Sun. May 26, 2019

[E] Oral | U (Union)：Union

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 101 1F

[U-01] JpGU-AGU-EGU Great Debate: Impact of research assessment and going forward

convener:Kazuaki Hori(Department of Geography, Graduate School of Environmental Studies, Nagoya University), Denis-Didier Rousseau(CNRS - ENS), Jonathan L Bamber(member), Chairperson:Yasuhiro Murayama(NICT)

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC

[U01-01] Panel discussion about research assessment

*Kazuaki Hori[1] (1.Department of Geography, Graduate School of Environmental Studies, Nagoya University)

[E] Oral | U (Union)：Union

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 101 1F

[U-02] Advancing workplace: progress, challenges and strategies for improvement

convener:Chiaki T. Oguchi(Institute for Environmental Science and Technology, Graduate School of Science and Engineering, Saitama University), Rie Hori, S.(Department of Earth Science, Faculty of Science, Ehime University), Yukihiro Takahashi(Department of Cosmosciences, Graduate School of Science, Hokkaido University), Claudia Jesus-Rydin(European Research Council), Chairperson:Rie Hori, Chiaki Oguchi

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[U02-01] Managing Diversity and Inclusiveness

*Jessica Federman[1] (1.California State University, Dominguez Hills)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[U02-02] Adina Paytan 12:36 PM (0 minutes ago)
to me **Where Have All the Women Gone?**

★Invited Papers

*Adina Paytan[1] (1.University of California Santa Cruz)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[U02-03] Gender balance and diversity in the ocean and geosciences: IODP, research cruise, and laboratories

*Natsue Abe[1] (1.R&D Center for Ocean Drilling Science Japan Agency for Marine-Earth Science and Technology)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[U02-04] Problem in paternity leave

*Yukihiro Takahashi[1] (1.Department of Cosmosciences, Graduate School of Science, Hokkaido University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[U02-05] Challenges in teaching interactive lectures with high student diversity using student response systems

★Invited Papers

*Thomas Parkner[1], Verena Pietzner[2] (1.University of Tsukuba, 2.University of Oldenburg)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[U02-06] **The AGU Ethics and Equity Center: New Resources for Advancing Workplace Excellence**

Brooks Hanson[1], Christine McEntee[1], Robin Elizabeth Bell[1], *Billy M Williams[1] (1.American Geophysical Union)

[J] Oral | O (Public)：Public

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | IC 2F

[O-01] Exploring Buratamori - How to make science accessible

convener:Kazutaka Mannen(Hot Springs Research Institute of Kanagawa Prefecture), Takayuki Ogata(Disaster Prevention Research Center for Island Regions, University of the Ryukyus), Chairperson:Takayuki Ogata

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[O01-01] Lessons from Buratamori – An introduction to the session

★Invited Papers

*Kazutaka Mannen[1] (1.Hot Springs Research Institute of Kanagawa Prefecture)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[O01-02] **The history of Buratamori**

★Invited Papers

*Mikio Hayashi[1] (1.Japan Broadcasting Corporation)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[O01-03] My experience as a geoscientific guide for the NHK-TV program Buratamori

★Invited Papers

*Masato Koyama[1] (1.Shizuoka Univ.)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[O01-04] A Visualized History by Buratamori

★Invited Papers

*Noriko Matsuda[1] (1.Kyoto Prefectural University)

2:45 PM - 3:15 PM JST | 5:45 AM - 6:15 AM UTC

[O01-05] General discussion 1

*Takayuki Ogata[1] (1.Disaster Prevention Research Center for Island Regions, University of the Ryukyus)

[J] Oral | O (Public)：Public

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | IC 2F

[O-01] Exploring Buratamori - How to make science accessible

convener:Kazutaka Mannen(Hot Springs Research Institute of Kanagawa Prefecture), Takayuki Ogata(Disaster Prevention Research Center for Island Regions, University of the Ryukyus), Chairperson:Kazutaka Mannen(Hot Springs Research Institute of Kanagawa Prefecture)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[O01-06] The role of experiment in NHK's entertainment / educational program "Buratamori"

★Invited Papers

*Shintaro Hayashi[1] (1.Akita University Graduate School of Education)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[O01-07] An attempt of field work for middle and high school students to comprehend an “area” in an integrated manner

★Invited Papers

*Takeshi Uemura[1], Shigeyuki Yokoi[2] (1.Osaka Prefectural Otemae Senior High School part-time course, 2.Kaijo Junior and Senior High School)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[O01-08] Desirable way of outreach activities in the Museum,learn by participating in the making process of "Buratamori".

★Invited Papers

*Inoue Motoko[1] (1.Saitama Museum of Natural History)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[O01-09] Methodology of Geoscientific Outreach of “Buratamori”

★Invited Papers

*Takayuki Ogata[1] (1.Disaster Prevention Research Center for Island Regions, University of the Ryukyus)

4:30 PM - 5:00 PM JST | 7:30 AM - 8:00 AM UTC

[O01-10] General discussion 2

*Kazutaka Mannen[1] (1.Hot Springs Research Institute of Kanagawa Prefecture)

[J] Oral | O (Public)：Public

10:15 AM - 11:25 AM JST | 1:15 AM - 2:25 AM UTC | IC 2F

[O-02] Recent Advances in Earth and Planetary Science

convener:Tatsuhiko Hara(International Institute of Seismology and Earthquake Engineering, Building Research Institute), Katsuyoshi Michibayashi(Department of Earth and Planetary Sciences, Nagoya University), Hajime Naruse(Department of Geology and Mineralogy, Graduate School of Science, Kyoto University), Yasuhito Sekine(Earth-Life Science Insitute, Tokyo Institute of Technology), Chairperson:Kou Yamada

10:15 AM - 10:50 AM JST | 1:15 AM - 1:50 AM UTC

[O02-01] The challenges of Asteroid Exploration Mission Hayabusa2 and its results up to now

★Invited Papers

*Makoto Yoshikawa[1] (1.Japan Aerospace Exploration Agency)

10:50 AM - 11:25 AM JST | 1:50 AM - 2:25 AM UTC

[O02-02] Earth's core revealed by ultrahigh-pressure experiments

★Invited Papers

*Kei Hirose[1,2] (1.Earth-Life Science Institute, Tokyo Institute of Technology, 2.Department of Earth and Planetary Science, The University of Tokyo)

[J] Oral | O (Public)：Public

11:30 AM - 12:15 PM JST | 2:30 AM - 3:15 AM UTC | IC 2F

[O-03] Poster presentations by senior high school students

convener:Tatsuhiko Hara(International Institute of Seismology and Earthquake Engineering, Building Research Institute), Katsuyoshi Michibayashi(Department of Earth and Planetary Sciences, Nagoya University), Miwa Kuri(International Research Institute of Disaster Science, Tohoku University), Kou Yamada(Waseda University), Chairperson:Kou Yamada, Katsuyoshi Michibayashi, Hajime Naruse(Kyoto University), Keiko Konya, Miwa Kuri(東北大学災害科学国際研究所)

11:30 AM - 12:15 PM JST | 2:30 AM - 3:15 AM UTC

[O03-01] Poster presentations by senior high school students

[J] Poster | O (Public) : Public

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_1

[O-03] Poster presentations by senior high school students

convener:Tatsuhiko Hara(International Institute of Seismology and Earthquake Engineering, Building Research Institute), Katsuyoshi Michibayashi(Department of Earth and Planetary Sciences, Nagoya University), Miwa Kuri(International Research Institute of Disaster Science, Tohoku University), Kou Yamada(Waseda University)

