degree of propagation of measurement errors to positioning errors. We firstly calculated EDOP/NDOP (the degree of error propagation to the EW/NS components of the array position) from the diagonal elements of the normal equation matrix of the observation equation of array positioning. Next, we computed error ellipses by diagonalizing the normal equation matrix because the nondiagonal elements were significantly large in many cases. The error ellipses clearly exhibit the feature that the estimation error of array positions was large in the direction from an observing point to the array center. Then, we converted the error ellipses to the positioning accuracy by multiplying the standard deviation of traveltime residuals when an array position was estimated using the data of all the 527 pings. The resulting positioning accuracy well explained the array position error and its dependency on the observing position found in the results of the sea trial.

The DOP analysis and its conversion into the positioning accuracy based on the actual observation data enable detailed assessment of the directional accuracy of GNSS-A positioning at arbitrary observing point, which is quite important in interpreting a realtime measurement of seafloor movement upon the occurrence of a huge earthquake. In this presentation, we will explain the above method and discuss its application to realtime GNSS-A positioning using the system assuming the occurrence of a huge earthquake.

Analysis for GNSS/acoustic ocean bottom crustal deformation considering the heterogeneity of sound speed structure in ocean

*Natsuki Kinugasa[1], Keiichi Tadokoro[1], Yukihiro Terada[2], Teruyuki Kato[3]

1. Graduate School of Environmental Studies, Nagoya University, 2. National Institute of Technology, Kochi College, 3. Hot Springs Research Institute of Kanagawa Prefectural Government

Observation for ocean bottom crustal deformation by GNSS (global navigation satellite system) acoustic method is monitoring long-term movements of transponders fixed on seafloor by acoustic ranging. We estimate the transponder position for each observation by vessel with the assumption that the relative position between transponders does not change temporally. Thus, precise estimation of the displacement needs having correct array shape.
The main factor of positioning error is temporal and spatial variation of travel time in ocean. Temporal variation is caused by the tide with a cycle of 12-24 hours and by the inertial gravity wave with a cycle of several 10 minutes. With the assumption that the transponder position is fixed during observation, the long-term variation can be estimated easily and the short-term variation cannot be cause of bias positioning error because its effect is included in the observed travel time as noise. The spatial variation is caused by the temperature, pressure, and salinity. The vertical gradient can be obtained by CTD (conductivity, temperature, depth profiler) measuring. Main factor of horizontal gradient is the temperature gradient which is generated significantly in the area near the Kuroshio current. We considered that the horizontal gradient has largest effect on the positioning. Then, we developed new estimation method considering both temporal and spatial variation of sound speed.
New method assumes that the horizontal sound speed structure has constant gradient. We applied this method to the observation point off the coast of Ashizuri and Kumano and compared the array shape estimated by new method and one considering only temporal sound speed variation. The result shows that the transponders where the sound speed is faster is estimated to be shallower. Making theoretical travel time small for the transponder where the sound speed is faster needs to make the propagation distance short. Since the ranging is operated on the circular route around the array, horizontal position cannot be biased to decrease the average of residual of travel time. That is why the position is estimated to be shallower. Thus, the accurate positioning needs considering the horizontal gradient of sound speed. We also discovered that the ship track has effect on its accuracy.

Seismic imaging using ocean bottom nodes in the Ishikari Basin, Japan Sea

*Tetsuo No[1], Takeshi Sato[1], Shuichi Kodaira[1], Satoshi Shimizu[2], Tetsuya Yokota[2], Karl Hosgood[3], Masako Robb[3], Tetsuro Tsuru[4]

1. JAMSTEC, 2. Nippon Marine Enterprises, 3. Emerson E&P Software, 4. Tokyo University of Marine Science and Technology

In the Japan Sea, damaging earthquakes caused by faults distributed in land–marine transition zones and coastal areas (such as the 2007 Niigata-ken Chuetsu-oki Earthquake and the 1964 Niigata earthquake) have occurred in the past (e.g. Usami et al., 2013). Moreover, according to recent reports, source faults which may cause large earthquakes became apparent in many coastal areas of the Japan Sea (e.g. Committee for Technical Investigation on Large-scale Earthquake in Sea of Japan, 2014). Therefore, data acquisition regarding crustal structures in land–marine transition zones and coastal areas is an important task for increasing the accuracy of the source fault model in the Japan Sea. In previous studies, seismic surveys using ocean bottom cables and two-ship seismic surveys have effectively obtained deep structure imaging in land–marine transition zones and coastal areas of the Japan Sea (e.g. Abe et al., 2010; Sato, 2013). However, owing to budget constraints, such methods and systems may not always be feasible. Therefore, to facilitate future seismic exploration in coastal areas, we attempted a seismic survey using ocean bottom nodes (OBNs), an approach that employs easy-to-handle equipment.

For our seismic survey, we used the JAMSTEC R/V *KAIMEI* to study crustal structures off of the northwestern coast of Hokkaido, Japan (Sato et al., 2018). The OBN system was constructed by Nippon Marine Enterprises, Ltd, comprising 10 nodes at approximately 100-m intervals in the Ishikari Basin. The OBN system was installed at a water depth of 800 m. Each node had a natural frequency of 15 Hz and recorded data for three component omnidirectional geophones and one hydrophone component (Shimizu et al., 2012). The data acquisition specifications were as follows: shot spacing was 25 m; tuned air gun array had a maximum capacity of 2,650 cu in (approximately 43.5 L) and comprised 11 air guns; standard air pressure was approximately 2,000 psi (approximately 14 MPa); and the air gun array was kept 6 m below sea surface throughout the experiment. In this survey line, a normal multi-channel seismic reflection (MCS) survey and a seismic refraction survey using ocean bottom seismographs were also separately performed.

Our data analysis used a method based on mirror imaging. Wave field separation using geophone and hydrophone polarity characteristics and multiple reflection waves was performed together with prestack migration (Dash et al., 2009). Normal reflection imaging was performed using the upgoing wavefield, which reflected on the reflector once. However, mirror imaging was performed using the downgoing wavefield. Using this approach, the imaging range could be extended to several times that of the developed OBN system. Based on a preliminary analysis of the OBN data, we obtained imaging of the sedimentary layer and the basement below the seafloor; the obtained results are consistent with those of the normal MCS profile.

[S-CG62] Potentiality of Machine Learning in Solid Earth Sciences

convener:Takahiko Uchide(Research Institute of Earthquake and Volcano Geology, Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST)), Hirokuni Oda(Institute of Geology and Geoinformation, Geological Survey of Japan, AIST), Chairperson:Takahiko Uchide(Geological Survey of Japan, AIST), Hirokuni Oda

The recent development of the machine learning techniques including the deep learning is leading innovations in various fields. The applications of these techniques to solid earth sciences are also expected to develop new frontiers by, for example, the classification, the pattern recognition, and the regression of data. On the other hand, there are concerns on the human-interpretability of the deep learning.
This session will provide an opportunity to share the application studies to various fields in solid earth science and inspire each other. We also look forward to studies addressing the black box issue of the deep learning.

Discussion

The Promise of Machine Learning in Solid Earth Geoscience: Examples from Seismology

*Gregory C Beroza[1], Mostafa Mousavi[1], Weiqiang Zhu[1], Karianne J Bergen[2], Paul A Johnson[3], Maarten V De Hoop[4]

1. Stanford University, 2. Harvard University, 3. Los Alamos National Laboratory, 4. Rice University

Physical, chemical, and biological processes all have substantial influence on the solid Earth. They range over tremendous spatial and temporal scales and can interact in complex ways. Increasingly, humans interact with the shallow reaches of the Earth in ways that are increasingly consequential. The solid Earth presents a variety of natural hazards that are poorly understood, yet increasingly impactful as exposure grows through increasing urbanization in hazard-prone areas. We need to improve our understanding of how the Earth works; however, attempts to understand the solid Earth are challenging because nearly all of the Earth’ s interior is inaccessible to direct observation. Knowledge of the Earth's interior must be based on inference, through interpretation of measurements taken at or near the surface, through controlled laboratory experiments, and through numerical simulations. For this reason solid Earth geoscience is both a data-driven and a model-driven field. Unanticipated discoveries increasingly will come from the analysis of large data sets, novel developments in inverse theory, and procedures enabled by computationally intensive simulations. Increasingly affordable and capable sensors are dramatically increasing the data available to drive this understanding. Moreover, the increasingly realistic character of computer simulations are better able to represent the behavior of the Earth. We are faced with the challenge of gaining new insights from these data and simulations, and techniques from the rapidly evolving field of machine learning (ML) are likely to play a key role in this effort. In this talk we illustrate the promise of machine learning using recent examples from seismology.

Automatic Approach to Low-Frequency Earthquakes Detection in Southwest Japan Based on Deep Learning Technique

*Yu Junyu[1], Yuji Yagi[1], Takanori Matsuzawa[2], Ryo Okuwaki[1]

1. Graduate School of Life and Environmental Sciences,University of Tsukuba, Tsukuba, 2. National Research Institute for Earth Science and Disaster Resilience

Slow earthquakes have been observed on both shallower and deeper sides of seismogenic zone of megathrust earthquakes and therefore been thought to potentially interact with disastrous megathrust ruptures. A class of slow earthquakes at a dominant frequency of 2–8 Hz, marked as deep low-frequency events (LFEs), are observed continuously along the Nankai Tough from the Southwest Shikoku to the Kii peninsula in Japan. The frequent occurrence of LFEs in this region may suggest an increased probability of impending megathrust earthquakes. Therefore, precise monitoring of the seismic activity of these LFEs may provide a key clue to the quantitative prediction of huge earthquakes and deepen our understanding of diverse earthquake processes. However, traditional approaches to earthquakes detection such as STA/LTA method fails to detect LFEs signal masked by background noise because of the lack of impulsive phase arrivals, which makes it challengeable to detect LFEs from raw seismograms automatically. The matched-filter method leverages the similarity of representative template waveform and continuous seismic waveform and has been used in the Japan Meteorological Agency (JMA) to distinguish and catalog LFEs automatically since July 2014, but it also makes detectability restricted by the limited prior knowledge that refers to available matching templates.

The recent advance in the field of deep learning has shown a robust capability of predictions or discriminations by using general features learned from fitting data, which can potentially be used in tackling LFEs detection. Deep-learning models are basically trained by scanning through large datasets and meanwhile tweaking their parameters gradually toward the direction in which the difference between fed data and the model's predictions descends.

To create training dataset in our study, we prepared a total of 4 years continuous three-component velocity seismograms data recorded by 75 stations of High-sensitivity Seismograph Network Japan (Hi-net) operated by the National Research Institute for Earth Science and Disaster Resilience (NIED) across Southwest Japan from January 2010 to December 2013. We first preprocessed raw data streams without applying bandpass filter and cut them into millions of single-station, 3-channel, 10-seconds event-waveform windows vectorized as 2D arrays at a sampling rate of 100 Hz. We then labeled 3,179,167 windows as noise, 161,930 windows as regular earthquakes, 29,090 windows as LFEs, and 262,209 windows as deep low-frequency tremors, which were considered to be a continuous LFEs signal, according to the JMA's seismic catalog and the World Tremor Database (WTD). Due to the fluctuation of the positions of seismic phases in the waveform windows, we choose to use the Convolution Neural Network (CNN); a deep-learning model that first extracts local features and then integrates them hierarchically so less disturbed by the inhomogeneity of data than the traditional model does. For each data window, the model outputs four probabilities corresponding to the likelihood of each respective class. Event detection is declared when one of four probabilities exceed the threshold we set (50% for general).

We trained the model preliminarily and evaluate the accuracy of the model on a brand-new test dataset generated by the same rules as those of creating training dataset using receiver operating characteristic

©2019. Japan Geoscience Union. All Right Reserved.

(ROC) analysis. We were given the area under the ROC curve (AUC) score of 0.923, 0.991, 0.981, and 0.914 (naive baseline = 0.5) for noise, regular earthquake, LFEs, and deep low-frequency tremor respectively, which suggests that our model is capable of classifying waveform windows correctly with high confidence. We also noticed that there are a lot of LFEs that are incorrectly identified as tremors in spite of the low ratio of tremors that are incorrectly identified as LFEs. To find a rational explanation for this asymmetric structure and the classifying borderlines of our model, we will do more error analysis and unbox each layer of our model to visualize how they are activated in further research. And we will further tune our model and integrate the single-station classifiers to build local networks that can identify earthquake events coherently.

Broadband ground motion waveform synthesis utilizing AI-based upsampling technique (2)

*Takahiro Maeda[1], Asako Iwaki[1], Hiroyuki Fujiwara[1], Kazutoshi Matsuzaki[2], Hiromitsu Tomozawa[2], Yuji Mori[2], Misato Tsuchiya[2], Naofumi Miyata[2]

1. National Research Institute for Earth Science and Disaster Resilience, 2. Mizuho Information & Research Institute, Inc.

To enhance the reliability of seismic hazard assessment, it is important to improve the accuracy of predicting broadband ground motion. For predicting broadband ground motion, a hybrid method is often used. The hybrid method synthesizes broadband ground motion by summing up long-period and short-period ground motion calculated separately. The long-period ground motion is calculated by a theoretical method such as the finite difference method which can consider the effect of the three-dimensional velocity structure. The short-period ground motion is calculated by empirical or semi-empirical methods such as statistical Green's function method can consider the effect of random heterogeneity of seismic source and propagation path. These methods, however, use different velocity structure models, it is known that problems such as the shift of travel time, discontinuity of spectral amplitude between the period range.

For this problem, Iwaki and Fujiwara (2013) proposed a method of synthesizing broadband ground-motion waveform based on the relationship of ground-motion waveform between long-period and short-period extracted from observation data. We considered this problem of extracting the relationship between long-period and short-period ground motions as a problem of upsampling in artificial intelligence and have studied this problem using the coupling learning method (Nagata et al., 2016) which is one of machine learning methods (Maeda et al., 2018). To construct a prediction model of a short-period ground-motion waveform from long-period ground-motion waveform based on artificial intelligence, we can utilize a vast amount of strong ground motion data recorded by K-NET and KiK-net.

The performance of the prediction model is evaluated based on the similarity of observed and predicted broadband ground motion. In the previous study, we evaluated the similarity based on the time series data of the broadband waveform. However, in this study, we used an envelope shape of waveforms for narrowband of 0.5-1.0 Hz, 1-2 Hz, 2-4 Hz, 4-8 Hz, 8-16 Hz, and a Fourier amplitude spectrum for evaluating similarity. The data sets used for learning and testing of artificial intelligence were (1) records of a single observation site, (2) records of multiple observation sites with similar ground conditions, (3) records of multiple observation sites due to earthquakes of the similar magnitude, (4) records of multiple observation sites due to earthquake occurring same region, and (5) a whole records from (1) to (4). We found a tendency that the prediction performance is somewhat higher in the case (1). Qualitatively, it is expected that the prediction performance in the case (1) that can take into consideration the site-specific characteristic of ground motion will be significantly higher and the result of this study suggests that there is room for improvement in the similarity evaluation.

Acknowledgments: This work was partially supported by the Council for Science, Technology and Innovation (CSTI) through the Cross-ministerial Strategic Innovation Promotion Program (SIP), titled “Enhancement of societal resiliency against natural disasters” (Funding agency: JST). This study was conducted as part of joint research with RIKEN.

Forecast trial of postseismic deformetion after the 2011 Tohoku-Oki earthquake by recurrent neural network

*Norifumi Yamaga[1], Yuta Mitsui[2]

1. Graduate School of Science and Technology, Shizuoka University, 2. Shizuoka University

The 2011 Tohoku-Oki earthquake caused large postseismic deformation, hiding possible small signals, such as slow slips and volcanic events. In general, postseismic deformation is fitted by a logarithmic, exponential or their combined function. To forecast postseismic deformation more accurately, we introduce a recurrent neural network method which is one of the machine learning approaches. This method autonomously learns relation between input and output data. We use 700-days sequence of GNSS time-series data of 191 stations (GEONET) as input data and the following data as output data for training the neural network. The results of the neural network better forecast the time-series data than those of regression analyses in an E-W direction. However, in an N-S direction, the neural network does not work better than regression analyses. These facts indicate that data with a sufficiently small signal to noise ratio is needed for the neural network. In the results of the E-W direction, we find several regions with low precision of the forecast, partly corresponding to the Niigata-Kobe strain concentration zone, as well as along the coast of Sea of Japan in northern Tohoku.

Deep Learning Approaches for Eruption Prediction of Sakurajima

*Tsuyoshi Murata[1]

1. Tokyo Institute of Technology

In this research, we take advantages of deep learning into time series data and apply this technique to sensor data acquired from volcanic monitors.
We focus on two problems: (1) volcanic eruption classification and (2) early prediction of volcanic eruption. The goal of (1) is to recognize the current status of the volcano, while the goal of (2) is to predict the future eruption by detecting the time series prior to the eruption which is the early signal of the upcoming eruption. For (1), the proposed method VolNet based on convolutional neural network achieves an average F-score of 90%. For (2), the proposed method based on Stacked 2-Layer LSTM achieves promising results of 66.1% accuracy. And the accuracy of 4-stage warning system is 51% in the critical stage. We demonstrate the effectiveness of our methods with the largest and the most comprehensive set of volcano sensor time series data.

[G-01] Disaster prevention education

convener:Hitoshi Nakai(Kobuchisawa Research Institute for Nature and Education), Jiro Komori(Teikyo Heisei University), Shintaro Hayashi(Akita University Graduate School of Education), Chairperson:Jiro Komori(Teikyo Heisei University)

Each time a serious disaster occurs, there are calls for better disaster prevention education in and around the stricken area, and such education is actually implemented. However, it is not extended to other parts of the nation. Although disaster prevention education really is needed across Japan, it tends to be implemented only in the directly affected locality of a catastrophic disaster. Moreover, even in affected areas, when 10 to 20 years have elapsed from a major event, with a decline in the number of survivors, there is less motivation to pass experiences and learning on to the next generation, despite the potential for such disasters to recur, tens or hundreds of years into the future. It is not easy to maintain conversations about disaster experiences through several generations. Consequently, effective disaster prevention education is provided only in the region stricken by a particular event, and it is practiced only for up to 20 years following the last disaster. As a result, provision of disaster prevention education has become less effective in many areas of Japan. This session focuses on the following two questions: (1) What kind of disaster prevention education can be practiced continuously nationwide? (2) How can such disaster prevention education be implemented in schools and educational sessions? We encourage anyone who wishes to help develop new disaster prevention education based on awareness of these issues to make a presentation in this session. Participation is not restricted to geoscientists; any person or group engaged in any domain of disaster prevention is welcome to submit a paper.

New high school compulsory subjects"Chiri-sougou(Comprehensive geography)"! : Possibility to promote disaster education

*Shintaro Hayashi[1]

1. Akita University Graduate School of Education

A new subject "Comprehensive geography(Chiri-sougou)" is implemented in high school from 2022. "Comprehensive geography" may be a powerful tailwind for promotion of disaster education education. Because
1) "Comprehensive geography" is a compulsory course to be taken by most high school students.
2) Learning about disasters is a big part.

Disaster-related officials, such as related organizations and departments of the country and the prefecture, researchers involved in disaster prevention education, NPO corporations, Geopark, etc., need to make sufficient preparations, such as contacting the high school side and discussing. If you do so, there is a possibility that you can greatly contribute to the dissemination of disaster prevention education by taking advantage of this new subject.
"Comprehensive geography" is a compulsory subject: High school "Geography comprehensive" is a compulsory subject to be implemented from 2022. It is indicated in the curriculum guidelines published by the Ministry of Education, Culture, Sports, Science and Technology in 2018, and the textbook preparation work is ongoing. Almost all high school students will be taking classes from 2022.
Since the 1970's, geography subjects have been taken as non-compulsory courses. The revision of this time has resulted in a great increase in the weight of geography subjects.
Learning about disasters is the main contents of "Comprehensive geography": contents of "Comprehensive geography" can be roughly divided into three - "contemporary world thought in maps and geographical information systems" "international understanding and international cooperation" "sustainable regional creation ".
"Sustainable community development" is further divided into "natural environment and disaster prevention", "research on living area and regional perspective". "Natural environment and disaster prevention" is to acquire knowledge about preparation and response to natural disasters, to undertake task exploration activities, and to acquire skills to read hazard maps and topographic maps.
However, the high school does not have enough resources to conduct the lesson of the natural disaster part of the new subject "Comprehensive geography". In high school there is a shortage of teaching materials and lessons for compulsory conversion of "Comprehensive geography". Educational materials necessary for implementation of "Comprehensive geography" are knowledge of various disasters, knowledge about disasters in the area, learning materials such as hazard maps, and so on. In addition, disaster prevention personnel can also be involved in "Comprehensive geography" as a lesson. Both materials can be provided to the high school side by disaster prevention related institutions.
Teaching Materials Required for "Comprehensive geography" Implementation: "Comprehensive geography"requires two kinds of teaching materials.
1) Materials concerning disasters in the region: Natural disasters occurred in the area in the past and materials on preparation for disaster are necessary. Materials on historical disasters are particularly important. Also, hazard maps and topographic maps are essential learning materials. Also, in "comprehensive geography", high school students will learn about either earthquakes, tsunami, weather disasters, or volcanic disasters.
2) Exploratory learning on disasters is based on "Regarding disaster prevention based on regional

©2019. Japan Geoscience Union. All Right Reserved.

characteristics, pay attention to relationships with nature and social conditions, common points and differences in areas, creating a sustainable community, It is multifaceted and multilateral consideration and expression for preparation and response to natural disasters (literal translation) ". Disaster prevention related organizations can provide materials for exploration. Disaster prevention related institutions themselves are also materials of explorative learning.
In this way, the new subject "Comprehensive geography" opened in high school from 2022 is highly likely to be a powerful tailwind for promoting disaster education education, People involved in disaster prevention need to participate in "comprehensive geography" classes.

The cases of the limit of dam impoundment during floods and necessity of information sharing at local disaster prevention

*Jiro Komori[1], Yuuri Masuhara[1]

1. Teikyo Heisei University

Two major flood of the 2018 Japan floods (heavy rain and flood disaster in the western Japan), Takahashi River in Okayama and Hiji River in Ehime had emergency discharge from managed dams in upper streams. The interpretation, especially the decision of success or failure of dam management is difficult. However, there are some concerns of local residents, and the fact of worsening of terms of natural condition due to global warning and sand accumulation in dam lakes.
Thus, we listed the similar cases of the 2018 floods, which occurred with emergency discharge at the upstream from a dam. Total 65 cases are compiled from web databases for the previous 60 years newspaper articles in Yomiuri, Asahi and Mainichi (Japanese 3 major dailies). The list shows recurrence cases of flood with discharge from same dam and tendency of “the limit of dam” of decrepit structure. While, educational effect are appear by information sharing between dam management and residents.

Disaster Tradition and Disaster Education of 2008 Sichuan Earthquake

*FU SIQI[1], Shiroshita Hideyuki[1]

1. Kansai University

When human beings try to do "disaster prevention", first of all, we are trying to prevent or reduce the assumed damage by clarifying disaster related things, especially the cause and mechanism of its occurrence, assuming the damage caused by the disaster . When realizing such a process that can be considered as "disaster prevention" in general, so-called disaster prevention experts such as researchers targeting natural disasters and administrative staff who formulate and implement laws and policies are the protagonists It plays a leading role as. In order to systematically study the prevention and reduction of damage in an objective way systematically, we will call such disaster prevention activities "disaster prevention science" in this research. It is believed that promoting "disaster prevention science", clearly informing its necessity, and surely implementing disaster prevention measures is the goal of "disaster prevention" now. One typical example is evacuation drills at school. Because it is clear that it is possible to reduce damage by carrying out evacuation drills, evacuation drills are actually spreading to schools throughout Japan. Currently, the majority of "disaster prevention" is putting power to such a goal. In other words, it can be said that equal signs are drawn between "disaster prevention" and "disaster prevention science". It is generally considered that "disaster prevention" education is to make things already evident as the necessity of disaster prevention, and to make things not done possible. Disaster prevention experts and general citizens are considered to be "disaster prevention" success if they can work together to achieve this situation. But what about the reality? Humans understand, but there are many things that they do not do. Even if we tell the citizens that decided measures based on "disaster prevention science" are decidedly effective as it is, they are often procrastinated or ignored. For example, according to a survey conducted by the Cabinet Office in Heisei 29, regarding "measures taken in preparation for a major earthquake," I fixed furniture, home appliances, etc. and did not mention falling, falling, and moving " People are 49.4% of respondents. And as a reason for not doing that, reasons such as "I'm trying to do but postpone it" or "It's awkward" are high ranked. On the other hand, human beings, as higher animals in the natural world, have been associating with nature for many years, touching important matters without knowing, and continuing to do it accidentally over the long term. No, it may not be a coincidence. Even if it is not scientific, it sometimes has the effect of calling disaster against disasters. It is a lifestyle habit useful for disasters even if people in Nepal always place water storage tanks on the roof for daily water cutoff measures. Even in Japan, after the Niigata Prefecture Chuetsu Earthquake occurred, the avalanche broke the road and could not transport necessary food and goods for evacuation. The ingredients that were useful at that time were the ingredients and firewood that the local residents had prepared before entering the winter. Neither bother to go for disaster prevention, but as a result it leads to disaster prevention. There are other things that wisdom that has already been implemented in the life like this "can actually do such a view from the viewpoint of disaster prevention" or "there is surprising effect when used in this way". Discovery, protection and dissemination of these are also considered to be a kind of disaster prevention education. Therefore, in this research the above idea also applies to disaster dragging. In other words, its approach differs depending on the country and region in disaster transmission, and aims to learn about the new approach of disaster transfer from the difference. Specifically, the case of "Sichuan Earthquake" that hit China's Sichuan Province on May 12, 2008 is taken as a case. About 11 years after the earthquake, we investigate how the disaster is recorded in the affected area and how we are trying to communicate it to posterity people in that way and compare it during the day. Based on the results of the hearing survey conducted by Youth in Chengdu and the future disaster prevention experience hall,

©2019. Japan Geoscience Union. All Right Reserved.

several disaster prevention education facilities, disaster transmission facility, we report on the new approach and disadvantage of disaster trading in Japan.

Preparedness for Nankai Trough Earthquake: Incorporating Understandings of Uncertainties in Disaster Prevention Education Schemes

*Manabu Hashimoto[1], Mika Shimizu[2]

1. Disaster Prevention Research Institute, Kyoto University, 2. Center for the Promotion of Interdisciplinary Education and Research, Kyoto University

For better disaster prevention education schemes to prepare for disasters, it is essential to examine how we address large-scale disasters with uncertainties which we have never experienced before, such as Nankai Trough earthquake. Specifically, how to incorporate “uncertainty” aspect into disaster prevention education and how to link the learnings into practices for better disaster preparedness is a critical challenge we are facing. The “uncertainty” is not a small component for disaster prevention. Rather, understandings of the reality of “uncertainty” at both scientific and social levels in terms of when, where, and how earthquakes may occur, affect the overall practical level of preparedness for disasters.

Given the above, addressing uncertainties is a challenge which multi-stakeholders need to work together, including natural and social scientists, policy communities, emergency practitioners, local governments, businesses, schools, and the public through collaborative learnings during normal times. For these learnings, it is critical for disaster prevention education to play a role. Especially the education schemes need to take into consideration: 1) how to make a common ground for understandings of uncertainties among multi-stakeholders based on available scientific information, 2) how to incorporate the understandings of uncertainties into learning process, and 3) how to direct the learnings into practices for better disaster prevention.

Based the above, a study group in Kyoto University where natural and social scientists collaboratively work together, have been seeking for the ways for addressing the reality of earthquake risks and uncertainties for different stakeholders through a series of workshops for the past three years. The presentation will report on the findings and insights drawn from the workshops targeted at education community (March, 2017), business community (June, 2017), civil disaster prevention community (March, 2018), and multi-stakeholders (January, 2019).

Specifically, the series of workshops were designed collaboratively by natural and social scientists with the focus on 1) scenario-based, 2) stakeholder-based, 3) site-based, and 4) dialogue-based or interactive-learning- based contexts. Especially, to optimize the learnings of earthquake risks and uncertainties, the workshops created processes for each participant to understand the uncertainties through themselves by applying it to their own daily lives or work settings.

Based on the workshops, overall, we have seen:

On the same table, different people with different backgrounds share their responses, awareness, and insights, which led to strengthen each understandings of the reality of uncertainties. Before and after the workshop, almost all participants changed their literacy and mindsets for addressing uncertainties. For examples, participants responded to workshops with comments: “earthquake risks have uncertainties

©2019. Japan Geoscience Union. All Right Reserved.

and it is important to act flexibly against the unexpected events”, “even as a person in charge in a company did not understand it before workshop”, and “I realized it is important to address “uncertainties” even if it is incomplete information.” As a collective knowledge from the workshop, as examples, from the one targeted for business, the following points were drawn:

- To provide any earthquake risk information is important even if the probability is low and uncertainty high. For this, information recipients’ literacy is necessary too.

- Providing information from authoritative institution is critical; since when we think about the real scenarios, information from SNS or other sources will be flooded.

- We need to think about not only BCP but also disaster risk management from daily basis, covering not only response, but also recovery.

Thus, based on the results drawn from the workshops, we will provide policy implications in terms of how to incorporate understandings of uncertainties in disaster prevention education schemes.

Importance of issuing evacuation for individual family

*Suzuki Shigeyuki[1]

1. Okayama University

Japan is a disaster-prone country and there are many variety of natural hazards. The hazards and degree of the risk are quite different in individual small area depend on geography and the site of disaster source. Disaster management for individual family is necessary to protect citizens from disasters. Recent examples of disaster reduction activities in local community and school will be presented.

Keywords: disaster management, natural hazard, disaster reduction activity

Outreach of geography on general books

*Naoko HASEGAWA[1], Yuuki NAKAGAWA[1]

1. Ochanomizu University

Publication of general books (books for general readers) is a way of outreach. We analysed recent general books of geography, on the point of writer’ s profession (researchers, teachers, others, etc.), their’ s contents, and those relationships.

Reserchers write geoscience, including physical geography. Middle and high school teachers, write whole contents of geography (general geography), which they learn in middle and high school. Writers as side business didn’ t write geoscience and general geography, they wrote especially on excursion.

Keywords: outreach, geography, general books

Dissemination of geographical and archaeological thinking by museum exhibitions: Practical approaches using three-dimensional models

*Yuichi S. Hayakawa[1,2], Sahoko Aki[2]

1. Faculty of Environmental Earth Science, Hokkaido University, 2. Center for Spatial Information Science, The University of Tokyo

The way of thinking in geography and archaeology are sometimes similar to each other in that they comprise both the spatial and temporal contexts. Geography is more spatial-oriented, while archaeology is more temporal-oriented. The outreaching collaboration of geography and archaeology would, therefore, be effective in developing the ability of thinking in a spatiotemporal context. Such the collaboration of geography and archaeology can be presented in a museum exhibition. Although the number of museums specifically designed for geography is limited in Japan, there are numerous archeological museums in which geographical contents can also be included. Here we discuss the effects of a museum exhibition on the dissemination of geographical and archaeological thinking by their collaborative works. In particular, three-dimensional models of landforms and landscapes are utilized to promote the geographical and archaeological thinking for the visitors. The case studies include several museum exhibitions in Aomori, Fukushima, Nagano, and Kyoto Prefectures, each of which showed different appearances of the exhibitions. The approaches using 3D models were supposed to be informative directly letting the visitors feel and think the geographical and archaeological contexts behind the models.

Introduction of Guide Skill Up Course and Its Effect in the Izu Peninsula Geopark

*Tsuda Kazuhide[1], Hiroshi Ono[1], Hiroshi Yamazaki[1], Akifumi Matsuo[1], Hideki Ono[2]

1. NPO Whole Earth Institute, 2. Izu Peninsula Geopark Promotion Conucil Bureau

[Introduction]
Generally, the material (volcano, mineral, topography, etc.) picked up at the geopark has an impression that it is professional and difficult to understand. The significance of existence of "attractive and meaningable geo guide" is great.
This report examined the lecture focusing on "transmitted technology" against the certified geo guide at the Izu Peninsula Geopark. We designed a lecture aimed at aiming to be able to express "exactly more easily" the expert knowledge that students have accumulated through various training etc. so far.

[Method]
The subjects were conducted on 30 Izu Peninsula certified geo guides in November to December 2018 once a week from 10:00 to 16:00 as shown below, with five contents.
As the 5th monitoring tour, we distributed a leaflet at the 1st lecture and started recruiting.
In addition, we conducted a questionnaire after each lecture, and tabulated the evaluation and effect of the course.

1. Guidance, How to make a place, Mental attitude of the guide
After confirming the flow of 5 times and treating it as a guidance of the course, learn how to start a program smoothly with the participants. Learn how to relate the guide to visitors and the mental attitude required to face the guide.

2. Transmission technology, Field tour, Lecture
The instructor carried out a simple geo tour for students. In the afternoon, we will give lectures and discussions on the "transmitted technology" that the instructor has taken in.

3. Program design, Sharing of guide methods
Learn the flow and composition of the program to effectively "transmit".Also, set up time to share daily guidance techniques and tools you are using among participating guides.

4. Program planning, Rehearsal
Organize 4 to 5 teams. Incorporate the techniques and ideas learned in the past three courses, and prepare a program for elementary school upper grades (about 15 minutes). Also suppose it will be rainy on that day.

5. Practice, Program execution
Provide programs created for primary school students , upper grades. While doing questionnaire and retrospect, notice what you got in the whole and take it their lifestyle.

©2019. Japan Geoscience Union. All Right Reserved.

[Results]
According to the results of the questionnaire, almost everyone was satisfied with the contents in each lecture. For students that answered that they could leverage what we learned in this course to their own program and were able to say the direction of how to communicate to geo tour.
Towards the actual implementation of the program created by the team to elementary school students, sometimes from lecturers and talks between students, the trick to assembling tips and programs, the process of discovering each other's potential , As the number of times repeated, the students became robust.
In addition, there were few students who gave a problem point, many positive opinions were received. Hospitality of drinks and music, etc. that create a relaxing space, group activities, drawing out the voluntariness of students, cooperativeness There are many opinions that we would like to continue, etc., and a constructive opinion went up to make it better.

Testcase of Science Cafe with Confrontation Axis Considerd to Complex of Earth and Space Science

*Harufumi Tamazawa[1,2], Yuko Ikkatai[3]

1. Disaster Prevention Research Institute, Kyoto University, 2. Faculty of Fine Arts, Kyoto City University of Arts, 3. kabli Institute for the Physics and Mathematics of the Universe, University of Tokyo

Science policies related to earth and planetary science include those with large scale, especially in connection with space science, and it is not clearly shown what kind of consciousness the public has due to high expertise, and as a result experts is the field. On the other hand, as far as the development of science and technology (ST)as well as space development, dialogue about science and technology with the public is shown as a goal from the government, and it is one thing to grasp what the public think about the policy Department. In the social survey on the space policy conducted on the Internet in 2014, the difference of images between space development and other ST policies, etc. are also being investigated, but on the other hand, regarding the specific budget allocation, It is difficult to judge whether or not you have a concrete image, such as answering to do (Fujita &Taromaru 2015). In 2017, we conducted an interview survey on why I responded to respondents after asking about the same contents, but some anserwed that it is difficult to consider space development compared to ST related to daily life (Tamazawa et al. 2018). Town meetings and public comments are being held as concrete attempts to foster opinions while encouraging citizens to feel familiar. It is a question to be examined including knowing how citizens think and thinking about how to reflect it in policy and effective method development.

Assuming to examine individual policy issues, it is necessary to share the process of grasping the background of the problem and organizing the problems, and how to visualize the problem and to discuss it is a challenge. is there. Especially, event formats such as those provided by a single science cafe, such as those provided by a regular science cafe, can deviate from the purpose of "gathering opinions" due to the information transmission and reception between participants and host. What type of format is effective to encourage participants to have their own opinions and think subjectively.