[O03-P01] Factors of the famine of Aomori in the Edo era viewed from the Hirosaki domain diarty

*Masyu Sakamoto[1], *Mizuha Kamata[1], *Aten Noguchi[1] (1.Ikedagakuen Ikeda Senior High School)

[O03-P02] Visual monitoring and surface wind analyzing clarified the importance of sea and valley wind in causing sudden shower in mountain basin

*Aihisa Kamijo[1] (1.Geoscience Club, Matsumoto Fukashi Senior High School)

[O03-P03] The effect of coastal erosion on Shinmaikohama Beach

*Yuuto Yoshida[1], *Izuki Onoda[1], *Ayaka Saitou[1], *Issei Suzuki[1], *Haruto Komiya[1], *Toshiki Sasaki[1], *Daisuke Baba[1] (1.Fukushima Prefectural Iwaki High school)

[O03-P04] Consideration by Grave seismology

*Yuito Kaji[1], Kosuke Kobayashi[1], Kaname Ishida[1], Yasuhiro Suzuki[1], Kyoichiro Uehara[1] (1.Yashiro High School)

[O03-P05] Analysis of metal ion concentration in the rivers of Yosemite Valley and comparison with Japanese rivers

*Kaname Ishida[1], Noa Harada[1], Michihiko Kondo[1] (1.Yashiro High School)

[O03-P06] Magnetic measurement of basalt dikes in the Sara river of Tsuyama

*Hayate Madokoro[1], *Yuta Emi[1], *Syota Matano[1], *Naoyuki Washida[1] (1.Okayama prefectural Tsuyama High School)

[O03-P07] The Study of Seawalls Combined with Moats

*Toshiatsu Aoki[1] (1.Yokohama Science Frontier High School)

[O03-P08] Relationship between the seismic moment release rate in the Nankai subduction zone and the 2011 Tohoku earthquake

*Yoko Kono[1] (1.Yokohama Science Frontier High School)

[O03-P09] Automation of the self-made pinhole type planetarium projector

*Masami Kanno[1], *Asahi Komori[1], *Haruhito Nakamura[1], Kano Makiyama[1], *Munehiro Asao[1], *Ryo Kakegami[1], Akika Shimizu[1], Tomoka Kawamoto[1] (1.Yokohama Science Frontier High School)

[O03-P10] Capturing Blue-shift of Red Edge using the Spectrum of Earthshine
-The Earth seen from the space-

*Noa Itou[1], *Ayami Yoshino[1] (1.Yokohama Science Frontier High School)

[O03-P11] Observation of Thundercloud

*Ayune Masuda[1] (1.Yokohama Science Frontier High School)

[O03-P12] A Historical Review of the Sky in Yokohama 1965 to 2014

*Rikako akai[1] (1.Yokohama Science Frontier High School)

[O03-P13] Seismic isolation system for furniture

*Tesshin Noma[1], *Syuntaro Hayashi[1] (1.Sakae-Higashi High school)

[O03-P14] How to use soil of school

*Hohoko Asahina[1], Honoka Oinuma[1] (1.Tokyo Metropolitan Tama High School of Science and Technology)

[O03-P15] Measurement of Cloud Cover at Night by Brightness

*Soyoka Okano[1] (1.Tokyo Metropolitan Tama High School of Science and Technology)

[O03-P16] Application of ion-exchange reaction in soil for desalination system

*Yushi Sato[1], Ryota Iizuka[1], Toya Nakano[1] (1.Tokyo Metropolitan Tama High School of Science and Technology)

[O03-P17] Investigation into agricultural utilization by the aluminum removal of the trass

*Yuto Miki[1] (1.Tokyo Metropolitan Tama High School of Science and Technology)

[O03-P18] Earthquake prediction by radio wave noise

*Sou - Yasuda[1], Ryosuke - Kiribuchi[1], Hiromori – Hayashi[1], Rinta - Yamada[1], *Aiku - Tanaka[1] (1.Tokyo Metropolitan Tama High School of Science and Technology)

[O03-P19] Construct quaking models by the geological structure varieties

*Kazuki Sugawara[1], *Hideto Sato[1], Shuya Yamaki[1], Masato Ono[1], Shun Suto[1] (1.Miyagi Rifu high school)

[O03-P20] Fe concentration measurement method in spring water

*Nozomi Kawaharata[1], *Yusuke Oba [1], Yuto Sasaki [1], *Tika Sakuma [1], *Rei Sato[1], *Siratake Kosuke[1], *Riku Sugawara [1], *Masaki Murayama [1] (1.Furukawa Reimi Junior and Senior High School)

[O03-P21] Cause of amateur radio failure in meteor radio observation and its substitution

*Shoki Yashima[1], *Kokoro Abe[1], *Azumi Sato[1], *Sora Endo[1], *Kokomi Sugawara[1] (1.Furukawa Reimei Junior and Senior High School)

[O03-P22] Spectroscopic observation of meteor using diffraction grating

*Soya Ito[1], *Atsuya Sugawara[1], *Tomoki Misao[1], *Shotaro Mino[1] (1.Miyagi Furukawa Reimei Junior and Senior High School)

[O03-P23] Predicting the sea level change in the Ariake bay through analysis of diatoms and pollens

*Ayuto Yamashita[1], *Shino Furuta[1] (1.Kumamoto prefectural Amakusa High School)

[O03-P24] Altering unused irrigation ponds to mitigate flooding, maintain habitats, and reduce maintenance burden

*Rikuto Fukushima[1], Nao Maeda[1], Reo Yoneyama[1], Yuki Takahashi[1], Hiiro Tabata[1], Koutaro Hayashi[1] (1.Hyogo Prefectural Kakogawa Higashi High School)

[O03-P25] Development of the equatorial telescope for from the beginners to the advanced astrophotographer at low cost

*Jun Ikeda[1], *Shimpei Iwasaki[1] (1.Kaijo Senior High School)

[O03-P26] How ripples formation dependence on the size of sand grains and the amplitude of vibration cycle

*Tsuyoshi Enta[1], *Ryutaro Mitsui[1] (1.Kaijo Senior High School)

[O03-P27] Organizing the relation ship of the viscosity of lava flow and the shape of columnar joijnt

*Kanta Takakura[1] (1.Kaijo junior and senior high school)

[O03-P28] Measurement of the geomagnetic horizontal component with a neodymium magnet

*Yushi Miyamoto[1], Hayato Ishiguro[1], Shun Takada[1], Kento Nakayama[1] (1.Sapporo Nihon University Senior High School)

[O03-P29] Relationship between sun elevation and RGB values of sunlight color

*Shun Takada[1], Kotaro Takemura[1], Taio Koizumi[1], Hayato Ishiguro[1] (1.Sapporo Nihon University Senior High School)

[O03-P30] Reserch about Dokuzawa mineral spring on Shimouswa hot spring

*Ryosuke Yanagisawa[1], *Yoshito Momoi[1], *Yoko Kamata[1], *Takumi Kamijyo[1] (1.Naganoken Suwa Seiryo Senior High School)

[O03-P31] Can you predict the weaather when you see the starry sky

*Aoi Takamori[1] (1.Naganoken Suwa Seiryo Senior High School)

[O03-P32] Fossil ophiuroid ossicles and ostracods from the Shimousa Group distributed around Magaki, Mihomura, Ibaraki Prefecture

*Asaka Yokobori[1], *Rin Mita[1] (1.Gunma Prefectural Ota Girls' High School)

[O03-P33] Conservation activities for bivalve fossils by Muroto High School Students

*Shuka Ishitani[1], Miku O̅no[1], Fukuoka Eri[1] (1.Muroto High School)

[O03-P34] Changes in Shinto Festivals in Muroto UNESCO Global Geopark

*Eri Fukuoka[1], Nanami Hashimoto[1], Yui Takemura[1], Hayato Nii[1], Taisei Hamada[1] (1.Muroto High School)

[O03-P35] The Study of Old Tottori sand dunes. Why the sand become hard ? Epilogue

*katsuki takana[1], *ren osaki[1], *ritsuki sugiura[1], satosi arita[1], syogo okayama[1], yuta sunaba[1], aoi hashikawa[1], ken hirooka[1] (1.Tottori Prefectural Tottorihigashi High School)

[O03-P36] Forest education by the making of a clay ball and a moss ball

*Yuna Miyachi[1], Arika Tsuji[1], Yuzuki Kobayashi[1], Sae Takami[1], Tatsuki Morikawa[1], Ryota Yamasaki[1], Yuto Umeda[1], Matsuki Rina[1], Nahoko Kubo[1], Yo Sayama[1] (1.Kyoto Prefectural Sagano High Scool)

[O03-P37] The Roles of Clay Minerals in the Pedosphere of the Woods for Field Practice Owned by Sagano High School

*Nahoko Kubo[1], Yo Sayama[1], Yuna Miyachi[1], Arika Tsuji[1], Sae Takami[1], Yuzuki Kobayashi[1], Yuto Umeda[1], Tarsuki Morikawa[1], Ryota Yamasaki[1], Rina Matsuki[1] (1.Kyoto Prefectural Sagano High School)

[O03-P38] For the development of brand-name products in WFS. ~ Selection of high quality Chamaecyparis and investigation of suitable drying method ~

*Yuzuki Kobayashi[1], Sae Takami[1], Rina Matsuki[1], Ryota Yamazaki[1], Yuto Umeda[1], Tatsuki Morikawa[1], Nahoko Kubo[1], Yo Sayama[1], Arika Tsuji[1], Yuna Miyachi[1] (1.Kyoto Prefectural Sagano High School)

[O03-P39] Grasping the human impact following a forest research and its recovery

*Yo Sayama[1], Yuna Miyachi[1], Arika Tsuji[1], Sae Takami[1], Yuzuki Kobayashi[1], Yuto Umeda[1], Tatsuki Morikawa[1], Ryota Yamasaki[1], Rina Matsuki[1], Nahoko Kubo[1] (1.Kyoto Prefectural Sagano High School)

[O03-P40] Considering the recent landslide disasters in Japan -Movement of water in pedosphere-

*Rina Matsuki[1], Nahoko Kubo[1], Yo Sayama[1], Arika Tsuji[1], Yuna Miyachi[1], Yuzuki Kobayashi[1], Sae Takami[1], Tatuki Morikawa[1], Ryota Yamasaki[1], Yuto Umeda[1] (1.Kyoto Prefectural Sagano High School)

[O03-P41] Comparison of GSI map data with the surveying data by targeting Woods for Field Practice Owned by Sagano High School

Yuto Umeda[1], Tatsuki Morikawa[1], Ryota Yamasaki[1], Rina Matsuki[1], Nahoko Kubo[1], Yo Sayama[1], Yuna Miyachi[1], *Arika Tsuji[1], Sae Takami[1], Yuzuki Kobayashi[1] (1.Kyoto Prefectural Sagano High School)

[O03-P42] Summary of our activities and the future direction in the Woods for Field Practice Owned by Sagano High School

*Takeshi Fujimoto[1], Ako Kinoshita[1], Rina Matsuki[1], Yo Sayama[1] (1.Kyoto Prefectural Sagano High School)

[O03-P43] Our challenge, the frozen earth : soil formation under the maple forests in Quebec

Yo Sayama[1], Rina Matsuki[1], Yuzuki Kobayashi[1], *Sae Takami[1], Nahoko Kubo[1] (1.Kyoto Prefectural Sagano High School)

[O03-P44] Color of the moon at the umbra lunar eclipse

*Koudai Fujino[1], *Kotaro Saito[1], *Yoshiki Kujiraoka[1], *Hyate Doi[1], *Ibuki Yasuda[1] (1.Saitama Prefectural Urawa High School)

[O03-P45] Study on vegetation change and validity of eruption age based on pollen analysis of the strata containing volcanic ash

*Taiga Suzuki[1], *Haruki Otiai[1], *Keita Ueno[1], *Athushi Watanabe[1] (1.Nirayama HighSchool)

[O03-P46] Statistical analysis of the columnar joints shape and study of its formation factor using high resolution 3D model by multicopter photos

*Akihito Oota[1], *Kouta Enomoto[1], *Maho Kubota[1], *Minako Nishijima[1], *Atsushi Watanabe[1] (1.Nirayama HighSchool)

[O03-P47] Restoration of the Paleo-Kano Bay

*Souta Kojima[1], *Mao Kubota[1], *Natsuki Yoneyama[1], *Takayuki Yamamoto[1], *Athushi Watanabe[1] (1.Nirayama HighSchool)

[O03-P48] **From deep water circulation to the World's environment**

*Taiga Kokubo[1], *Yuito Tsukada[1], *Hiroki Nakada[1], *Mitsuki Nakada[1], *Hikaru Fujita[1] (1.Zushi-Kaisei Senior High School)

[O03-P49] Mystery of hot and cold Hatoyama

*Yohei Yamamoto[1], *Yusuke Yoshimura[1], *Atsuhide Machida[1], *Syotarou Shinoda[1] (1.Saitama prefectural Kumagaya High School)

[O03-P50] A New Story for Saturn Satellite Dione's History seen in Crater Counting

*Shu Ishibashi[1], *Kyota Kono[1], *Kota Takeda[1] (1.Tennoji Senior High School Attached to Osaka Kyoiku University)

[O03-P51] Which Weather Proverbs are Suitable for The Weather Forecast in Osaka

*Haruto Shimada[1], *Nao Asahi[1], *Aki Yamamoto[1] (1.High School Attached to Osaka Kyoiku University (Tennoji Campus))

[O03-P52] An Effect on Seismic Waves Beneath Active Volcanoes

*Ten Hayashida[1], *Mitsuki Komeda[1], *Miku Yamamoto[1] (1.Tennoji Senior High School Attached to Osaka Kyoiku University)

[O03-P53] The Research Analyzes Structure of Ray with Crater

*Mayuko Suzuki[1], *Mirei Okada[1], Suzuka Kanazawa[1], *Natsuko Okude[1], *Mio Sawai[1], *Meika Minami[1] (1.Tennoji Senior High School Attached to Osaka Kyoiku University)

[O03-P54] The Way of Improving Salt-Damaged Soil

Sezaki Kanon[1], Tamaki Ueno[1], *Ai Kitanishi[1] (1.Tennoji Senior High School Attached to Osaka Kyoiku University)

[O03-P55] Prediction and survey of moonlight power generation amounts –Development of new electricity generation system “Mr. Nisshin Geppo”

*Takaaki Ishimoto[1], *Ryota Suzuki[1], *Koichi Sato[1], *Yuki Yonemura[1], *Hajime Yamamoto[1], *Tatsuya Amamiya[1], *Shinya Amamiya[1] (1.Chuo University Junior and Senior High School)

[O03-P56] Filtering capability of fossil coral skeletons *Porites* sp. and *Favia* sp.