In January 2018, in a science café in a science café at the wine bar, a discussion on ST and society at the university, two topic donors were discussed and opinions of the participants were chronologically aligned We made a test case of a science cafe in a controversial style, taking the approach of visualizing. Under either theme "Setting the environmental change of Mars is allowed", from the topic provider, after giving representative opinions from the standpoint of favor and opposition, after agreeing and opposing axes on the white board , And asked the magnet to indicate the position of the participant's opinion. In order to see the transition of opinion after discussion among the participants, they asked for the position of opinion again after the discussion.

In the case of doing it in a university class, after the initial opinion, we had a discussion by the group including approval and opposition for each group, asked for suggested criteria and presented the opinions of the individual again There were participants who changed opinions on the other side from the viewpoint of environmental ethics, generation ethics, diversity. On the other hand, participants who strongly agreed or opposed from the beginning did not see much change.

In the event held at the wine bar, the agreement side agreed more, the other side moved the opinion to the other side more. There was an opinion that the opinion after the end of the science cafe considered

©2019. Japan Geoscience Union. All Right Reserved.

taking care of participants into consideration. In both cases, it turned out that the position of the participants varied to some extent through the visualization of opinions, and that there were constant layers of standing position changes with the discussion. In general events related to ST such as science cafe, there is a tendency for people with a high level of interest in science and technology to participate (Kano, Mizumachi et al.), And such layers include a place of opinion such as question and answer at the event If there is, there is a possibility that the speaking participant may stand behaving apart from its own opinion transition, contributing to facilitation and activation of the discussion, on the other hand, excessive role consciousness is said to be a citizen's awareness From the point of view it may be possible that it is separate from the person's own opinion.

Literacy for Rumors of Earthquake Occurrence

*Yoshiaki Orihara[1], Masashi Kamogawa[2], Toshiyasu Nagao[1]

1. Institute of Oceanic Research and Development, Tokai University, 2. Department of Physics, Tokyo Gakugei University

A rumor of earthquake occurrence has often emerged after the most of large earthquakes (EQs), such as the 2016 Kumamoto EQ (Magnitude: M7.3) and the 2018 Hokkaido Eastern Iburi EQ (M 6.7). In the Kumamoto EQ, one of the hotels in Kochi prefecture was temporally closed due to the rumor. After the large EQs, the other false rumors such as animal escaping from the zoo and stop the supply of public water also emerged. In addition, the rumor of EQ occurrence often emerges not only after the large EQs but also during the aseismic period. In this study, we introduce features of the rumors of EQ occurrences and discuss literacy for them to identify the false rumors.

Coastal topography and tsunami deposits caused by trench type earthquakes can be clearly observed around the Kuril subduction zone, eastern Hokkaido. We conducted a geological excursion on the theme of geological phenomena caused by giant earthquakes, which can be participated by local citizens on September 3-4, 2018 as a related event of the 125th annual scientific congress of the Geological Society of Japan in Sapporo. In this excursion, we taught that future disasters can be predicted based on the past information from strata and topography recorded during the past several thousand years. And these are useful for teaching materials for students. We also hope that local citizens will consider future giant earthquake and tsunamis and disaster prevention using peel specimens of tsunami deposits for local museums, etc.

Constructing quaking model in the geological club activity and discussion activities around crack investigation

*Ryo S Nakamura[1]

1. Miyagi Rifu high school

Our school region is standing on the field of active-fault "Nagamachi-Rifu" line.
Our school region is standing on the field of active-fault "Nagamachi-Rifu" line.
We have had activities upon the surrounding research, for the fault's activity and sediments research.
Therefore, we seeked leading method to make experimental motion in the class and science club activity.
I will talk about daily geological activities, also concern to against disaster education as follows;

(1) Leading method of sediment materials research
Students tried to find some geological faults on the ground. They found boling core samples above the faults and succeed to analyze sediments and mentioned volcanic ash contains.

(2)Constructed motor-controlled quaking apparatus
The quaking model plays much important rolls to mention real breaking phenomena. Our students discussed the several soil model made by corn and chocolate-flakes, and constructed quake mechanics. Firstly they quaked by the hand-quaked, but the reproducibility was lower level. Then they planned motor-controlled and made by steel cans and rubber plugs which everything found surroundings. Reproducibility and easy constructing is much valuable model to make leading geological methods.

(3)Discussed cracks on the building by the stress
Students found the cracks on the building to specific direction, they mentioned about ground stress characteristic. Essentially, our region is located the border between ocean and continental plates. They also discussed the effects made by flat-constructed grounds.

The Impact of Middle School Students' "BOSAI Narratives" on the Community of Tosashimizu City

*Risako Tokoro[1], Kei Usui[1], Ayana Kawasaki[2], Tosei Nagamatsu[3], Satoko Oki[2]

1. Keio University, Faculty of Policy Management, 2. Keio University, Faculty of Environment and Information Studies, 3. Keio Research Institute at SFC

Students of Shimizu Middle School, located in Tosashimizu City (Kochi Prefecture) has been writing short stories called “BOSAI Narratives” since 2016. In JpGU 2018, Nagamatsu presented on how the students themselves were influenced by writing them (Nagamatsu, 2018). This year, we will discuss the results of our study on how the narratives affected the students’ parents and other people in the community.

About Tosashimizu City and the “BOSAI Narratives”

Tosashimizu City is a provincial city with a population of 14,000 people; 47% of it being over 65 years of age. In 2012, the Japanese government announced that in the Nankai Trough Earthquake, the tsunami height estimation of the city can be as high as 34 meters (Cabinet Office, 2012). The announcement was meant to increase people’s awareness, but it resulted in leading some people to lose hope in surviving the earthquake (Sun, 2014 and Oki, 2017). However, the “BOSAI Narratives” seem to be changing the situation.

We developed the “BOSAI Narrative” with the teachers of Shimizu Middle School in 2016. It is a short story written by individual students imagining their own situation in the event of the Nankai Trough Earthquake. They could write about anything that they imagine to be happening at the time of the disaster, under the condition that they must end in hope.

Research Method

At the end of the school year 2017, we conducted a survey on all the parents of the community, who had read the “BOSAI Narratives” written by the students of that year. Out of the respondents, we selected 10 parents to interview individually in order to conduct further qualitative research on how they were impacted by reading the students’ narratives.

Results

Through careful analysis of the survey and interview results, we discovered the following: 1) readers obtained and understood information concerning the occurrence of earthquakes, despite its uncertainty. In other words, the students played the role of “translating” scientific language into a daily context; 2) moreover, readers began to reconsider their everyday lives; 3) readers have trust in the disaster preparedness education program itself; 4) how the readers are impacted relies heavily on their individual backgrounds; 5) the narratives do not necessarily induce readers in perceiving earthquakes subjectively; 6) some readers learned to seek value in living the moment; 7) the narratives exposed the readers to other worlds and situations (term in Japanese: “guuyusei”) (Yamori, 2007); 8) the narratives’ setting to “end in hope” led some readers to imagine the opposite situation; thus 9) empowering readers to contemplate disaster (Yamori, 2007); and lastly 10) as for the interviewees in this study, most of them had already taken preventive measures prior to reading the narratives. Thus, only a few cases of behavioral changes were recognized in the narratives’ readers.

Disaster Prevention Education Programs to Increase Risk Perception

*Erina Hyuga[1], Hitomi Sasaki[1], Satoko Oki[1]

1. Keio University

1. Introduction

The 2011 Great East Japan Earthquake raised awareness of the importance of disaster prevention education. Japan's Ministry of Education, Culture, Sports, Science, and Technology (2013) has emphasized the importance of developing education programs that nourish children's independence. However, a survey we conducted in 2015 revealed that it is difficult for school teachers to develop such programs for disaster prevention by themselves (Nagamatsu and Oki, 2015).

2. The "*Finding Risks in the Photo (FRP)* Class" and Photovoice method

This research will discuss a teaching material that we developed mainly for elementary school students. In it, named the "*FRP* Class", students are to look at photographs of themselves in certain situations and find items that may be dangerous when a large earthquake occurs. Since the students themselves are in the photos, they can perceive earthquakes as their own problems. In fact, we have been receiving reports that students became more proactive in learning about disaster prevention, and also became faster at reacting to earthquakes and drills (Oki, 2016).

The Photovoice method, established in public health studies, resembles the "*FRP* Class" in that it uses photos. By explaining to others about the pictures that they took, people find problems of themselves or their community. Originally in the "*FRP* Class", the students were pictured in the photos. This time, by applying the Photovoice method to the "*FRP* Class", each student became the photographer, rather than the subject. We investigated how their awareness of disaster risk management would change throughout the process.

3. Research methodology

We held a workshop on disaster prevention in Tsuruoka City, Yamagata prefecture, targeting students from Grades 2 to 4 in Tsuruoka and nearby cities. Participants took two pictures of their favorite places and sent them to us by e-mail in advance. During the workshop, the students learned about disaster prevention through various activities. Later in the workshop, we had the students introduce their favorite places to each other and explain its dangerous points. In the end, we assigned them to take pictures of the same place that they had taken beforehand, and to rethink about what they like, and what they think is dangerous about the place. We found that some took photos from different angles, to capture the dangers that had not been pictured in their previous photos. This suggests their ability to evaluate risks in actual earthquakes.

4. Results

We conducted a follow-up survey on some participants. As a result, almost all of them spoke of what they learned to their friends or family in addition to re-considering dangerous points. Furthermore, some reviewed their emergency bags and others discussed about evacuation sites. This corresponds to the three elements of study in the theory of "community of practice" (Lave and Wenger, 1991), that is 1)internalization of knowledge, 2)change of identity, and 3)expansion of learning community.

Geoscience education for infants using geological specimen

*Naoki Morita[1,2], Mana Yasui[2,3], Hiroshi Hagiya[2,4]

1. Meisei University, 2. Non-Profit Organization Science and Art, 3. Waseda research institute for science and engineering, 4. Tokyo City University

NPO Science and Art has developed natural science education in kindergarten since 2016.
The classroom runs a natural science class of 9 classes (60 infants and 8 elementary school students) every week. In this presentation we will introduce the following three programs and their educational effects.
1 ·Fossil Excavation Experience
2 ·Mineral Kaleidoscope
3 ·Dinosaurs Card Game
In the fossil excavation experience, the real ammonoid is embedded in the mixture material of gypsum plaster and sand. Children feel the excavation sensation with wooden sticks and rubber hammers. Let the fossils found by the children are made labels, and let them manage themselves as children's own collection.
Mineral Kaleidoscope program uses small stones such as quartz(purple/pink) and olivine to make a kaleidoscope. While observing the stone, develop a story to its origin and the topic of the production area.
In Dinosaur Card Game, while playing ordinary game, let children show and touch fossils (replicas, real fossils) of dinosaurs and marine
reptiles that appeared in Card.Teach children how to get dinosaurs information by using an picture books.
By introducing the feedback of this program, not only can infants earth science, but also includes the role of extending the interest afterwards. This program is proposed to be an excellent program in earth science education from early childhood.

Introducing Narrative Approach to Earthquake Disaster Prevention (BOSAI) Teacher Training: Practice in Saitama Prefecture

*Ami Pareek[1], Satoko Oki[1], Kohei Yamaguchi[1], Mirei Toba[1]

1. Keio University

1. Introduction

Since the March 11th, 2011 Great East Japan Earthquake occurred during the daytime when students were in class, the importance of disaster education again became the focal point of society. However, educators have expressed concerns regarding the topic (Nagamatsu, Oki, 2015). Although the effectiveness of disaster prevention education is well known, there are still numerous challenges to it. For example, working hours of school teachers greatly exceed “Karoshi level,” which is over 80 hours per month. Furthermore, the curriculum in public schools is widespread, in addition to fundamental subjects. In a curriculum where there is very little space for additional implementations, it is very difficult to teach disaster prevention education that the teachers themselves have never learned before. There are no teaching materials prepared, and at school, the teachers already have their hands full guiding their students and parents. In most schools, there is only one faculty member assigned to be in charge of school safety including disaster prevention, and in essence, that faculty member has to formulate an annual safety plan and a disaster prevention manual prescribed by the School Health and Safety Law by his/herself. Based on this manual, he/she is responsible for implementing disaster prevention education for that school. With the lack of time, experience, and budget, it is unreasonable to think that the faculty is capable of making improvements from the previous year's plan. As a result, only the continuation of evacuation exercises that have become a mere micromachining and a slight modification of the manual remains.

This presentation will report more efficient and effective ways of conducting earthquake disaster prevention teacher training, and also its achievements.

2. Research Methodology

This study was carried out to alleviate such confusion of the school site. We focused on teacher training, especially for disaster prevention education that is aimed to resolve problems mentioned before by introducing a narrative approach. Teachers are introduced to a hypothetical case in which a large earthquake occurs under school management - the expression and behavior of a child, anxiety, and frustration of a teacher is described in detail from a teacher 's perspective. Teachers are then asked to write out the risks inspired by reading this, participate in group work with other teachers in charge of the same grade, and to share thoughts in front of other teachers in that school. As a result of the training, it is made possible to raise awareness of tackling disaster safety within the entire faculty, and to visualize risks and reevaluate current evacuation methods. This program is 50 minutes in total. We also made handouts which support teachers to improve the evacuation drills after the training.

3. Activities in Saitama Prefecture and Progress

We have been working with two model schools (one public elementary school, and one public junior high school) in Saitama. First, we have done the teacher training, and after that we have done the follow-ups. Teacher training was a good opportunity for the teachers to think about disaster prevention. As a result, there were many activities done positively by school. For example, autonomously revising the evacuation drill, actively making a new plan for it and practicing it, etc. We have also conducted the follow-up surveys in the end of the year.

©2019. Japan Geoscience Union. All Right Reserved.

Other than the activities of two model schools, all of the school principals in the city gathered for a meeting on July 2018. After the meeting there were positive reactions from some principals, that they were willing to do some activities of disaster prevention.

Practice of Disaster Education in Mexico: "Cultural Tuning" Based on Comparative Study of Public Educational Curriculum Between Japan and Mexico

*Takuya Iwahori[1], Genta Nakano[1], Katsuya Yamori[1]

1. Disaster Prevention Research Insutitute, Kyoto University

The purpose of this research is to compare curriculum of public education between Japan and Mexico with specific focus on knowledge of seismology. The authors at first review the public compulsory educational curriculum in each country, and secondly, carried out practice of disaster education in a university in Mexico City and analyzed the questioner survey of the class. As the result, the authors found that "plate tectonics" is the key to compare the system of the knowledge constructed in the course of public education in each country.

Discussion

"Science reading" in the Oki Island Library Let's science reading! The story of Light deliver "science reading and demonstration experiments in the Oki Island Library

*Kunihiro Abe[1]

1. Shimane Penunsula Shinjiko Narumi, Kuibiki Geopark Promotion Committee

Concept The phenomenon of the light seen on the island of Oki is stared again, and how the phenomenon might happen, and the light is learnt through the science reading and the demonstration experiment, and it hopes that the inquiring mind which tries to pursue it will grow up, and this course was done.

Basic content Need

light to see things Because there is a certain character in light, the shape of the one is seen and the color is seen. The nature of Light •light goes straight without any obstruction. Light goes straight while diffusing from the light source. •natural light source and artificial light source for light source -Reflection and reflection of light... In an object where light cannot pass, it reflects at the boundary surface, and the angle of incidence and reflection angle of the normal of the reflected surface of light are equally reflected. (Positive reflections and irregular reflection) The light has a color. (It leads to spectrum, wave, and interference in the future.) Three primary colors of light, rainbow The difference and shadow of black and white
The demonstration experiment was performed in such an idea.

Difference in elementary students' understanding of a solar eclipse by using different ICT devices

*Koji Imai[1], Yasuhiro Murayama[1], Takahiro Yamanishi[2]

1. National Institute of Information and Communications Technology, 2. MITSUBISHI MINATOMIRAI INDUSTRIAL MUSEUM

To progress active learning by effective utilization of ICT devices, we studied three different learning methods of a solar eclipse for elementary school students: a passive learning method providing materials by a projector, an active learning method with a tablet, and a virtual experience learning method with a stereoscopic model. According to the results of the questionnaire survey about the degree of ease in understanding, the students answered that it was easy to understand using a tablet or model, and all students showed increased motivation for learning.

Let’s learn landform and disaster risk

*Yuki Kurisu[1]

1. Geospatial Information Authority of Japan

Education for disaster prevention is internationally attached importance as is the case with Sendai Framework for Disaster Risk Reduction 2015 - 2030. In Japan, course of study is promoted substantial education for disaster prevention and safety. Geospatial Information Authority of Japan (GSI) released education contents for learning landform and the disaster risk, provides the contents through toolbox for geography education (http://www.gsi.go.jp/CHIRIKYOUIKU/index.html). We would like to report about this contents. We devised three points in order to learner’s interest.

The first point is learning landform and the disaster risk with character. From geography point of view, they can learn disaster of mountainous areas, plain areas and coastal areas with resident. Finally, they can study disaster risk in familiar region using Hazard Map Portal Site.

The second point is interactive development of story. The introduction part leads them to think the relationship between landform and disaster with proverb. The development part has them considered disaster risk with cases and land condition. The conclusion part prompt them to reconfirm inseparable relationships with landform and the disaster risk.

The last point is easy representation of technical terms. They have to understand characteristics of river

in order to grasp flood. In the contents, we compare river a valley to a funnel.

GSI will continuously provide useful information about disaster risk such as this content and support geography education.

Educational activities of the Earth and planetary science in the collaboration of schools, science museums, and scientists using digital globe

*Akinori Saito[1], Takuya Tsugawa[2]

1. Department of Geophysics, Graduate School of Science, Kyoto University, 2. National Institute of Information and Communications Technology

Educational activities of the Earth and planetary science using Dagik Earth, a digital globe, have been carried out in the collaboration of schools, science museums, and scientists. Dagik Earth has been developed by Earth and planetary scientists in Kyoto University, NICT and others. Many scientists join the project to develop the contents using the Earth and planetary data. It is presented as permanent and temporal exhibitions in science museums. Some science museums have training seminars of Dagik Earth for school teachers. Because it is simple and easy to use, it is designed to use regular classrooms. The manual for teachers is developed for science and social class in elementary schools, junior high schools, and high schools in Japan. As the usage of Dagik Earth expands in the collaboration of schools, science museums, and scientists, the difficulties to use it in classrooms become clear. For example, the whole Earth is rarely taught in the science class in the elementary school because the study of the country-scale is more focused. In the presentation, current status of the project, its difficulties in schools, and the future plan will be reported.

Discussion

Improving Awareness of Marine Conservation and Sustainability among Taiwanese Middle School Students by Teaching Slow Fish Movement

*Ya-Yin Liao[1], Liang-Ting Tsai[2], Ting-Kuang Yeh[3], Cheng-Chieh Chang[1]

1. National Taiwan Ocean University Institute of Education , 2. Taiwan Marine Education Center, 3. National Taiwan Normal University

The ocean is the largest life support system on Earth. Through long-lasting evolution, an enriched variety of ocean specimens have been produced, thereby fulfilling human needs such as those of food, medicine, and marine recreation. Numerous marine products contain health-beneficial compounds; for example, oils obtained from multiple types of fish are enriched with Eicosapentaenoic acid (EPA) and Docosahexaenoic acid (DHA), which are beneficial to human eyes and brain development, respectively. Additionally, these components are immensely beneficial for controlling inflammation, lowering cholesterol, and replenishing calcium. Therefore, usage of marine products is closely related to the growth and development of the human body and regulation of its physiological functions; seafood is thus a key element of a healthy diet. However, human behavior and activities over the preceding ten years have posed the threat of damage to the health of ocean environments and productivity of marine resources. Hence, marine conservation and generating awareness of it is a pivotal task.

The study aimed at measuring the impacts of Slow Fish Movement curriculum on students' marine purchasing and eating habits along with determining the changes in student's understanding level regarding marine awareness and sustainability. For the same, a questionnaire designed for Slow Fish Movement (SFM) curriculum map with core values derived from Sustainable Development Goal 14 (SDG 14) in the United Nations, Slow Fish promotion in Italy, as well as Principles for Seafood Consumption Recommended by Taiwan Seafood Guide. The study objects were seventh and eighth-grade students of Er-Xin Middle School in Keelung city. The experiment lasted for three weeks. The experimental group contained 1,007 students and compared their performance difference with pre-test & post-test. Of the 1,070 questionnaires distributed, Invalid questionnaires were 63 and thus eliminated—resulting in 1,007 valid responses, the overall response rate was 94.11%. Before the SFM course, a pre-test was conducted to understand students' original knowledge, attitudes and behaviors in life about marine conservation and sustainability. After SFM course for three weeks, a post-test was conducted to understand if students improve understanding levels on ocean conservation and sustainability. After retrieval and sorting of the responses, the statistics software SPSS 20.0 for Windows was used to calculate the mean and standard deviation and conduct paired sample *t*-test. The result revealed:
The most common consumption seafood by mistake in Taiwan Seafood Guide "SAY NO" criterion is Cuttlefish which usually caught by methods that destroy marine habitats. Slow fish movement curriculum map significantly impacted students' judgments on selection environment-friendly of seafood consumption ($t = -46.229$, $p < .001$) After taking the course of Slow Fish Movement that students exhibited significantly increased understanding of marine conservation and sustainability ($t = -19.064$, $p < .001$).

Sustainable development is the core target of Global growth. Teaching SFM curriculum map to promote awareness of environmentally friendly seafood-purchasing methods can enable consumers to eat more

Prototyping of the teachable moment presetation for recent earthquakes in Japan (2) ---The case of the 3 January 2019 Kumamoto earthquake (M5.1) on and improvement from the previous prototype---

*Reiji Kobayashi[1]

1. Graduate School of Science and Engineering, Kagoshima University

Several news topics can be a good sources of teaching materials. Relation between news and contents of textbooks can interest students.

The Incorporated Research Institutes for Seismology (IRIS) have provided us with slides of teachable moment presentation on recent earthquakes in the world. Teachable moment means a good opportunity for teaching. I sometimes use the presentation slides in my lectures. However, the IRIS does not create the slides on moderate magnitude earthquakes, which cause moderate damages.

Therefore, I plan to prepare teachable moment presentation for recent earthquakes in Japan. I discussed the preparation guidelines based on that of the Incorporated Research Institutes for Seismology.

The guidelines are that the presentation 1) is prepared for high school and university students in Japan learning geoscience, 2) is created on recent earthquakes occurred in Japan, which may appear in a front page of a newspaper, 3) can be interpreted in about 10 minutes, 4) contains information of hypocenter, magnitude, seismic intensities, damages, tectonic background, historic seismicity, focal mechanism solution, aftershock distribution, seismograms, and other event-specific information, 5) is uploaded within 12 hours after the earthquake, 6) is created in a few hours by using the template, 7) is a classroom-ready product that can be customized, 8) contains open information, which sources are clearly given in slides, and 9) contains only information which may be agreed by most seismologist.

I created a prototype presentation on the 2018 Hokkaido Eastern Iburi earthquake, and uploaded it on the webpage (http://reijikan.my.coocan.jp/RETMJ/retmj-index.html) (Kobayashi, 2018a, b). Kobayashi (2018b) also discussed issues on the contents and the future project system.

On 3 January 2019, a M5.1 earthquake in Kumamoto prefecture. The JMA seismic intensity scale is up to 6 lower. I also created the presentation. I modified expression of the geometry of the fault plane including roughly approximate extent of the fault plane, and adopted a movie on the propagation of the seismic waves created by the National Research Institute for Earth Science and Disaster Resilience (NIED).

I hope that such developments of teachable moment presentation on volcanic eruptions, typhoons, and so on, are carried out to increase number of students learning geoscience.

Development of web application for polarizing microscope observation

*Fumitoshi Morisato[1]

1. Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo

It is essential to handle actual natural phenomena and natural samples to cultivate the scientific view of nature through geoscience education. At the same time, from the viewpoint of assisting and promoting achievement of the purpose, good quality geoscience materials that anyone can access anytime, anywhere is also necessary. For example, rocks and minerals show various diversity, so to acquire these appraisal methods it is necessary to observe while comparing multiple samples. Among them, concerning the appraisal using a polarization microscope, the cost, and labor required to prepare microscopes and rock slices can be a barrier, especially in self-study. To solve this problem, the speaker has developed a web application that can interactively observe the observation of rocks and minerals by polarizing microscope (“SCOPin rock,” URL is https://microscope.fumipo-theta.com). At the present stage, I have implemented sample selection, rotation, and enlargement of the field of view, switching between open Nicol and cross Nicol, and displaying variable scale.

This application's unique attempt as a polarizing microscope simulator is to deal with various devices including smartphones and tablets and to reduce the amount of data transfer. First of all, you can use this application regardless of the machine as long as you install a modern browser (such as Google Chrome, Safari, and Microsoft Edge), and you can use it in the excellent layout according to the screen size of the device. Second, while maintaining the smooth rotation of the visual field image, the number of images required for one sample is limited to 12 to 24 images. As a result, when using JPEG images of 1280 ×1280 px, the data size is about 2 to 3.5 MB, and the number of requests to the server is only one.

I assume the following use cases for this application.

1. In class, teachers can project polarized microscope images on the screen if there is a projector.

2. In the class, all the students can view and operate the same rock slice picture at hand.

3. In the geological excursion, you can share rock slice photos at the time of guidance.

In the future, I would like to realize content expansion and response to various use cases by publishing the upload function of polarization microscope image data by users and providing private repository creation service of image data.

Usage and Utilization of 3D display function on GSI Maps

*Ryoichi Kojiroi[1]

1. Geospatial Information Authority of Japan

GSI Maps which is a web map system operated by the Geospatial Information Authority of Japan (GSI), have a 3D display function, the so-called GSI Maps 3D. With the GSI Maps 3D, it is possible to visually grasp various topographies. The GSI Maps 3D can be used by Internet browsers, and it is also supported in smartphones. So the GSI Maps 3D will be useful for teaching material development. To create teaching materials, we encourage to make and enjoy various virtual terrain with the GSI Maps 3D.

First of all in my presentation, I will touch on how to use the GSI Maps 3D. In the latter part of my presentation, I will introduce examples of the topographical representation in 3D. I would like to take up as many things as possible, such as volcanic landform, rock-controlled landform, terrace, fault topography.

GSI Maps can represent various topographies in various ways, and new functions are added as needed. I will continue to consider useful examples for Geoscience education.

Keywords: GSI Maps, topography, 3D, Geoscience education, teaching materials

Bringing field- and laboratory work into the classroom by using online modules in the edX platform

*Alejandra Quintanilla-Terminel[1], Matej Pec[1], Oliver Jagoutz[1]

1. Massachusetts Institute of Technology

We present two projects that aim at enhancing geoscience education in the classroom through the use of online modules in the edX platform. “Deform the earth” and “Virtual field trip” are two online modules that the department of Earth, Planetary, and Atmospheric sciences is developing in collaboration with MITx . These two modules will be used residentially at MIT, and by being freely accessible through the edX platform, also aim at expanding access to geoscience education worldwide. Each module addresses different challenges in geoscience education. How to teach laboratory skills in the classroom, particularly in a field that is both dangerous and difficult to access? How to teach field skills in a dynamic and effective way and how to make sure the students make the most out of their field experience?

Experimental rock deformation studies allow us to acquire data by measuring mechanical properties of rocks and minerals under a broad range of conditions. This data is essential for geodynamical models and tectonic interpretations. However, because the experimental protocols are difficult to explain in a classroom, and only few rock deformation laboratories exist world-wide, students overlook this component of Earth Sciences and often lack the knowledge to critically evaluate experimental results. Through “Deform the Earth” we want to introduce students to experimental rock deformation. An online module will allow us to both build and assess an experimentalist skill-set without ever needing to enter a real laboratory. The module is built on how-to videos explaining each step in the experimental procedure and analytical explanations of the data analysis. This module will allow us to experiment on ideal methods on how to teach a skill-set by scaffolding the experience for students. In addition, we plan to use pre- and post-testing to find out the most common misconceptions and worked and faded examples to teach how to interpret experimental data. The module will be freely accessible online and could be used by teaching institutions that do not have access to experimental rock deformation facilities.

An essential part of the geology training is learning how to make reliable field observations. This skill, however, is extremely difficult to teach in a traditional classroom setting. It is usually taught through field trips and it is a fundamental part of the curriculum that motivates and excites students into pursuing further studies in geology and earth sciences in general. In introductory classes, students are still learning to distinguish important characteristics in outcrops and may not be able to make important connections during the field trip. “Virtual field trip” aims at recreating the learning experience of the Introduction to geology class in the edX platform. It will be used residentially to provide the students access to the information learned in the field at different stages of the semester-long class, and allow them to consolidate their learning by strengthening connections between concepts they learned in the field and in the classroom. We plan to use pre- and post-testing and compare them with previous runs of the class that did not have access to the online module in order to evaluate its effectivity. The broader audience will benefit from a curated field experience that can be replicated by going to the sites.

Keywords: online learning, field trip, laboratory skills, blended learning

Sun. May 26, 2019 9:00 AM - 10:30 AM JST | Sun. May 26, 2019 12:00 AM - 1:30 AM UTC | 301B 3F

[M-IS24] Integrated Analysis of Geoscience Observations from the Floor to Surface of the Ocean

convener:Keisuke Ariyoshi(Japan Agency for Marine-Earth Science and Technology), Motoyuki Kido(International Research Institute for Disaster Science, Tohoku University), Daisuke Inazu(Tokyo University of Marine Science and Technology), Narumi Takahashi(National Research Institute for Earth Science and Disaster Resilience), Chairperson:Keisuke Ariyoshi, Motoyuki Kido

Sea bottom pressure data contains various components such as crustal deformation, ocean oscillation, tidal variability, atmospheric change, and instrumental drift. So far, seismologists have treated the ocean oscillation as noise, and ocean physicists have done vice versa (considering crustal deformation as noise). Such problems apply to ongoing undersea acoustic distance measuring and other types of ocean observations. In this session, we welcome contribution on various topics focusing on the complementary relationship between seismology, ocean physics, meteorology, tsunami technology, and other related fields.

Off Kii Peninsula, DONET is distributed to monitor earthquake and tsunami at seafloor in real time. Because observed pressure change at seafloor includes atmospheric and oceanic oscillation as well as crustal deformation, it is important to observe atmosphere and ocean over DONET. On the other hand, Kuroshio affects atmosphere due to heat and moisture fluxes. To observe atmosphere and ocean processes around Kuroshio, meteorological observations at Shionomisaki Wind Effect Laboratory have been conducted in parallel with “Chikyu”, Shinsei-maru, Seisui-maru during 11-20 October (Obs1), 5-9 November (Obs2) and 12-16 November (Obs 3) in 2018. Through the observation period, upper-air observation using GPS sonde has been conducted twice a day at 03 JST and 15 JST. In addition, atmospheric boundary layer has been observed using a drone, a doppler lidar and pilot barons.

GNSS-A data analysis to estimate the sound speed profile

*Tadashi Ishikawa[1], Yusuke Yokota[2], Shun-ichi Watanabe[1]

1. Hydrographic and Oceanographic Department, Japan Coast Guard, 2. Institute of Industrial Science, the University of Tokyo

Seafloor geodetic observation based on GNSS - Acoustic ranging combination (GNSS-A) is a technique for estimating the absolute position consistent with International Terrestrial Reference Frame. For that reason, it may be called “seafloor GNSS”.

In this observation technique, the distance between the sea-surface ship and seafloor acoustic transponder is measured by acoustic wave. Therefore, the accuracy of sound speed affects the accuracy of position of transponder. For positioning at the centimeter level, it is necessary to have a sound speed with an accuracy of 0.1 m/s. It is not difficult for the current observation instruments to measure within this accuracy. However, it is needed the values at the place and time through which acoustic ray path passed. Because of the complex spatial and temporal variations of the sound speed, it is impossible in practice to make enough observations to cover all these variations in detail. Thus, for centimeter-level positioning, it is not sufficient to use an observed sound speed data only. On the other hand, the observed travel-time data include not only information about the range but also about the sound speed along the ray path. Taking advantage of this fact, we estimate a sound speed correction function. This idea is similar to estimating the atmospheric delay in a precise GNSS data analysis.

To improve an accuracy of positioning, it is important to improve the method to extract the information of sound speed. In this observation, the vessel is moving for about 6 to 20 hours in a region of about 2 to 5 km square. Temporal and spatial variations of sound speed are estimated from the fluctuation of spatial-temporally distributed acoustic data. In this analysis, the geometrical distribution of acoustic data greatly affects the accuracy of sound speed estimation. Therefore, it is necessary to set track line of the ship properly to accurate observation. We investigate the effect of track line on estimation of sound speed. This evaluation is expected to lead to the design of an appropriate observation system.

Comparison of Ocean Bottom Pressure Observation Timeseries with Result of Real Ocean Estimating Models around the Pacific Rim Earthquake Zone

*Yoichiro Dobashi[1], Daisuke Inazu[2]

1. Tokyo University of Marine Science and Technology, 2. Tokyo University of Marine Science and Technology department of marine resouces and energy

Ocean Bottom Pressure gauge observation (OBP) has an ability to detect centimeter scale seafloor vertical deformations near the plate boundaries. However, timeseries of OBP contain not only crustal deformation signal but also ocean tide or other oceanic variations, so detection of vertical displacements from OBP variation is not easy task. Especially, non-tidal oceanic variations have common timescale (several days to weeks) with seafloor deformations related to slow earthquakes which have different features from usual earthquake we know. Therefore, removing non-tidal oceanic variations is demanded and one possibility to solve this question is estimating the non-tidal oceanic variations by real ocean estimation model simulations. Actually, this method has already applied to some observation areas.

In this research, we used two realistic ocean estimation models and evaluated how these can reduce the amplitude of non-tidal oceanic variations by applying to multiple ocean area around the Pacific Rim Earthquake Zone.
We introduced a data assimilated product, ECCO (Estimating the Circulation of the Ocean assimilated by JPL) in addition to the single layer-barotropic ocean model (Inazu et al, 2012) and compared these two calculation result with observed OBP time series. In this comparison, we collected OBP timeseries mainly from IRIS Data Management Center and Ocean Networks Canada including Hikurangi Subduction Zone, Cascadia Subduction Zone and Chile Trench.

As a result, we can see the different characteristics of two models and timeseries variation of each sites and evaluate the variation amplitude because 1hPa change means 1cm change in seawater height and seafloor vertical displacement. In case of Hikurangi subduction zone, ECCO can reduce OBP amplitude about 15-25% and standard deviation of after correction is 1.5-2.5 (hPa), and single layer-barotropic ocean model can reduce OBP amplitude about 30%-40% and standard deviation after correction is 1.1-1.8 (hPa). In case of south area of Cascadia subduction zone, the reducing rate is common to each model about 5-15% which isn't so high as Hikurangi subduction zone however standard deviation after correction is 0.9-2.0 (hPa) which is almost same as after correction of Hikurangi subduction zone but in north area of Cascadia subduction zone, standard deviation after correction is 1.6-2.6 (hPa) though two model can reduce amplitude10-20%.
This implies that using model is effective at Hikurangi site and also Cascadia subduction zone is suitable site to detect centimeter scale seafloor vertical deformation from the viewpoint of simple amplitude variation analysis.

Experimental challenges for interpretation of in-situ observation of bottom pressure recorders (BPRs) at the seafloor

*Hiroyuki Matsumoto[1], Toshinori Kimura[1], Shuhei Nishida[1], Yuya Machida[1], Eiichiro Araki[1]

1. Japan Agency for Marine-Earth Science and Technology (JAMSTEC)

The Japan Marine-Earth Science and Technology (JAMSTEC) involves various underwater technologies related to long-term seafloor or borehole observatories in the seismogenic zone, by which real-time measurement by BPRs (Bottom Pressure Recorders) can contribute to early tsunami detection, slow-slip seismic event monitoring, or possibly crustal deformation’ s measurement etc. JAMSTEC has used the ocean-bottom borehole temperature and pressure simulator for the recent one decade in order to promote our knowledges taking place in the in-situ BPRs’ observations. In the presentation, we present the recent experiment which characterize the hydro-dynamic pressure at the seafloor during an earthquake. A moderately strong earthquake occurred while the authors were evaluating the long-term stabilities of bottom pressure recorders (BPRs) in conjunction with a broadband seismometer in JAMSTEC. In this experiment, a hydro-static pressure simulating that at the seafloor with a depth of 1000 m was applied by using a pressure standard (i.e., a piston gauge). Consequently, the pressurized BPRs were able to completely record the pressure fluctuations induced by the vibrations of a dead weight on the piston-cylinder during the earthquake. The experiment effectively demonstrated the aspects of the hydro-dynamic pressure data obtained through in situ observations during the same earthquake. We were also able to simultaneously obtain records from unpressurized BPRs; these data suggest that the internal mechanics of the BPRs were unaffected by the earthquake. This experimental evidence that BPRs can record true in situ pressure changes without instrumentally induced contamination may be useful for more thorough interpretations of in situ BPR observations by those communities that utilize BPRs.