*Yuki Ishisaka[1] (1.Chuo University Senior High School)

[O03-P57] Relationship between the eclipse of partial eclipse and solar radiation and illumination intensity

*Satoshi Yamamoto[1] (1.Hongo senior high school)

[O03-P58] How much can the revolution of the moon be explained by the second law of Kepler?

*Kana Uchida[1], *Haruki Kobata[1], *Toa Hattori[1], Shuhei Asano[1], Mamiko Usui[1] (1.GIZAN SENIOR HIGH SCHOOL)

[O03-P59] The formation age and environment of the Tubo River outcrop,Seki in Gifu prefecture, Central Japan.

*Yuya Yamada[1], *Keisuke Ohno[1] (1.GIZAN SENIOR HIGH SCHOOL)

[O03-P60] The change with time of the gigantic jet off the coast of Ibaraki on December 11, 2017 and comparison with the past jets

*Naoya Yamashita[1], *Shin Hirano[1], *Hayato Matsuyama[1], *Yuya Okubo[1] (1.Shizuoka Prefectural Iwata Minami High School)

[O03-P61] Reconstruction of Late Holocene environmental changes based on analysis ofcore sediments from Kaicho Temple

*Tomoya Ina[1], *Daisuke Suzuki[1], *Keito Tsutahara[1] (1.Shizuoka Prefectural Iwata Minami High School)

[O03-P62] generation of 3D model on the coast of Samejima,the sea of Enshu and detection of coastline by drones

*Eito Takagi[1] (1.Shizuoka Prefectural Iwata Minami High School)

[O03-P63] Factors of beach change on the Ose coast in Ibaraki prefecture

*Kaito Kotsuti[1], *Kosuke Shimano[1], *Haruto Sakachi[1], *Fuyu Tokuda[1], *Syunsuke Nagayama[1], *Hiroki Nemoto[1], *Towa Murakami[1], *Yuki Mimori[1], *Yasushi Wada[1], Takemi Ogawa[1], Eri Yoshida[1] (1.Ibaraki Prefectural Hitachi First Senior High School)

[O03-P64] Hiraodai and Hirotani Wetland Research of soil hardness and water sources + Ramsar Convention

Mariko Hirota[1], *Yujin Ito[1], *Natsuki Abe[1] (1.Higashichikushi Gakuen High school)

[O03-P65] **Ecological study on *Micrasterias hardyi* recently invaded to Lake Biwa: its dependency on water temperature**

*Ayane Kawai[1], Michio Kumagai[2] (1.Shiga Prefectural Ishiyama High School, 2.Authorised NPO Biwako Trust)

[O03-P66] Changing environments on the earth – first termination of overturning in Lake Biwa

*Hinata So[1], Michio Kumagai[2] (1.Shiga Prefectural Zeze High School, 2.Authorized NPO Biwako Trust)

[O03-P67] Let's solve the mystery of gyre drift toward north !

*Masaki Tsuji[1], Michio Kumagai[2] (1.Shiga Prefectural Zeze High School, 2.Authorized NPO Biwako Trust)

[O03-P68] Exploring Atmospheric Properties from Color Change Observation of the International Space Station

Kuroiwa Hiroaki[1], *Ishimura Daiki[1], *Kurohabaki Nanami[1], *Takizawa Shizuku[1], *Yamamoto Yuka[1] (1.Iiyama Senior High School)

[O03-P69] Re-examination of capillary phenomena with gravity as a variable : Second report

*Koushi Hashimoto[1], *Haruka Ono[1], *Riku Nakaima[1], *Takeo Matsuda[1], *Yoshie Sawazaki[1], *Takako Yamashita[1], *Takeru Wakabayashi[1] (1.Otemae Senior High School of Osaka prefecture : the evening course)

[O03-P70] The Study of Kabutoyama

*Manami Nakazawa[1], *Masahiro Okuyama[1], Dai Iijima[1], Haruta Moriya[1], Ayato Watanabe[1] (1.Yamanashi prefectural Hikawa Highschool)

[O03-P71] Proposal of GEO-KAMISHIBAI that enhances the appeal of SANRIKU Geopark and conveys it in an easy-to-understand.

*Keisei Yasuhara[1], *Kana Kato[1], *Mizuho Gondai[1], *Arisa Okubo[1], *Haruto Kawasaki[1], *Mai Kawabata[1], *Seiya Yoshida[1], *Hitomi Kimura[1] (1.Mariento Chikyu Tanken Club Senior)

[O03-P72] Research of the Fukui Earthquake Fault (VII)

*Nobuyasu Nagata[1], *Takuma Yoshizawa[1], Shintaro Umeda[1], Reiji Ohigashi[1], Mahiro Tajima[1], Ryuto Kubota[1] (1.Fujishima High School)

[O03-P73] Estimation of sedimentary environment of volcaniclastic deposit and location of craters in the Nomashi formation, Izu Oshima

*Kouki Aida[1] (1.Musashi High School and Junior High School)

[O03-P74] Why Is the Baseball Ground in Our School Badly Drained ?

*Ryou Ito[1], *Shuta Aoshima[1], *Tomoya Mizutani[1], *Daichi Ishii[1], Yosuke Saito[1] (1.Tokyo Gakugei University Senior High School)

[O03-P75] Spectroscopic observations of Geminids with video cameras and diffraction grating

Yuzaburo Takamura[1], *Momoo Hayashi[1], Moeka Yamagishi[1], Keisuke Nobutoki[1], Yuna Buma[1], Fuyuno Anpuku[1] (1.Ichinomiya High School)

[O03-P76] Observation of the dust storm over the polar cap of Mars

Yuzaburo Takamura[1], *Rino Hayakawa[1], Soma Ohashi[1], Yuna Kuriki[1] (1.Ichinomiya High School)

[O03-P77] Analyzing the shape of (51)Nemausa

*Taiga Hirozawa[1], Suguru Okada[1], Tomoki Suzuki[1], Tomohiro Shibayama[1] (1.Ichinomiya High School)

[O03-P78] Characteristics of lightning discharge that generated sprites

Kazuki KOJIMA[1], Nanami INOUCHI[1], *Misa NAKASUJI[1], *Yasumichi NAKAHAMA[1] (1.Kagawa Prefectural Sambommatsu High School)

[O03-P79] Get closer to the mustery of Sprites and Elves.

*Ayumu Nishihara[1], *Shogo Kawamura[1], *Hidetoshi Oka[1], Daichi Iriki[1], Shunsuke Nakao[1] (1.Prefectural Kochi Ozu High School)

[O03-P80] Prediction of the giant-squid movement around Japan using the dataset of ocean current and temperature.

*Yuka Koike[1] (1.Hiroo Gakuen Senior High School)

[J] Oral | O (Public)：Public

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 106 1F

[O-04] New earth and planetary science education created by hybrid community between society and JpGU

convener:Yasushi Fujiwara(Evening Classes; Integrated Course, Kanagawa Prefectual Mukainooka Technical High School), Hiroaki Akimoto(Faculty of Economics,Dokkyo University), Chairperson:Yasushi Fujiwara(Evening Classes; Integrated Course, Kanagawa Prefectual Mukainooka Technical High School), Hiroaki AKIMOTO(Dokkyo University)

1:45 PM - 2:15 PM JST | 4:45 AM - 5:15 AM UTC

[O04-01] In the next Course of Study, let's send information on world standard "geography / geography" from Japan to the world

★Invited Papers

*YOJI TAKIKAWA[1] (1.NPO Association of Science Curriculum Initiative NPO Galileo Science Workshop)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[O04-02] What a mantle scientist hopes geoscience education

★Invited Papers

*Natsue Abe[1] (1.R&D Center for Ocean Drilling Science Japan Agency for Marine-Earth Science and Technology)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[O04-03] New high-school compulsory subject “General Geography” and related cooperation of geographers and earth scientists for human resource development

★Invited Papers

*Takashi Oguchi[1] (1.Center for Spatial Information Science, The University of Tokyo)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[O04-04] Visualization of terrain by Red Relief Image Map(RRIM) and geoscience education

★Invited Papers

*Tatsuro Chiba[1] (1.Asia Air Survey Co., Ltd.)

[J] Oral | O (Public)：Public

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 106 1F

[O-04] New earth and planetary science education created by hybrid community between society and JpGU

convener:Yasushi Fujiwara(Evening Classes; Integrated Course, Kanagawa Prefectual Mukainooka Technical High School), Hiroaki Akimoto(Faculty of Economics,Dokkyo University), Chairperson:Yasushi Fujiwara(Evening Classes; Integrated Course, Kanagawa Prefectual Mukainooka Technical High School), Hiroaki AKIMOTO(Dokkyo University)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[O04-05] A lesson plan using Tsunami to cultivate the ability to think critically about a subject based on the data given in New government curriculum guidelines for "Basic Earth Science"

★Invited Papers

*Kodama Hidefumi[1] (1.Chiba Prefectural Matudokokusai High School)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[O04-06] The planning of “Integrated Geography” and its aimed competency

★Invited Papers

*Yasutaka Kogawa[1] (1.Okayama Prefectural Tsuyama High School)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[O04-07] Earth and planetary science education considered by the current student

★Invited Papers

*Hideto Otsuka[1] (1.Geology Course, Department of Science, Faculty of Science, Shinshu University, National University Corporation)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[O04-08] Invitation to Geography —Relationship Between Geography and Intellectual Curiosity in Daily Life–

★Invited Papers

*Takuya Miyao[1] (1.Master Program in Education, University of Tsukuba)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[O04-09] Let's build a bridge between "Rika" and society with new geography and geology education in class

★Invited Papers

*Naoki Hosaka[1] (1.science writer)

[J] Oral | O (Public)：Public

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 101 1F

[O-05] English improvement tips for Japanese scientists

convener:Chisato Yoshikawa(Japan Agency for Marine-Earth Science and Technology), Wonsuh Song(Waseda University), Rumi Ohgaito(Japan Agency for Marine-Earth Science and Technology), Chairperson:Chisato Yoshikawa(JAMSTEC), Wonsuh Song, RUMI OGAITO(JAMSTEC)

10:45 AM - 11:05 AM JST | 1:45 AM - 2:05 AM UTC

[O05-01] Giving a successful presentation in English: Mission Possible!

★Invited Papers

*Joel Laurier[1] (1.University of Tsukuba)

11:05 AM - 11:25 AM JST | 2:05 AM - 2:25 AM UTC

[O05-02] How to deliver good presentations in a foreign language

★Invited Papers

*S. Lan Smith[1] (1.Marine Ecosystem Dynamics Research Group, Research Centre for Global Change, Japan Agency for Marine-Earth Science and Technology)

[J] Poster | O (Public)：Public

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_1

[O-06] How to cope with intensifyng storm and flood disasters

convener:Jun Matsumoto(Deaprtment of Geography, Tokyo Metropolitan University), Yukihiro Takahashi(Department of Cosmosciences, Graduate School of Science, Hokkaido University), Akira Wada(Tokyo Institute of Technology)

[O06-P01] Automatic extraction analysis of widespread sediment disasters from satellite images in the Heavy Rain Event of July 2018, Japan

*Hiroyuki Shimomura[1], Kanichiro Mochizuki[1], Tomokazu Itano[1], Atsuo Noda[1], Yasuaki Honda[1], Mayumi Miyazaki[1], Masashi Omata[1], Noriyuki Shibuya[1] (1.PASCO CORPORATION)

[O06-P02] Examination of the factors influencing the people's evacuation behaviors and cognition of reconstruction in the western Japan heavy rain disaster in July 2018

*Shoji Ohtomo[1], Reo Kimura[2] (1.Konan Women's University, 2.University of Hyogo)

[J] Poster | O (Public)：Public

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_1

[O-06] How to cope with intensifyng storm and flood disasters

convener:Jun Matsumoto(Deaprtment of Geography, Tokyo Metropolitan University), Yukihiro Takahashi(Department of Cosmosciences, Graduate School of Science, Hokkaido University), Akira Wada(Tokyo Institute of Technology)

[O06-P01] Automatic extraction analysis of widespread sediment disasters from satellite images in the Heavy Rain Event of July 2018, Japan

*Hiroyuki Shimomura[1], Kanichiro Mochizuki[1], Tomokazu Itano[1], Atsuo Noda[1], Yasuaki Honda[1], Mayumi Miyazaki[1], Masashi Omata[1], Noriyuki Shibuya[1] (1.PASCO CORPORATION)

[O06-P02] Examination of the factors influencing the people's evacuation behaviors and cognition of reconstruction in the western Japan heavy rain disaster in July 2018

*Shoji Ohtomo[1], Reo Kimura[2] (1.Konan Women's University, 2.University of Hyogo)

[J] Oral | O (Public)：Public

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 103 1F

[O-06] How to cope with intensifyng storm and flood disasters

convener:Jun Matsumoto(Deaprtment of Geography, Tokyo Metropolitan University), Yukihiro Takahashi(Department of Cosmosciences, Graduate School of Science, Hokkaido University), Akira Wada(Tokyo Institute of Technology), Chairperson:Jun Matsumoto(Tokyo Metropolitan University)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[O06-01] Extreme rainfall and heat wave over Japan in 2018 summer: A series of extreme events and underlying global warming

★Invited Papers

*Hisashi Nakamura[1] (1.Research Center for Advanced Science and Technology, University of Tokyo)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[O06-02] Influence of meteorological disasters on marine ecosystem

★Invited Papers

*Yu Umezawa[1,2] (1.Tokyo University of Agriculture and Technology, 2.Study Group on Marine Environmental Problems, the Oceanographic Society of Japan)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[O06-03] Understanding of geomorphic condition indicating the flooding disaster and hazard mapping

★Invited Papers

*Yohta KUMAKI[1] (1.Senshu University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[O06-04] A role of free satellite remote sensing data as a case study of heavy rain disaster in July 2018

★Invited Papers

*Yuji Sakuno[1] (1.Graduate School of Engineering, Hiroshima University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[O06-05] State of the Crisis Mapping for heavy rain in west of Japan, 2018.