Continuous bottom pressure observation by real-time buoy system for tsunami and crustal displacement

*Narumi Takahashi[1], Kentaro Imai[2], Motoyuki Kido[3], Yusaku Ohta[3], Tatsuya Fukuda[2], Yasuhisa Ishihara[2], Hiroshi OCHI[2], Kensuke Suzuki[2], Ryota Hino[3]

1. National Research Institute for Earth Science and Disaster Resilience, 2. Japan Agency for Marine-Earth Science and Technology, 3. Tohoku Univerisity

We have developed real-time observation buoy system for tsunami and crustal displacements and carried out one-year continuous observation around eastern Nankai Trough area. Already we reported a part of the records, for example, tsunami signals brought by Off Southeastern Mie prefecture at 1st April 2016. In general, seafloor pressure observation includes many types of signals, which are crustal displacement, long-term seismic signals, tsunamis, density variation brought by sea current, ocean tide, atmospheric pressure and so on. Therefore, we attached many sensors on the buoy system. Atmospheric sensors to measure pressure, wind speed, wind direction were attached on the buoy, and their data was collected with a sampling of 10 minutes. Precise point positioning, a navigation system using four antennas, and gyro compass were also set on the buoy, and we collected navigation data including buoy position with 2 Hz sampling. Sea floor pressure data using low pass filtered of 0.023 Hz was collected with a sampling of 15 seconds and they were sent to the buoy via the wire end station using acoustic data transmission (Takahashi et al., 2015). The crustal displacement data was also collected, and the buoy has a transducer to communicate with seafloor transponders (Imano et al., 2017; Kido et al., 2018). Many types of observation were succeeded, and next step of our actions is to distinguish these signals. We applied bandpass filter changing the frequencies to the seafloor pressure data. As the results, we found that various signals with relative low frequency were recorded. Although these amplitudes were approximately 0.5 hPa, there were cases with signals with a low frequency of a few minutes, or that from approximately one hour to two hours and with relative short duration. It is possible that slow slip events with various frequencies distribute around off Enshu-nada. In addition, much disturbance was recorded on the pressure sensor during low atmospheric pressure. Such phenomena were recorded by Dense Oceanfloor Network system for Earthquakes and Tsunamis (DONET; Kaneda et al., 2015; Kawaguchi et al., 2015), it is possible that micro tsunami produced by sea surface fluctuation due to variation of atmospheric pressure. In order to clarify the cause of such phenomena, it is essential to observe from seafloor to sea surface. We have successfully observed various physical data both seafloor and sea level in this observatory system. In this presentation, we will introduce various signals recorded by many types of sensors on the real-time buoy system.

Looking into the ocean and Earth’s interior from their boundary

*Yoshio Fukao[1]

1. CEAT / Japan Agency for Marine-Earth Science & Technology

Introduction

Table 1 summarizes the recent ocean bottom observations in which I have been involved. Although these observations were made solely by seismologists, more than half of the published papers were on the oceanic disturbances, including tsunamis, infragravity (IG) waves, internal tides and frontal bores. Less than half were reports on the solid Earth disturbances including VLF earthquakes and slow seafloor deformation. This fact indicates importance of collaboration of oceanographers and seismologists to analyze and interpret the ocean bottom records. I will pick up several topics from Table 1 to explain what may be required to reach a correct interpretation of the records.

Example studies

No. 2. Dispersive IG waves incoming to the off-Aogashima pressure gauge array (A-array), south of Japan, were backprojected by the method conventionally used in seismology. The results were combined with oceanographic information about the spatiotemporal variation of significant wave heights of IR waves provided by WAVEWATCH III. This combination made it possible to locate the excitation sources of the observed IR waves.

No. 3. Off Miyagi, Japan, 42 tilt events dipping landward in a direction perpendicular to the trench axis were detected by a triaxial accelerometer and a tilt-output from BBOBS through an observational period of 10 months. The possibility of seafloor tilting was precluded by a parallel oceanographic observation using a current-meter operated in a limited period. The current record showed that each tilt event was associated with landward flow of cold water. The thermometer inside the accelerometer confirmed that a tilt event was always associated with temperature drop. Clearly, the recorded tilt events were consequences of the frontal passages of advancing bores (solitary waves characterized by an upsloping surging front followed by cold waters). It would be essential for a single station observation to deploy multiple seismological and oceanographic instruments on the seafloor

No. 6. Using the A-array records, we detected the first-mode M2 internal tidal waves propagating with a horizontal phase speed of ~1 m/s in the onshore and offshore directions over the array along the eastern slope of Aogashima Island. The PSD of the internal tide was ~3000 times smaller than that of the M2 external tide. A tide-resolving ocean circulation model (JCOPE-T) was used to simulate the bottom pressure variations at the array. The analysis of the simulated records well reproduced the observed onshore and offshore internal tidal waves. This work represents a good example of collaborations of seismologists and oceanographers.

©2019. Japan Geoscience Union. All Right Reserved.

No. 11. Slow deformation of the seafloor with a time scale of hours was detected on the records from the far-off Torishima pressure gauge array (B-array) deployed near the Izu-Bonin Trench. Retrieval of signal of this time scale is in general challenging because of the overlaps of tidal disturbances of larger amplitudes and air-pressure disturbances of possibly comparable amplitudes. I developed a method to remove effects of these oceanic and atmospheric disturbances to detect seafloor displacement including its permanent component.

Discussion

Based on these limited experiences, I suggest several possible collaborative works between oceanographers and seismologists. Suggestion includes (No.2) monitoring of the IG wavefield in the Pacific Ocean using data from the seafloor networks such as DONET, S-net and NEPTUNE, (No.3) quantification of internal bores generated in the deep ocean by long-term oceanographic observations at the sea bottom, (No.6) update of a tide-resolving ocean circulation model such as JCOPE-T by assimilating data from the seafloor networks, and (No.11) use of the tide-resolving ocean circulation model to remove “noises” of oceanic and atmospheric origins to retrieve “signals” from the Earth’s interior.

[M-IS25] Recent weather disasters: factors and impact on the atmosphere, hydrosphere, and human beings

convener:Kazuaki Nishii(Graduate School of Bioresources, Mie University), Chairperson:Kazuaki Nishii(三重大学)

A record heavy rain event occurred in July 2018 around western Japan, which caused lots of flood and sediment disasters. The toll of dead and missing was more than 200. The heavy rain was followed by a record heat wave. The highest temperature in a day reached 41.1 degrees Celsius in Kumagaya, which is an all-time high in Japan. This year also suffered from typhoons over and over again. In July 2017, there was another heavy rain event in northern Kyushu area, which also caused tremendous damage. The aims of this session are to discuss factors that caused weather disasters in recent years, and to clarify those impact on the atmosphere and hydrosphere as well as on human beings.

Heavy Rainfall Event in Middle Viet Nam on 8-9 December 2018 and current QPE/QPF at VNMHA

*Kazuo Saito[1,2,3], Le Duc[4,3], Du Duc Tien[5], Mai Khanh Hung[5]

1. Japan Meteorological Business Suport Center, 2. Atmosphere and Ocean Research Institute, the University of Tokyo, 3. Meteorological Research Institute, 4. Japan Agency for Marine-Earth Science and Technology, 5. National Center for Hydro-Meteorological Forecasting, Viet Nam Meteorological and Hydrological Administration

On 8-9 December 2018, a heavy rainfall event occurred in Middle Viet Nam, and at Da Nang, a record-breaking rainfall 635 mm was observed in 24 hours from 19 LST (12 UTC) 8 December. This heavy rainfall was relating to the strong cold surge from the north and eastern wind, a typical heavy rainfall situation in Viet Nam.
Since June 2018, a bilateral cooperative project between the Japan International Cooperation Agency (JICA) and the Viet Nam Meteorological and Hydrological Administration (VNMHA) for strengthening capacity in weather forecasting and flood early warning system in Viet Nam has been conducted. This project is relating to S-band radars that installed in Hai Phong (Phu Lien) and Vinh by another grant aid project in September 2017, and the Japan Meteorological Business Support Center (JMBSC) is contributing to four scopes of the project on surface meteorological observation, radar maintenance and products, weather forecasting, and regional weather dissemination.
In the presentation, we introduce the ongoing JICA project, and refer to the heavy rainfall event on 8-9 Decemebr 2018, and the quantitative precipitation estimation (QPE) system based on automatic weather station (AWS) and radar networks and satellite data and the quantitative precipitation forecast (QPF) system based on numerical weather prediction (NWP) at VNMHA. Current and future subjects of the project on the two systems will be discussed.

Acknowledgments: The authors thank to JICA project team members including Kenji Akaeda, Michihiko Tonouchi, Masao Mikami, Kiichi-Sasaki, Hiroyuki Ichijo, Chiho Kimpara, and staff of VNMHA including Nguyen Vinh Thu, Nguyen Dang Quang, and Nguyen Thu Hang. Generation of the precipitation analysis map at VNMHA is partly supported by the national research project “Developing an operational heavy rainfall forecast system for Bac Bo area - Vietnam” (code KC.08.06/16-20; project manager Hoang Duc Cuong).

High-resolution flow-simulation in Typhoon 21, 2018: tremendous loss of water plants in South Lake Biwa

*Satoshi Nakada[1], Hiroki Haga[2], Maho Iwaki[1], Keisuke Hatano[3], Koji Mabuchi[1], Noriko Takamura[1]

1. National Institute for Environmental Studies, 2. Lake Biwa Museum, 3. Japan Water Agency

The typhoon 21 (Jebi) of Category 5 landed in Japanese main island on September 4 in last year (2018) and catastrophically damaged in mainly west Japan. The typhoon generated the extreme fluctuation of the water level observed in the south basin of Lake Biwa and induced the massive loss of aquatic plants, especially submerged macrophytes in the whole basin. The similar water level fluctuation was first observed in 2nd Muroto Typhoon in September 16, 1961. In recent years, the widespread exuberance of the aquatic macrophytes was often emergent in the south basin, which can severely affect water quality and biota in the lake bed. On the positive side of the aquatic macrophytes, they can absorb the nutrients dissolved in the lake to purify water and spawning ground for freshwater fishes such as carp and crucian. The massive loss of aquatic macrophytes can greatly impact the water environment in the south basin. It is anticipated that the climate change can induce the intense typhoons, understanding the massive loss mechanism of water macrophytes is essential to manage the lake water quality in the near future. This study investigates the physical processes of massive loss of aquatic macrophytes in the south basin based on the high-resolution flow simulation in Lake Biwa to reproduce the extreme fluctuation of the water level in the period of the typhoon 21 attack. We employed the prognostic, three-dimensional, unstructured-grid Finite-Volume Community Ocean Model (FVCOM). This model uses an unstructured triangular grid and provides better flexibility to fit the irregular coastal geometry and bathymetry in the Lake Biwa. The finite-volume approach ensures the conservation of mass necessary to reproduce water level fluctuation in the lake under conditions of a strong atmospheric disturbance. Reanalysis meteorological Grid Point Value datasets of the Meso-Scale Model datasets produced by the Japan Meteorological Agency were input into the FVCOM as mean hourly air temperature, precipitation, cloud cover, relative humidity, dew-point temperature, and wind speed. Hourly-mean data of river inflow to the lake and outflow from the Seta weir located in the south basin were input to the simulation. The initial conditions of water temperature used in the lake simulation were produced by the observational data obtained in August 2018. The simulations began from an initial state of rest, starting 28 August 2018 and was conducted for 2 weeks. Water level data to validate the simulated water level were downloaded from the Water Information System operated by the Ministry of Land, Infrastructure, Transport and Tourism of Japan. The simulation reproduced the extreme fluctuation of the water level, indicating that correlation coefficient between simulated and observed data was more than 0.9. When the water level pronouncedly decreased approximately 1 meter in the typhoon approach near the Lake Biwa, the northward current stronger than 1 m/s was formed in the whole south basin. The bottom shear stress and the drag force on the aquatic submerged macrophytes were calculated based on the simulated data. The bottom shear stress was smaller than critical shear stress suggesting little scouring in the basin bed. On the other hand, the drag force was larger in the areas of the higher vegetation height of submerged macrophytes, indicating that the map of the drag force was similar to the horizontal distribution of the macrophytes loss. These results suggested that the stronger horizontal flow induced by the typhoon wind formed the large drag force on the higher submerged macrophytes leading to uprooting and washout over the speed limit. The south wind over the 20 m/s blowing above the lake surface can induced the flow stronger than 1 m/s to uproot the submerged macrophytes.

Northern mid-latitude warming prolonged for more than 6 months in 2018 well-predicted by the JMA's operational seasonal prediction system

*Chiaki Kobayashi[1], Ichiro Ishikawa[1]

1. Meteorological Research Institute

In Japan, record-breaking heavy rains were observed in various places, mainly in western Japan in early July 2018 (Tsuguchi et al, 2018). Thereafter, an extremely high temperature continued mainly in eastern and western Japan (JMA, 2018). East Japan's summer average temperature recorded the highest since the statistical records began in 1946 (JMA, 2018). One of the background factors that brought such a hot summer is that the zonally averaged tropospheric temperature anomaly was high in the northern mid-latitudes (JMA, 2018). Here, we conduct re-forecast and sensitivity experiments by the JMA Seasonal Prediction System (JMA/MRI-CPS2; Takaya et al., 2018) and discuss factors of the formation of the prolonged high temperature anomaly in the Northern mid-latitude.
The seasonal mean 200 hPa height shows positive anomaly in almost all areas of the northern mid-latitudes. This indicates tropospheric warming in the northern mid-latitudes. In particular, the positive anomalies were large in the area from Mongolia to northern China, the vicinity of Alaska Bay, the vicinity of the Labrador Peninsula and in the southern part of the Scandinavian Peninsula. The positive anomalies of the northern mid-latitudes were remarkable in the zonally averaged field, and in the time series, the positive anomalies of the northern mid-latitudes had been continuing from around autumn of 2017.
This prolonged northern mid-latitude positive anomalies were well predicted in re-forecast experiments using a coupled model with initial date at October 28, 2017, despite the fact that the initial date is more than six months ago.
From the end of 2017 to the spring of 2018, the sea surface temperature in the Pacific equator shows anomaly pattern of the La Niña type, then ENSO became neutral during the summer of 2018. From spring to summer, the SSTs over the northern side of the equator showed positive anomalies and the SSTs over the southern side of the equator showed negative anomalies. This SST anomaly pattern continued during spring and summer 2018. This pattern was also well predicted by the model.
In order to investigate the influence of this SST anomaly pattern on the atmospheric anomaly field, we conducted an experiment in which the SST of the tropical Pacific region was nudged to climate SST. The northern mid-latitude height in this experiment (referred to as 'sensitivity experiment' hereafter) was lower than that of re-forecast experiment during the period from the end of 2017 to the summer of 2018. The positive anomalies of convective activity on the north side of the equator were well predicted in the re-forecast experiment, but in the sensitivity experiment, the convective activity anomalies in the same region were weak. This suggests that the SST anomalies in the tropical Pacific has played an important role through the anomalies of convective activity to the formation of the prolonged Northern midlatitude positive height anomalies.

Synoptic-scale Predictability of Heavy Rain over Western Japan in July 2018

*Akira Kuwano-Yoshida[1]

1. Disaster Prevention Research Institute, Kyoto University

Heavy rain event occurred between 5 and 8 July 2018 over western Japan. Japan Meteorological Agency (JMA) had published a press release about the event at 1400 JST 5 July before the event began. Using week ensemble prediction data and reanalysis data by JMA, predictability of westerly jet at middle troposphere and moisture flux at lower troposphere, which are main factors of heavy rain by Baiu front, are analyzed. The ensemble prediction initialized after 12 UTC 30 June well predicted meridional position of westerly jet at middle troposphere. However, horizontal moisture flux maximum at lower troposphere was predicted over the East China Sea at that time. The moisture flux flowing to western Japan was firstly predicted at 00 UTC 1 July. An upper trough developing over Eurasia Continent affected the westerly jet prediction. On the other hand, formation position of Typhoon 1807 (Prapiroon) east of Taiwan determined the zonal position of moisture flux. Predictability of rain continuance is affected by an upper ridge propagated from Eurasia Continent which is well predicted after 3 July.

Anomalous Moisture Transport and Oceanic Evaporation during a Torrential Rainfall Event over Western Japan in Early July 2018

*Shion Sekizawa[1], Takafumi Miyasaka[1,2], Hisashi Nakamura[1], Akihiko Shinpo[3], Kazuto Takemura[3], Shuhei Maeda[3]

1. Research Center for Advanced Science and Technology, University of Tokyo, 2. Meteorological Research Institute, 3. Japan Meteorological Agency

Western Japan experienced torrential rainfall in early July 2018, which caused severe floods and landslides especially over western Japan. Japan Meteorological Agency (JMA) reported that this extreme event was associated with extreme enhancement of northward moisture flux and its convergence over western Japan. Some recent studies have pointed out an essential role of surrounding oceans for extreme rainfall events through the anomalous heat and moisture supply to the warm, moist monsoonal airflow. This study investigates anomalous oceanic evaporation during the torrential rainfall event over western Japan based on the objective analysis data from the JMA Meso-Scale Model. We have found that the heavy rainfall was associated with enhanced oceanic evaporation extensively around Japan, especially along the Kuroshio and entirely over the Japan Sea. We then conducted a linear decomposition of local surface latent heat flux anomalies based on the bulk formula to determine factors for the enhanced evaporation. Our results show that the enhanced evaporation under the pronounced southerly inflow toward the extreme rainfall region was mainly due to increase in the surface wind speed along the Kuroshio south of Japan, with an additional contribution from warm SST anomalies to the enhanced moisture inflow into central Japan. In order to quantitatively assess contribution of the enhanced evaporation to anomalous moisture transport in the mixed layer, we also performed a backward trajectory analysis for moist air parcels. It reveals that anomalous moisture supply from the ocean to air parcels along trajectories is dominated by enhanced evaporation due to the stronger surface wind speed, which corresponds to about 20 % of the column water vapor anomaly and about 5 % of the total column water vapor.

Leading modes of atmospheric circulation variability during the heavy rain event in July 2018

*Kazuaki Nishii[1], Bunmei Taguchi[2], Hisashi Nakamura[2]

1. Graduate School of Bioresources, Mie University, 2. Research Center for Advanced Science and Technology, The University of Tokyo

A continuous heavy rain was observed in western Japan in early July 2018. The aim of this study is to investigate the atmospheric circulation from a view point of leading modes of atmospheric circulation variability and its relationship to external forcings. The first mode of the EOF analysis, applying to interannual variability of 300-hPa westerlies around Japan in early July, represents variability of intensity of the westerlies and precipitation associated with the Baiu front. The score of this mode in 2018 suggests that this mode contributed to the weakening of the westerlies and reduction of precipitation at the climatological position of the Baiu precipitation. The second mode represents meridional shifts of westerly jet axis and position of precipitation. The score of the second mode in 2018 suggests that this mode contributed to northward shift of westerlies and Baiu precipitation. A series of ensemble experiments of an atmospheric general circulation model (AGCM) was conducted under five boundary conditions. The emergence of the first (second) mode is often observed in an experiment in which observed sea surface temperatures are prescribed in the extratropics (tropics), while climatological-mean SST is prescribed in the tropics (extratropics). The score of the second mode is, however, not as large as observed in 2018, which may be one of reasons why the AGCM experiment can not reproduce the heavy rain event in July 2018.

Discussion

Exploration of the earth environment using meteorological satellite "Himawari"

*ryuta ando[1], Shigeto Watanabe[1], Ken T. Murata[2]

1. Hokkaido Information University, 2. National Institute of Information and Communications Technology

We investigated the earth environment using the meteorological satellite "Himawari 8" and artificial intelligence (AI). Generally, AI needs images more than tens of thousands for the recognition of image. However, we used spectral data extracted for each pixel of spectral image at 16 wavelengths (visible to infrared) from "Himawari 8" for AI learning in this research. By characterizing the spectral data and the earth environment, we developed an AI system to recognize the earth environment and the environmental changes. This study is the first time to learn the spectral data of 16 wavelengths for each pixel in AI and to investigate the earth environment. Moreover, this AI model uses only hundreds of data sets of 16 wavelength for learning the earth environment in all space and time such as latitude / longitude, day / night, season. Our developed AI using spectral data of the meteorological satellite "Himawari" is useful for predicting typhoons and drift ice, etc. The AI is also useful to investigate planetary environment as well as the earth environment.

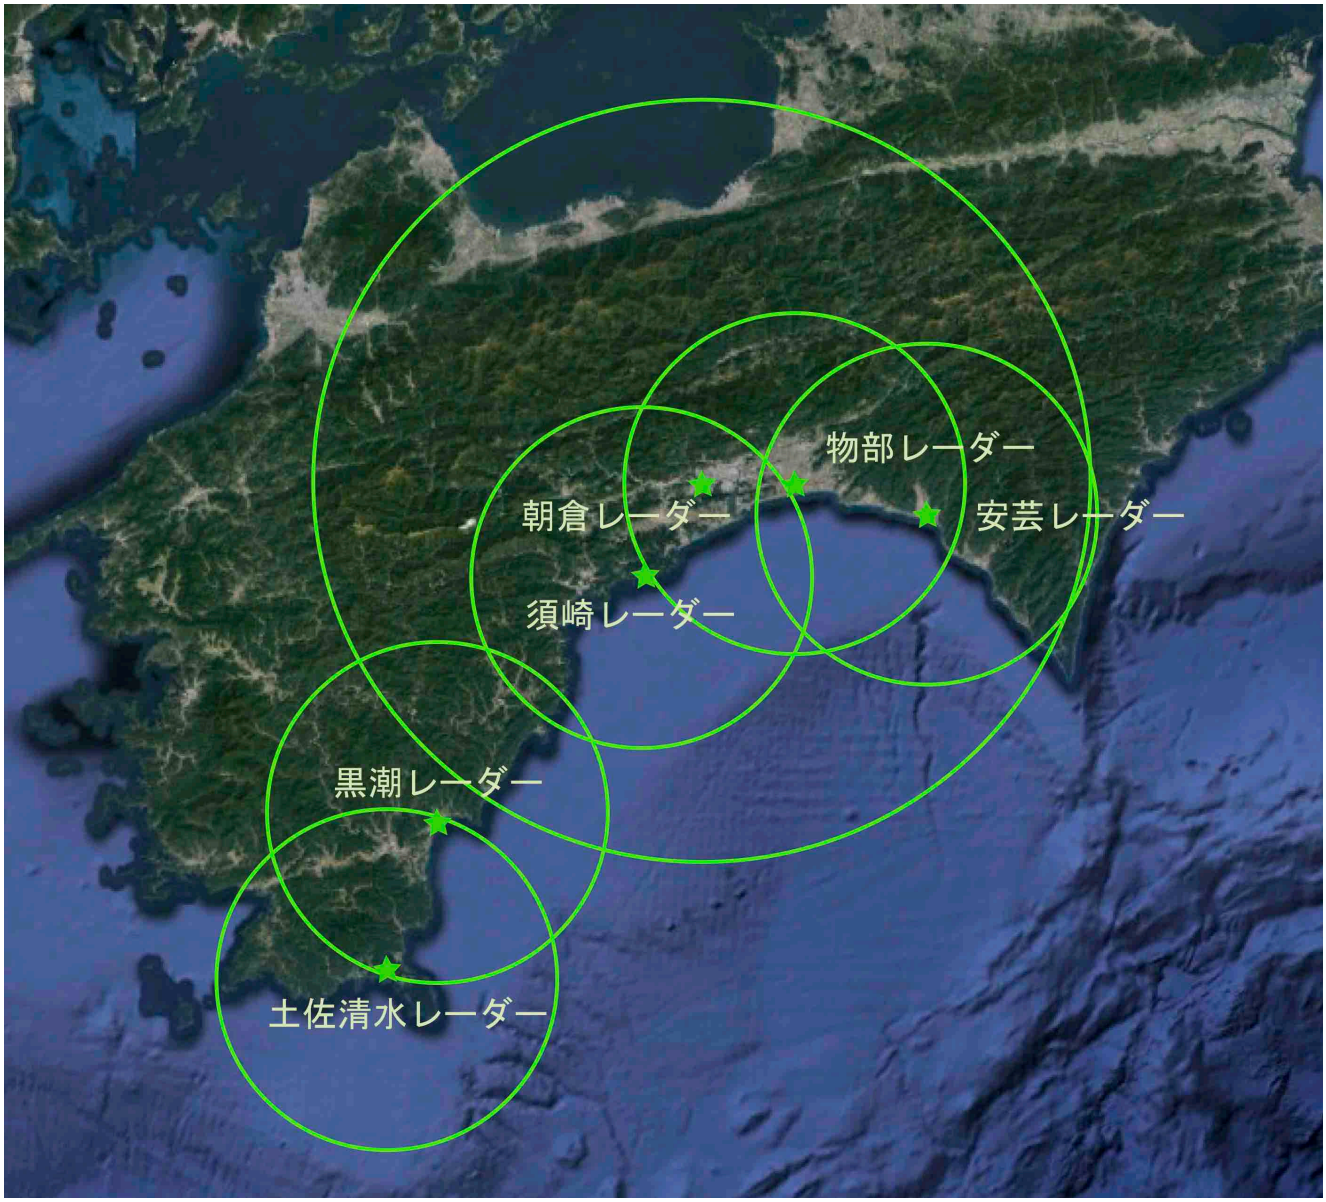
Kochi radar network composed of compact X-band radars



*Koji Sassa[1], Toshiaki Takaki[2], Ken T Murata[3]

1. Natural Science Cluster, Kochi University, 2. Furuno Electric Co.,Ltd., 3. National Institute of Information and Communication Technology

Kochi Prefecture is the heaveist rain area in Japan. Heavy rain events and hazardous winds causing disaster frequently occur there. But, only one C-band Doppler radar of JMA and two C-band polarymetric radars in high mountains cover the area and warm rain near ground cannot be observed by these radars well.
Then we constructed high resolution radar network composed of 6 compact X-band polarymetric radars settled in Kochi Prefecture and started continuous observation. These radars are solid state type. The observation range and beam width of one radar is 80 km and 2 deg., respectively. The other 5 radar observes within 30 km and these beam width is 2.7 deg. They make volume scan at relatively low elevation angles every 1 minute and 1 km CAPPI data are obtained from them. These big data are corrected in science cloud in NICT via wonms settled at each radar sights. We can show the 1km CAPPI network data about 4minutes after the observation.
We succeeded to observe the organised convection systems, such as linear rain bands by 5 radars when torrential rain occurred in the west Japan in early July, 2018. We also observed the vortices in parent clouds causing tornadoes in detail.

Rain Echo Classification by Deep Learning Using Observation Big Data of Phased Array Weather Radar

*Shinsuke Satoh[1], Hiroshi HANADO[1], Seiji Kawamura[1], Tomohiko Konno[1], Michiaki Iwazume[1], Shigenori Otsuka[2], Takemasa Miyoshi[2]

1. National Institute of Information and Communications Technology, 2. RIKEN Center for Computational Science

The phased array weather radar (PAWR) was developed with the goal of early detection and prediction of sudden weather disasters caused by torrential rain and tornados and gusts. The PAWRs installed in Suita, Kobe, Okinawa, are operated regularly and generate three-dimensional data every 30 seconds. The observation big data exceeding 2 PB has been accumulated. The real-time observation data is used by the smartphone app "3D Rain Watch" and "RIKEN 3D Nowcast" and the research results of data analysis and data assimilation have been published, but the accurate prediction of torrential rain could not be realized. Also, many of archived past data cannot be used effectively. In recent years, it has become an era when a computer can realize judgment using a deep learning which has developed rapidly. Although deep learning needs to be learned using a large amount of data, new results which cannot obtain by human data analysis, are expected. In this study, we aim to automatic extraction of the precursor phenomena leading to torrential rain prediction by using deep learning technology called convolutional neural network (CNN). As the first attempt, we try to classify rain echoes from two-dimensional image data of rainfall distribution observed by PAWR. In terms of rain echo classification, the difference in rainfall type, convective or stratiform, is also important, but in addition to that, we attempt to classify rainfall distribution patterns such as isolated, linear, and mass.
The original data of PAWR observation is archived as binary data of polar coordinates, but for this deep learning we use a quick look (QL) image showing the horizontal distribution of the radar echo intensity of the altitude of 2 km which is published in real time on the Web Page. The number of accumulated QL images of Kobe PAWR reaches 4 million in total, but more than half are QL images without rain in the radar observation range of 120 km in diameter and cannot be used for rain echo classification. In order to perform deep learning, it is necessary to label the QL images, but it is not easy for a man to manually label 10000 images. Fortunately, in order to create a rain summary graph on the Web, numerical information of the average rainfall amount, maximum rainfall amount, and rainfall area corresponding to each QL image is saved as a text file. After rough labeling using the information, eventually it is judged by human eyes. Finally, we classify into eight categories of strong / weak isolated convective, linear convective, mass convective, stratified, and no rainfall. Using more than 900 samples in each category from 50 days observation data in June, July, August 2016, we repeatedly learned them about 1000 times using a simple 7-layer CNN, and as a result it was able to perform rain echo classification with an accuracy of 72%. We believe it is possible to increase accuracy by removing ambiguous labeling samples or using a more complicated CNN network. In the future, we want to advance research that leads to heavy rain prediction by using three-dimensional data and time-series data.

Internet of Things (IoT) where data of many sensors are collected through the Internet is one of important social infrastructure technologies. Various sorts of regional IoT technologies were developed and expected to be tools for the enhancement of public services and the resolution of public issues in the community thorough use and application of the collected data. We conducted communication environment measurement of private LoRa (Long Range), which is one of the low-power wide area (LPWA) communication technologies in Chikuma city, Nagano prefecture, Japan, using community bus services. In this experiment, we set up LoRa relay stations at three locations in the city: the Koshoku governmental building (the northern part of the city), the Togura governmental building (the southern part of the city), and the Amenomiya drainage plant (the eastern part of the city). In addition, beacon transmitters were installed in the community buses (nine routes in all). The location and time information were transferred from the routes of the buses to the NICT Science Cloud servers in real time through the relay stations. Experimental results are summarized in an area map, indicating that we succeeded in communicating in most of the bus routes and confirmed the possibility of covering the entire city by the LPWA. Even in the insensitive area of this experiment, the communication will become possible by adding several relay stations.

Development of an inexpensive and small balloon observation device, and its application in observing the Earth's upper atmosphere

*Taku Takada[1], Yui Sasaoka[1], Shiya Ueta[1], Ken T. Murata[2], Hidehiko Suzuki[3]

1. National Institute of Technology, Kochi College, 2. National Institute of Information and Communications Technology, 3. Meiji University

In this presentation we will outline the development of an inexpensive and small balloon observation device and its use in observing the Earth's atmosphere, from the troposphere to the stratosphere. By enclosing helium in a rubber balloon used for meteorological observation, it is possible to make the observation device fly in a region extending beyond the troposphere to the stratosphere. We have been developing balloon observation devices and carrying out balloon-based observation experiments with students since 2014. In 2018, we aimed to develop an observation system capable of monitoring the flight path of the balloon devices, by installing three to four ground stations (including mobile stations) and using communication equipment based on Long Range (LoRa) modulation of the 920 MHz band. We conducted experiments with LoRa communication equipment with a line-of-sight of up to 28 km, which confirmed that communication via LoRa modulation can be successfully applied in balloon monitoring. Furthermore, we are currently developing a balloon detachment system and, by separating the balloon near the designated altitude, we can shorten the distance traveled in the horizontal direction and lengthen the observation time at the optimum altitude. In the current balloon observation system, we aim to develop its use for various atmospheric observations, mainly for classifying the following three observation sequences: (1) when reaching the stratosphere (about 25 km altitude), the balloon bursts and deploys a parachute; (2) when reaching an altitude of about 15 km, when air density becomes sufficiently low, the balloon detaches and deploys a parachute, (3) when reaching an altitude of between 7 and 10 km, after completely passing through the tropospheric cloud layer, the balloon detaches and deploys a parachute. We hope to develop a balloon observation system suitable for use with various observation targets.

Introduction of “ChOWDER”: A tiled display driver that augment large scale visualization of geoscience.

*Tomohiro Kawanabe[1], Kenji Ono[2], Atsushi Higuchi[3], Koichi Toyoshima[3], Kazunori Yamamoto[4], Kazuya Muranaga[5], Ken T. Murata[4]

1. RIKEN , 2. Kyushu Univ., 3. Chiba Univ., 4. NICT, 5. Systems Engineering Consultants Co.,LTD.

1. Introduction
The Tiled display is a method that tiles multiple physical displays to provide large pixel space. Demand for tiled displays is expected to increase in the research fields that deal with data requiring large-scale, high-resolution visualization such as geoscience. In this paper, we first describe the outline of "ChOWDER", a system that realizes tiled display in software, and then introduce example applications in geoscience. Finally, we will explain how to obtain ChOWDER software.

2. ChOWDER
ChOWDER is an open source tiled display driver which is jointly conducting research and development between RIKEN and Kyushu University, running on Windows, Linux, and macOS. It has a unique feature called "Virtual Display Area "(Hereinafter referred to as" VDA ") which is not available in other tiled display drivers.
The VDA is a logical two-dimensional space managed by the ChOWDER server, and the display contents can be arranged at arbitrary positions and magnification ratios here. In addition, since the display device which is the content display destination can also be placed on the VDA at an arbitrary position/magnification ratio, by using this, it is possible to build a tiled display with high flexibility such as mixed displays with different resolutions and aspect ratios.
Since the necessary software for the display device is only an ordinary Web browser such as Firefox, Chrome, there is no need to install special software or expensive graphics board corresponding to multiple display connection. When the Web browser connects to the ChOWDER server, it is in the full-screen display mode, and the whole pixels of the physical display is used as the display area of ChOWDER. In other words, it functions as (a part of) the ChOWDER tiled display as long as it is a device on which the ordinary web browser runs.
Also, the device of the display content sending side needs only the Web browser. Static content such as text file, image file, PDF file and streaming contents such as movie file, the desktop screen of sending side device, web camera can be displayed on ChOWDER tiled display.
In addition, ChOWDER can mirror tiled displays of multiple sites. By lay over the display device positions of each site on the above VDA, it is possible to share and display contents between multiple sites.
With these features, we believe ChOWDER is a flexible software that can build a tiled display with a relatively small investment.

3. Use cases
Fig.2 shows a 16K resolution image by visualization software HIVE developed by RIKEN and display it to a tiled display consisting of twelve 4K display (15,360 ×6,480 total pixel resolution) through ChOWDER. It is parallel computation result of climate simulator NICAM used the whole system(88,128CPU) of "K computer". HIVE has the function of directly transmitting the rendering result image to ChOWDER, hence it is possible to simultaneously observe the entire overview and detailed parts without thinning out the high-resolution data generated by the large-scale simulation using the supercomputer.
Fig.3 shows a tiled display (17,280 ×5,120 total pixels) composed of 36 full HD displays owned by the

©2019. Japan Geoscience Union. All Right Reserved.