★Invited Papers

*Taichi Furuhashi[1] (1.Aoyama Gakuin University)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[O06-06] A Study on Spatial and Temporal Resolution of Evacunation Infomation for Effective Evacuation Behavior

★Invited Papers

*Michinori Hatayama[1] (1.Disaster Prevention Research Institute, Kyoto University)

[J] Oral | O (Public)：Public

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 103 1F

[O-06] How to cope with intensifyng storm and flood disasters

convener:Jun Matsumoto(Deaprtment of Geography, Tokyo Metropolitan University), Yukihiro Takahashi(Department of Cosmosciences, Graduate School of Science, Hokkaido University), Akira Wada(Tokyo Institute of Technology), Chairperson:Akira Wada(Tokyo Institute of Technology), Yukihiro Takahashi(Hokkaido University)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[O06-07] Multi-layered Countermeasures against Widespread Devastating Flood Disasters

★Invited Papers

*Koike Toshio[1] (1.International Centre for Water Hazard and Risk Management)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[O06-08] Technologies and wisdom in housings and buildings for protecting our lives from river floods

★Invited Papers

*Kazuo Tamura[1] (1.Seismic Design Laboratory)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[O06-09] State and Challenges of Disaster Waste Management - Lessons from Recent Disasters –

★Invited Papers

*Yuichi Moriguchi[1], Masahiro Osako[2] (1.Graduate School of Engineering, The University of Tokyo, 2.Center for Material Cycles and Wasre Management Research, National Institute for Environmental Studies)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[O06-10] Evacuation Planning for School Children and Community Residents

★Invited Papers

*Takeshi Sato[1], Yoshiaki Yazaki[2] (1.Tohoku University, 2.Institute of Safety Education for School Children)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[O06-11] Health Emergency and Nursing on Flood Disaster

★Invited Papers

*Sakiko Kanbara[1], Aiko Yamamoto[2] (1.University of Kochi, 2.Shitennoji University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[O06-12] General discussion

*Jun Matsumoto[1,2], Yukihiro Takahashi[3], Akira Wada[4] (1.Tokyo Metropolitan University, 2.JAMSTEC, 3.Hokkaido University, 4.Tokyo Institute of Technology)

[J] Oral | O (Public)：Public

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | Convention Hall B 2F

[O-07] Kitchen Earth Science: Let's stimulate your brain by hands-on experiments!

convener:Ichiro Kumagai(School of Science and Engineering, Meisei University), Miwa Kuri(International Research Institute of Disaster Science, Tohoku University), Kei Kurita, Mie Ichihara(Earthquake Research Institute, University of Tokyo), Chairperson:Ichiro Kumagai(Meisei University), Miwa Kuri(東北大学災害科学国際研究所), Mie Ichihara(Earthquake Research Institute, The University of Tokyo), Kei Kurita

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[O07-01] Analogue experiments for understanding a crystal morphology variation of igneous rocks using a no-calorie sweetener

*Kuniyuki Furukawa[1], Ririka Watanabe[1], Risa Ito[1], Saori Kotani[1] (1.Faculty of Business Administration, Aichi University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[O07-02] Making volcanic edifice with edible lava

*Tatsuo Kanamaru[1], Akihiko Fujinawa[2] (1.Department of Earth and Environmental Sciences, College of Humanities & Sciences, Nihon University, 2.Department of Earth Sciences, Faculty of Science, Ibaraki University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[O07-03] Columnar joint: Geometric pattern analysis and analogue experiment using starch pastes

*Yuri Akiba[1], Aika Takashima[1], Hiroyuki Shima[2] (1.Graduate School of Life and Environmental Sciences, University of Yamanashi, 2.Department of Environmental Sciences, University of Yamanashi)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[O07-04] Viscoelastic characterization of a solid projectile impact onto a dense potato starch suspension

Kazuya Egawa[2], *Hiroaki Katsuragi[1] (1.Graduate School of Environmental Studies, Nagoya University, 2.Department of Earth and Planetary Sciences, Nagoya University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[O07-05] Pattern formation within a sandpile formed by a mixture of grains: The selection of stratification and segregation patterns

★Invited Papers

*Michiko Shimokawa[1], Hidestugu Sakaguchi[2] (1.Fukuoka Institute of Technology, 2.Kyushu University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[O07-06] Measuring radiation by DIY Geiger Counter Kit GC10

*George HASHIMOTO[1], Yusuke KOSHIO[1] (1.Department of Earth Sciences, Okayama University)

[J] Poster | O (Public)：Public

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_1

[O-07] Kitchen Earth Science: Let's stimulate your brain by hands-on experiments!

convener:Ichiro Kumagai(School of Science and Engineering, Meisei University), Miwa Kuri(International Research Institute of Disaster Science, Tohoku University), Kei Kurita, Mie Ichihara(Earthquake Research Institute, University of Tokyo)

[O07-P01] Application of kitchen earth science for multidisciplinary and interdisciplinary education

*Miwa Kuri[1] (1.International Research Institute of Disaster Science, Tohoku University)

[O07-P02] Considering controlling factors of eruption styles through syrup eruption experiments

*Mie Ichihara[1], Kazuya Yamakawa[1], Kurumi Iwahashi[1], Akira Nishijo[1], Yo Kanno[1] (1.Earthquake Research Institute, University of Tokyo)

[O07-P03] Cooking karinto, analogical link to magmatic vesiculation and explosion

*Kei Kurita[1], Ichiro Kumagai[3], Mie Ichihara[1], Ayumi Ogawa[2], Michiyo Kumagai[2], yusaku nagata[2], Midori Kasai[2] (1.The University of Tokyo, 2.Ochanomizu University, 3.Meisei University)

[J] Poster | O (Public)：Public

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_2

[O-07] Kitchen Earth Science: Let's stimulate your brain by hands-on experiments!

convener:Ichiro Kumagai(School of Science and Engineering, Meisei University), Miwa Kuri(International Research Institute of Disaster Science, Tohoku University), Kei Kurita, Mie Ichihara(Earthquake Research Institute, University of Tokyo)

[O07-P01] Application of kitchen earth science for multidisciplinary and interdisciplinary education

*Miwa Kuri[1] (1.International Research Institute of Disaster Science, Tohoku University)

[O07-P02] Considering controlling factors of eruption styles through syrup eruption experiments

*Mie Ichihara[1], Kazuya Yamakawa[1], Kurumi Iwahashi[1], Akira Nishijo[1], Yo Kanno[1] (1.Earthquake Research Institute, University of Tokyo)

[O07-P03] Cooking karinto, analogical link to magmatic vesiculation and explosion

*Kei Kurita[1], Ichiro Kumagai[3], Mie Ichihara[1], Ayumi Ogawa[2], Michiyo Kumagai[2], yusaku nagata[2], Midori Kasai[2] (1.The University of Tokyo, 2.Ochanomizu University, 3.Meisei University)

[J] Oral | O (Public)：Public

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | Convention Hall B 2F

[O-08] How to make the image of the earth's phenomenon to the general people in the Geopark

convener:Noritaka Matsubara(Graduate School of Regional Resource Management, University of Hyogo), Yayoi ICHIHASHI(Sado Island Geopark Promotion Office), Hokuto Obara(Mine-Akiyoshidai Karst Plateau Geopark Promotion Council), Marekazu OHNO(Unzen Volcanic Area Geopark Promotion Office), Chairperson:Yayoi Ichihashi, Hokuto Obara, Hiroko Imai, Suzuka Koriyama(San'in Kaigan Geopark Promotion Council), Noritaka Matsubara(兵庫県立大学大学院)

10:45 AM - 11:15 AM JST | 1:45 AM - 2:15 AM UTC

[O08-01] Significance of the guide to introduce the landscape interestingly

★Invited Papers

*Daisuke Fukushima[1] (1.Sakurajima Museum)

11:15 AM - 11:45 AM JST | 2:15 AM - 2:45 AM UTC

[O08-02] Understanding of "geology" without difficult explanation. - Let's conduct experiment to tell about geology more easily. -

★Invited Papers

*Hikaru Yokoyama[1] (1.Hokusho University)

11:45 AM - 12:15 PM JST | 2:45 AM - 3:15 AM UTC

[O08-03] The appealing points and challenges of Japanese geoparks, as seen from a foreigner’s point of view.

★Invited Papers

*Jagoda Woloszyn[1] (1.Oki Islands UNESCO Global Geopark Promotion Committee)

[J] Oral | O (Public)：Public

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | Convention Hall B 2F

[O-08] How to make the image of the earth's phenomenon to the general people in the Geopark

convener:Noritaka Matsubara(Graduate School of Regional Resource Management, University of Hyogo), Yayoi ICHIHASHI(Sado Island Geopark Promotion Office), Hokuto Obara(Mine-Akiyoshidai Karst Plateau Geopark Promotion Council), Marekazu OHNO(Unzen Volcanic Area Geopark Promotion Office), Chairperson:Yayoi Ichihashi, Hokuto Obara, Hiroko Imai, Noritaka Matsubara(兵庫県立大学大学院), Suzuka Koriyama(San'in Kaigan Geopark Promotion Council)

1:45 PM - 2:15 PM JST | 4:45 AM - 5:15 AM UTC

[O08-04] What do we need to do fun geotours that interests the earth?

★Invited Papers

*kana nishitani[1] (1.Global nature club)

2:15 PM - 2:45 PM JST | 5:15 AM - 5:45 AM UTC

[O08-05] The Important Things in Communicating Earth's Activity to Local Residents: the Awareness during Four Years after Changing a Job from a Geoscience Postdoc to a Curator

★Invited Papers

*Kyoko Kanayama[1] (1.San'in Kaigan Geopark Museum of the Earth and Sea, Tottori Prefectural Government)

2:45 PM - 3:15 PM JST | 5:45 AM - 6:15 AM UTC

[O08-06] "Blatamori" How to communicate the earth activities valued by guide guides

★Invited Papers

*Makoto Hasuoka[1], Yusuke Suzuki[2], Hiroko Imai[3] (1.Bandai-san Geopark Council, 2.Izu Peninsula Geopark Promotion Council, 3.COM SUPPORT OFFICE)

[J] Poster | O (Public)：Public

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_2

[O-08] How to make the image of the earth's phenomenon to the general people in the Geopark

convener:Noritaka Matsubara(Graduate School of Regional Resource Management, University of Hyogo), Yayoi ICHIHASHI(Sado Island Geopark Promotion Office), Hokuto Obara(Mine-Akiyoshidai Karst Plateau Geopark Promotion Council), Marekazu OHNO(Unzen Volcanic Area Geopark Promotion Office)

[O08-P01] An analysis of the implementation of Mikasa Geopark`s experienced-based GeoTour and its impacts on recruitment and changes in the participant population.

*kei SHIMOMURA[1,2], souta KAMIGUCHI[1,2] (1.Mikasa Geopark Promotion council, 2.Regional Development and Geopark Promotion Division, Mikasa City Office)

[O08-P02] Strategy for revaluation and promotion of Toya-Usu UNESCO Global Geopark through SDGs

*Nire Kagaya[1] (1.Toya-Usu UNESCO Global Geopark Council)

[O08-P03] Examination of the way to convey geo diversity of Mt. Apoi Geopark - Through efforts of geo tour outside the geopark area -

*KATO SATOMI[1] (1.samani town office)

[O08-P04] Geosite Cleanup Activities Leading to Solutions for Global Environmental Problems

*Satoshi Ishikawa[1], Takuya Koike[1] (1.Shimokita geopark promotion council)

[O08-P05] Inspiring geosites and not-inspiring geosites: Case study of the Oga Peninsula-Ogata Geopark

*Norihito Kawamura[1] (1.Faculty of Education and Human Studies, Akita University)

[O08-P06] Are habitats such as fumaroles or areas with heavy snowfall suitable for organisms living in Yuzawa Geopark?
Considering the efficacy of the Geopark Guides with a focus on Yamatanukiran and snow camellia.

*Haruki Takayanagi[1] (1.Yuzawa Geopark Promotion Council)

[O08-P07] **The evaluation of geosites in Sanriku Geopark**

*Sho Nagata[1], Hideo Takagi[2] (1.Waseda University, 2.Department of Earth Science, Faculty of Education and Integrated Arts and Sciences, Waseda University)

[O08-P08] **The nature experience program created by Geopark and National Youth Outdoor Learning Center**

*Takuya Harada[1], Mizuki Kobayashi[1], Ken-ichi Yamada[2], Akiyoshi Adachi[2] (1.Mt. Kurikoma Area Geopark Promotion Committee, 2.National Hanayama Youth Outdoor Learning Center)

[O08-P09] A review of geosites in the Bandaisan Geopark

*Yojiro Taketani[1], Hiroshi Sato[2], Makoto Hasuoka[1] (1.Bandaisan Geopark Council, 2.Mt. Bandai Museum)

[O08-P10] Receiving a Yellow Card: Efforts and Future Actions of Sado Island Geopark

*Yayoi ICHIHASHI[1] (1.Sado Islanad Geopark Promotion Office)

[O08-P11] Method for resetting geosites and their use in Sado Island Geopark

*Takeyoshi SADAKANE[1], Yayoi ICHIHASHI[1], Mituhisa AIDA[1] (1.Sado Island Geopark Promotion Office)

[O08-P12] Look back on the 10 years at the statistical data of the Itoigawa UNESCO Global Geopark

*Takahiko Ogawara[1], Ko Takenouchi[1], Yousuke Ibaraki[1], Takeo Kobayashi[2] (1.Fossa Magna Museum, 2.Itoigawa Geopark Promotion Office)

[O08-P13] Application of terrain representation in Geosite
- Case study in North Ibaraki Geopark Project -

*Go Ishikawa[1], Keiko SUZUKI[1], Mamoru Koarai[2], Rika Imaizumi[3], Naoki Takeda[4] (1.Tokyo Map Research Inc., 2.College of Science, Ibaraki University, 3.Aero Asahi Corp., 4.Association for Promotion of North Ibaraki Geopark Project)

[O08-P14] Evaluation and utilization of 34 geosites in Geopark Chichibu

*Hideo Takagi[1], Satomi Hirose[2] (1.Department of Earth Science, Faculty of Education and Integrated Arts and Sciences, Waseda University, 2.School of Education, Waseda University)

[O08-P16] Aiming for Further Development in Hakone Geopark

Ichiro Murayama[1], Shinobu Katano[1], *Yusuke Okutsu[1] (1.Hakone Geopark Promotion Council)

[O08-P17] Citizen Science Forecast and Evaluate Ship and Airplane Operation Success to a Remote Oceanic Island: a case study for Izu-oshima

Kazuhiro Nakamura[2], Juri Hashimoto[1], *Rika Usui[1], Yuichiro Teramoto[1], Kana Nishitani[3] (1.Izu Oshima Geopark Promotion Committee, 2.Former Tokyo Metropolitan Oshima High School Teacher, 3.Corp. Global Sport Club)

[O08-P18] Minami-Alps Geopark Development of programs for education and spread activities

*Eri Ozawa[1], Takahiro Kitahara[1], Airi Karasawa[1] (1.Minami-Alps MTL area Geopark Council)

[O08-P19] Present situation and issues of the Tateyama Kurobe Geoparkafter Yellow card