Center for Environmental Remote Sensing, Chiba University. It displays two of AMATERASS (http://amaterass.nict.go/ index.html) screens and an image from Himawari 8 provided by the National Institute of Information and Communications Technology. The screen of AMATERASS is streamed from the users PC screen to ChOWDER, and when AMATERASS is operated on the PC, it also follows the display on the tiled display at the same time. Since PCs of multiple users can be displayed as contents sending sources and respective information can be displayed side by side on one tiled display, bird's-eye view-ish collaborative work can be performed.

4. Software distribution

ChOWDER is an open source software distributed under the BSD 2 clause license and can be used free of charge for academic and commercial use. You can download software and user documentation from GitHub. (https://github.com/SIPupstreamDesign/ChOWDER)

Keywords: Tiled Display, Visualization, Web Browser, Collaborative work

The ERG (Exploration of energization and Radiation in Geospace) is a Japanese geospace exploration project. Its core component is the ERG satellite, also known as Arase, an inner magnetosphere satellite with the full set of particle and field instruments launched on December, 2016. The ERG project consists of the satellite observation team, the ground-based network observation team, and the integrated data analysis/simulation team. Besides these research teams, ERG Science Center (ERG-SC) has been organized and operated by ISAS/JAXA and ISEE/Nagoya University from the very beginning of the ERG project. Since then, ERG-SC has been playing an essential role in managing the data center for all kinds of scientific data as well as promoting close collaborations of the three teams and other research projects, maximizing scientific output from the ERG project. For studies of Geospace, where different plasma populations are interacted with each other via cross-energy and cross-regional coupling processes, the integrated data analysis combining various kinds of data sets is key to comprehensive understanding of multiscale dynamical processes. For these purposes, the level-2 (calibrated, in physical unit) science data and higher level data products of the Arase satellite as well as the ground observation network data are archived in the Common Data format (CDF), which was developed by NASA, and are basically open freely to the international science community from the ERG-SC data repository. The integrated data analysis tool is also developed on the basis of the Space Physics Environment Data Analysis Software (SPEDAS), which is de facto standard software of the space physics community, enabling the data users to combine Arase data with the other satellite, ground, modeling data seamlessly in plotting and manipulating them.

Department of Mechanical and Electrical Engineering, National Institute of Technology, Tokuyama College, 4. University of Iowa, 5. KOSEN-1 Team, 6. Middle Tennessee State University, 7. University of Maryland Baltimore County, 8. NASA Radio JOVE Team

Since the discovery of Jupiter's decametric radio emissions in 1955, important details of its radiation mechanism have not yet been elucidated. In order to investigate the beaming structure of Jupiter's radio emission to clarify aspects of the emission mechanism, we plan to launch a 2U-size CubeSat for observation of Jupiter's radio waves and observe simultaneously in outer space and on the ground. The purpose of this project is to measure the emission delay time by using a correlation analysis method. The delay time can be measured by the correlation analysis of waveform data obtained by simultaneous observations of Jupiter's radio S-bursts between this satellite and the ground. If the beam of Jupiter's radio S-bursts is moving together with the rotation of Jupiter, we can calculate a time difference of about 70 milliseconds at the baseline length of 8000 km. Using the proposed simultaneous observations, it is possible to test whether the Jovian S-bursts are emitted like a 'beacon', rotating with Jupiter's magnetic field and sweeping by the Earth, or like a 'flashlight', an instantaneous emission with a 0 millisecond time delay. This information is very important to determine the nature of the Jupiter's radio emission mechanism.

Our application for the launch of a 2U-CubeSat named KOSEN-1 by a JAXA Epsilon rocket was selected on Dec. 12, 2018, as a CubeSat candidate for JAXA's innovative satellite technology demonstration program. This rocket launch including our KOSEN-1 project is scheduled at the end of 2020. The worldwide ground-based observations together with the KOSEN-1 satellite will be supported by the NASA Radio JOVE project, an education and outreach program for planetary radio astronomy.

The KOSEN-1 project is supported by the Coordination Funds for Promoting AeroSpace Utilization of the Ministry of Education, Culture, Sports, Science and Technology (MEXT), JAPAN.

We have obtained various types of auroral image data in various shooting styles around the world. In this lecture, we will report on several problems of data processing. Experiments currently undertaken include real-time image processing of aurora with possibility of 4K / 8K streaming, acquisition of continuous image data of 100 fps by the EMCCD camera and the data release, and photographing of aurora from unmanned aircraft using a small infrared camera. In the past attempts using commercially available digital cameras, outreach-purpose experiments include 4K-3D dome-master time-lapse images and 20K-VR shooting, scientific-purpose experiments include automatic detection of auroras to control high-speed imaging of aurora.

Innovative progress in ground observation of snow crystals and weather conditions by citizen science

*Kentaro Araki[1]

1. Meteorological Research Institute

To improve forecasts of snowfall events, a better understanding of the horizontal distribution of precipitation types and the microphysical properties of snow clouds is required. Observations of cloud microphysical properties, however, has been limited because of the sparse observation network. Recently, ground observations of precipitation types are performed by citizen science approaches especially in United States. In this study, ground observations of snow crystals and weather conditions are conducted by citizen science in Japan, and we would like to introduce recent progress in ground observation study and discuss the potentialities and challenges of citizen science big data.

The Meteorological Research Institute (MRI) has conducted the "#KantoSnowCrystal Project" to collect images of snow crystals from citizens during snowfall events in the Kanto and Koshin regions in Japan from November 2016. Smartphone cameras were used to capture the images, which were mainly collected through social networking services. Through the project, we were able to establish an easy method for snow crystal observation and data collection. More than 10,000 snow crystal images were gathered throughout the 2016-2017 winter, of which 73% were analyzable. In the case of heavy snowfall event in the Kanto plain on 22 January 2018, more than 40,000 snow crystal images were gathered in only a day. The #KantoSnowCrystal Project thereby realized spatiotemporally ultra-dense observations of snow crystals in these metropolitan areas, and the observation dataset should contribute to investigations of snowfall mechanisms in these areas and the verification and improvement of numerical weather models, etc. The amount of data, however, varied considerably between heavily populated central urban areas and less-populated inland areas. As the number of the data became enormous, it was also a challenge to efficiently collect and analyze the big data.

To investigate the characteristics of citizen science data, an existing dataset obtained from citizens of the "10-minute weather report" provided by Weathernews Inc. was examined. In this data, weather types are classified into 15 categories based on citizens' experiences. From the result of the examination of about 60 million weather reports from 2012 to 2017, it was found that the number of citizen science data and the population were proportional and the number of the data highly depended on human activity. The number of the data tended to increase in the case of rare and severe storm events in the metropolitan areas, such as heavy snowfall events in Tokyo in winter. From the comparison of the data between citizen science and the Japan Meteorological Agency, about 90 % of the weather types of rain and snow agreed in each data. The coincidence rate of weather type, however, declined for graupel and mixed rain and snow. These results indicate that citizen science data is effective in the snowfall study in the metropolitan areas and greatly contributes to the snowfall study if there is objective information such as photographs of precipitation.

Based on the results of these studies, the #KantoSnowCrystal Project of the MRI has started to use the App "SoraWatch by 3D AmagumoWatch" (https://sora-watch.3d-amagumo.com/) for smartphone and tablet devices and to gather the information of weather type and snow depth images in addition to snow crystals from all over Japan from February 2019. Citizen scientists are able to select 16 weather types (sunny, cloudy, rain, mixed rain and snow, snow, ice pellet, hail, thunder, tornado, fog, frost, burnt sky,

©2019. Japan Geoscience Union. All Right Reserved.

rainbow, cloud iridescence, halo and arc, and the other), 11 snow crystal types, and snow depth with these photographs on the App. The database is also available for the purpose of scientific research and education. Big data obtained from citizen scientists through the App has possibility to contribute to not only the snowfall study but also various meteorological research fields, educations, commercials, etc.

Efforts of landslide susceptibility mapping for slope disaster risk evaluation

*Kazunori Hayashi[1], Akihiko Wakai[2], Go Sato[3], Takashi Kimura[4], Ken T. Murata[5], Akino Watanabe[2]

1. Okuyama Boring Co., Ltd., 2. Gunma University, 3. Teikyo Heisei University, 4. National Research Institute for Earth Science and Disaster, 5. National Institute of Information and Communications Technology

We introduce the current situation and efforts of the landslide susceptibility mapping method required for risk evaluation of slope disasters in this presentation.

The type of ladnslide movement is controlled by the geological and geomorphological factors. For example, shallow-seated landslides and highly fluidized landslides frequently occur on slope covered by unconsolidated volcanic sediments. Moreover, in Sedimentary rock regions with continuously bedding plane structure, large translational slides prone to occur on dip slope, while shallow-seated landslides prone to occur on steep cliffs of the anti-dip slope. In other words, the factors of data used for landslide susceptibility mapping and their weighting depend to the type of landslide movement at each slope, and on the geological and geomorphological conditions at each region.

On the other hand, rainfall indices such as effective rainfall and soil water index are used for announcement of the landslide disaster alert in Japan, but it does not sufficiently consider geographical and geomorphological conditions. For this reason, the spatial resolution as an evaluation unit is only 5 km square, and issues are still remained for landslide risk evaluation on each slope units and classification of landslide susceptibility areas. In addition, it is generally difficult to evaluate large-scale, deep-seated landslides, which are caused by complicated geological structures and underground hydrological conditions.

In this presentation, as a case study of the landslide susceptibility mapping considering geological and geomorphological factors, the activity evaluation of the landslide slopes using the AHP method, development of susceptibility mapping method for earthquake-induced landslides, and heavy rainfall-induced landsides in the volcanic regions will be introduced. A new slope stability evaluation method using a simple prediction model for shallow groundwater level rising will be introduced as well.

Keywords: landslide, slope, heavy rainfall, earthquake, disaster, susceptibility mapping

[M-AG41] Dynamics of radionuclides emitted from Fukuchima Dai-ichi Nuclear Power Plant in the environment

convener:Yoshio Takahashi(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Kazuyuki Kita(Faculty of Science, Ibaraki University), Yuichi Onda(Center for Research on Isotopes and Environmental Dynamics, University of Tsukuba), Daisuke Tsumune(Central Research Institute of Electric Power Industry), Chairperson:Yoshio Takahashi(東京大学), Yuichi Onda(Center for Research on Isotopes and Environmental Dynamics, University of Tsukuba)

The Great East Japan Earthquake caused the severe accident in TEPCO Fukushima dai-ichi nuclear power plant (FDNPP), leading to emission of huge amount of radionuclides to the environment. They have been transported and diffused by atmospheric motion, depositing them to soil and vegetation. Deposited radionuclides are dynamically shifted in the earth environment; atmosphere, soil, inland water, ocean, and ecosystem. To understand this dynamic shift in the environment and for the long-term prediction of the disaster by the radionuclides, investigation and discussion based on not only the earth sciences including ecology but also on the radiochemistry and other related sciences. In this session, various efforts to understand the dynamic behavior of radionuclides emitted from FDNPP accident in the earth system as well as to predict their influences on the environment. It is expected that this session will offer a good opportunity to discuss radionuclides in the earth environment from wide aspect and to exchange information in various research fields.

The 2011 Fukushima Daiichi Nuclear Power Plant (F1NPP) accident caused several significant releases of radioactive particulates into the environment.The physical and chemical properties of these particles, which have not been known before,have been an area of significant study. It is suggested that these fine particulates could also remain,in significant amounts,inside the nuclear reactor cores where the accidents occurred. Though appropriate samples cannot currently be obtained from the inside of the stricken reactor cores, radioactive particles collected near to the site serve as a valuable evidence for elucidation of the accident events for each reactor unit explosion and as micro-scale samples of the residual fuel debris inside the reactors. Study of these particles can help to better establish an acceptable procedure for decommissioning (collection of molten fuel, etc., decontamination inside the reactor, safety of workers, etc.). Thus, it is necessary to investigate the physical and chemical properties using advanced micro-scale analytical methods, at the same time as examining effective separation and collection methods for the radioactive particles based on the obtained property information. This will all contribute to risk reduction of the whole "decommissioning" plan. Thus, we started the analysis of such radioactive particles by using the state-of-the-art technologies such as micro-X-ray analysis, Kelvin force microscopy, induced flourescent microscopy, etc. along with radiochemical analysis.

Dynamics of radioactive microparticles released from the Fukushima nuclear plant: heating and dissolution characteristics

*Taiga Okumura[1], Noriko Yamaguchi[2], Terumi Dohi[3], Kenso Fujiwara[3], Kazuki Iijima[3], Toshihiro Kogure[1]

1. The University of Tokyo, 2. National Agriculture and Food Research Organization, 3. Japan Atomic Energy Agency

A significant amount of radiocesium was released due to the Fukushima Daiichi Nuclear Power Plant accident in March 2011, causing radioactive contamination in east Japan. Most of the radiocesium is believed to have been released in a gaseous state, descended with rainwater and sorbed mainly by clay minerals in soil. On the other hand, spherical microparticles substantially consisting of silicate glass (radiocesium-bearing microparticle, CsMP) were also released from the damaged reactors. CsMPs are generally spherules of a few microns in diameter and contain Cl, K, Fe, Zn, Mn, Rb, Sn, and Cs in silicate glass. Since CsMPs have very high radioactivity per particle compared with soil particles sorbing radiocesium, the influence of radiation on their vicinity is a concern. However, the knowledge about dynamics of CsMPs in the environment is still limited and required urgently. Here, we report heating and dissolution characteristics of CsMPs.

Incineration of radioactive waste including CsMPs is under consideration for volume reduction. Therefore, we collected CsMPs and heated in the air in order to investigate their thermal behavior. As a result of heating treatment, the radioactivity of CsMPs gradually decreased from 600 ˚C and almost disappeared when heated up to 1000 ˚C. Scanning electron microscope (SEM) examination revealed that the morphology of CsMPs did not change even after heating at 1000 ˚C, but Cl and alkaline elements such as Cs and K were diffused away from CsMPs. The internal structure of CsMPs after heating was also investigated using transmission electron microscopy (TEM). Fe, Zn and Sn originally dissolved in the glass matrix were crystallized to oxide particles inside the CsMPs. Furthermore, when CsMPs were heated together with weathered granite soil collected in Fukushima, the radiocesium released from CsMPs was adsorbed by soil particles. These results of heating experiments suggested that highly radioactive particles such as CsMPs do not remain in the waste incinerated at a sufficiently high temperature.

Although CsMPs have been reported as “insoluble” particles thus far, they should be gradually dissolved in the environment because they substantially consist of silicate glass. We conducted dissolution experiments using CsMPs collected from the environment and investigated the dissolution behavior and lifetime of CsMPs. CsMPs were incubated in three kind of solutions, namely pure water, artificial seawater, and hydrochloric acid, under various temperature conditions, and the dissolution rate of CsMPs was estimated from the decrease in radioactivity. Furthermore, the activation energy for dissolution was calculated from the Arrhenius plot, resulting in 65 and 88 kJ/mol for pure water (pH is ~5.2 due to absorption of carbon dioxide in the atmosphere) and seawater, respectively. The calculated dissolution rate at 13 ˚C (approximate average temperature in Fukushima) is ~10 times larger in seawater than in pure water, and CsMPs are expected to be completely dissolved in seawater within ~10 years. This suggests that most of the CsMPs that fell into the sea immediately after the accident have already been disappeared. SEM observation of the CsMPs before and after dissolution in pure water revealed that their size was decreased and their spherical shapes were considerably altered without maintaining geometry. In the case of the CsMPs dissolved in seawater, plate-like secondary minerals rich in Fe and Mg were precipitated around the CsMPs to form a crust, and glass matrix was dissolved inside the crust. In addition, when CsMPs were incubated in hydrochloric acid with pH adjusted to 3, the radioactivity decreased considerably at the beginning, but ceased to change with time. A layer mostly consisting of SiO_2 was formed on the surface of the CsMPs, which may become a passive layer inhibiting dissolution.

Dynamics of atmospheric ^{131}I just after the Fukushima accident related to ^{137}Cs by analysis of published data

*Haruo Tsuruta[1], Yuichi Moriguchi[2], Teruyuki Nakajima[3]

1. Remote Sensing Technology Center of Japan, 2. The University of Tokyo, 3. Japan Aerospace Exploration Agency

The spatio-temporal distribution of atmospheric ^{131}I just after the Fukushima Daiichi Nuclear Power Plant (FD1NPP) accident has not been understood due to the very limited measurements, compared to those of atmospheric ^{137}Cs and to many datasets of ^{131}I deposition density measured in east Japan. Accordingly, current estimates of internal exposure from inhalation have large uncertainty. The purpose of this study is to clarify the behavior of atmospheric ^{131}I in east Japan just after the accident, analyzing all the published data in the east Fukushima and Kantou areas. In the Kantou area, we mainly analyzed the data measured at JAEA-Nuclear Science Research Institute (NSRI) in Tokai (Ohkura et al., 2012). In the east Fukushima area, we used the data measured by Ministry of Education, Culture, Sports, Science and Technology (MEXT, 2012), by US Department of Energy (DOE)/National Nuclear Safety Administration (DOE/NNSA, 2011), and by Tokyo Electric Power Company (TEPCO, 2011) who measured on the sites of FD1NPP and Fukushima Daini Nuclear Power Plant (FD2NPP). The particulate/aerosol ^{131}I(g) and volatile/gaseous ^{131}(a) concentrations were decay-corrected to March 11, 2011 to normalize all the data due to the short half-life time of 8 days (the symbol of * is used). The major results are as follows. (1) For most of the dataset, particulate radionuclides were collected on the first filter (HE-40T or HE-40TA), and gaseous radionuclides were collected on the second filter cartridge (CHC-50 impregnated with 10% of TEDA) to increase in the collection efficiency of gaseous ^{131}I. The ^{137}Cs concentrations were detected on not only the first filter but also the second filter. After checking the data at NSRI in detail, we used the ^{137}Cs data only on the first filter mainly due to any contamination of measurement/sampling system (Ohkura et al., 2013; Tsuruta et al., to be submitted), while we used the ^{131}I data collected on both of the first and second filters. (2) The ratios of ^{131}(a+g)*/^{137}Cs in radioactive plumes were divided to three groups of A (10), B (75), and C (360). In addition, the ratios of ^{131}I(a)*/^{131}I(a+g)* were also divided to the same three groups. (3) These differences were caused by each plume, regardless of the measurement sites located in east Fukushima or Kantou area. Radionuclides in the A group were estimated to be emitted from Unit 2 and/or Unit 3, because the ratio of 10 was nearly equal to the inventory data of 9.7 (Unit 2) and 9.2 (Unit 3) by Nishihara et al.(2012). In contrast, the ratios in groups B and C were much higher than in group A. (4) The extremely high ratios of ^{131}(a+g)* /^{137}Cs in Group C measured from the afternoon of March 21 to March 25 were possibly caused by a new emission event after water supply to FD1NPP, such as the one proposed by Hidaka and Ishikawa (2014). This new event should be studied in future, although Group C has not been focused until now.

Distribution of ^{237}Np and Plutonium isotope in terrestrial environment in Fukushima Prefecture

*Miho Fukuda[1], Zheng Jian[1], yamazaki Shinnnosuke[1], Tatsuo Aono[1]

1. National Institute for Quantum and Radiological Science and Technology, National Institute of Radiological Science

After the accident at the Fukushima Dai-ichi Nuclear Power Station (FDNPS) happened in March 2011, large amounts of radionuclides released from the FDNPS into the atmosphere and marine environments.The total amounts of ^{134}Cs and ^{137}Cs, which are volatile materials, released from the accident were estimated as 18 PBq and 15 PBq, respectively. In contrast, those of ^{238}Pu,^{239}Pu and^{240}Pu, which are non-volatile materials, amounts were estimated as 0.0019 PBq, 0.0000032 PBq and 0.0000032 PBq and these amounts were not many compared to abundance before the accident (Report of Japan government to the IAEA Ministerial Conference on Nuclear safety, 2011). ^{241}Pu, half-life of which is about 14 year, detected in forest litter samples at some stations collected in April and May, 2011 and it is suggested that these samples were originated from the FDNPS accident also using the results of ^{240}Pu/^{239}Pu and^{241}Pu/^{239}Pu atomic ratio (Zheng et al., 2013). It is possible to identify origin to Pu and Np isotopes using not only Pu isotope atomic ratio such as ^{240}Pu/^{239}Pu and^{241}Pu/^{239}Pu but also ^{237}Np/^{239}Pu atomic ratio. Shozugawa et al (2012) reported that many radionuclides including^{239}Np in terrestrial environment soil and pine leaf collected in front of FDNPS and Iiidate Villege were measured. Other than Shozugawa et al (2012), reports for Np in Environment after the FDNPS accident was almost nothing. In this study, we discussed spatial distributions and origin for Neptunium (Np) and Pulutonium (Pu) based on the results of the Neptuniumand plutonium atom ratios (^{237}Np/^{239}Pu,^{240}Pu/^{239}Pu, ^{241}Pu/^{239}Pu) in soil samples collected in Fukushima Prefecture.Collected soil samples were air-dried,and then, ashed using muffle furnace at 450˚C at least 4 hours to decompose the organic matter (Wang et al., 2015). 0.57 pg of ^{242}Pu was used as recovery tracer for^{237}Np and Pu isotopes. Then, the anion-exchange resin AG MP-1M was used separated of ^{237}Np and Pu isotopes from u, Th and other interfaces (details for Haung et al. prepared).^{237}Np and Pu isotope measured using the Sector-Field ICP-MS. The ^{237}Np activity concentrations in soil samples were 1/100-1/1000 values compared to those of ^{239}Pu and ^{240}Pu. The rough profiles for these all radionuclide decreased with increasing core depth. Both ^{237}Np/^{239}Pu and ^{240}Pu/^{239}Pu atomic ratios were generally within global fallout ranges. Hereafter, it is necessary to elucidate factor controlling a values of outside the range in some layer were outside value.

This work was partially supported by Research and Development to Radiological Sciences in Fukushima Prefecture.

Study on deposition of ^{134}Cs and ^{137}Cs from atmosphere to freshwater environment using a mountainous lake, Lake Haruna in Gunma Prefecture, Japan

*Seiya Nagao[1], Shouhei Miyasaka[2], Shun Watanabe[3], Kyuma Suzuki[3], Shinya Ochiai[1]

1. Institute of Nature and Environmental Technology, Kanazawa University, 2. Graduate School of Natural Science and Technology, Kanazawa University, 3. Gunma Prefectural Fisheries Experimental Station

The Great East Japan Earthquake occurred on 11 March 2011 and damaged the Fukushima Daiichi Nuclear Power Plant (FDNPP) seriously. Through the FDNPP accident, a large amount of radiocesium was released to the environment. It is important to elucidate the short-term and long-term impacts of the accident on terrestrial environments.

This study investigated the deposition of ^{134}Cs and ^{137}Cs at a mountainous lake, Lake Haruna, which is located at 1084 m height in Gunma Prefecture, Japan. The lake has a small inflow stream and one outflow river with watershed of relatively high radiocesium accumulation area. The lake sediments were collected at two sites from northern part (HR1) and central part (HR2) of the lake by using a gravity corer in September 2015. The sediment core samples were sectioned for 1 cm interval. The sediment core was also collected at HR3 from central part of the lake in October 2017. After freeze-drying of the sectioned samples, the radioactivity of ^{134}Cs and ^{137}Cs were measured by a low background Ge detector of Low Level Radioactivity Laboratory, Kanazawa University and shows as Bq/kg in dry-sediment basis at the sampling date.

Radioactivity of ^{134}Cs and ^{137}Cs ranged from D.L. to 2,922 Bq/kg and from D.L. to 34,000 Bq/kg, respectively. Two peaks of the radioactivity are observed for the HR1 sediments at 2-3 cm and 5-6 cm depth in core. One distinct peak of the radioactivity of ^{134}Cs and ^{137}Cs is observed at 3-4 cm depth in the core of HR2. Maximum of the radioactivity is also detected for the HR3 sediment core (2,920 and 23,760 Bq/kg) at 4-5 cm depth. The sedimentation rate based on ^{210}Pb for the HR1, HR2 and HR3 was 0.14, 0.031and 0.026 $g/cm^2/y$, respectively. The higher sedimentation rate at HR1 shows two peaks, but lower sedimentation rate at HR2 and HR3 show one peak of radiocesium concentration. However, the inventory of ^{134}Cs is almost constant (2.1-2.3 $x10^4$ Bq/m^2) for the three sampling sites. Two major deposition was observed in the middle of March and the early of April 2011 from the monitoring data of air gamma-ray dose rate at Takasaki and the fallout analysis of radiocesium at Maebashi in Gunma Prefecture. These results suggest that the accumulation of rediocesium at Lake Haruna mainly results from atmospheric deposition and shows short-term deposition to the bottom sediment at early stage of the accident.

Departments of Geography, University of Delaware, Newark, Delaware, USA

This study aims to clarify the spatial variability radiocesium deposition through the tree canopy via branchflow and stemflow in the aftermath of the Fukushima Dai-ichi Nuclear Power Plant accident. Working in both a coniferous forest (*Cryptomeria japonica*, young Japanese cedar stands, mean height is 10.9 m, mean DBH is 0.560 m) and a mixed deciduous broadleaved forest (*Quercus serrata*, Japanese oak stands, mean height is 14.3 m, mean DBH is 0.789 m), we investigated the fate of radiocesium transported by branchflow from upper and lower portions of canopy and deposited by stemflow at trunk-based. Particular attention was paid to the leachable radiocesium at the tree canopy and the mechanism of radiocesium transport via stemflow and branchflow. In addition, we used isotopes to clarify the signature of evaporation loss via branchflow and stemflow on its routing through the canopy. Significant variability of ^{137}Cs concentration was detected among the sampling periods and differed between the two forests, with the oak stand generally exhibiting higher a ^{137}Cs concentration than the cedar stand. The preliminary results further revealed that the ^{137}Cs concentration was larger from dead foliage as compared to mixed and young foliage at the branchflow of cedar stand. Radiocesium leached more in lower stemflow of the trunk compared to upper trunk stemflow, possibly due to the increased residence time of stemflow on the lower reaches of the trunk. We also found that the isotopic composition of branchflow was generally enriched in δ^{18}O and δD compared to open rainfall and throughfall. However, the differences in enrichment between branchflow and stemflow remain unclear. Canopy architecture and canopy cover affected the cycling of radiocesium in stemflow and branchflow by foliage storage and washout capacity.

[M-AG41] Dynamics of radionuclides emitted from Fukuchima Dai-ichi Nuclear Power Plant in the environment

convener:Yoshio Takahashi(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Kazuyuki Kita(Faculty of Science, Ibaraki University), Yuichi Onda(Center for Research on Isotopes and Environmental Dynamics, University of Tsukuba), Daisuke Tsumune(Central Research Institute of Electric Power Industry), Chairperson:Kazuyuki Kita(Ibaraki University), Daisuke Tsumune(Central Research Institute of Electric Power Industry)

The Great East Japan Earthquake caused the severe accident in TEPCO Fukushima dai-ichi nuclear power plant (FDNPP), leading to emission of huge amount of radionuclides to the environment. They have been transported and diffused by atmospheric motion, depositing them to soil and vegetation. Deposited radionuclides are dynamically shifted in the earth environment; atmosphere, soil, inland water, ocean, and ecosystem. To understand this dynamic shift in the environment and for the long-term prediction of the disaster by the radionuclides, investigation and discussion based on not only the earth sciences including ecology but also on the radiochemistry and other related sciences. In this session, various efforts to understand the dynamic behavior of radionuclides emitted from FDNPP accident in the earth system as well as to predict their influences on the environment. It is expected that this session will offer a good opportunity to discuss radionuclides in the earth environment from wide aspect and to exchange information in various research fields.

Temporal changes in vertical distributions of radiocesium in forest soils after the FDNPP accident

*Junko Takahashi[1], Daichi Hihara[1], Takuya Sasaki[1], Yuichi Onda[1]

1. Center for Research in Isotopes and Environmental Dynamics, University of Tsukuba

After the Fukushima Dai-ichi Nuclear Power Plant accident on March 2011, several studies including our own showed that the downward migration of ^{137}Cs from litter to mineral soil is more rapid in forests in Fukushima than in forests affected by the Chernobyl accident. Therefore, the downward migration within mineral soil layers is more important in predicting long-term dynamics of ^{137}Cs in forest ecosystems in Fukushima. In this study, temporal changes in the detailed vertical distribution of ^{137}Cs in litter and soil layers for 7 y (2011–2018) at three forest sites (Mixed Forest, Mature Cedar forest and Young Cedar forest) were investigated in Kawamata town, Yamakiya district to quantify the downward migration of radiocesium.

The soil samples were taken in 5 mm increments between 0–5 cm, 1.0 cm increments between 5–10 cm, and 5.0 cm increments between 10–20 cm using a scraper plate. From 2017, the saturation water under litter, 5 cm, 10 cm and 20 cm depth of soil layers were collected using tension-free lysimeter to estimate the amount of downward migration by soluble radiocesium in saturation water. The radioactivity of ^{137}Cs in the samples was determined by gamma-ray spectrometry.

For the Young Cedar site, the total inventory of ^{137}Cs in the litter and soil layers gradually increased with time owing to deposition from the canopy, whereas temporal changes in the total ^{137}Cs inventories were not clear for the Mixed Forest and Mature Cedar sites. The ^{137}Cs concentrations and inventories in the litter layer exponentially decreased with time for all sites, with more than 80–95% of the ^{137}Cs deposited on the forest floor distributed in the mineral soil layer by 2018. As the downward migration from litter to mineral soil progressed, the ^{137}Cs concentration in a few cm of mineral soil surface gradually increased and became higher than the ^{137}Cs concentration in the litter within 2–3 y of the accident. In the Mature Cedar site, the amount of downward migration of soluble radiocesium from litter layer to mineral soil surface was estimated at 0.60 kBq m^{-2} from Aug. 2017 to July 2018 and about 7% of total downward migration that was calculated from temporal changes in the vertical distribution of radiocesium. Both concentration and flux of radiocesium in saturation water were higher in summer than in winter. Because the dissolved organic carbon showed similar trend with radiocesium, it was suggested that radiocesium in litter and mineral soil was dissolved and penetrated downward with the decomposition of litter and soil organic matters.

The ^{137}Cs concentration in mineral soil layers exponentially decreased with depth throughout survey period, and an exponential equation fitted well. The relaxation depth of ^{137}Cs concentration in mineral soil layers estimated by the exponential equation were constantly increasing in the Mature and Young Cedar sites with 0.08 cm y^{-1}. In contrast, there was no temporal increase in the relaxation depth in the Mixed Forest site, although the percentage of ^{137}Cs inventory in subsurface soil layers deeper than 5 cm has increased with time.

Change of sediment sources in suspended sediments due to surface decontamination in the Niida river catchment area affected by the Fukushima Daiichi nuclear power plant accident

*Yuichi Onda[1], Yuki Yamanaka[1], Yoshifumi Wakiyama[2], Keisuke Taniguchi[3], Takaaki Kubo[1]

1. Center for Research on Isotopes and Environmental Dynamics, University of Tsukuba, 2. Institute of Environmental Radioactivity, Fukushima University, 3. Fukushima Prefectural Centre for Environmental Creation

The Fukushima Daiichi Nuclear Power Plant (FDNPP) on March 2011 accident released massive amounts of radiocesium into the terrestrial environment such as Cs-137 and Cs-134. The Niida river basin (265 km ^{2}) on the north eastern part of Fukushima prefecture is indeed a case in point. The river basin has a highly contaminated area on its upstream part and evacuation have been ordered, and the cropland and paddy field becomes grassland in the summer of 2011, but the downstream part has not contaminated so much. The upstream area of the basin had been subject to decontamination works, such as scraping surface soil and reversal tillage and so on, since 2012.

In the Niida river basin, we installed an integrated suspended sediment sampler, turbidity sensor, and water level sensor at the downstream site starting in December 2012, and another three sites, Sakegawa-bashi (SK), Notegami-Kita (NT) and Warabi-daira (WR) in July 2014. The monitoring has been continued until now. During our monitoring period, most of the agricultural land (paddy and cropland), the topsoil up to 5 cm and replaced with lower part of the soil taken from 2014 to 2015.

We found that the flux of suspended sediments has increased with executing rate escalation of decontamination activity. Also after the decontamination activities, the number of counterclockwise hystereses increased compared with other types. In this presentation, we will discuss the effect of decontamination on the fine sediment yield to the downstream, and the use of radiocesium as a tracer of suspendiment sediment sources.

The Fukushima Nuclear Power Plant (FNPP) accidentally leaked substantial amount of radiocesium to the environment in March 2011. The radiocesium is known to have three input pathways to the marine environment: atmospheric deposition,direct discharge from the FNPP, and river discharges. The last process has lagged behind the accident by occasional floods that have delivered terrestrial deposition through hydrological processes, while the other two processes occurred immediately after the accident. Therefore, the local coastal seas have suffered from continuous contamination due to riverine suspended radiocesium inputs that must be assessed carefully. Niida River,Fukushima,has been a source of riverine suspended radiocesium even after the FNPP accident, as its watershed was prominently covered with the atmospheric deposition at the accident.

In this study, we examined the oceanic dispersal and inventories of the sediments and suspended radiocesium deposited in the ocean floor derived from Niida River byusing a quadruple nested JCOPE2-ROMS 3D oceanic circulation model in a high-resolution configuration at the lateral grid spacing of 50 m.This model is coupled with a 3D multi-class sediment transport model along with a two-layer stratigraphy model of the marine bed,the iRIC-Nays 2DH river sediment transport model,the SWAN spectral wave model,and a static radiocesium absorption model. A particular attention was paid to the storm and subsequent flood event associated with Typhoon 201326 (Wipha)passed off the Fukushima Coast in October 2013,which provoked an enormous amount of precipitation,subsequent increase of the riverine freshwater discharge, and associated sediment and suspended radiocesium fluxes to the ocean. The model results were diagnosed with a guide of several in situ observed data collected in the Fukushima Coast after the storm. We found that the modeled and observed lateral and vertical distributions of sediment grain sizes and attached radiocesium concentrations were reasonably well correlated and consistent each other. We then investigated the accumulation and erosion of the sediments and resultant suspended radiocesium distribution around the river mouth and nearshore areas along the Fukushima Coast.

Particle size distribution and radiocesium concentration in suspended particles within the high turbidity layer at near sea bottom off Fukushima prefecture

*Hideki Kaeriyama[1], Naoki Furuichi[2], Kouichi Sugimatsu[3], Yuya Shigenobu[1], Shizuho Miki[1], Takami Morita[1], Daisuke Ambe[1], Tadafumi Ichikawa[1]

1. National Research Institute of Fisheries Science, Japan Fisheries Research and Education Agency, 2. National Research Institute of Fisheries Engineering, Japan Fisheries Research and Education Agency, 3. Seikai National Research Institute, Japan Fisheries Research and Education Agency

The Fukushima Dai-ichi Nuclear Power Plant accident of March 2011 resulted in the release of radiocesium to the ocean. The concentration of Fukushima-derived ^{137}Cs in pelagic fishes had been decreased drastically during two years from the accident, associated with the concentration of dissolved ^{137}Cs due to the dispersion and dilution of seawater. The concentration of ^{137}Cs in demersal fishes had also been decreasing for eight years, although the decreasing rates of them are slower than those of pelagic fishes. The seabed sediment in the coastal region of Fukushima revealed higher concentration of ^{137}Cs than those observed before the accident. To elucidate the fate of Fukushima-derived radiocesium in the oceanic environment, the benthic ecosystem in the coastal region of Fukushima is the most important study area.

In this study, we focused on the high turbidity layer observed at near sea bottom as a possible source of radiocesium for the benthic organisms in the coastal region of Fukushima. Field observation was conducted in the coastal region off Fukushima and nearby prefectures during June–July 2018. The LISST-200X was used for obtaining the vertical profiles of volumetric concentration of particles and particle size frequency at 28 stations. LISST-HOLO was used concurrently at some stations shallower than 200 m to obtain holographic image of particle. To measure the concentration of ^{137}Cs in suspended materials, large volume *in-situ* pump was deployed on the sea bottom for collecting suspended materials just above the sea bottom (ca. 80 cm above bottom) at three stations.
The volumetric concentration of particle (especially >100 μm) was increased with depth and formed a peak at pycnocline and was decreased with depth. From holography images, diatom colonies and crustacean plankton (copepod) frequently observed at this peak may represent the sub-surface chlorophyll peak was developed around pycnocline. The increase of volumetric concentration of particle were also observed at near sea bottom at some stations located around continental shelf (ca. 100–200 m depth). The particles of 10–100 μm were abundant at this high turbidity sea bottom boundary layer, on the other hands the particles within this size range were less abundant in the above water column. The holography images of particles represented variable forms including crustacean plankton (copepod), rod shape fragment and amorphous detritus at the high turbidity sea bottom boundary layer. The ^{137}Cs concentration of suspended particle collected at near sea bottom ranged from 0.1 to 0.2 Bq g-dry^{-1} and was 2 to 13 times higher than that in the sea bottom sediment at same location. These results (10–100 μm particles abundant in sea bottom boundary layer and relatively high ^{137}Cs concentration in this particles) revealed the high turbidity layer at near sea bottom could be one of the sources for radiocesium uptake by the benthic organisms. Further studies needed to verify the role of this suspended particles not only the variability of ^{137}Cs concentration, but also portion of organic fraction, particle size distribution, and the horizontal distribution of particles in the continental shelf area off Fukushima.

Fukushima-derived radiocesium in the subarctic region of the North Pacific Ocean in the summer of 2017

*Yuichiro Kumamoto[1], Michio Aoyama[2], Yasunori Hamajima[3], Akihiko Murata[1]

1. Japan Agency for Marine-Earth Science and Technology, 2. Fukushima University, 3. Kanazawa University

The accident of Fukushima Dai-ichi Nuclear Power Plant occurred in March 2011 resulted in release of 20-40 PBq radiocesium into the environment. It is estimated that 70-80% of them deposited and discharged in the North Pacific Ocean and most of them are dissolved in seawater. Therefore, Fukushima-derived radiocesium has been spreading throughout the North Pacific along the surface water currents with dilution by seawater mixing. Previous studies revealed that radiocesium deposited and discharged in the coastal area of Japan was transported eastward along the surface current in the mid-latitude of the North Pacific Ocean and reached the west coast of the North American continent in 2015, about four years after the accident. We collected seawater samples during Japan Agency for Marine-Earth Science and Technology "Hakuho Maru" cruise conducted in the North Pacific in the summer of 2017 and measured activity concentrations of radiocesium in them. Because the activity concentration of Fukushima-derived ^{134}Cs has decreased to less than 1 Bq m^{-3} due to dilution and radioactive decay (its half-life is about 2 years), it is difficult to measure it unless it is concentrated. For the concentration, Cs resin (potassium nickel ferrocyanate on polyacrylnitrile, KNiFC-PAN) manufactured by Triskem was used. About 40 L of seawater sample was passed through 5 ml (about 1 g) of the Cs resin at a flow rate of 50 ml min^{-1} to concentrate the radiocesium in the resin. Stable cesium (^{133}Cs) chloride was added as a carrier to the seawater sample (concentration was about 100 ppb), and the recovery rate of radiocesium was estimated to be about 95% from a difference in ^{133}Cs concentration before and after the passing through the seawater sample. After washing the Cs resin in our laboratory on shore, activity concentrations of ^{134}Cs were measured using gamma ray spectrometers (Ge semiconductor detectors) in Japan Agency for Marine-Earth Science and Technology and Kanazawa University. According to vertical transection along with the two observation lines of east-west (47 north degree line) and north-south (145 west degree line) across the Gulf of Alaska in the eastern North Pacific, the activity concentration of Fukushima-derived ^{134}Cs in surface layer shallower than 300 m depth in the eastern and northern stations, namely stations closer to the coastal area of the North American continent was relatively high (the maximum decay-corrected concentration was 6 Bq m^{-3}). This suggests that Fukushima-derived ^{134}Cs reached the North American continent has been transported northward along the continent and then westward in high latitude (50-60 north degree) of the North Pacific. These results imply that Fukushima-derived ^{134}Cs will return to the coastal area of Japan along the anti-clockwise circulation in the subarctic area of the North Pacific (North Pacific subarctic gyre) within the next few years.

Temporal and spatial variations of radiocaesium in the East China Sea and Sea of Japan until 2018

*Michio Aoyama[1], Yayoi Inomata[2], Yasunori Hamajima[2]

1. Institute of Environmnetal Radioactivity, Fukushima University, 2. Institute of Nature and Environmental Technology, Kanazawa University

The temporal and spatial variations of radiocaesium activity concentrations in the Sea of Japan (SOJ) and the East China Sea were investigated. We also investigated transport process from the North Pacific Ocean to the SOJ through the East China Sea (ECS) during 2012–2018. Since 2012, increase of Fukushima Dai-ichi Nuclear Power Plant derived ^{137}Cs activity concentrations were observed in the East China Sea (ECS) and Sea of Japan (SOJ) and reached maxima in 2014/2015 in the ECS and in 2015/2016 in the SOJ. In the ECS, the FNPP1-^{137}Cs activity concentrations tend to decrease after 2016. In 2017 and 2018, decreasing trend of FNPP1-^{137}Cs activity concentrations were also found in the SOJ. The propagation of Fukushima-derived radiocaesium in surface seawater from the ECS into the SOJ required approximately one year. The maximum FNPP1-^{137}Cs activity concentration at each monitoring station was 0.9-1.4 Bqm^{-3}, which contribute to about 40-49% increase against those to the ^{137}Cs activity concentration derived from the global fallout. It appeared that ^{134}Cs/^{137}Cs activity ratios indicated that part of the FNPP1-derived ^{137}Cs and ^{134}Cs was transported with 4-5 years-time scale to the ECS and then to the SOJ via Subtropical Mode Water from the North Pacific southern part of Japan (Inomata et al., 2018). In the ECS, clear meridional distribution of radiocaesium was observed in 2018. ^{137}Cs activity concentrations was low at Yonaguni and Ishigaki, south of ECS and high at west of Kyushu, north of ECS.

[M-TT48] Frontiers in Geochemistry

convener:Hirochika Sumino(Department of Basic Science, Graduate School of Arts and Sciences, The University of Tokyo), Tetsuya Yokoyama(Department of Earth and Planetary Sciences, School of Science, Tokyo Institute of Technology), Hajime Obata(Marine inorganic chemistry division, Atmosphere and Ocean Research Institute, University of Tokyo), Chairperson:Hirochika Sumino, Hajime Obata(Atmosphere and Ocean Research Institute, University of Tokyo), Tetsuya Yokoyama(Tokyo Institute of Technology)

In modern earth and planetary sciences, many new findings have been obtained by using state-of-the-art technique. These new findings include highly precise and accurate data, which is supported by recent developments of the new analytical methods. To use these data correctly and effectively, we need to deepen our knowledge on the methodology. This session aims at providing an opportunity for various geoscientists to get together and have a strategic discussion on frontiers in geochemistry and cosmochemistry. Especially, researchers, who would like to apply such innovative techniques, will have chances to discuss with those who work on devising new geochemical methods. We welcome a wide range of cutting-edge geochemical topics, including technical development, which have a potential for breakthrough of earth and planetary sciences. Any presentations related to the direction of geochemistry and cosmochemistry in future are also welcome. We expect wide-ranged and future-oriented discussion to develop geochemistry and cosmochemistry.

Data science approaches to geochemical data analysis

*Kenta Ueki[1]

1. Japan Agency for Marine-Earth Science and Technology

"Data science approaches" such as machine learning, multivariate statistical analysis, and artificial intelligence, are rapidly developing in various fields based on the recent advances in measurement techniques, rapid enhancement of database and improvement in computing power. Such data science approaches are increasingly being used in the Earth sciences. Geochemical data is high-dimensional and complex data of multivariate and multiple samples. By using the data science method, we can extract the fundamental structure or pattern from the high-dimensional geochemical data, and can evaluate the geological processes to derive the geochemical variations. We will present our recent results of the geochemical studies based on data science approaches, such as machine-learning-based geochemical tectonic discrimination and feature selection of global volcanic rocks, and stochastic crustal compositional model of the Japanese crust. In addition, we will discuss the future possibility of data science approach in the geochemistry.

Rapid *in situ* analyses of hydrogen and sulfur isotope ratios in basaltic glass by SIMS and their appilications

*Kenji Shimizu[1], Takayuki Ushikubo[1], Tomokazu Murai[2], Fumihiro Matsuura[2], Yuichiro Ueno[2]

1. Kochi Core Center, Japan Agency for Marine-Earth Science and Technology, 2. Tokyo Institute of Technology

We developed rapid and accurate *in situ* analyses of hydrogen and sulfur isotope ratios of basaltic glass using high-resolution, multi-collection secondary ion mass spectrometry (CAMECA IMS-1280HR). Hydrogen and sulfur isotopes of standard basaltic glasses were determined by a high-temperature conversion elemental analyzer/isotope ratio mass spectrometer (IRMS) and IRMS, respectively. For the *in situ* analysis of sulfur isotopes, a defocused Cs beam (~0.5 nA; ~10 μm diameter) was used, but for hydrogen isotopes, we used a larger defocused beam (~5 nA; ~15 μm diameter) to decrease the hydrogen background. For analyses of D/H ($^{34}S/^{32}S$) ratios, ^{16}OH (^{32}S) and ^{16}OD (^{34}S) were measured in multi-detection mode with a Faraday cup and an axial electron multiplier, respectively. Each measurement lasted 6–7 minutes. Precisions (2 standard errors) for D/H and $^{34}S/^{32}S$ ratios were ~6 ‰(H_2O > 1 wt%) and ~0.6 ‰(S > 1000 ppm), respectively. Our developed method for rapid and high spatial resolution analysis can determine concentrations of volatiles, hydrogen and sulfur isotopes in a single small melt inclusion of ~30 μm diameter. Using this method, we analyzed hydrogen and sulfur isotope ratios of submarine basaltic glasses from mid-oceanic ridges and oceanic islands of Hawaii and confirmed that their D/H and S isotope ratios were consistent with reported values.

Determination of siderophile elements in metallic materials using multiple spot laser ablation-ICP-MS technique

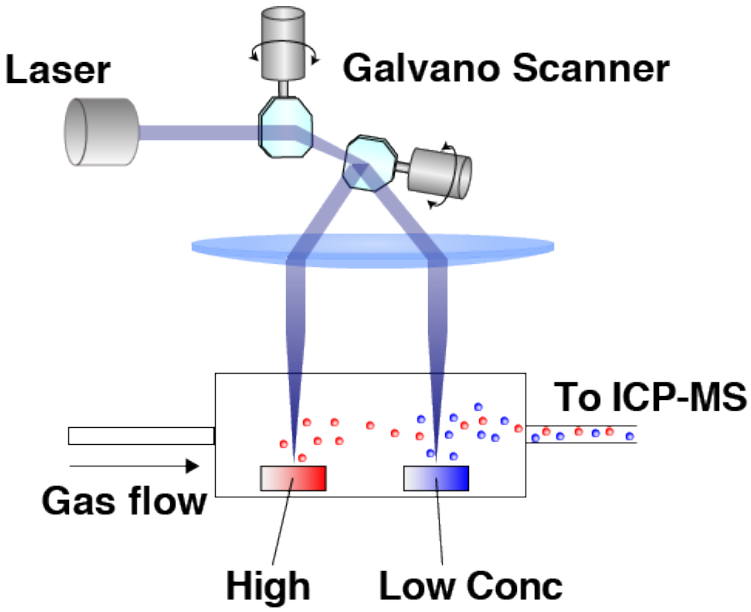
*Yoshiki Makino[1], Yasuo Kuroki[2], Takafumi Hirata[1]

1. Geochemical Research Center, Graduate School of Science, The University of Tokyo, 2. Thermo Fisher Scientific

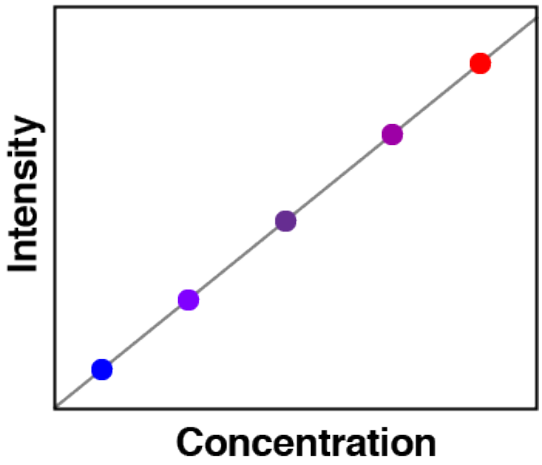
Abundances of siderophile elements in metallic phase of the meteorites can provide various cosmochemical information for the formation sequence of the core formation on the small planets including planetesimals[1]. Among the siderophile elements, fractionation pattern of Mo and W relative to other refractory siderophiles of similar volatility (Re, Os, Ir, Ru, Pt) reflects the oxygen fugacity or the partial pressure of oxygen in early solar system[2]. Despite this, sensitive and precise elemental analysis on metallic materials have been retarded mainly due to analytical difficulties, originating from low concentration of the elements and matrix effects.

Laser ablation-inductively coupled plasma-mass spectrometry (LA-ICP-MS) has been used as a method to directly determine trace elemental composition in a metallic iron[3, 4]. With the LA-ICP-MS technique, multi-element determinations for trace-elements can be achieved. Moreover, with the newly developed multiple spot laser ablation protocol, elemental sensitivity and analysis repeatability can be further improved, and now the elemental determinations for trace-elements with concentrations of lower than ng g^{-1} can be made.

One of the major analytical difficulty to obtain reliable abundance data for analytes would be the availability of calibration standard with proper concentration ranges. This is the main reason why resulting abundance values for the trace-elements became erroneous. Faced with this, we have developed new analytical protocol using multi-spot laser ablation technique using a Galvanometric optics (msLA-ICP-MS). With the multiple spot ablation, two or more solid samples can be ablated almost at a same time, and the laser ablation induced sample aerosol could be mixed and introduced into the ICP-MS, suggesting that mixing, dilution of analytes, and spiking of second elements can be made just like a treatment of solution samples. This suggests that concentration ranges of the analytes can be adjusted, and therefore, the ranges of the calibration curve can be fit to the concentration range of the analytes.



In this study, present msLA-ICP-MS was applied for elemental determinations of 35 trace elements (B, C, Mg, Al, Si, P, Ti, V, Cr, Mn, Fe, Co, Ni, Cu, Zn, Ga, Ge, As, Zr, Nb, Mo, Ru, Rh, Pd, Sn, Sb, La, Ce, Ta, W, Re, Os, Ir, Pt, Pb) in 13 various metallic materials (iron meteorite, low alloy steel, stainless steel, tool steel). Hence, concentration range for the analytes were adjusted by mixing two standard materials (JSS 654 stainless steel and Hoba IV iron meteorite). To evaluate the accuracy of the measurements, abundances of Cr in various materials were measured by the msLA-ICP-MS technique. The resulting abundance values for Cr was 7080±120 $\mu g\ g^{-1}$ for NIST SRM 661 (low alloy steel), 15.78±0.41 % for JSS 650 (stainless steel), 23270±430 $\mu g\ g^{-1}$ for JSS 603 (tool steel). These results exhibited good agreement with the literature values within 5 %. The detection limit calculated from the calibration curve is about 1 $\mu g\ g^{-1}$, thus the measurement with about 6 orders of magnitude in dynamic range could be made. The precision of the measurements defined by repeatability of the measurements from 5 times repeated analysis was better than 3 %. The precision and accuracy of the results obtained by the msLA-ICP-MS technique were comparable to those obtained by the solution based ICP-MS. In addition, similar accuracy and precision were obtained for other trace elements acquired simultaneously.



©2019. Japan Geoscience Union. All Right Reserved.

These data obtained here clearly demonstrate that msLA-ICP-MS can become a powerful tool for elemental analysis in solid samples. In this presentation, we will describe both the principle of msLA-ICP-MS and its application for the trace elemental analysis in metallic irons.

Iron isotopic compositions of Luna 16, 20, 24 soils

*Satoki Okabayashi[1], Tetsuya Yokoyama[1], Takafumi Hirata[2], Kazuo Terakado[3], Erick M. Galimov[4]

1. Tokyo Institute of Technology, 2. The University of Tokyo, 3. Japan Space Forum, 4. Russian Academy of Science

Iron is one of the most abundant elements in the Moon. The Fe exhibits not only siderophile property but also lithophile and chalcophile properties, thus, it is included in most of the minerals and rocks that compose the Moon. Therefore, Fe isotopic composition of the Moon potentially record the fractionation process that occurred during the formation of the Moon and the differentiation or alteration after the Moon formation. Previous works on Fe isotopic analyses of lunar samples suggested that the observed Fe isotopic compositions record fractionation during evaporation of Fe related to giant impact [1], differentiation of lunar magma ocean [2]–[4], and space weathering [5]–[7].

At present, there are no lunar meteorites collected as fall, thus, returned samples of the Moon are important for lunar Fe isotopic studies. In this study, we have measured Fe isotopic ratios of soil samples from the Soviet Luna missions, Luna 16, 20, and 24, using MC-ICP-MS. A highly matured sample from Luna 16 shows clearly distinguished Fe isotopic compositions between the fine-grain and coarse-grain fractions, while such Fe isotopic discrepancies among different size fractions were much smaller in submature (Luna 20) and immature (Luna 24) samples. The Fe isotopic ratios of separated grains show that agglutinates have higher δ^{57}Fe values than the bulk and monomineralic grains, indicating the abundant np-Fe^0s in agglutinates and the partial evaporation of Fe during its melting.

The δ^{57}Fe value for the coarsest grain fraction of very low-Ti basalt from Luna 24 was found to be 0.08 ± 0.04‰, which is the first Fe isotopic composition reported for very low-Ti mare basalts. This value is clearly lower than previously reported δ^{57}Fe values for high-Ti and low-Ti basalts, and is nearly identical to those of Mg-suites. This observation is consistent with the Fe isotopic evolution model during differentiation of lunar magma ocean [3]. Furthermore, the Fe isotopic ratio of the very low-Ti basalt is indistinguishable from that of the Earth’ s mantle, thus, the bulk silicate Earth and Moon are considered to possess an identical or very close Fe isotopic composition.

Synthesis of calcite reference materials for *in situ* U–Pb dating through crystallization from amorphous calcium carbonates

*Yusuke Miyajima[1], Ayaka Saito[1], Hiroyuki Kagi[1], Tatsunori Yokoyama[2], Takafumi Hirata[1]

1. Geochemical Research Center, Graduate School of Science, The University of Tokyo, 2. Tono Geoscience Center, Japan Atomic Energy Agency (JAEA)

Calcium carbonates are ubiquitously present throughout the Earth history as animal shells, speleothems, fault-related vein fillings, and hydrothermal or cold-seep precipitates. Direct dating of carbonates provides valuable information on paleoenvironmental change, tectonics, and fluid and material cycling. Uranium–lead (U–Pb) dating using high spatial-resolution laser ablation inductively coupled plasma mass spectrometry (LA-ICP-MS) is a key technique to date natural carbonates such as fault-hosted calcite that cannot be dated by biostratigraphy or Sr isotope stratigraphy (Roberts and Walker, 2016; Beaudoin et al., 2018). *In situ* U–Pb dating by LA-ICP-MS needs matrix-matched reference materials to correct matrix-dependent elemental fractionation in LA-ICP-MS. Roberts et al. (2017) demonstrated that a natural calcite cement WC-1 (254.4 ±6.4 Ma) is suitable as a calcite reference material. However, the WC-1 calcite has an inhomogeneous distribution of U and Pb and lacks concordance in the U–Pb system (Roberts et al., 2017). In this study, we synthesized novel calcite reference materials with homogeneous U and Pb concentrations and isotope ratios. Incompatible elements such as Sr can be incorporated into calcite through pressure- or heat-induced crystallization from amorphous calcium carbonate (ACC) precipitated from element-doped reagent solution (Matsunuma et al., 2014; Saito et al., 2017). We incorporated U and Pb into calcite through heat-induced crystallization from U, Pb-doped ACC. The homogeneity of the U/Ca and Pb/Ca ratios in the synthetic calcite examined with LA-quadrupole (Q)-ICP-MS was generally better than 8% and 13%, respectively, in relative standard deviation (2SD, n = 10). The $^{207}Pb/^{206}Pb$ ratio of the synthetic calcite measured with LA-multiple-collector (MC)-ICP-MS was homogeneous within ~1% errors, whereas the $^{238}U/^{206}Pb$ ratio was less homogeneous (3%–11% errors). The inhomogeneity in the U/Pb isotope ratio would be propagated into the analytical precision for unknown samples. In order to test the usability of the synthetic calcite, we dated WC-1 using the synthetic calcite for correction of elemental fractionation. We calculated the nominal $^{238}U/^{206}Pb$ ratio in the synthetic calcite from its U and Pb concentrations measured by LA-Q-ICP-MS using Ca as an internal standard. We then obtained the fractionation factor to correct bias between the isotope ratios measured by LA-MC-ICP-MS and the nominal value. Using the fractionation factor, we could accurately date WC-1 with an ~3% precision (246.6 ±7.3 Ma). If the isotopic compositions of the synthetic calcite are certified by isotope-dilution technique, we could date natural carbonates with <10% precisions using the synthetic reference calcite.

College of Asia and the Pacific,The Australian National University, 5. Center for Advanced Marine Core Research, Kochi University

Speleothems can be an ideal record of paleomagnetism since they retain continuous geomagnetic records in stable condition as well as having applicability of high-precision radiometric dating via U-series and radiocarbon techniques. Although their weak magnetic signals hinder this archive to be widely used in the field, Lascu et al. (2016) successfully reconstructed paleomagnetic signatures during the Laschamp excursion from a stalagmite. A scanning SQUID Microscope (SSM) can image very weak magnetic fields at high spatial resolution, and hence could potentially solve this obstacle. However, only a primitive paleomagnetic mapping without interpretation has been made on a speleothem using SSM (Myre et al., 2019). In this study, we have conducted magnetic imagings at submillimeter scale with an SSM at Geological Survey of Japan, AIST on a speleothem collected at Anahulu cave in Tongatapu Island, the Kingdom of Tonga. The ^{14}C age of the surface part of the stalagmite is around 10 ka. The stalagmite block samples were cut perpendicular to the growing direction and shaped to a thickness of ca.0.2 mm before measurements with the SSM. The measured magnetic field is ~±1.5 nT at a senor-to-sample distance of ~200 μm. In association with the laminated structures of the speleothem, we observe stronger magnetic field for the surface layer compared with that of the inner layers. Furthermore, we conducted several magnetic experiments; i.e. first-order reversal curve (FORC) measurements, and low temperature magnetometry. We also conducted decomposition of Isothermal Remanent Magnetization (IRM) acquisition curves at a room temperature and a temperature below Verwey transition. These results show that the speleothem contains a mixture of magnetite and maghemite with different magnetic domain states. The proportion of magnetite and maghemite are shown to be different between the surface layer and the inner layers. These observations are consistent with the magnetic image of a rock magnetic parameter representing coercivity (S-ratio) calculated by inversion of a series of IRM measurements with the SSM.

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-TT Technology & Techniques

Sun. May 26, 2019 3:30 PM - 5:00 PM JST | Sun. May 26, 2019 6:30 AM - 8:00 AM UTC | 201A 2F

[M-TT48] Frontiers in Geochemistry

convener:Hirochika Sumino(Department of Basic Science, Graduate School of Arts and Sciences, The University of Tokyo), Tetsuya Yokoyama(Department of Earth and Planetary Sciences, School of Science, Tokyo Institute of Technology), Hajime Obata(Marine inorganic chemistry division, Atmosphere and Ocean Research Institute, University of Tokyo), Chairperson:Hirochika Sumino, Hajime Obata(Atmosphere and Ocean Research Institute, University of Tokyo), Tetsuya Yokoyama(Tokyo Institute of Technology)

In modern earth and planetary sciences, many new findings have been obtained by using state-of-the-art technique. These new findings include highly precise and accurate data, which is supported by recent developments of the new analytical methods. To use these data correctly and effectively, we need to deepen our knowledge on the methodology. This session aims at providing an opportunity for various geoscientists to get together and have a strategic discussion on frontiers in geochemistry and cosmochemistry. Especially, researchers, who would like to apply such innovative techniques, will have chances to discuss with those who work on devising new geochemical methods. We welcome a wide range of cutting-edge geochemical topics, including technical development, which have a potential for breakthrough of earth and planetary sciences. Any presentations related to the direction of geochemistry and cosmochemistry in future are also welcome. We expect wide-ranged and future-oriented discussion to develop geochemistry and cosmochemistry.

Uptake and accumulation of methylmercury by marine phytoplankton

*Yuya Tada[1], Kohji Marumoto[1]

1. National Institute For Minamata Disease

Introduction: Eating marine fish are the main source of the toxic and bioaccumulative methylmercury (MeHg) exposure in human. However, information about the accumulation process of MeHg through marine food webs is severely limited. Phytoplankton serve as a main entry for dissolved methylmercury (MeHg) into aquatic food webs. Thus, measuring uptake ratio and accumulation of MeHg by marine phytoplankton is critical for understanding mercury risks for marine organisms and human. To date, most research on the algal uptake of MeHg were conducted using freshwater phytoplankton, and there is few studies on marine species. In this study, we examined the uptake and accumulation of MeHg using 5 marine phytoplankton cultures affiliated with different algal lineages (2 diatoms, cyanobacteria, pelagophyte, and haptophyte), and evaluated that the differences of bioaccumulation between dead and live cells.

Materials and methods: Five axenic phytoplankton cultures *Thalassiosira pseudonana* (CCMP1335), *Thalassiosira oceanica* (CCMP1005), *Synechococcus* sp. (CCMP1334) *Pelagomonas calceolate* (CCMP1756), *Emiliania huxleyi* (CCMP374) were used for incubation experiments with MeHg addition. After preculture in L1 medium, all species were cultured axenically in the L1 medium with MeHg (ca. 1,000 pg / l) at 22ºC under light or light:dark (12 h: 12 h) conditions. Incubation time was varied from several hours (short term) to days (long term). During incubation experiments, we collected subsamples of cultures several times. Phytoplankton cells (particulate fraction) were collected using the GF-75 glass-fiber filter, and stored at -80 ºC until further analysis. Filtrate (dissolved fraction) was amended with H_2SO_4 and stored at 4 ºC. To evaluate the bioaccumulation of dead and live cells, we used the *T. pseudonana* cells killed by heating (100 ºC for 20 min). Particulate and dissolved MeHg concentration were analyzed using a combined technique of dithizone extraction and the EPA method 1630.

Results and discussion: Incubation experiments revealed that all phytoplankton cultures incorporated and accumulated MeHg during incubation. In addition, incorporated MeHg would not be released from phytoplankton cells during incubation experiment. Short term incubation experiments revealed that phytoplankton cells took up 60 to 87% of the amended MeHg within 1 hour. Cellular MeHg concentration varied among phytoplankton cultures, and those of *Synechococcus* sp. (0.1-0.2 ag MeHg / cell) were relatively lower than those of other cultures. Experiments using dead and live cells showed that MeHg concentrations of dead cells were obviously lower than those of live cells, suggesting that a active MeHg uptake for this culture. Our results suggest that phytoplankton cells could actively take up and accumulate MeHg, and bioaccumulation ratio varied among phytoplankton species.

A protocol for simultaneous analysis of archaeal core and intact polar lipids using normal-phase HPLC/ESI-MS

*Shunsuke Horai[1], Hiroshi Naraoka[1,2]

1. Kyushu University, 2. Research Center for Planetary Trace Organic Compounds

Isoprenoidal glycerol core lipids (CLs) from archaeal cell membranes have been utilized as proxies for paleo-environmental reconstruction (e.g., Schouten et al., 2002), and their intact forms (i.e., intact polar lipids: IPLs) can provide information on *in situ* archaeal activities in natural ecosystems (e.g., Lipp et al., 2008). Each form has been analyzed with normal phase (NP)-HPLC/ESI-MS for IPLs (Sturt et al., 2004) and with NP-HPLC/APCI-MS for CLs (Hopmans et al., 2000; Schouten et al., 2007) after the sample preparation (i.e. pre-separation of the total lipid extract into a polar and an apolar fraction, followed by acid hydrolysis of the polar fraction). However, such analytical protocols require relatively large amount of sample with great time and effort for the sample preparation. Furthermore, the acid hydrolysis of polar head groups and the APCI often cause degradation of labile lipids (e.g., hydroxyarchaeol) and byproduct formation (Liu et al., 2012; Sprott et al., 1990; Koga and Morii, 2005).

To overcome these shortcomings of traditional lipid analysis, we developed a novel NP-HPLC/ESI-MS protocol for simultaneous characterization of the distribution of CLs and IPLs from total lipid extracts in one analytical run. In order to cover the broad range of archaeal lipids in natural samples, the chromatographic separation and MS detection were optimized using the total lipid extracts of archaeal cultures having greatly different lipid compositions (*Methanosarcina barkeri* and *Sulfolobus acidcaldarius*).

With this protocol, CLs were separated according to structural variation of the alkyl chains and subsequently IPLs according to polar head group polarity into individual lipid classes. The distinct partitioning of separation part of CLs and IPLs is an important advantage when screening archaeal lipids in complex natural samples. Moreover, hydroxyarchaeol and their intact polar derivatives, which were lost in the conventional NP-HPLC/APCI-MS protocol, were detected in the total lipid extract from *M. bakeri*.

We also compared the quantitative accuracy and sensitivity on the detection of CLs between APCI and ESI-MS by using core GDGTs isolated and purified from a culture of *S.acidcaldarius*. As a result, the relative distributions of core GDGTs with NP-HPLC/ESI-MS were similar to those when analyzing with NP-HPLC/APCI-MS. This result suggests that our protocol can be applied to the study of core GDGT-based environmental proxies.

In addition to development of this protocol, we plan to apply the simultaneously chromatographic separation of this protocol to the preparation for compound-specific isotope analysis and structural identification of archaeal lipids, which will contribute for the study of archaeal activities in the environment that sample amounts are limited.

Assessment of Northeastern Japan Tree-Ring Oxygen Isotopes for Reconstructing Early Summer Hydroclimate and Spring Arctic Oscillation

*Wataru Sakashita[1,2,3], Yusuke Yokoyama[3], Hiroko Miyahara[2], Takahiro AZE[3], Stephen Obrochta[4], Motonari Ohyama[5], Hitoshi Yonenobu[6]

1. Forestry and Forest Products Research Institute, 2. Musashino Art University, 3. Atmosphere and Ocean Research Institute, The University of Tokyo, 4. Akita Univeristy, 5. Tohoku University, 6. Naruto University of Education

The spring Arctic Oscillation (AO) significantly affects the subsequent summer rainfall in the East Asian Summer Monsoon (EASM) region, and analysis of meteorological data indicates this teleconnection strength varied on interdecadal timescales during the late 20th century. Tree-ring records may be able to extend the relatively short observational record, but the extent to which these proxy reconstructions correspond to AO variability has yet to be explored in this region. Therefore, we present new tree-ring cellulose oxygen isotope ($\delta^{18}O$) records from northeastern Japan (Akita, northern limit of EASM), spanning AD 1950 to 2003 which overlaps with the instrumental record. Tree-ring $\delta^{18}O$ is used for reconstructing the past hydroclimate variability and allows us to consider whether tree-ring $\delta^{18}O$ has the potential to clarify the longer-term interdecadal changes in the spring AO-EASM relationship. Measurements and analyses show that our tree-ring $\delta^{18}O$ datasets have a significant negative correlation with May-June-July relative humidity, and the tree-ring $\delta^{18}O$ in northeastern Japan also significantly correlates with the summer EASM index. Temporal comparisons between our record and observed monthly AO index indicate that reconstructed following early summer relative humidity significantly correlates to the previous March-April-May AO. This linkage changes on interdecadal timescales, and the linkage is relatively strong during early 1970s through early 1990s. Similar results are also obtained using a separate tree-ring $\delta^{18}O$ record from a separate location about 200 km to the southeast, suggesting that tree-ring cellulose $\delta^{18}O$ in northeastern Japan is indeed useful for better understanding the long-term teleconnection between the spring AO and EASM.

Development of the rotational diamond anvil cell for high-pressure deformation experiments and its measurement systems

*Shintaro Azuma[1,2], Ryuichi Nomura[3,4], Kentaro Uesugi[5], Yu Nishihara[4], Doi Shunta[4], Takeshi Arimoto[4], Tetsuo Irifune[4]

1. Tokyo Tech., 2. Kyushu Univ., 3. Kyoto Univ., 4. Ehime Univ., 5. JASRI

The mechanical properties of lower mantle materials are key to understanding the dynamics and evolution in the Earth’s interior. However, the pressure range of deformation apparatuses which can achieve large strain is limited to ~30–40 GPa due to a technical reason. We developed a new deformation apparatus named rotational diamond anvil cell (rDAC). This deformation apparatus can apply the torsional deformation to a sample, thus the rDAC can theoretically produces an infinite strain within the sample under ultra-high pressure conditions, corresponding to those of core-mantle boundary [Nomura et al., 2017]. The rDAC is the most suitable deformation apparatus with which to investigate the mechanical properties of deep-Earth materials. In this presentation, we will mainly present the measurement systems, technology and idea which were applied to the rDAC.

Deformation apparatuses used in Earth science need high-pressure and high-temperature techniques, the constant strain rate, and the measurement systems of the stress and strain. The rDAC can apply high pressure and torsional deformation to a sample with constant strain rate by a gearbox and diamond anvils with grooves [Azuma et al., 2018]. *In situ* strain measurements are conducted using X-ray laminography techniques at BL47XU, SPring-8 [Nomura and Uesugi, 2016]. High-temperature conditions and stress measurements have not been achieved in rDAC. Recently, however, the vacuum chamber newly designed for rDAC was installed for high temperature experiments, and stress measurements using X-ray Diffraction (XRD) were applied to deformation experiments in rDAC at SPring-8 (Japan).

To test the high temperature technique and stress measurements using XRD with the new vacuum chamber, the mixture of bridgmanite $(Mg,Fe)SiO_3$ and ferropericlase (Mg,Fe)O, which was synthesized from San Carlos olivine, was deformed under torsion geometry using the rDAC at BL47XU, SPring-8. The vacuum chamber has a removable Kapton window for incident and diffracted X-ray, and can keep the vacuum state (<~10 Pa) to prevent the diamond anvils from oxidation during high-temperature deformation experiments. Platinum wires were used as a resistance heater surrounding the sample and Rhenium gasket. Stress was measured by collecting X-ray diffraction pattern at twelve different azimuthal angles, Ψ= 0º, ±30º, ±60º, ±90º, ±120º, ±150º, and 180º.

In heating experiments using new vacuum chamber, temperature was monitored by Pt/Rh thermocouple placed close to the sample and we succeeded in increasing temperature up to ~1000 K. However, the resistance heater (Pt) was unstable in vacuum. In the future, high-temperature deformation experiments using rDAC will be performed in reducing atmosphere produced by inactive gas (e.g., Argon gas) or internal heating system should be developed for the rDAC .

Stress in bridgmanite was estimated by using diffraction peaks (110) and (112) at P= 50 GPa and T= 673 K. Shear stress in bridgmanite was relatively constant values, whereas uniaxial stress changed during deformation experiments. This preliminary experiment was performed under low-temperature and high-pressure conditions, thus the equivalent stress in bridgmanite was about three times higher than that in previous studies [e.g., Girard et al., 2016].

Speciation of metal ions in hydrosphere: Further classification of intermediately hard ligands in HSAB theory

*Makoto Nagasawa[1], Masato Tanaka[1], Asami Miyaji[2], Yoshio Takahashi[1]

1. Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 2. Hiroshima University

Complexation of metal cations with oxygen donor ligands such as hydroxide ion, carbonate ion, phosphate ion, and carboxylate ion is one of the most important factors controlling their behaviors in hydrosphere. Turner (1981) classified these ligands as “intermediately hard ligands” in HSAB (hard and soft acids and bases) theory. However, we found that the reactivity of hydroxide ion greatly depends on cation’s ionic radius, which results in distinguishing this ligand from the other intermediately hard ligands. Taking divalent alkaline earth metal ions as an example, Mg^{2+} mainly precipitates as hydroxide (brucite), whereas Ca^{2+} prefers carbonate (calcite) or phosphate (apatite) to hydroxide, but quantitative discussion on the mechanism has not been performed.

In this study, we evaluated the standard Gibbs free energy change of reaction ($\Delta G^0_R = \Delta H^0_R - T\Delta S^0_R$) on the complexation of hydrated metal cations with above ligands, based on thermodynamic data. The results revealed that the entropic contribution to the stabilization was large for hydroxide complexes of smaller cations. Since the entropy in aqueous complexation reaction is controlled by the number of water molecules released to the solution possibly due to replacement of the water molecules by inner-sphere complexation, it is suggested that hydroxide complexes of larger cations are less stable due to the small effect of the dehydration.

In order to support this suggestion, we conducted quantum chemical calculation, using Gaussian 09. The distance between hydrated metal cation (M) and oxygen of ligand (O) was calculated for several ions. The results showed that the average M-O distance of hydroxide complex increased with the increase of cation’s ionic radius more remarkably than that of the other complexes such as carbonate ion. This means that hydroxide favors to form outer-sphere complex for larger cations, which is consistent with our suggestion based on the thermodynamic data.

Difference in the partition behaviors and speciation between scandium and other rare earth elements in nickel laterite ore deposits

Haibo Qin[1], Kenzo Sanematsu[2], Arcilla Carlo[3], *Yoshio Takahashi[1]

Institute for Geo-Resources and Environment, National Institute of Advanced Industrial Science and Technology (AIST), 3. National Institute of Geological Sciences, College of Science, University of the Philippines

Scandium (Sc) is a critical metal with wide applications in modern industrial applications. Consequently, the enrichment of Sc at earth surface has been of great interest in resource geology. It has been reported that laterite enriched with nickel (Ni laterite) contained significant amounts of Sc (about 80-100 ppm). The vertical profile of Ni laterite mainly consists of bed rock, saprolite, and limonite layers from bottom to the top. Generally speaking, Ni remobilized downward during weathering processes leads to the enrichment of Ni in the saprolite layer, while maximum Sc enrichment is found in the limonite layer mainly consisting of goethite. However, distribution and speciation of Sc in the limonite layer are not clear at present, which was examined by μ-XRF mapping and X-ray absorption fine structure (XAFS) spectroscopy in this study. In addition, similar information such as abundances and speciation was obtained also for other rare earth elements including yttrium (REY) to compare geochemical behaviors between Sc and REY.

Micro-XRF analysis revealed that Sc and Y are distributed to goethite in the limonite layer. Sequential extraction revealed that Sc remains in the residual phase which goethite is still present even after the treatments by reducing agents and aqua regia. XANES and EXAFS analyses for Sc in the limonite layer and its comparison with synthetic samples of Sc coprecipitated with goethite and Sc adsorbed on goethite revealed that Sc was incorporated within the goethite structure replacing Fe^{3+} site. This result is reasonable considering the similar ionic radii (6 coordination number) of Sc^{3+} (0.75 Å) and Fe^{3+} (0.65 Å). On the contrary, EXAFS for the Y samples synthesized similarly to Sc showed that Y cannot be incorporated within the goethite structure, possibly due to its large size (ionic radius of Y^{3+}: 0.90 Å) compared with Fe^{3+}. The sequential extraction showed that most of Y was present as ion-exchangeable species or Y in amorphous Fe and Mn oxides, which are consistent with the fact that Y is mainly present as adsorbed species on goethite. These results clearly explain fractionation of REY and Sc in limonite layer, with steep increase from Yb^{3+} to Sc^{3+} when we plot Sc at right of Lu in REY pattern.

The high concentration of Sc in Ni laterite is caused by (i) high concentration of Sc in the original rock (peridotite) and (ii) effective fixation of Sc^{3+} within goethite by substitution of Fe^{3+} site by Sc^{3+} during intense weathering to form laterite.

[U-05] Large-scale Research Projects: Master Plan 2020 and its beyond

convener:Eiichi Tajika(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Shigeko Haruyama(Department of Environmental Science, Graduate School of Bioresouces,Mie University), Ryoichi Fujii(Research Organization of Information and Systems), Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Chairperson:Eiichi Tajika, Shigeko Haruyama

Many of top sciences in Earth and Planetary Science (EPS) are progressed by big projects that require 10 billion JPY or more in 10 years or so. In order to realize such projects, we need an arena where they are brushed up through critical reviews among various fields in EPS. Deeper mutual understandings through serious discussions there will enable us to reach a final consensus on the priorities of the projects. The Master Plan (MP) of Large-scale Research issued by the Science Council of Japan strongly motivates us to follow the process described above. Indeed some of the selected projects have been funded by the Ministry of Education, Culture, Sports, Science & Technology since 2010.
Since the current Master Plan 2017 is going to be thoroughly revised in 2020, we propose to hold a session in which large-scale research projects are concisely introduced and critically reviewed. This session is to be convened by JpGU and EPS Committee of Science Council of Japan.

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

1. Department of Earth Science and Astronomy, Multi-disciplinary Sciences - General Systems Studies, Graduate School of Arts and Sciences, The University of Tokyo

“Large Scientific Research Projects” under national strategic perspectives naturally comprise multidisciplinary efforts of Japanese scientists, by aggregating cutting-edge technology and knowledge to tackle research issues that had yet to be explored by anyone and bringing about dramatic development of those fields. Such projects will continue to necessiate strategic, systematic promotion through a long-term outlook, while garnering the support and understanding of the general public and society overall. As to the earth and planetary sciences in Japan during the late 20th and early 21st centuries, most researches focused on individual fields, such as studies on atmosphere, ocean, surface environment, solid earth (plate, plume, geomagnetism etc.). Nonetheless, in the views from abroad, most of efforts appear to have been concentrated in transplanting ideas and technology from western communities without nurturing domestic original ones. Under the limited financial budget of Japan, there is one hopeful possibility in earth science, which enables multispheric system studies involving core, mantle, surface crust, biosphere, and outer space. The most advantageous estate in Japan is the “earth history samples” collected from various countries during the last 30 years bu Japanese earth scientists. As there is non-such analogue in the rest of the world, we should build a new project centered by a research center “Astro-Bioscience”, which promote intimate network with many countries centered in Japan in order to reveal the entire history of the Earth and life. This project is directly linked to the sustainability of our planet, to which all humans on the Earth are facing today.

Energy from the sun is divided into radiation and solar wind (high-speed particles), which are maximum at the equatorial and polar regions, respectively. We study the flow of the energy and materials in the whole atmosphere by establishing following two large atmospheric radars at these singular points, and global observation network.
(1) Equatorial fountain
The energy and material flows that occur in all height regions of the equatorial atmosphere are named as "Equatorial Fountain." These processes from the bottom also cause various effects in the upper atmosphere. We establish Equatorial MU Rdar (EMU radar) in Indonesia as main instrument for the studies.
(2) Energy inputs into polar upper atmosphere and its response
The energy/particle inflow results in auroral Joule heating and ion drag of the atmosphere. The ion outflow from the polar ionosphere controls ambient plasma constituents in the magnetosphere. We will contribute the international EISCAT_3D radar project that has started in northern Scandinavia since 2017.
(3) Global network of observation and data
We develop a global observation network of compact radio and optical remote sensing equipment from the equator to polar region. Data from the observations will be archived and utilized by the data exchange framework of IUGONET.

This project was selected as one of important projects in both Masterplan 2014 and 2017. It was also selected as a new project in the roadmap 2014 by the Japanese Ministry of Education, Culture, Sports, Science and Technology. We continue proposing the project to Masterplan 2020.

Development of the global earth observation system using satellites

*Shinichi Sobue[1], Yoshiaki HONDA[3], Shuichi Rokugawa[2], Akira Iwasaki[2], Nobuhiro Takahashi[4], Yukari Takayabu[2], Riko Oki[1], Toshiyoshi Kimura[1], Teruyuki Nakajima[1], Takeo Tadono[1], Kosuke Yamamoto[1]

Global efforts to solve social and scientific issues related to the earth environment are ongoing globally and it is critical to develop and operate a global earth observation system. Especially, as also shown in “Yume road map”, the satellite-based observation system is indispensable tool from present to future. However, the Earth Observation Satellite, which simultaneously realizes the two functions of both scientific and practical observation, such as the GCOM series and the TRMM / GPM series, is marked as the "advancement of other remote sensing and sensor technologies" and there is no long-term plan beyond 2020 in the chart of the space basic program.

"Advanced Earth Science Research Working Group (WG)", one of the working groups of Task Force Remote Sensing Subcommittee (TF; 23 academic societies + 2 organizations), we created the "Earth Observation Grand Design" which shows the strategies for realizing the proposals of the Science Council of the scientific community and various institutions concerning Earth Observation after the successful endorsement at the TF general assembly. The purpose of this “Earth Observation Grand Design” is aimed at proposing Earth observation mission towards the space related ministries and agencies’ with brining consensus of new earth observation satellites missions from the academic societies and organizations in TF.

In the Earth Observation Grand Design published in 2018, the following five missions are proposing through a simple selection / review process as a mission to be realized in the short term, in addition to the mission described in the chart of space basic plan.

A) Mission on elucidating global climate change / water circulation mechanism

B) Mission for forest biomass estimation

C) Mission to reduce short life air pollution

D) Mission concerning elucidation of cloud and rainfall process

E) Mission concerning monitoring and elucidation of global environmental change (global radiation enforcement force and ecosystem change affecting global warming)

Based on the consent of the TF Executive Committee in late 2018, as a first step to evolve the above selection process with revision of Earth Observation Grand Design, we called for new satellite earth observation missions from a wider field and selected those missions, including ongoing satellites series missions such as high resolution optical and SAR mission, GHGs missions and geostationary observation missions, while ensuring fairness and transparency. We will make a primary selection of the proposal and

©2019. Japan Geoscience Union. All Right Reserved.

will discuss further by JpGU 's special session coming. As a result, we will select additional missions as well as deepen consideration of promising proposals and establish a feedback process from experts toward realizing the mission.

By using those proposed missions, global climate change and water circulation mechanism will be studied to solve various social problems such as improvement of accuracy of global warming prediction, high accuracy of weather forecast, disaster, etc. These missions will also be expected to contribute to the achievement of Society 5.0 and UN / SDGs that compatibility of social tasks.

Promotion of Scientific Research on Climate and Earth System Sciences Using Aircrafts

*Makoto Koike[1,2]

1. Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 2. The Meteorological Society of Japan

The aim of this proposal is to promote climate and earth system research in the area of atmospheric science, oceanography, glaciology, volcanology, and ecology by introducing a dedicated aircraft for Earth observations.

The Earth’s environment has been changing rapidly, particularly as manifested by global warming, and the changes are imposing large impacts on the fundamental structures of our lives, including socio-economic activities and supplies of water and food. It is critically important to fully understand the current status of the changes and to investigate the controlling processes, in order to predict future changes and protect human society and ecosystems from serious damage. At present, direct atmospheric observations by aircraft are lacking in important geographical regions; they are needed for understanding greenhouse gases, aerosol-cloud interactions, and the hydrologic cycle, including predictions of typhoons and torrential downpours. Japan lacks an aircraft dedicated to scientific measurements, so Japanese scientists have been obliged to charter commercial aircraft for their experiments. Therefore it has been difficult to plan and conduct systematic aircraft experiments, which are indispensable for studies of climate and Earth system science.

In this study, we plan to acquire a dedicated aircraft and outfit it with an observation system that will be designed and utilized by scientists from a variety of fields and institutions on a long-term basis. Our aim is to enable the systematic planning of next-generation Earth observations and research activities by operating instrumented aircraft platforms on a long-term basis and attaining the highest levels of scientific outcome and impacts. We plan to provide today’s scientists and the next generation of scientists with exciting opportunities to use aircraft platforms to pursue new scientific ideas and to develop and use new technologies and methodologies. It is also planned to extend these new research opportunities to foreign scientists so that this Japanese system serves as a center of research and promotes Earth observations throughout Asia. The basic scientific knowledge obtained by this program will be made public in order to contribute to the welfare of world societies. All the processes involved in this research plan, including organizing scientists and activities, selection and scheduling of instruments, soliciting proposals, making field measurements, data archiving, and using the data, will be transparent to all scientific communities.

We plan to use the Gulfstream IV type aircraft as rental from a private company such as Diamond Air Service. The total cost is 15.5 billion Japanese yen for ten year project. The Institute for Space-Earth Environmental Research of Nagoya University has established the “Center for Orbital and Suborbital Observations” in order to play a central role in aircraft observations. This center will organize and manage activities related to aircraft observations in close cooperation with scientists from several institutions in Japan, such as the University of Tokyo, Chiba University, the Meteorological Research Institute, the National Institute for Environmental Studies, the National Institute of Polar Research, and the National Institute of Information and Communications Technology. We can receive advice and support aeronautical section of JAXA on determination of test plan and flight conditions in the flight test to realize more efficient and safety flight experiment. Through this study, we will contribute to SDSs and Future

Global deployment of Deep Argo floats toward accurate prediction of future climate and ecosystem changes

*Toshiyuki Hibiya[1]

1. Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo

Long-term assessment and conservation of marine bio-resources are crucial in securing the global food supply. Given the very rapid warming of global climate at present, however, marine environmental changes could be a very serious threat to human beings. Actually, acidification of surface seawater and decrease of dissolved oxygen in subsurface layers have been detected recently; if these trends are significant, an irreversible global/oceanic change in a longer time scale would be realistic. The deep oceanic circulation plays a key role in the marine environmental change. A recent numerical model suggests a global temperature change of more than 4°C and a decrease of marine biological production by 20% under a condition of weakened deep oceanic circulation. The actual feature and mechanism of the deep oceanic circulation are still largely unknown, and the comprehensive observation of deep sea would be also important in the assessment of oceanic ecosystem.

The Oceanographic Society of Japan submitted a research proposal in association with the 16 academic societies in theFisheries/Oceanography Research Liaison Counciland the Paleontological Society of Japan.The proposal aims to unveil the deep oceanic circulation, which is currently acting as the bottleneck in reproducingpast and future climate variability and global environmental changes in numerical models.More specifically, the proposal focuses on observation of turbulence in the deep sea with a turbulence sensor attached to the deep-sea Argo float (target depth more than 4000 meters) or "Deep NINJA". More than 10 floats of this type with conventional temperature and salinity sensors are in actual operation in the Southern Ocean. By deploying approximately 1000 floats, observation of temperature, salinity and turbulence will be conducted globally from the ocean surface to seafloor. The obtained data will be incorporated into a coupled atmosphere-ocean global climate model, and the simulation conducted using the leading Japanese supercomputer facility would yield an accurate reproduction and prediction of the past and future climate. Responses of biological community to the reproduced paleo-environmental changes can be validated by paleontological data such as microfossil record in sediment core, and the validation further refine the model prediction. A far more accurate prediction of future climate, marine biological production and marine bio-resources will be achieved through the proposed research project.

A new aspect of the polar science: integrated observations of the ice sheet mass loss for better prediction of the sea level rise

*Takuji Nakamura[1], Shin Sugiyama[2], Ayako Abe-Ouchi[3], Teruo Aoki[4], Yoshifumi Nogi[1], Takeshi Tamura[1]

1. National Institute of Polar Research, 2. Institute of Low Temperature Science, Hokkaido Univ., 3. Atmosphere and Ocean Research Institute, the University of Tokyo, 4. The Graduate School of Natural Science and Technology, Okayama University

Recently the global environmental change is of great interest for the governments and general public, as well as scientists on the earth and planets. The Arctic and the Antarctic regions significantly affect global environment and also provide invaluable information on its variation. In the Arctic region, for example, temperature increase due to the global warming is the largest on the globe. The climate change is most significantly emerging which causes change of ecology, human economic activity and life. On the other hand, very little is known on the response of the huge Antarctic ice sheet to the global warming, and hence a possible change in Antarctic region on a global scale and its prediction are of greatest interest. Variations in both polar regions are not independent but connected through the ocean and atmosphere circulations, and therefore it is necessary to consider them to be one unified system. Moreover, the Arctic and Antarctic regions are the best observation and/or investigation field for space/planetary sciences, atmospheric/hydrospheric sciences, and solid earth sciences, indicating that the polar regions are important windows for earth and planetary sciences.

Greenland Ice Sheet amounts about 9 % of total ice mass on the glove, and its mass loss is becoming faster due to the rapid warming in the Arctic region. This causes acceleration of the global sea level rise. On the other hand, the Antarctic Ice Sheet, which as about an order larger mass, also indicating a significant mass loss in the western part. Once the East Antarctic Ice Sheet also started to melt quickly, which has much larger mass than the West Antarctic Ice Sheet, the sea level rise would become fatal. Thus, it is very important to understand the current variation of the ice sheets, which could cause more than 60 m of sea level rise as a total amount, and monitor its trend.

This proposal focuses on the sea level rise due to the ice sheet mass loss. We propose to carry out integrated observations at remote sites in the Antarctica and Greenland, by deploying new technical challenge with un-manned and remote controlled system. Then, by unifying in-situ observations, detailed analyses, satellite observations and numerical modelings, we plan to clarity variations of the ice sheet and ocean in the past and at present, then improve the forecast of future sea level rise, which might rapidly proceed even within this century.

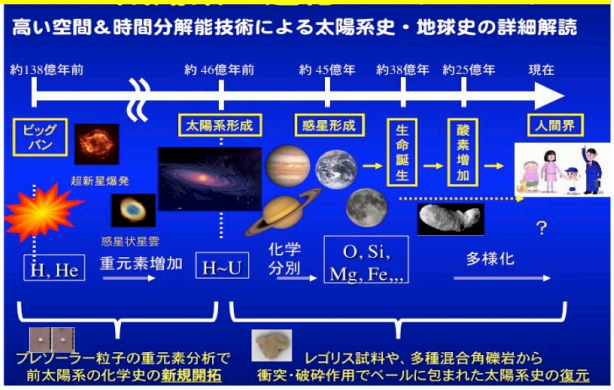
New frontier of Earth, Space and Life Sciences pioneered by the innovative developments of new-generation mass spectrometry

*Kentaro Terada[1]

1. Department of Earth and Space Science, Graduate School of Science, Osaka University

So far, various mass spectrometers, which can determine elemental abundance, isotopic composition and molecular weight of macromolecule have greatly contributed to understanding of the Earth, Space and Life sciences. Above all, high-precision isotopic measurements of natural samples using sensitive mass spectrometers provide us an important clue to decipher the origin and evolution of the Earth and/or Solar system. Whereas, it is also known that many unresolved scientific issues are still remained because of technical restrains of “general-purpose” commercially-available mass spectrometers. Therefore, the “science-oriented” development of mass spectrometer has been highly desired.



Here, Osaka University, Geochemical Society Japan, and Mass Spectrometry Society of Japan collectively propose the ideas of an innovative development of mass spectrometers that are specialized for the “Scientific issues”, which consists of two directions; (1) high-sensitive and high-spacial resolution and/or (2) reduction in size and weight with high-mass resolution. These innovative development conducted by Osaka University would pioneer a new horizon of the Earth and Planetary Science such a decipher of the pre-solar history, on-site real–time geo-cosmo-chemistry so on. These technical innovation of mass spectrometers designed for the cruel Earth and space Science would also promote the other science such as agriculture, material science and life science, so on.

Building of archive and curating system for astrogeoscience materials

*Tsuyoshi Komiya[1]

1. Department of Earth Science & Astronomy Graduate School of Arts and Sciences The University of Tokyo

We, Geological Society of Japan, propose “Building of archive and curating system for astrogeoscience materials” for Master Plan 2020.

Approximately 150 years passed after foundation of modern science in Japan. The Japanese researchers collected great amounts of terrestrial samples and meteorites, from over the world as well as Japan, using national and private funds during this period. Natural history is traditionally regarded as important in European countries and USA, but it is neglected more or less in Japan. As a result, Japan is far behind the European countries and USA as regards the preservation of the samples for future work, and curating system of the samples.

However, many paradigms were born from the well-organized sample archive such as Burgess Shale collection for the Cambrian Explosion and recent discovery of deep-sea economic deposit, and so on.

In addition, social responsibility of science is often emphasized in many European courtiers and USA: Open access of scientific journals, data and original samples, and guarantee of reliability of original data. However, Japan is also far behind other countries including China regards the open access.

We would like to propose building of archive and curating system for astrogeoscience materials for the future works and social responsibility.

This program is proposed by Geological society of Japan, and supported by AIST (Geological survey of Japan), National Institute of Polar Research, National Museum of Nature and Science, JAMSTEC, Kanagawa Prefectural museum of Natural History, and departments of Earth and Planetary sciences of 28 universities.

Keywords: Astrogeoscience materials, Archive and curating system

Innovative 4D imaging of subduction-zones through real-time observatories, ultra-deep drilling and high-pressure experiments

*Masataka Kinoshita[1], Naoshi Hirata[1], Masanao Shinohara[1], Tetsuo Irifune[2], Hiroyuki Kagi[7], Teruyuki Kato[3], Shigeaki Ono[4], Katsuyoshi Michibayashi[6], Natsue Abe[4], Fumio Inagaki[4], Kentaro Omura[5], Kazushige Obara[1]

1. Earthquake Research Institute, University of Tokyo, 2. Ehime University, 3. Hot Springs Research Institute, 4. JAMSTEC, 5. NIED, 6. Nagoya Univ., 7. Geochemical Research Center, Univ. Tokyo

In 2017, we submitted a proposal for the Masterplan for Advancing Major Academic Research, entitled “Earthquake and volcanic eruption prediction science through integrated onland, seafloor and ocean drilling observations -Challenge of the spatio-temporal informatics in subduction zones- “, to the Science Council of Japan. Here, we integrate this plan with the ocean-buoy GNSS observatory project and high-pressure (down to the mantle) experiments project to create a high-precision, time-lapse imaging around the subduction zones, in order to delineate the earthquake and volcanic eruption scenarios and eventually to predict the far fate of the Earth and ocean. For this purpose, we propose to construct a real-time observatory network for earthquake and crustal deformation monitoring through seafloor cables and GNSS buoys. We also propose to obtain (and try to reproduce) the state and property around the subduction zones and in the mantle, by means of ultra-deep drilling and ultra-high pressure experiments. We are extremely interested in the mantle rheology, which is primarily controlled by the thermal structure and the abundance in volatiles (e.g. water), which we believe is only possible by integration of geophysical observation and by ground-truthing, insitu experiments.

Keywords: Seafloor cable network, Ultra-deep drilling, High pressure experiments, GNSS buoy, Subduction zone, Mantle rheology

Construction of the Cooperative Research Infrastructure for Intelligent Muography in Earth and Planetary Sciences, Other Sciences, and Society

*Hiroyuki Tanaka[1]

1. Earthquake Research Institute, the University of Tokyo

Since 10 years ago when Japan first used muography to visualise the internal structure of volcanoes for the first time (with elementary particle originated in the universe), this technique has been evolving. In 2019, at least 7 ventures were generated in Canada, Finland, France, Israel, Spain, UK, and USA. Japan still holds the technological initiative in this field, and based on this advantageous position, we will construct the cooperative research infrastructure for intelligent muography in earth and planetary sciences, other sciences, and society by adding the artificial intelligent function.

Keywords: muography

[U-05] Large-scale Research Projects: Master Plan 2020 and its beyond

convener:Eiichi Tajika(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Shigeko Haruyama(Department of Environmental Science, Graduate School of Bioresouces,Mie University), Ryoichi Fujii(Research Organization of Information and Systems), Hodaka Kawahata(Atmosphere Ocean Research Institute, the University of Tokyo), Chairperson:Eiichi Tajika, Shigeko Haruyama

Many of top sciences in Earth and Planetary Science (EPS) are progressed by big projects that require 10 billion JPY or more in 10 years or so. In order to realize such projects, we need an arena where they are brushed up through critical reviews among various fields in EPS. Deeper mutual understandings through serious discussions there will enable us to reach a final consensus on the priorities of the projects. The Master Plan (MP) of Large-scale Research issued by the Science Council of Japan strongly motivates us to follow the process described above. Indeed some of the selected projects have been funded by the Ministry of Education, Culture, Sports, Science & Technology since 2010.
Since the current Master Plan 2017 is going to be thoroughly revised in 2020, we propose to hold a session in which large-scale research projects are concisely introduced and critically reviewed. This session is to be convened by JpGU and EPS Committee of Science Council of Japan.

Discussion

Consortium for Planetary Exploration

*Yoshi-Yuki Hayashi[1], Shigeto Watanabe[2,5], Taishi Nakamoto[3,4]

1. Department of Planetology/CPS, Graduate School of Science, Kobe University, 2. SGEPSS, 3. The Japanese Society for Planetary Sciences, 4. Dept. of Earth and Planetary Sciences, Tokyo Institute of Technology, 5. Hokkaido Information University

Consortium for Planetary Exploration is planed to establish a set of distributed infrastructures in the fields of solar system sciences in Japan to plan, promote, and realize Japanese solar system exploration missions by supporting, cooperating and/or leading the mission implementing agency, JAXA, from the viewpoint of sciences, and also promoting international corporations among other organizations in the world, and help the science community maximize scientific outcomes from those missions. The consortium is to fulfill the lack of scientific leaders of such fields as data reduction, simulation modeling, instrument development, material analyses who have good experience and expertise both of the solar system sciences and the mission planning and driving, and also fundamental environments for research and development. More importantly, the focus of the consortium plan is not only to improve the number of researchers and the fundamental environments, but to cultivate graduate students and young scientist to be working on those places. The requirement for the consortium will be briefly summarized in the presentation.

Keywords: planetary exploration, infrastructure for research and dvelopment , cultivating human resources

Japanese contribution to CAESAR: comet astrobiology exploration sample return

*Tomoki Nakamura[1], Kazuhiko Yamada[2], Yoshihiro Furukawa[1], Yuki Kimura[3], Aki Takigawa[4], Tomohiro Usui[2], Hitoshi Kuninaka[2], Team CAESAR SRC team

1. Tohoku University, 2. ISAS/JAXA, 3. Hokkaido University, 4. Kyoto University

Comet is the most ideal target for Japanese planetary scientists who investigate the origin of the solar systems, particularly the origin of habitable planets. However, the mission scale of the comet sample return exceeds the Japanese space mission capability. Thus, the involvements to an international mission is more realistic strategy to share the science values of cometary sample return. A NASA NEW Frontier 4 cometary sample return proposal team requested JAXA to participate in the proposal, providing key devices and knowledge which have acquired in previous successful missions. This Master Plan proposal explains the science and engineering contributions to the NEW Frontier 4 proposal from Japan so far and in the future and how this mission provides valuable opportunities to the Japanese planetary science community.

Comets contain minerals, volatiles, and organic compounds that formed before the formation of the solar system. Thus, the cometary sample is a key material to access the origin of our solar system and the origin of life’s building blocks in space. Comet astrobiology exploration sample return (CAESAR) is the first mission to bring the macro cometary materials to the Earth without significant alteration. Japanese planetary science community have a strategy to promote the missions which investigate the formation of habitable planetary environments and its continuation. The target of CAESAR fits the strategy and particularly, investigates the materials which formed our planetary system and the origin of prebiotic organic compounds. This mission is one of the two finalist of NASA New Frontier 4 mission that has been selected from 12 proposals. JAXA is a major partner in the CAESAR mission, developing a sample return capsule based on the heritage of Hayabusa mission. Japanese sciences have also involved in the proposal planning and will be responsible for several sample analysis. The sample return of CAESAR is the most challenging among of the history of human’s sample return mission, trying to get the most abundant sample form the most far objects with the lowest temperature. This provides significant science values and also provides significant engineering heritage for Japanese communities

The early evolution of solar system stars from the conversion of interplanetary dusts into planetary materials. Hayabusa and Hayabusa 2 have strategy to investigate materials formed in the inner region of the solar system. CAESAR have complementary strategy to investigate the samples form outer region of the solar system in which material before the formation of the solar system present abundantly than inner solar system. In the astrobiological motivation, CAESAR has complementary strategy to Hayabusa 2 mission. CAESAR investigates cometary organics which have been provided mostly with micrometeorites to the Earth whereas Hayabusa 2 investigates organic compounds which have been provided mostly with meteorites. These achievements will contribute significantly to understand the origin of solar system and the origin of prebiotic organic compounds on the Earth.

CAESAR-JAPAN is working as a preproject (Phase A), developing components of sample return capsule and revising the proposal. The final selection for NASA New Frontier 4 will be open this summer. After the first step analysis, the CAESAR sample will be distributed to international science community including Japan. This will contribute significantly in planetary science, astrobiology, astronomy, and related

Strategic Mars exploration: Orbiter and EDL demonstration mission for space weather, climate, and aquatic environment

*Kanako Seki[1], Shigeto Watanabe[2], Taishi Nakamoto[3], Naoki Terada[4], Atsushi Yamazaki[5], Ayako Matsuoka[5], Tomohiro Usui[5], Yasuhito Sekine[3], Kazuhisa Fujita[5], Shoichiro Yokota[6], Satoshi Kasahara[1], Yoshifumi Saito[5], Hiromu Nakagawa[4], Atsushi Kumamoto[4], Hiroyuki Maezawa[7], Mars Orbiter and EDL Technology Demonstration Mission Planning Team

1. Graduate School of Science, University of Tokyo, 2. Department of Cosmosciences, Hokkaido University, 3. Tokyo Institute of Technology, 4. Graduate School of Science, Tohoku University, 5. ISAS, JAXA, 6. Graduate School of Science, Osaka University, 7. Department of Physical Science, Osaka Prefecture University

This presentation will report on outline of the strategic Mars exploration with an orbiter and EDL technology demonstration to investigate the space weather, climate, and aqua-environment at Mars, which is to be submitted to the Master Plan 2020 of the Science Council of Japan. The research project was previously proposed from Society of Geomagnetism and Earth, Planetary and Space Sciences (SGEPSS) as “Exploration of the space weather and climate at Mars,” which is listed in the Master Plan 2017 of the Science Council of Japan as the large scientific research project number 79, category number 24-2. The project has been developed since then through discussions over larger related academic communities including the planetary science. Here we propose the renewed project as a joint proposal between SGEPSS and the Japanese Society for Planetary Sciences.
In the roadmap of the solar system exploration in coming 20 years, understanding of the formation and evolution of the habitable environment is regarded as an essential goal of the planetary science. Among various targets, Mars is an idealtarget for comparative planetology and astrobiological researches, since it once had a habitable environment with an abundant water on its surface. Mars sample return mission with international collaborations is under planning for the 2030’s. In order for Japan to play a leading role there,implementation of our original strategic Mars exploration missions in 2020’s is under vital demands from both the scientific and technological points of view.
As an important step in the Japanese strategic Mars exploration to strengthen our ability to contribute the future Martian exploration scenario by ISECG (international space exploration coordination group), this project combines the orbiter and EDL (entry, descending, and landing) technology demonstration, focusing on the responses of Martian environment to extreme solar variations and its co-evolution with subsurface aquatic environment.The mission will elucidate influence of the active sun on the habitable environment and provide the basis for our future landing exploration in 2030’s. In particular, by investigating the instantaneous response to extreme solar variations, which can be usual conditions in ancient sun, we will obtain the key knowledge to understand how atmospheric escape to space contributes to the loss of habitable environment from ancient Mars. The project will also provide knowledge about Martian radiation environment and will achieve demonstration of key technologies for the future landing exploration as well as important information of possible landing sites.In order to achieve the goal, we identified three observational requirements and 11 model payloads for the mission. In the presentation, details of these items will be also introduced.

We are conducting a 1.8-m aperture off-axis telescope project PLANETS under international collaborations. In this presentation, we report the current status of PLANETS project and our scientific targets, and also promote use cases in other research fields in astronomy and planetary/exoplanetary sciences. PLANETS is characterized by low-scattering and high-contrast capability thanks to off-axis mirror system, and also by monitoring observation. We mainly concern variations in planetary atmospheres, faint gases produced from satellites, exoplanetary atmosphere, and also welcome other targets that match to the advantages of PLANETS. Continuous monitoring is essential to understanding the planetary atmospheric phenomena, and therefore, own facilities with even small- and medium sized telescopes and instruments are important. We have demonstrated that continuous monitoring is effective for understanding planetary and satellite phenomena using small telescopes at the summit of Mt. Haleakala, Hawaii (3050 m altitudes). We are now operating 40 cm (T40) and 60 cm (T60) telescopes at Haleakala combined with high-resolution spectrometers in visible and infrared ranges to observe faint atmospheric emissions/absorptions, such as plasma and neutral torus produced by Jupiter’s satellite Io, neutral torus produced by Saturn’s satellite Enceladus, gases in Venus and Mars, sodium gasses of Mercury, and so on. The polarization imager DIPOL-2 is also installed to measure the weak polarization of exoplanetary light. Our and guest investigators’ observations are also linked to Mercury, Venus (Akatsuki), Mars (Mars Express, MAVEN) and Jupiter (Juno) missions.
To achieve precise spectroscopy and polarimetry for faint emissions/absorption in planetary/exoplanetary atmospheres and satellites, PLANET’s a 1.8-m aperture with low-scattered light optics is necessary. PLANETS project is managed by the PLANETS Foundation (www.planets.life), which is an internationally organized entity whose board members are from several institutes in Japan, USA, Germany, Brazil, and France. This off-axis optical system brings us unrivaled high-dynamic range scientific capabilities on coronagraphy and polarimetry. It will have a Gregoian focus with a FOV of 6' (Fno=13) and a Coude focus with a FOV of 20" (Fno=49). The main mirror is Clearceram Z-HS with a diameter of 1850 mm, which is now on the final polishing process. We are designing mechanical structure of telescope for both cases of equatorial mount and azimuthal-elevation mount. We are also designing a mirror support structure in two ways, active support and passive support. We are aiming to get first light with PLANETS telescope within next several years.

Martian Moon eXploration MMX: science objectives and their promotion

*Kiyoshi Kuramoto[1,2], Yasuhiro Kawakatsu[2], Masaki Fujimoto[2], Jean Pierre Bibring[3], David Lawrence[4], Hidenori Genda[5], Naru Hirata[6], Takeshi Imamura[7], Shingo Kameda[8], Koji Matsumoto[9], Hideaki Miyamoto[7], Tomokatsu Morota[10], Hiroshi Nagaoka[2], Hiromu Nakagawa[11], Tomoki Nakamura[11], Kazunori Ogawa[12], Hisashi Otake[2], Masanobu Ozaki[2], Sho Sasaki[13], Hiroki Senshu[14], Shogo Tachibana[7,2], Naoki Terada[11], Tomohiro Usui[2], Koji Wada[14], Sei-ichiro WATANABE[10], MMX study team

1. Hokkaido Univ., 2. JAXA, 3. IAS, 4. APL, 5. ELSI, 6. Aizu Univ., 7. Univ. of Tokyo, 8. Rikkyo Univ., 9. NAOJ, 10. Nagoya Univ., 11. Tohoku Univ., 12. Kobe Univ., 13. Osaka Univ., 14. Chiba Inst. Tech.

Martian Moons eXploration, the next Japanese sample return mission following Hayabusa 2, is under extensive study for the upshift to phase B with a schedule to be launched in 2024 and return to Earth in 2029. MMX will make close-up observations of Phobos and Deimos over ~3 years and sample return from a moon, from which the origin of the Martian moons will be conclusively revealed. Simultaneously, the formation and evolution of a habitable planet having liquid water and atmosphere will be elucidated from the deep search for both moons and parallel Mars atmosphere observations, by making the best use of the inherent nature of the moons that have long history since the formation stage of Mars and orbits near the parent planet. Particularly, MMX will shed light on the formation and early evolution of Mars and the volatile transport from the outer planet region to inner one in early solar system, which are hardly assessed from the survey of Martian surface geology alone. Mission instruments to be on board are telescope camera (TENGOO), multiband visible camera (OROCHI), infrared spectroscopic imager (MacrOmega), gamma-ray and neutron spectrometer (MEGANE), light detection and ranging (LIDAR), dust monitor (CMDM), ion mass spectrum analyzer (MSA) and sampler. A rover is also under study as an additional science instrument to probe the moon’s surface microscopic structure and composition. To achieve the mission science objectives, it is essentially important to conduct close interplay among analyses of data from multi-instruments, sample analyses, and theoretical studies. To traverse the instrument development teams and data analysis, sample analysis and theoretical scientists, the MMX science board is going to be organized the sub-science teams, which will produce the best initial scientific results fully answering the mission objectives and conduct preparations for observations, data analyses, sample analyses in parallel with theoretical studies.

Implantation of Martian Materials in the Inner Solar System by a Mega Impact on Mars

*Ryuki Hyodo[1], Hidenori Genda[1]

1. Tokyo Institute of Technology, Earth Life Science Institute

The rare asteroids, called A-type asteroids, orbit within the Hungarian region and within the main asteroid belt region. They have olivine-rich spectral features [DeMeo&Carry 2013]. Their origin is still under debate even though some could be mantle materials fragmented and ejected by a catastrophic impact of differentiated primordial asteroid [Sanchez et al. 2014]. On the other hand, olivine is a major mineral of the Martian upper mantle with ~60 wt% [e.g. Bertka&Fei 1997, Zuber 2001]. Also, at the surface of Martian grabens, such as Nili Fossae, an olivine-rich signature is detected [Hoefen et al. 2003, Mustard et al. 2009].

Recent studies showed that a giant impact may occur on Mars and it produced Mars-orbiting debris from which Martian moons, Phobos and Deimos, acreete [Rosenblatt et al. 2016, Hesselbrock&Minton 2017, Hyodo et al. 2017, Canup&Salmon 2018]. Recently, Polishook et al. (2017) suggested that such Martian-moon forming impact may also produce debris that escapes from Mars' gravitational field, and some of them may have delivered to the asteroid region. However, quantitative arguments such as mass, composition and orbits of the impact ejecta have been not studied yet.

In this talk, we will present our recent work [Hyodo&Genda 2018, ApJL] that investigated the compositional and thermodynamic properties of the impact ejecta produced by a giant impact that forms Martian moons [Hyodo et al. 2017]. We also present their mass and heliocentric orbits and discuss the possibility of forming rare A-type asteroids.

We perform high-resolution SPH simulations of Mars' giant impact (impactor mass of ~0.03 mass of Mars, impact velocity of ~6 km/s and impact angle of 45 degrees without pre-impact Martian spin). We found that the giant impact produced the following escaping debris [Hyodo&Genda 2018, ApJL]:

1. Mass of ~$10^{-2}M_{Mars}$
2. ~20wt% originates from Mars and the rest originates from the impactor
3. ~50% of the Martian material originates from Martian mantle (between 50 and 200 km in depth)
4. Temperature ranges between 1000 and 4000K with a peak around 2000 K

Assuming the Mg# (=Mg/(Mg+Fe) in mol) of bulk silicate Mars of ~75% [Elkins-Tanton et al. 2003] and thus ($Mg_{0.75}$, $Fe_{0.25}$) SiO_4olivine solid solution as a major mineral of the Martian upper mantle, solidus and liquidus temperatures are about 1850 K and 2000 K [Bowen&Schairer 1935]. Then, using our SPH simulations, we found that ~10% of escaping Martian mantle debris does not melt but ~70% of the debris completely melts. In the case of partial melting (2000 K), ~20% of the Martian mantle debris avoids melting and thus they would preserve their primitive minerarogy. Hence, the unmelted Martian mantle material (olivine-rich material) is estimated to be about ~2% of the total ejected mass (~1.7×10^{20}kg). This mass is much larger than those of current A-type asteroids found in the Hungarian region (~2.8×10^{15}kg) and the current main asteroid belt (~8.9×10^{18}kg).

The orbits of the ejected particles are distributed between ~0.5-3.0 AU with eccentricity upto ~0.6 and

©2019. Japan Geoscience Union. All Right Reserved.

inclination up to ~0.3 radian. Detailed stidues on the long-term evolution of the debris is required but the initial orbits of the debris shows that they can easily reach the asteroid belt region and thus unmelted Martian mantle material (a maximum of ~2% of the total debris mass) is potentially expected to settle into stable orbits as rare A-type asteroids found in the Hungarian and main asteroid belt regions.

We also expect that the debris hit the pre-existing asteroids with impact velocity larger than 5 km/s. The nominal collision velocity between existing asteroid is ~5km/s [Bottke et al. 1994]. Such high-velocity collision between the debris and pre-existing asteroid may record a reset of ^{40}Ar–^{39}Ar age and/or impact melts [Kurosawa&Genda 2018] and thus the timing of the giant impact on Mars may be recorded in some chondrite.

Hydrodynamic escape of a reduced proto-atmosphere on early Mars

*Tatsuya Yoshida[1], Kiyoshi Kuramoto[1]

1. Hokkaido University

The short growth time of proto-Mars inferred from analyses of Martian meteorites implies that the proto-Mars likely gravitationally maintained both the solar nebula component and the impact degassed component as a proto-atmosphere. Planetary building blocks containing metallic iron should induce production of reduced volatiles such as H_2, CH_4 and CO because metallic iron acts as a reductant for the degassed component (Kuramoto and Matsui, 1996). Atmospheres with reduced compositions are promising sites for photochemical production of organic matters precursory for life (Schlesinger and Miller, 1983). If a reduced proto-atmosphere was formed and maintained on early Mars, it may be important as a field for synthesis of organic matters linked to the emergence of life organisms.

However, the reduced proto-atmosphere once possibly formed on a rocky planet has been considered to be rapidly lost by hydrodynamic escape. Hydrodynamic escape occurs when radiative heating of an atmosphere accelerates a radial outflow of an atmosphere against the planetary gravity and it is possibly induced by the extreme ultraviolet (EUV) flux of the young Sun. Previous numerical studies (Lammer et al., 2013; Erkaev et al., 2014) estimate the atmospheric escape rate of an oxidized Martian proto-atmosphere, suggesting that the proto-atmosphere with the amount equivalent to ~100 bar could have been lost per 10 Myr under the EUV flux 100 times the present. But their result likely depends on the assumption that molecules are fully dissociated into atoms. Since the gravity on Mars is small, it is likely that a considerable fraction of molecules stays undissociated in the escape outflow. If infrared active molecules are included in the atmosphere, they may reduce the atmospheric escape rate by radiative cooling. If the atmospheric escape rate decreases, the reduced environment that is suitable for producing organic matters likely continues for a long time. So far, the effect of radiative cooling on hydrodynamic escape remains poorly understood. Here, we develop a one-dimensional hydrodynamic escape model which include radiative cooling processes and photochemical processes for a multi-component atmosphere. We calculate the escape rate of a reduced Martian proto-atmosphere and estimate the duration of the reduced environment on early Mars.

We solved the fluid equations for a multi-component gas assuming spherical symmetry considering radiative processes and photochemical processes. These equations are solved by numerical integration about time until the physical quantities settle into steady profiles. We use the UV spectrum 100 Myr after the birth of the Sun estimated by the observations of solar-type G stars. We consider CO and CH_4 as radiative coolant, and consider their energy transitions with high emissivity. We calculate the radiative cooling rate by using the photon escape probability. In this modeling, a hybrid-type atmosphere in which the degassed component and solar nebula component are mixed is supposed with 18 chemical components including photolysis products.

The mass escape rate decreases more than one order as the mixing fraction of CO and CH_4 increases > 10% because of the energy loss by radiative cooling of CO and CH_4. Concurrently, the mass fractionation between H_2 and other heavier species occurs more remarkably. Time scale for H_2 loss may be longer than 100 Myr when the the degassed component is larger than ~1.0×10^{21} kg equivalent to ~100 bar atmosphere. In many simulation cases, CO and CH_4 are left behind implying that the reduced environment further continues until these reduced species are oxidized by photolysis. Our result suggests

©2019. Japan Geoscience Union. All Right Reserved.

a reduced environment on early Mars may have continued more than 100 Myr and played an important role producing organic matters.

Orbital evolution of Martian moons by rotating Martian proto-atmosphere with low angular momentum

*Ryo Matsuoka[1], Kiyoshi Kuramoto[1]

1. Department of Cosmosciences, Graduateschool of Science, Hokkaido University

Martian moons, Phobos and Deimos has radii about several km to 10 km, and irregular shapes. Their low albedos and reflectance spectra are similar to those of primitive carbonaceous asteroid which supports “capture scenario” for their origin.

In previous studies considering the capture due to energy dissipation by gas drag from the Martian proto-atmosphere caused by the gravitational bound of the nebula gas, it is possible to circularize the moons’ orbit (Hunten 1979, Sasaki 1990). While this spherically symmetric atmospheric structure can make moon’s orbit circular, it is impossible to attenuate the orbital inclination of the moon. Also, the satellite constantly receives atmospheric drag and cause moons to fall into Mars eventually. Although the giant impact theory (e.g. Rosenblatt+ 2016) explains such moons’ orbital feature, it is difficult to form moons with carbonaceous composition because of high temperature environment during moon formation. On the other hand, in context of capture scenario, Matsuoka & Kuramoto (2018, JpGU) considered the atmospheric rotation and showed that the attenuation of inclination occurred and the orbital shrinking was inhibited. However, since this atmosphere has extremely large angular momentum (1.3 times the Martian spin anugular momentum) due to Keplerian rotation beyond the co-rotational radii, thus it seems difficult to realize to form. Also, there is a problem that moons are formed and stay beyond Deimos’ orbit. In this study, we construct models of rotating atmosphere with much small anugular momentm and show that it is more advantageous in explaining the orbital features of the current Martian moons.

This study assumed that atmospheric rotation is limited within the Bondi radii and the velocity field is modeled as follows so that the rotational velocity becomes continuous by changes with distance. (1) Mars surface to co-rotational radii R_C: co-rotational atmosphere with Mars’ spin. (2) co-rotational radii to Bondi radii R_B: attenuated atmospheric rotation with distance given by $v(r)=((R_B-r)/(R_B-R_C))^{\Gamma} v_K(r)$ (v_K is a Keplerian velocity, Γ is a constant which we set unity in this study). (3) Bondi radii to Hill radii: stationary atmosphere connecting nebula at Hill radii. Such atmosphere can be regarded as a case that has not enough angular momentum to make Keplerian rotation outside the co-rotational radii. The density field of the atmosphere was determined by the balance of centrifugal force by this velocity field, Mars gravity and pressure gradient, and the drag force by these velocity field and density field were given to the equation of motion of moons. This atmosphere has low angular momentum of only 0.14 % of the Martian spin angular momentum.

In numerical experiments, moons have the inward radial velocity component in all regions, but the orbital shrinkage is suppressed near the co-rotational radii due to small speed difference between moons and atmosphere. The typical timescale of attenuation of semi-major axes of Phobos size moons is the order of 10^4 yr or more. This timescale sharply increased as approaching the co-rotational radii, indicating that the moons stay well in this region. This result naturally explains the initial position near the co-rotational radii of moons before tidal orbital evolution. Since there is a speed difference between moons and the atmosphere even if the inclination takes small value, the attenuation of inclination occurs efficiently. In contrast to timescale of inclination decay derived in our previous study that is rapidly increasing with the

©2019. Japan Geoscience Union. All Right Reserved.

decay of inclination, timescale derived in this study has an upper limit of several thousand years for a Phobos size moon. This result explains small orbital inclination of the current Martian moons. Such tendencies are recognized in the same way when Γ has different positive values, and in the cases of the Deimos size moons, such orbital evolution occur more rapidly than those of Phobos size moons.

N-body simulations of Moon formation with cooling evolution of the protolunar disk

*Takanori Sasaki[1], Natsuki Hosono[2]

1. Department of Astronomy, Kyoto University, 2. Japan Agency for Marine-Earth Science and Technology

The previous studies about Moon formation focused on the first and last stages: the giant impact process (~1 day) has been investigated by SPH simulations, and the lunar accretion process (~1 month) from the circumterrestrial particulate disk has been investigated by N-body simulations. Although the Moon formation process should proceed on the cooling timescale of the protolunar disk (~100 years), there has been no study to simulate the long-term evolution of the disk. In this study, we developed an N-body code to simulate the cooling evolution of a protolunar disk in vapor/melt equilibrium, and executed long-term N-body simulations for the disk evolution and lunar accretion processes simultaneously with PEZY-SC processors. Our result showed that "mini-Moons" system would form instead of forming a single Moon.

Possibility of giant planet formation by pebble accretion in Class 0/I YSOs

*Yuki Tanaka[1], Yusuke Tsukamoto[2]

1. Tokyo Institute of Technology, 2. Kagoshima University

Recently, pebble accretion in protoplanetary disks attracts attention in theoretical works of planet formation. In this process, it is thought that cm-sized particles, so-called pebbles, drift inward in the disk, and growth of planets will be accelerated due to accretion of pebbles onto proto-planets. Various theoretical works which assume pebble accretion, such as giant planet formation and formation of super-Earths systems, have been done so far.

Meanwhile, recent radio observations by ALMA have revealed that existence of clear gaps and rings in many very young protoplanetary disks. Mechanisms to generate these structures of gaps and rings are yet to be investigated, and many theoretical models have been proposed. One of these hypotheses is that gas giants in the disks carve gaps in the dust disks and create such structures. Numerical simulations which assumed the existence of the planet have been shown that gaps and rings similar to the observations can be represented. However, a time-scale for planet formation will be long because the observed radii of gaps and rings are relatively large, so it is unclear whether the planet with enough mass to create a gap can form in very young disks.

Here we focus on planet formation in much earlier stages, Class 0/I phases. Combining an analytical model of a gravitationally unstable disk around Class 0/I YSOs with a model of pebble accretion, we investigate possibility of giant planet formation in the early stages of disk evolution. We find that in many cases a time-scale of pebble accretion in the condition of Class 0/I YSOs is much shorter compared to that in a typical protoplanetary disk, because of larger mass accretion rates. We also find, however, the accretion time-scale is not always a decreasing function of the gas accretion rate, and the time-scale can be longer as the increase of the gas accretion rate depending on parameters. Using derived time-scales, we investigate growth of proto-planets with different parameters such as the gas accretion rate and dust-to-gas mass ratio. Based on our results, we discuss a required initial mass of the proto-planets to form cores of the giant planets within Class 0/I phases.

The effect of the three-dimensional gas flow around an embedded planet on pebble accretion

*Ayumu Kuwahara[1], Hiroyuki Kurokawa[2]

1. Tokyo Institute of Technology, 2. Earth-Life Science Institute

Pebble accretion is a new model of planet formation, which may overcome several problems remaining in conventional planetesimal accretion theory. Accreting mm—cm-sized particles, called pebbles, onto the proto-cores can form the massive cores faster than accreting the planetesimals. In addition to the formation of the Jovian cores in a realistic timescale, pebble accretion scenario can explain the formation of various types of planets—for instance, close-in super Earths, water-rich planets, and the size distribution of terrestrial planets in the solar system. The key point of this scenario is that the pebbles experience not only the gravitational interaction with the proto-cores but also gas drag. The hydrodynamic effect is important when we consider the planet formation via pebble accretion.

Previous works have found the three-dimensional flow field around an embedded planet. Gas from the protoplanetary disk enters the Bondi or Hill sphere of the planet at high latitude and exits through the mid-plane region in the isothermal condition (Kuwahara et al. 2019). This recycling mechanism may have both positive and negative effect on the accretion of solid materials. When the particles are moving in the region at high latitude of the planet, the accretion may be promoted by the inflow of gas. On the other hand, if the particles are in the mid-plane region, the accretion of the particles can be suppressed by the outflow barrier. Though some studies considered the accretion of dust particles in the realistic flow field (Ormel 2013; Popovas et al. 2018ab), the effect on the accretion efficiency is not fully understood. This study aims to understand the hydrodynamic effect and to obtain the accretion efficiency of particles for the range of planetary masses and particle sizes.

In this study, using the numerical data obtained from three-dimensional hydrodynamical simulations, we numerically integrated the equation of motion of pebbles including the gravitational interactions and gas drag under the influence of the flow field in three dimensions. We also performed the similar calculations on the Keplerian shear flow field without the effect of planet gravity on the flow, then investigated how the description of the pebble accretion changed on the flow pattern, pebble size, and dimensionless planetary mass, $m=R_{\mathrm{Bondi}}/H$, where R_{Bondi} and H are the Bondi radius of the planet and disk scale height, respectively.

In the flow field, we found that the description of pebble accretion differs from that of in the Keplerian shear flow. Pebbles at high altitude tend to descend toward the planet because of the downward stream of gas. The accretion rate of pebbles became smaller than in the Keplerian shear flow. In spite of the pebbles descend toward the planet, the accretion of pebbles can be suppressed because of the effect of the flow field. Since the gas flows rapidly in the vicinity of the planet, the gas flow field deflects the trajectories of the pebble in the vicinity of the planet and reduces its accretion rate. The flow field has the stronger effect on the smaller pebbles. Based on these results, we will discuss the implications for planet formation via pebble accretion.

Icy pebble accretion onto terrestrial planets: the effect of gas flow

*Hiroyuki Kurokawa[1], Ayumu Kuwahara[2], Satoshi Okuzumi[2]

1. Earth-Life Science Institute, Tokyo Institute of Technology, 2. Tokyo Institute of Technology

Earth, the only life-hosting planet we know, is characterized by the small water fraction in the bulk composition: the ocean mass being 0.023% of the Earth mass. Because the abundance of water control the physical and chemical evolution of planets by atmosphere-hydrosphere-lithosphere interactions and by changing the mantle properties, unveiling how water-depleted planets form is crucial for understanding the emergence of habitability on them. Pevious studies have pointed out that icy pebble accretion following the snow line migration in protoplanetary disks typically deliver an excess amount of water to terrestrial planets unless the initial size of the disk is small (30--50 au) or a giant planet in the outer orbit (e.g., Jupiter in our solar system) formed early (Morbidelli et al. 2016; Sato et all. 2016; Ida et al. 2019). In contrast to the previous studies where the accretion rate derived for pebbles moving in (sub-) Keplerian flow, we used the accretion rate derived for pebbles moving in the gas flow perturbed by the gravity of the planet (Kuwahara et al. 2019; Kuwahara et al. in prep.). The presence of horseshoe region and outflow shuts off the accretion of small pebbles. We show that, because migrating icy pebbles at ~1 au are small, the gas flow significantly suppress the accretion onto Earth-sized planets, whereas Mars-sized planets accretes a significant amount of icy pebbles. Our results suggest that Earth-like, water-depleted rocky planets may form in a disk-size range wider than previously considered and in the systems where no giant planet exists.

Delivery of ammonia ice to Ceres by pebble accretion

*Yuto Nara[1], Satoshi Okuzumi[1], Hiroyuki Kurokawa[2]

1. Tokyo Institute of Technology, 2. Earth-Life Science Institute, Tokyo Institute of Technology

Recent studies with the spectrometer onboard the Dawn spacecraft detected the presence of ammoniated phyllosilicates on the surface of Ceres. It is presumed that ammonia may have reacted with the phyllosilicates on Ceres during differentiation. Ammonia can not exist alone as a solid in the current temperature at the location of Ceres. It has yet to be shown how ammonia is delivered to Ceres.

In this study, by adopting a theory "Ceres formed a protoplanetary core around the current main asteroid belt and accreted ammonia-bearing ice pebbles there", we aim to give constraints on the free parameters of the protosolar nebula. We numerically calculate the growth and radial inward drift of icy dust particles, and the evolution of the surface density of the gas flow and the disk temperature in a viscous disk. We employ a formula of pebble accretion presented by a previous study to quantify the amount of ammonia-bearing ice pebbles delivered to asteroids at 2.8 au.

We find that when the free parameters of the protosolar nebula satisfy certain conditions, Ceres accretes ammonia-bearing ice pebbles with ~ 10 –100 km thickness on its surface by pebble accretion. This result can explain the observations that there is ~ 15km of relief with craters on the surface of Ceres, and the ammoniated phyllosilicates on its surface were formed globally. In our result, we support the disk model with strong turbulence. Moreover, we suggest if ammoniated phyllosilicates come from pebble accretion, the amount of ammoniated phyllosilicates on planets' surface strongly depends on accreting planet masses.

Volatile-driven cryovolcanic eruption on asteroid Ceres as a probe to its interior

*Koki Yumoto[1], Yuichiro Cho[1], Seiji Sugita[1]

1. Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo

Introduction: Imageries from NASA's DAWN mission revealed the presence of localized bright spots (or faculae) exhibiting brighter materials with likely composition of anhydrous sodium carbonate (De Sanctis et al., 2016) within the dark Ceres surface. These materials are assumed to be remnants of cryovolcanic ejecta which ascended from brine reservoirs thorough impact induced fractures. Quick et al., (2018) showed that excess pressure caused by the gradual freezing chamber could be a driving source for its ascent. However, DAWN image revealed the presence of both explosive (e.g. Vinalia faculae) and effusive (i.e. Cerealia facula and Ahuna Mons) eruptions, implying the possibility that fragmentations of cryomagma are induced by exsolved volatiles and this could be a primal driving source.
Objectives: Volatile exsolution are known to play an important role in ascent dynamics of silicate volcanism, and it enables ascent of relatively high density cryomagmas, but their contributions to cryovolcanism are not well understood. This study attempts to obtain new constraints on the properties of a subsurface brine reservoir and conduit geometry based on phase equilibria and model calculations.
Model: The equilibrium composition of CO_2-H_2O-NaCl system by Akinfiev & Diamond (2010) was used as the cryomagma composition. The cryomagma is assumed to have a viscosity of 10^5-10^8 Pa s (Quick et al., 2018), and this slurry-like rheology constrains the temperature within the solidus and liquidus curves along decompression. If we assume ascents to be isothermal at velocity $>10^{-3}$ m/s (Quick et al., 2018) and salinity lower than the stability region of hydrohalites, then the temperature of cryomagma should be within ~260 - 270 K, consistent with impact simulation (Bowling et al., 2018), and salinity <~20 wt%. One-dimensional 2-phase (i.e. cryomagma and exsolved gaseous volatile) steady flow in a cryovolcanic conduit was modelled with the theory developed by Kozono & Koyaguchi (2009) for terrestrial volcanoes. Major modifications in our model were, adjustment of the henry's law, application of choking condition at the surface, and the liquid stability of CO_2. The depth, volatile content, viscosity of brine reservoir, and conduit radius were constrained from the estimated explosive eruption velocity of Vinalia faculae 26 - 54 m/s (Quick et al., 2018) derived from its emplaced radius.
Result and Discussion: Calculation results indicated that for a given viscosity (e.g, 10^5 Pa s), a series of combinations of conduit radius and volatile content, ranging from 10 m and 4 - 7 wt% to 50 m and 0.8 - 3 wt%, 200 m and 0.7 - 3 wt%, can achieve the above eruption velocity. Note that plausible conduit radii should lie within 1 - 100 m (Fagents 2003) and robust upper limit is given by observed radii of vent-like feature ~200 m. We found that reservoir depths have little influence on eruption velocities. For a given viscosity (10^6 Pa s), similar combinations of conduit radius and volatile content ranging from 50 m and 2 - 3 wt% to 200 m and 0.7 - 3 wt% can achieve the eruption velocity. Although higher viscosity $>10^7$ Pa s can achieve similar eruption velocity when a larger conduit radius >100 m is assumed, such large conduits are not consistent with estimations (Quick & Marsh, 2016). Results for explosive eruptions experienced fragmentation at >100 m depth and showed that volatiles could drive the ascent and cause fragmentation of cryomagmas. If effusive eruptions occurred from the same reservoir, conduit radii should be <1 m. However, the probable abundance of such conduits is inconsistent with the lack of effusive eruptions on Ceres and thus could have formed differently, such as diapiric ascents (Buczkowski et al., 2018). Our model calculations showed that cryomagmas could be volatile-driven and may cause fragmentations to erupt explosively. Also, constraints from our calculation showed that Ceres subsurface could be volatile-rich than previously assumed.

Ice sheet formation on synchrnously rotating earth-like planets in M-dwarf abitable zones

Soma Arai[1], Kiyoshi Kuramoto[1], *Masaki Ishiwatari[1], Shunichi Kamata[1]

1. Department of Cosmosciences, Graduate school of Science, Hokkaido University

It is considered that terrestrial planets near M-dwarf are synchronously rotating (Von Bloh et al, 2007). Some of such planets exist in the habitable zone defined by vertical one-dimensional atmospheric models and are expected to have liquid water on their surface. However, in synchronously rotating planets, there is a possibility that all of liquid water are lost since water vapor transported form warm day-side to cold night-side is condensed on night-side surface as ice. In order to examine this problem, Menou (2013) conducted atmospheric general circulation model (AGCM) experiments using a synchronously rotating planet configuration with surface water of 50m depth. He estimated ice sheet thickness formed on the planet surface based on the calculated amounts of precipitation and surface evaporation. The result is that the amount of ice sheet on night-side can reach the all amount of surface water given to the planet. In his estimation, GCM results obtained without topography were utilized. Since surface height will change according to the growth of ice sheet, atmospheric circulation are influenced by topography of ice sheet and distributions of precipitation and surface evaporation are also changed. Therefore, the ice sheet thickness can be different from the values estimated by Menou (2013). In this study, in order to consider the effect of the topography produced by ice sheet formation in the night-side, we perform GCM experiment with changing surface height distribution.

The model utilized is DCPAM5(https://www.gfd-dennou.org/library/dcpam/). Atmospheric constituents and parameters such as planet radius are same as those of Earth. We perform two kinds of experiments: one is aqua-planet experiment in which all surface are covered with water or ice, the another is land-planet experiment in which initial water of 20cm depth is given to day-side surface and water transport on the surface is neglected. In land-planet experiment, surface liquid water distribution is determined by atmospheric transport. The value of surface albedo is fixed to 0.15. First, integration for 1500 days with no topography is performed, then thickness of ice sheet is prognosed with considering melting of ice at the bottom of ice sheet and condensation of ice on the surface calculated from distributions of precipitation and surface evaporation. Then, using the horizontal distribution of surface height estimated by the above method, integration for 1500 days is performed and ice sheet height is prognosed again. With repeating these procedures, we search for equilibrium states in which ice sheet thickness becomes constant in time. The results of land planet experiment show that an equilibrium state with ice sheet over 4000m height can be obtained. Contrary to this, in aqua-planet experiment, equilibrium state are not been obtained in our experiment. Ice sheets with height over 10000m are formed in the night-side, although the value of ice sheet height is transient. The result of the experiment with topography determined by the above estimated ice sheet height show that day-side surface temperature become lower than 273K, and therefore, globally ice-covered state can emerge. As for the reason, we consider that day-side surface is cooled by cold air blowing from night-side with high elevation to day-side with low elevation. Since albedo change due to the ice sheet formation is neglected in our experiments, our result suggests that the atmospheric circulation influenced by ice sheet topography can produce globally ice-covered state.

Three-dimensional linear calculation for non-isothermal type 1 planetary migration

*Kohei Okada[1], Hidekazu Tanaka[1]

1. Tohoku University

Planet migration is one of the serious problems in the standard theory of planet formation. A planet excites density waves, that causes a rapid inward migration in a protoplanetary disk. In this study, we formulate the linear wave excitation by a planet in three-dimensional non-isothermal gaseous disks and calculate the torque on the planet more correctly than previous studies.
The torque on a planet has been studied by linear and non-linear calculations. In previous three-dimensional linear calculations the torque was calculated only for isothermal disks. This is because the three-dimensional linear equation has the term that is strongly divergent at corotation in non-isothermal disks. This problem has not been resolved yet and we cannot test non-linear three-dimensional calculations with linear calculations.
In linear studies of gravitational interaction between a planet and a three-dimensional gaseous disk, there are two-dimensional waves that do not have the z-component of velocity and three-dimensional waves that have non-zero v_z. Only three-dimensional waves have a divergent term but it is known that the absolute values of the torque in three-dimensional waves are much small than those of two-dimensional waves in the isothermal disk. In this study, therefore, we ignored three-dimensional waves and examined the torque on a planet in three-dimensional non-isothermal disk approximately. Actually since there is no sign of divergent in previous non-linear hydro-dynamical simulations, this approximation seems good.
With this approximation, we carry out the three-dimensional non-isothermal linear calculation. The obtained torque coincides with non-linear three-dimensional hydro-dynamical simulations. Because of this, we confirmed that our three-dimensional linear calculation is accurate.

Dependence of Central star mass on Protoplanetary disk evolution

*Ryuunosuke Nakano[1], Takeru Suzuki[1], Masahiro Ogihara[2], Eiichiro Kokubo[2]

1. University of Tokyo, 2. National Astronomical Observatory of Japan

More than 4000 outer planets have been discovered in recent years. The discovery of rocky planets such as the Earth is increasing with this. On the other hand, how such a planetary system was born and evolved has a big uncertainty factor. Understanding the evolution of protoplanetary disks are fundamentally important in considering the formation and evolution of planets. The disk is made of dust and gas and plays a central role in the formation and evolution of rocks and planets, but in order to clarify the dynamics and growth of dust, it is necessary to understand the physical state of the background gas component. It is still unknown how the dissipation of the disk is done by photoevaporation from the central star and by the wind of the magnetically driven disk wind but how they contribute over time and also depend on the difference in mass of the central star.

In this study, a one-dimensional radial simulation of gas components of protoplanetary disks was done in consideration of photoevaporation by X-ray (Owen et al. 2010) and magnetically driven disk wind (Suzuki & Inutsuka et al., 2009). We investigated how the evolution of the disk changes by the difference of the central star mass.

We performed the evolution of protoplanetary disks with different masses of the central stars. If we define the evaporation time at 1au as the time when the surface density there falls below the observable level, it is shorter for a more massive central star, because the photoevaporation is more efficient.

In contrast, the evaporation time at the snowline shows the opposite trend; the evaporation is more rapid for disks with less massive central stars. This is because the location of the snowline has a very sensitive dependence on the mass of a central star.

Radiation Hydrodynamic Simulations of the Formation of Circumplanetary Disks

*Yuri Fujii[1], Oliver Gressel[2], Kengo Tomida[3], Udo Zieglar[2]

1. Institute for Advanced Research, Nagoya University, 2. Leibniz Institute for Astrophysics Potsdam, 3. Osaka University

Formation of regular moons and/or planetary atmospheres are governed by the gas flow into the vicinity of forming giant planets. Gas around a sufficiently massive planet is thought to form a circumplanetary disk instead of falling directly onto the planet. Recent studies, however, have shown that the circumplanetary gas forms an expanded envelope rather than a thin, rotationally supported Keplerian disk in cases where the gas temperature is very high. Thus, calculating the temperature of the accretion flow properly is important to determine the disk structure. We performed three-dimensional radiation hydrodynamic simulations of the formation of circumplanetary disks with an equation of states that considers effects such as hydrogen dissociation and helium and hydrogen ionization. The region within the deep potential of the planet reached very high temperature regime, however, we observe a disk to form in our simulations.

Inefficient Magnetic Accretion Heating in Protoplanetary Disks: Evolution of The Snow Line

*Shoji Mori[1], Xuening Bai[2], Satoshi Okuzumi[3]

1. Department of Astronomy, The University of Tokyo, 2. Tsinghua Center for Astrophysics, Tsinghua University, 3. Department of Earth and Planetary Sciences, Tokyo Institute of Technology

The structures of the inner region of protoplanetary disks are essential for understanding the formation process of terrestrial planets. The gas temperature in the region is thought to be determined by accretion heating, which is conventionally attributed to turbulent dissipation. Because the turbulent dissipation occurs in the disk, the released heat accumulates in the disk and thereby effectively increases the disk temperature. However, recent studies have suggested that the inner disk (a few AU) is largely laminar, with accretion primarily driven by magnetized disk winds, as a result of nonideal magnetohydrodynamic (MHD) effects from weakly ionized gas, suggesting an alternative heating mechanism by Joule dissipation.

Purpose of this study is to investigate the accretion heating with the nonideal MHD effects and to understand thermal structure in the inner disk region. We perform local stratified MHD simulations including nonideal MHD effects and investigate the role of Joule heating and the resulting disk vertical temperature profiles. We find that Joule heating occurs at several scale heights above the midplane, making the midplane temperature much lower than that with the conventional viscous heating model. Also, 80 % of the accretion energy is flown out by the disk wind. Our results further suggest that the midplane temperature in the inner region is almost entirely determined by irradiation heating. We also discuss the evolution of the water snow line based on our results and the formation process of the earth.

Formation of super-Earths and their atmospheres with *N*-body simulations

*Masahiro Ogihara[1], Yasunori Hori[2,1]

1. National Astronomical Observatory of Japan, 2. Astrobiology Center

A large number of super-Earths have been discovered by various exoplanet search programs that include the Kepler mission, which provide the perfect opportunity for a development of planet formation theory. In fact, recent *N*-body simulations have made major progress in understanding the origin of close-in super-Earths (e.g., Izidoro et al. 2017; Ogihara et al. 2018). In these previous studies, they focus on orbital properties (e.g., period-ratio distribution) and aim to reproduce them.

In this study, we also pay attention to the amount of atmospheres and make further progress in formation models of super-Earths. According to the mass-radius relation of transiting super-Earths, it is unlikely that they generally possess massive atmospheres. This is consistent with the fact that the occurrence rate of hot Jupiters is considerably smaller than that of close-in super-Earths. The amount of atmospheres would provide useful constraints on the development of formation models of super-Earths. The gas accretion onto super-Earth cores depends on several factors (e.g., formation history, disk evolution); therefore it is crucial to follow the planetary growth, the orbital evolution, and the atmospheric accretion self-consistently.

We perform *N*-body simulations of super-Earth formation in an evolving disk considering the accretion of atmospheres. In our simulations, we also consider the pebble accretion, which is a physical process in which protoplanets grow rapidly through accumulation of small particles under gas drag. The pebble accretion would help to accelerate the core formation of gas giants in the outer region. Moreover, the pebble accretion may play an important role in the accretion of close-in super-Earths.

In this presentation, we are going to discuss several important questions about the origin of super-Earths. For example, we aim to reveal realistic formation processes by results of *N*-body simulations that include the atmospheric accretion, the pebble accretion, and the disk evolution. Then we discuss properties of formed super-Earths and compare with observed super-Earth systems. We also determine whether the pebble accretion can prevent the accumulation of massive atmospheres.

The orbital stability of planets in resonances: the evolution of mass ratio

*Yuji Matsumoto[1], Masahiro Ogihara[2]

1. Academia Sinica Institute of Astronomy and Astrophysics, 2. National Astronomical Observatory of Japan

Many systems composed of Earth or super-Earth sized planets are observed to date (e.g., Gillon et al., 2017). In some systems, three or four adjacent planets are in a series of mean motion resonances, called resonant chains (Mills et al., 2016; Luger et al., 2017). The resonant chain can be reproduced when the planets migrate inward (e.g., Ogihara & Ida 2009; Izidoro et al., 2017; Bitsch et al., 2019). After gas depletion, planets in resonant chain become orbitally unstable when their number exceeds the critical number that the planets are stable in resonance (Matsumoto et al., 2012). Izidoro et al. (2017) showed over half systems hold more than five planets in their simulations that planets are stable in resonant chain after gas depletion. The disagreement of the number of planets in resonant chain between observations and simulations can be explained by some mechanism reduces the orbital stability of planets in resonances.

The mass ratios between planets in close-in orbits and their central stars would not keep the same value after their formation. There are some mechanisms that super-Earths lose their envelopes, e.g., energy limited escape (Owen 2018). Also, young stars lose their mass by the stellar wind and coronal mass ejection (Cranmer 2017).

We perform simulations that the planets trapped in the first order resonant chain considering their mass ratio change. At first, planets migrate in the disk gas and are trapped in the resonant chain composed of the same resonant commensurability. Then, the disk gas is removed and the mass ratio between planets and the central star is changed, exponentially. When the number of planets in resonant chain exceeds the critical number corresponding resonant chain, their crossing time increases as the mass ratio decreases since the separation normalized by Hill radii becomes larger. In the cases that the resonant systems hold less planets than the critical number, planets sometimes cause orbital instability when their mass ratios change. In some conditions, the orbits of planets in resonant chain become unstable, when their mass ratios decrease only a few percent. Such instabilities tend to occur in systems that hold more planets.

Experimental study on the structure of shock remnant magnetization

*Shota Kato[1], Masahiko Sato[1], Kosuke Kurosawa[2], Masashi Ushioda[3], Sunao Hasegawa[4]

1. The University of Tokyo, 2. Planetary Exploration Research Center, Chiba Institute of Technology, 3. Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology, 4. Japan Aerospace Exploration Agency

The history of planetary magnetism is a key to understanding the evolution of planets. We focus on shock remnant magnetization (SRM) as a record of the magnetic field of planets: the magnetic anomaly field from SRM of a planetary crust can be measured by spacecraft magnetometers. It is essential to understand the structure of SRM for estimating planetary paleofield from magnetic field data because the observed magnetic anomaly field above craters is determined by the sum of the contribution of the materials beneath the crater with the SRM. In this study, the structure of SRM is experimentally investigated by using a two-stage light gas gun placed at the Institute of Space and Astronautical Science(ISAS) of Japan Aerospace and Exploration Agency(JAXA). We measured the SRM of 3 mm cube samples cut from basalt cylinders shocked in the weak magnetic field. The characteristic features of SRM structure are as follows: (1) The intensity of SRM tends to increase with increasing the distance in less than ~10 mm from the collision point. (2) The intensity of SRM tends to decrease with increasing the distance in more than ~10 mm from the collision point. Then the intensity of SRM of blocks are compared with the pressure and temperature from iSALE (Impact-SALE) calculation. In this talk, we will discuss the structure of SRM and the relationship between the SRM structure and the calculated change in pressure and temperature.

Acknowledgement: We appreciate the developers of iSALE, including G. Collins, K. Wünnemann, B. Ivanov, J. Melosh, and D. Elbeshausen.

Low-dispersion spectra of lunar impact flashes in 2018 Geminids

*Masahisa Yanagisawa[1], Yuki Uchida[1], Seiya Kurihara[1], Shinsuke Abe[2], Ryota Fuse[2], Keisuke Onodera[3,4], Ryuhei Yamada[5]

1. The University of Electro-Communications, 2. Nihon University, 3. SOKENDAI (The Graduate University for Advanced Studies), 4. Institute of Space and Astronautical Science/Japan Aerospace Exploration Agency, 5. The University of Aizu

In the collisions in the solar system, there are many cases where the collisions occur at speeds exceeding 10 km/s, which are difficult to reproduce in laboratory experiments. In such a collision, melting, evaporation, and ionization of silicate, iron, etc. which do not occur at a speed lower than this occur. Understanding of high-speed collisions accompanying such processes is an important issue for planetary sciences. However, it is not clear yet what kind of phenomenon actually occurs. We can approach this problem from the observation of lunar impact flashes.

Several research results have been reported on the occurrence frequency and brightness of lunar impact flashes and their time variations. However, there are few reports on their spectra. As part of the SAKURA Japan-France joint observation project, that is, the joint observation of meteoroids' impacts as lunar seismic sources, we observed the flashes due to the collisions of December Geminids' meteoroids by simple spectral cameras for visible wavelength (Fig. 1) [1]. At the University of Electro-Communications (Chofu-shi, Tokyo), observations were made with two spectral cameras attached to a Newtonian telescope with an aperture of 450 mm and a focal length of 2015 mm and a Schmidt–Cassegrain telescope with an aperture of 280 mm and an effective focal length of 920 mm. At Nihon University (Funabashi-shi, Chiba Prefecture), observations were carried out mainly with an ordinary movie camera attached to a telescope with a 400 mm aperture.

Thirteen flashes were detected by the observations at the University of Electro-Communications on 15th December, 2018 (JST) and nine of them were detected simultaneously at Nihon University. For those that were not detected at the same time, it is conceivable that there are differences in the sensitivity of the observation devices and temporary interruptions of observation, but the examination in detail is a future task. We named these 13 events from A to M. Their locations on the lunar surface are shown in Fig. 2 [2]. Their spectra were obtained by comparing their spectral images with those of comparison stars which were observed every 30 minutes [2, 3]. An example is shown in Fig. 3. Most of the flash spectra can be approximated well by the blackbody radiation spectrum of about 3000 K, but some are not. For the former, they would be due to the blackbody radiations from micro-droplets of melted rocks generated at the impacts. On the other hand, there is a possibility that the latter may be reflection of sunlight by space debris.

High velocity cratering experiments on sand-gypsum targets simulating asteroids

*Ryo Sugimura[1], Masahiko Arakawa[1], Minami Yasui[1], Takuya Ishiguro[1]

1. Kobe University

A lot of impact craters are found on asteroids. To clarify the impact cratering processes on asteroids, many researchers conducted impact cratering experiments using various materials such as sand, ice, and basalt. Housen and Holsapple (2011) proposed crater scaling laws and it enable us to extrapolate experimental results to asteroid impact results on the surface. They referred rocky materials having the compressive strength larger than several MPa to constructed the crater scaling laws, but it is unclear whether these scaling laws can be applied to porous materials having low strength or not. Therefore, we conducted impact cratering experiments in order to study the cratering processes on porous rocky asteroids with low strength and the effects of the strength on the crater size and the ejecta velocity. Then, we propose the crater scaling laws applicable to low strength porous materials.

A low strength target was made by mixing quart sands with the diameter of 100 μm with porous gypsum. The mixing ratio of sand to gypsum was changed from 2:1 to 30:1 in the wt.%, and the measured tensile strength was found to change with this mixing ratio. Impact experiments were conducted by using a two-stage light gas gun, and an Al spherical projectile with the size of 2mm was launched at the velocity of 2, 4 and 6km/s. The impact-cratering process was observed by using a high-speed video camera at the framing speed of 10^5fps. Furthermore, we set a 1cm-slit on the target surface to observe 2-dimensional ejecta flow: the slit can exclude most of the ejecta covering through the line of sight of the high-speed camera. This 2-dimensional ejecta observation gave us an accurate relationship between the initial position and the velocity of ejecta fragments.

The tensile strength of the porous mixed sample was measured by a Brazilian test and we found that the tensile strength was changed in the three orders of magnitude from 1MPa to 1kPa with the increase of the sand volume content from 30 to 50%.

The morphology of the recovered crater was characterized by two regions: they are a spall region and a pit region. The spall region looks rough circle but actually it has a polygonal shape with a shallow depth, and it is formed by tensile wave reflected from the surface. The pit region exists at the center of the crater and it has a semi-spherical shape with the diameter rather smaller than the spall region. This spherical region could be formed by the compressive wave and the shear failure was expected in this region. The spall diameter was found to increase with the decrease of the target tensile strength, however the crater depth, which is defined as the depth from the initial surface to the pit floor, showed constant, irrespective of the tensile strength. Moreover, it is very difficult to recognize features characterizing a pit and a spall region in the crater interior for the low strength target as low as 1kPa.

We constructed a crater size scaling law on the strength regime by using our results and compared it to the previous studies obtained for a high strength material. Then, the obtained scaling law for a weak target was written by , where $\pi_R$is the scaled crater radius and $\pi_Y$is the scaled strength in the conventional scaling laws. We found that our $\pi_R$was smaller than the $\pi_R$of frozen sand but larger than the $\pi_R$of porous gypsum. We also constructed the crater scaling law for the crater depth, and it was written by , where π_d is the scaled crater depth, and then it is obvious that $\pi_d$was almost constant, irrespective of

©2019. Japan Geoscience Union. All Right Reserved.

the tensile strength. The reason why our π_R is smaller than the result of frozen sand is considered to be due to the impact energy being consumed by collapsing tiny porous in the gypsum in the target.

Experimental study on collisional processes of highly porous ice balls simulating Saturn’s ring particles

*Yukari Toyoda[1], Minami Yasui[1], Masahiko Arakawa[1]

1. Graduate School of Science, Kobe University

Introduction: Saturn's rings consist of mm- to meter-sized particles of water ice, and they collide with each other at the relative speed slower than a few cm/s. After the collisions, the ring particles coagulate or rebound or fracture, and it could affect the evolution and the structure of Saturn's rings. Saturn’s rings were a very thin disk (the thickness thinner than 100-200 m) and this is because the particles collide with each other inelastically so the kinetic energy might dissipate effectively. Therefore, in order to clarify the formation processes and the evolution of Saturn’s rings, it is necessary to investigate the collisional properties of the ring particles. In particular, it is very important to examine the effects of material properties of the ring particles and the impact velocity on the coefficient of restitution (*e*).

It is estimated from ground observations and planetary explorations that the ring particles are speculated to be a non-porous ice, porous ice (snow), non-porous ice covered with frost etc. Previous studies have investigated the e of non-porous ice and that covered by the frost, but the e of porous ice (snow) has not been investigated yet in detail. In this study, we focused on the porosity of Saturn‘s ring particles and examined the dependence of the porosity on the relationship between the *e* and the impact velocity.

Experimental methods: We used ice balls with a smooth surface and snowballs with the porosity of 45, 50, 60% having the diameter of 3 cm to simulate the Saturn’s ring particles. We conducted free fall experiments of the balls on an ice plate with a smooth surface and a granite plate. The impact velocity changed from 0.8 to 280 cm/s. We measured the e by two methods. One is an acoustic emission (AE) method. The AE sensor was attached on the plate and it could detect the elastic wave by each collision of the ball. So the impact and the rebound velocities of the ball could be calculated by measuring the time interval between the collisions. Another is a laser displacement meter method. A laser displacement meter was used to measure the position of the free falling ball with time. The e was calculated from the time interval between the collisions of the ball, as same as AE method.

Experimental Results: In the case of ice ball- ice plate collision, the e was almost constant (~0.9) at low impact velocity (quasi-elastic region), while as the impact velocity exceeded a critical velocity, the e decreased drastically (inelastic region). This critical velocity, v_c, was obtained to be 24.5 cm/s. In the inelastic region, the relationship between the e and the impact velocity could be fitted by using the empirical equation, $e=e_{qe}(v_i/v_c)^{-\log(v_i/v_c)}$, where v_i is the impact velocity and e_{qe} is the average value of the e in the quasi-elastic region. In the case of ice ball-granite plate collision, the relationship between the e and the impact velocity was similar to that of ice ball-ice plate collision, but the v_c was obtained to be 11.2 cm/s, which is almost a half of the ice ball-ice plate collision result.

The e of the snowball continued to decrease as the impact velocity increased and the critical velocity, v_c, could not be appeared for both collisions on the granite plate and the ice plate. Furthermore, the e of the

©2019. Japan Geoscience Union. All Right Reserved.

snowball decreased as the porosity increased monotonically, but they merged with each other at the impact velocity lower than 10 cm/s. This is because the kinetic energy of the snowball was consumed by crushing the pores near the impact point on the snowball surface at higher impact velocities. We found that the relationship between the impact velocity and the e could be shown by $e=a\cdot v_i^{-b}$ where a and b are constant. The a was obtained as 0.9 - 0.97, irrespective of the porosity, while the b increased with the increase of the porosity.

IN-SITU FORMATION OF THE URANIAN SATELLITES FROM WIDE DEBRIS DISK FORMED BY GIANT IMPACT

*Ishizawa Yuya[1], Takanori Sasaki[1], Natsuki Hosono[2]

1. Department of Astronomy, Kyoto University, 2. JAMSTEC

We adopted the so-called giant impact scenario to explain both the large axial tilt of Uranus and the formation of the Uranian regular satellites simultaneously. Hydrodynamic simulations for a giant impact onto proto-Uranus have been carried out, which showed that the giant impact can explain the large axial tilt of Uranus and also suggested that ejected materials produced by the giant impact could be distributed throughout the current orbits of the Uranian regular satellites.
In this study, we modeled wide debris disks of solids with several conditions, and performed N-body simulations to investigate the in-situ satellite formation from the wide debris disks to constrain the parameters of debris disks for the in-situ satellite formation. We found that the five major satellites formed around the current orbits from wide debris disks with several times the total satellite mass. Although one or two large satellites usually form inside the current orbits of the major satellites, such satellites would migrate inward due to the tidal torque from the planet and finally be disrupted by the planetary tides or fall onto the planet over several hundred million years. We also propose that the Uranian rings could form from the disrupted satellites and the inner regular satellites could form by use of the ring materials.

Effect on the obliquity due to a giant impact on a rotating ice giant

*Kenji Kurosaki[1], Shu-ichiro Inutsuka[1]

1. Department of Physics, Nagoya University

Solar system planets have intrinsic rotation period and obliquity. Especially, Uranus's obliquity is 98 degrees, which is larger than Jupiter, Saturn, and Neptune. Obliquity of Uranus is to the giant impact event. However, previous studies ignored the pre-impact rotation of Uranus. To understand the tilted rotation axis via a giant impact, we calculate the giant impact on a rotating target. We use Godunov Smoothed Particle Hydrodynamics simulation. We include that a giant impact can reproduce the present obliquity of Uranus if the impactor collides on anti-rotating direction.

[P-PS07] Formation and evolution of planetary materials in the Solar System

convener:Yoko Kebukawa(Faculty of Engineering, Yokohama National University), Wataru Fujiya(Ibaraki University, College of Science), Shin Ozawa(Department of Earth Science, Graduate School of Science, Tohoku University), Megumi Matsumoto(Graduate School of Science, Tohoku University), Chairperson:Wataru Fujiya, Shin Ozawa

This session will focus on the evolution in the Solar System with interaction and co-evolution in minerals, water, organic matter, and noble gas in meteorites and interplanetary dust particles. New innovative analytical and theoretical techniques in various fields will be discussed. The developing methods are welcome to submit for the future mainstream of meteorite study. In order to explore the planetary materials and their evolution, both meteorite studies and experimental approaches are necessary. In this session, we will discuss these topics from extraterrestrial sample analyses and experimental works. Research works on undifferentiated and differentiated meteorites and parent body processes such as aqueous alteration, thermal metamorphism, shock metamorphism, volcanic activity, and core-mantle-crust differentiation are especially included in this session.

Introduction

Eucrites have been considered to come from the surface crust of asteroid 4 Vesta. Eucrites experienced varying degrees of shock and thermal metamorphism. The scaling of the degree of shock metamorphism necessary for the understanding of the formation history of Vesta. However, the degree of shock metamorphism has not been established. Recent studies of X-ray diffraction (XRD) analyses using the in-plane rotation of polished thin sections (PTSs) for ordinary chondrites [2] showed that the XRD technique has a potential for the classification and identification of shock and metamorphic stages. In this study, we applied this technique for the thin or thick sections of 13 basaltic and 3 cumulate eucrites. We show that the bulk XRD data may be a useful indicator for characterizing the shock degree for eucrites.

Measurement and analytical methods

We performed X-ray measurement by SmartLab (RIGAKU) at National Institute of Polar Research, Tokyo, on the condition of Cu Kα with 40 kV and 40 mA through the slit of 10 x 5 mm in size.

We defined the shock degrees of studied eucrites from A to D by the petrographic and mineralogical features of thin and thick sections: shock degree A (unshocked) = sharp optical extinction of plagioclase and pyroxenes, shock degree B (low) = weak undulatory extinction or mosaicism of plagioclase and pyroxene, shock degree C (moderate) = the presence of maskelynite, and shock degree D (high) = most (>70-80 vol%) of the plagioclase converted to maskelynite. The degrees of A, B, and C, D for eucrites roughly correspond to 0, 1 and 2 of shock stage for basaltic meteorites defined by Bischoff and Stöffler. (1992) [3], and S1, S2-4, and S5 for enstatite chondrites by defined Rubin et al. (1997) [4], respectively.

Results

We obtained the XRD patterns of 12 eucrites exhibiting the high degree of randomness (e.g., Agoult), whereas four eucrites show the feature of the crystal orientation (e.g., Moama). We identified the peaks of plagioclase, pigeonite, and augite from the XRD patterns of eucrites. The bulk XRD data of each eucrite shows the positive correlation between the full width at half maximum (FWHM) values (for both mean and total) and the shock degree estimated from the textures. On the other hand, the number of the peak in the XRD pattern shows a negative correlation for the increasing of shock degree.

The specific peaks of plagioclase (especially -202) show the decreasing peak intensity and the increasing FWHM values for the increasing shock degree. The peak of pyroxene (pigeonite 310 and augite -311) (2theta = ~30.7º) also shows the increasing FWHM value of pyroxenes for the increasing shock degree.

Discussion

The increase of the averaged FWHM values for each eucrite are related to the shock metamorphism of pyroxene and plagioclase. The negative correlation between the peak intensities of plagioclase and shock degree implies the maskelynitization of plagioclase by shock metamorphism. In particular, most of the plagioclase peaks in A-87272, the strongest shocked sample (D) studied here, have disappeared. The pyroxene peaks show a positive correlation between the FWHM value and shock degree, whereas there is no correlation between the peak intensity and shock degree. This indicates that the shock metamorphism produces the strain in pyroxenes.

In-plane rotation of PTSs method of XRD analysis for eucrites is affected by the crystal orientation in the meteorites, especially coarse-grained unbrecciated rocks and crystalline portions in brecciated rocks.

©2019. Japan Geoscience Union. All Right Reserved.

Nevertheless, we suggest that the FWHM is a useful indicator for measurements of the shock degree of eucrites, since this factor is not affected by the randomness of the crystal orientation of the meteorites.

Hf-W dating of main-group pallasites

*Yoshitaka Homma[1], Tsuyoshi Iizuka[1], Akira Ishikawa[2]

1. Department of Earth and Planetary Science, The University of Tokyo, 2. Department of Earth and Planetary Sciences, Tokyo Institute of Technology

Pallasites are stony-iron meteorites consisting mainly of olivine and FeNi metal, providing us a unique opportunity to study an interior of their parent body. Classically, pallasites have been thought to represent the core-mantle boundary of their parent body, since there are some links with IIIAB irons, which are the representative of the core (e.g. Clayton & Mayeda, 1996). Yet, some recent studies suggest pallasite formed at a shallower region than the core-mantle boundary likely by impact mixing (e.g. Yang et al., 2010; Tarduno et al., 2012). Chronological investigations of pallasites are important since they enable to determine the ages and the timescales of crystallization of pallasite minerals. Although the Al-Mg dating of pallasite olivine yielded a model age of 1.27 Myrs after the CAI formation (Baker et al., 2012), other chronological constraints are still required for resolving the two contrasting models of pallasite formation. Here we apply the Hf-W chronology to four pallasites to constrain when the metal segregated on their parent body. Previously reported W isotopic data of pallasites show a large variation in $\varepsilon^{182/184}$W (Quitté et al., 2005), some of which correspond to the model ages older than CAIs. These isotopic data may reflect multiple causes and effects, such as a nucleosynthetic anomaly, radiogenic and neutron capture effects. We combined the W and the Pt isotopic measurements to evaluate the neutron capture effect which may lead to misinterpretation in age. Also, we measured unradiogenic W isotopes to estimate if the nucleosynthetic anomaly existed in the pallasite parent body. The obtained $\varepsilon^{182/184}$W values corrected for the neutron capture effect by using Pt isotope data range from -3.53 ±0.14 to -3.45 ±0.18, which correspond to the model Hf-W ages of -0.30 ±1.43 to 0.31 ±1.74 Myrs after the CAI formation. Moreover, the $\varepsilon^{183/184}$W values are indistinguishable from the terrestrial value, suggesting that the pallasite parent body accreted in the inner solar system. The model Hf-W ages obtained in this study are coincident with the model Hf-W ages of magmatic irons (Kruijer et al., 2013) and the model Al-Mg age of pallasite olivine, suggesting its magmatic origin rather than impact origin. The implication is that the pallasite metal was originated from the planetary core and was segregated within first 2 Myrs of the solar system evolution.

Mineralogical study of TCIs in CM carbonaceous chondrites

*Akane Iemoto[1], Yusuke Seto[1], Akira Miyake[2]

1. Graduate School of Science, Kobe University, 2. Graduate School of Science, Kyoto University

Introduction

TCIs, intergrowths of tochilinite ($6(Fe_{0.9}S)\cdot 5[(Mg,Fe)(OH)_2]$) and cronstedtite (Fe-bearing serpentine) occur in most of CM chondrites, which are considered to be aqueous alteration products on the chondrite parent bodies. Based on the textures and chemistries, they can be divided into two types. Type I appears as massive and are generally found in chondrules, while type II exhibits fibrous textures and are generally found within the matrix. Many researchers support that kamacite in chondrules had been altered into type-I TCIs. However, precursors or alteration processes of type-II TCIs are still remains unknown. TCIs potentially provide important information regarding aqueous environments on chondrite parent bodies. Here, we report microtextures of type-II TCIs in 4 CM chondrites and review the formation process.

Materials and methods

We observed the following CM chondrites; QUE97990 (2.6), Murchison (2.5), Nogoya (2.2), Cold Bokkeveld (2.2). The number in parenthesis are the alteration index for CM chondrites proposed by Rubin et al. (2007), in which they defined the index ranging from 2.6 (moderately altered) to 2.0 (highly altered). Textural observation and chemical analyses were performed using an SEM-EDS (JEOL, JSM6480LAII), and nanometer-scale observations using an STEM-EDS (JEOL, JEM2100F) after processing into thin films using an FIB (FEI, Quanta 3Di).

Results and discussion

In QUE97990 and Murchison, less altered meteorites in this study, the type-II TCIs are distributed in the matrices. They are aggregates of a few μm-sized tochilinite and cronstedtite, where thin tochilinite veins occurred inside cronstedtite, suggesting that tochilinite had formed after the formation of cronstedtite. This gives us a constraint on the aqueous condition of CM chondrites. In Nogoya, the TCIs texture showed that very fine serpentine-rich region is located at core, and toward rim, gradually changed to fibrous cronstedtite and mixed-layer phase (alternate layer phase of tochilinite and cronstedtite structure in nanometer scale). The TCIs of Cold Bokkeveld also showed the core-rim structure, where core is often rich in mixed layer phase, and rim is consists of relatively coarse-grained tochilinite and cronstedtite. In the latter two highly altered CM chondrites, the both core showed very fine, fibrous, and fluffy texture, and no evidence of precursor material, suggesting that type-II TCIs were directly formed from water solution.

Importance of 10Be as a key indicator of (solar) cosmic ray irradiation in the early solar system

*Hajime Hiyagon[1], Yuuki Tanimura[1], Tomoya Nakamura[1], Kohei Fukuda[3], Wataru Fujiya[4], Naoji Sugiura[1], Takanori Kagoshima[2], Naoto Takahata[2], Yuji Sano[2]

1. Graduate School of Science, The University of Tokyo, 2. Atmosphere and Ocean Research Institute, the University of Tokyo, 3. Department of Geoscience, University of Wisconsin-Madison, 4. College of Science, Ibaraki University

Beryllium-10, which decays to ^{10}B with a half-life of 1.4 Myr, is produced mainly by spallation reactions of solar system materials induced by solar or galactic cosmic rays, but not by thermonuclear reactions in stars. Possible existence of ^{10}Be in the early solar system materials, therefore, has significant importance in considering irradiation processes near the early Sun or in the molecular cloud [1].

Excesses in ^{10}B correlated with Be/B ratios in a number of CAIs from CV chondrites [2-9] suggest the presence of live ^{10}Be at the time of CAI formation. The inferred initial ^{10}Be/^{9}Be ratios are mostly within the range of (0.5-1) x 10^{-3}, though the data are restricted to coarse-grained CAIs from CV chondrites. Recent studies including small CAIs from CH/CB chondrites [10-12] show that the initial ^{10}Be/^{9}Be ratios may be much higher and more variable (from ~10^{-4} to ~10^{-2}), suggesting that the origin of ^{10}Be in CAIs is spallation reactions induced by solar cosmic rays.

Data for chondrules are scarce. Sugiura (2001) [13] analyzed anorthite in chondrules from the Y82094 (ungrouped C3.2) chondrite and found a possible correlation between ^{10}B excesses and Be/B ratios, but the results are not conclusive due to relatively large errors. We further conducted Be-B isotope analyses for chondrules in Y82094 chondrite using NanoSIMS at the Atmosphere and Ocean Research Institute, The University of Tokyo [14]. Resolvable excesses in ^{10}B are found in some of the Y82094 chondrules, but ^{10}Be was probably not alive at the time of the chondrule formation. Some carriers of excess ^{10}B are required in the precursor materials of these chondrules.

Here we review recent progress in Be-B isotopic studies and discuss their importance in understanding the irradiation processes in the early solar system. We will also show our some new results on Be-B systematics for chondrules from Y82094 (C 3.2) and NWA7936 (LL 3.15) chondrite.

Introduction

Oxygen isotopic compositions can be used to identify the origins of planetary materials. Components of carbonaceous chondrites show wide range of oxygen isotopic compositions ($\delta^{17,18}$O: ~-50–0 ‰) that keep nearly constant δ^{17}O/ δ^{18}O ratio of ~1 [e.g.,[1]]. The isotopic variation is thought to be resulted from both mass-dependent isotope fractionation and mixing of two distinct reservoirs of ^{16}O-rich and ^{17,18}O-rich in the solar nebula. The composition of the ^{16}O-rich reservoir has been estimated from the isotopic compositions of CAIs and AOAs which were originated from the reservoir [e.g.,[2]]. Recently, Fe-rich material originated from the ^{17,18}O-rich reservoir, called cosmic symplectite (COS), has been reported from the primitive carbonaceous chondrite Acfer 094 [3]. COS have the heaviest oxygen isotopic composition ($\delta^{17,18}$O: ~180 ‰) among solar materials and consist of nanometer-scaled symplectitically intergrowth of magnetite and Fe-Ni sulfides [3,4]. They are thought to have formed by oxidation of Fe-Ni metal and sulfides by ^{17,18}O-rich water or water vapor in the early Solar System. However, petrological and mineralogical information of COS still remain limited. In this study, we performed synchrotron radiation-based X-ray computed tomography (SR-XCT) and NanoSIMS analysis to investigate the origin of COS.

Results and discussion

First, we observed a polished Acfer 094 section (~2.2 mm^2) by FE-SEM and found five COS grains. The COS grains (~10 μm) show rope-like structure like as COS reported by Abe et al. (2017) [5]. One of the five COS grains was extracted as a block (~25×25×30 μm) using FIB and analyzed by high spatial resolution (~100 nm) SR-XCT at SPring-8 BL47XU. The 3D image shows that the COS grain has irregular shape with many topographic depressions on the surface and contains small (<1 μm) inclusions. The inclusions are not connected to the outside of the COS by clack, ensuring that they were trapped when the host COS formed. We made a cross section surface of the inclusions using FIB and analyzed it by FE-SEM. The inclusions have Na, S, O rich compositions, and such material was not observed in the surrounding matrix. We confirmed that the COS, host of the inclusions, consist of symplectitically intergrowth of magnetite and Fe-Ni sulfides.

We obtained oxygen isotopic composition of the COS gain using NanoSIMS. The COS grain has ^{17,18}O-rich composition (δ^{17}O = 159.06 ±5.79 (1 σ) ‰, δ^{18}O = 166.31 ±3.18 (1 σ) ‰) which is similar to the COS grains reported by previous study [3]. We could not check the difference in oxygen isotopic compositions between the inclusions and the host COS because the inclusions were too small to obtain their compositions.

The inclusions found in this study have not been reported from other COS grains. It is possible that

©2019. Japan Geoscience Union. All Right Reserved.

previous studies could not find the inclusions because most of the inclusions were plucked from the host COS during sample polishing. In fact, many COS grains reported in previous studies contain abundant pores which probably formed by plucking of inclusions. If inclusion is common in COS, it is important to constrain the origin of COS. We will present the results of further TEM analysis of the COS and their inclusions, and discuss the origin of them.

Chondrule-like objects and refractory inclusions in GEMS-bearing Antarctic micrometeorites and an interplanetary dust particle.

*Takaaki Noguchi[1], Noriaki Ohashi[2], John P. Bradley[3], Daisuke Nakashima[4], Tomoki Nakamura[4], Makoto Kimura[5], Takayuki Ushikubo[6], Noriko T. Kita[7], Naoya Imae[5]

1. Department of Arts and Science, Kyushu University, 2. NEC Networks and System Integration Co., 3. Univ. of Hawaii at Manoa, 4. Tohoku Univ., 5. National Institute of Polar Research, 6. Kochi Institute for Core Sample Research, JAMSTEC, 7. Univ. of Wisconsin-Madison

Glass with embedded metal and sulfide (GEMS) is regarded as a characteristic component of cometary dust. GEMS-bearing Antarctic micrometeorites (AMMs) and interplanetary dust particles (IDPs) containing chondrules and refractory inclusions are important to understand comets as well as P- and D-type asteroids.

We found three chondrules and a refractory inclusion (RI) in GEMS-bearing AMMs and IDP. We investigated them by TEM, FE-SEM, FE-EPMA, and SIMS. All the chondrules belong to type II (Mg# <90). An AMM contains a spinel-hibonite-perovskite (sp-hb-pv) inclusion, in which spinel contains tiny (<100 nm) Ti-bearing Zr oxides and Mo- and Ru-bearing Ir-Os alloy and that perovskite contains Y and Zr, suggestive of ultra-refractory nature. All the fine-grained matrices are highly porous and contain GEMS, olivine, low-Ca pyroxene including enstatite whisker, high-Ca pyroxene, pyrrhotite. In addition, the matrix and the embedded RI contains minor phyllosilicate. Oxygen isotopic ratios of olivine and pyroxene in two chondrules are plotted 0.7‰ below and 2.7‰ above the terrestrial fractionation line on the three-oxygen isotope diagram, respectively. Oxygen isotope ratios of spinel in the RI are $\delta^{18}O$ of -43.8‰ to -45.1‰ and $\delta^{17}O$ of -44.8‰ to -46.8‰, respectively. Resolvable ^{26}Mg excesses ($\delta^{26}Mg^*$ ~ 13±2‰ and 14±3‰) are observed in hibonite with $^{27}Al/^{24}Mg$ ratios of 35-43, while spinel show marginal excess (~1‰).

The olivine/(olivine + low-Ca pyroxene) ratios were deduced from the mid-infrared spectra of asteroids and comets; those of B-, G-, and C-type asteroids, P- and D-type asteroids, and comets are <12%, 36-52%, and >50%, respectively. The ratios of the matrices in the samples range from 0.4 to 0.61, which are well above the values of B-, G-, and C-type asteroids and comparable with those of P- and D-type asteroids and comets. Therefore, P- and D-type asteroids and comets seem to be more plausible as parent bodies of these AMMs and an IDP than B-, G-, and C-type asteroids. If that is the case, P- and D-type asteroids and comets contain abundant GEMS. Ferromagnesian silicates with Mg#<90 in the chondrules distribute around $\Delta^{17}O$ ~0‰ in the Mg# vs $\Delta^{17}O$ diagram like those in the Stardust samples. This seems to be consistent with the hypothesis that P- and D-type asteroids were migrated from the Kuiper belt. The chondrules were formed in more oxidizing conditions than chondrules in CR chondrites because type II chondrules in them occupy only ~1%.

This session will focus on the evolution in the Solar System with interaction and co-evolution in minerals, water, organic matter, and noble gas in meteorites and interplanetary dust particles. New innovative analytical and theoretical techniques in various fields will be discussed. The developing methods are welcome to submit for the future mainstream of meteorite study. In order to explore the planetary materials and their evolution, both meteorite studies and experimental approaches are necessary. In this session, we will discuss these topics from extraterrestrial sample analyses and experimental works. Research works on undifferentiated and differentiated meteorites and parent body processes such as aqueous alteration, thermal metamorphism, shock metamorphism, volcanic activity, and core-mantle-crust differentiation are especially included in this session.

The parent bodies of carbonaceous chondrites are thought to be C-type asteroids based on the similarity of visible (Vis) -infrared (IR) spectra between carbonaceous chondrites and C-type asteroids [e.g., 1-5]. Several C-type asteroids are thought to have been heated and dehydrated judging from their spectra which are similar to the spectra of experimentally-heated chondrites [1,6]. The Hayabusa2 spacecraft of the Japan Aerospace Exploration Agency (JAXA) was arrived at the target C-type asteroid 162173 Ryugu in June 2018. Ryugu spectra exhibit a weak 2.72-μm OH absorption band that is present across the surface of the asteroid, and nearly always darker than values typical for carbonaceous chondrites [7,8]. The meteorites whose spectral features are most similar to Ryugu are shocked or moderately-heated carbonaceous chondrites. In this study, we performed spectral analysis in Vis-NIR range and mineralogical analysis in micro scale using carbonaceous chondrites that heated dehydrated on their parent bodies.

Spectral and mineralogical analyses were performed using nine naturally-heated and dehydrated carbonaceous chondrite samples (seven CM, one CI, and one CV chondrites), which classified into heating stages (HS) from I to IV based on X-ray diffraction results [9]. In-situ heating of samples at 120–400 ˚C was performed during spectral measurements and successfully removed absorption water and part of rehydrated water from chondrite samples. Lewis Cliff (LEW) 87022 (unheated CM), Jbilet Winselwan, and Dhofar 735 (heated at 600–900 ˚C [10]) were used for transmission electron microscope (TEM) analysis.

Reflectance spectra of HS-I samples show the positive slope in Vis- IR range and the significant 0.7- and 3-μm absorption bands. The 0.7-μm band appears in only HS-I sample spectra. With increasing heating degree, (1) Vis-IR slope decreases, (2) the 0.7- and 3-μm bands decrease, and (3) Mid-IR spectral feature (i.e. Christiansen feature (CF) and Reststrahlen bands (RB)) shifts toward longer wavelength. TEM/EDX analyses showed that the matrix of severely-heated chondrites consists of tiny olivine, low-Ca pyroxene, and fine Fe- and Ni-rich metal grains (<1 μm). It is indicated that in proportion to the heating degree, amorphization and dehydration of serpentine and tochilinite from HS-I to HS-II might cause the 0.7- and 3-μm band weakening, and spectral slope and albedo decreasing of spectra. Then, formation of secondary olivine and pyroxene, and FeNi-rich metal grains at HS-IV would be responsible for the 3-μm band depth decreasing, spectral slope and albedo increasing, CF peak shift, and RB changes of chondrite spectra.

We plan to compare other IR reflectance spectra of asteroids, such as those acquired by AKARI [11], to better interpret remotely sensed data of Bennu (NASA’s OSIRIS-REx mission target) and Ryugu. Future NIRS3 observations before/after the Small Carry-on Impactor (SCI) crater experiment and lab analyses of returned samples will reveal additional compositional properties of Ryugu.

Heterogeneity of oxygen and carbon isotopic compositions within carbonate grains in the Yamato 791198 CM chondrite and evolution of isotope ratios during aqueous alteration

Carbonate minerals are ubiquitous in CM chondrites and formed by aqueous alteration in their parent body [1]. Previous studies have revealed a large variation in C isotope ratios of CM carbonates with $\delta^{13}C$ values ranging from ~20 to ~90 ‰[e.g., 2,3]. However, the reason for this variability has remained poorly understood. Here, we conducted in-situ C- and O-isotope measurements by SIMS along crystal growth within single carbonate grains in Yamato 791198 (CM 2.4) to trace the change in $\delta^{13}C$ values during aqueous alteration.

First, we obtained color CL images of seven calcite ($CaCO_3$) grains with an FE-EPMA. Then, we measured O and C isotope ratios of the calcite grains with the CAMECA ims-1280HR. Typically, the isotope measurements were carried out on three different points for each calcite grain. Finally, we obtained quantitative chemical compositions and elemental maps of Mg, Si, Ca, Mn, and Fe of the calcite grains using the same FE-EPMA as that for the CL images.

All grain analysed exhibit a clear zoning of Mn, Mg, and Fe. The zoning is well correlated with CL images. The heterogeneous distribution of minor elements and CL intensity likely reflects the crystal growth of these grains.