*Yuta Yamaoka[1], Akira Takeuchi[1], Hajime Iida[2], Kiyoshi Imai[1], Kazuo Kaneko[1], Yukimitsu Shimura[1], Osamu Inamura[3], Tohru Ikurumi[4], Kiichi Imahori[1], Satoshi Kotani[1] (1.Tateyama Kurobe Geopark Society, 2.Tateyama Caldera Sabo Museum, 3.Uozu Aquarium, 4.Lifelong Learning Division, The Board of Education, Kurobe City)

[O08-P20] 1 year survey conducted by Hakusan Tedorigawa Geopark regarding number of pamphlets taken from Roadside station Shirayamasan

*Nakano Kaori[1], Tsuyoshi Hibino[1], Ryoichi Onishi[1] (1.Hakusan Tedorigawa Geopark Promotion Council)

[O08-P21] Promotion of the earth science utilizing the Geopark “Making the stone specimen in Hakusan Tedorigawa Japanese Geopark”

*Yuya Kitoh[1], Satoshi Hirai[1], Kiyofumi Tamamura[1], Tsuyoshi Hibino[2], Kaori Nakano[2], Tomoaki Morishita[3], Yoshihiro Hiramatsu[3], Maki Hamada[3] (1.Ishikawa Geological Survey Association, 2.Hakusan Tedorigawa Geopark Promotion Council, 3.Kanazawa University)

[O08-P22] School Trip from Hong Kong to Dinosaur Valley Fukui Katsuyama Geopark : Challenges and Prospects

*Sumiaki Machi[1] (1.Dinosaur Valley Fukui Katsuyama Geopark Promotion Council)

[O08-P23] Outline of the activities of the Kumano Kodo Ohechi Rangers

*Keishi Jimbo[1] (1.Nanki Kumano Geopark Guide Club)

[O08-P24] Diversity of Nature Activities Related Geodiversity

maeda atsushi[2], Ministry of the Environment Kinki Regional Environment Office, *Suzuka Koriyama[1], Noritaka Matsubara[3] (1.Sanin Kaigan Geopark Promotion Council, 2.SGAR, 3.Graduate School of Regional Resource Management, University of Hyogo)

[O08-P25] Understanding of regional scientific importance by local Residents – In case of San’in Kaigan UNESCO Global Geopark

*Noritaka Matsubara[1] (1.Graduate School of Regional Resource Management, University of Hyogo)

[O08-P26] Stones forming tombs of feudal lords during Edo period in some geoparks located along the coast of the Sea of Japan

*Tohru Sakiyama[1] (1.Graduate School of Regional Resource Management, University of Hyogo)

[O08-P27] Science Design to make the earth attractive

*Hiroaki Kamiyoshihara[1], Tetsuro Ninomiya[1], Yuri Yoshihara[1], Kenji Shimazoe[1], Hiroyuki Takahashi[1], Hiroyuki Tanaka[1], Hideaki Miyamoto[1] (1.University of Tokyo)

[J] Oral | P (Space and Planetary Sciences)：P-PS Planetary Sciences

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A02 TOKYO BAY MAKUHARI HALL

[P-PS07] Formation and evolution of planetary materials in the Solar System

convener:Yoko Kebukawa(Faculty of Engineering, Yokohama National University), Wataru Fujiya(Ibaraki University, College of Science), Shin Ozawa(Department of Earth Science, Graduate School of Science, Tohoku University), Megumi Matsumoto(Graduate School of Science, Tohoku University), Chairperson:Megumi Matsumoto, Wataru Fujiya

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[PPS07-01] Investigation of sugars in meteorites

★Invited Papers

*Yoshihiro Furukawa[1], Yoshito Chikaraishi[2], Naohiko Ohkouchi[3], Nanako O. Ogawa[3], Tomoki Nakamura[1] (1.Graduate School of Science, Tohoku University, 2.Institute of Low Temperature Science, Hokkaido University, 3.JAMSTEC)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[PPS07-02] Establishment of ice sublimation method for detection of soluble organic matter contained in Antarctic micrometeorites in Antarctic glacier ice

*Yui Ishikawa[1], Yamamoto Kota[1], Hiroshi Naraoka[2], Toru Yada[3], Tatsuaki Okada[1,3] (1.Graduate School of Science, The University of Tokyo, 2.Graduate School of Science, Kyushu University, 3.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[PPS07-03] Magnesium-containing organic compounds in the Tagish Lake and Murchison meteorites.

*Minako Hashiguchi[1], Hiroshi Naraoka[2,1] (1.Research Center for Planetary Trace Organic Compounds, Kyushu University, 2.Department of Earth and Planetary Sciences, Kyushu University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[PPS07-04] Interactions between minerals and organic materials on thermal processes in meteorite parent bodies

*Naoki Hirakawa[1], Yoko Kebukawa[1], Kensei Kobayashi[1] (1.Yokohama National University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[PPS07-05] Organic matter in carbonaceous chondrite lithologies of Almahata Sitta meteorite, a polymict ureilite

*Yoko Kebukawa[1], Michael Zolensky[2], Cyrena Anne Goodrich[3], Motoo Ito[4], Nanako O. Ogawa[5], Yoshinori Takano[5], Naohiko Ohkouchi[5], Hiroki Suga[9], Matthew Marcus[6], David Kilcoyne[6], Takuji Ohigashi[7], Zia Rahman[2], Muawia H. Shaddad[8], Kensei Kobayashi[1] (1.Yokohama National University, 2.NASA Johnson Space Center, 3.Lunar and Planetary Institute, 4.Kochi Institute for Core Sample Research JAMSTEC, 5.Japan Agency for Marine-Earth Science and Technology, 6.Lawrence Berkeley National Laboratory, 7.Institute for Molecular Science, 8.University of Khartoum, 9.The University of Tokyo)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[PPS07-06] Thermal Evolution of Hydrous Minerals on Small Bodies: To Understand Thermal Histories of Ryugu and Bennu

*Kana Ishimaru[1], Shogo Tachibana[2] (1.University of Tokyo, 2.UTokyo Organization for Planetary and Space Science, University of Tokyo)

[E] Poster | P (Space and Planetary Sciences)：P-EM Solar-Terrestrial Sciences, Space Electromagnetism & Space Environment

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_2

[P-EM14] Recent Advances in Ionosphere Observation and Modeling for Monitoring and Forecast

convener:Yang-Yi Sun(China University of Geosciences), CHIYEN LIN(Center for Astronautical Physics and Engineering, National Central University, TAIWAN), MINYANG CHOU(National Cheng Kung University)

[PEM14-P01] **The Daytime and Nighttime Mapped Whistler Plasmapause Observed by DEMETER**

*ChaoYen Chen[1,2], Tiger J. Y. Liu[1,2,3] (1.Institute of Space Science, National Central University, Taiwan, 2.Center for Astronautical Physics and Engineering, National Central University, Taiwan , 3.Center for Space and Remote Sensing Research, National Central University, Taiwan)

[PEM14-P02] Global Plasma Density Irregularity Distributions Observed by Advanced Ionospheric Probe Onboard FORMOSAT-5 Satellite

*Chi-Kuang Chao[1], Yi-Wun Chen[1] (1.Graduate Institute of Space Science, National Central University)

[PEM19-05] Radiation magnetohydrodynamic modeling of solar coronal dynamics

*Haruhisa Iijima[1] (1.Institute for Space-Earth Environmental Research, Nagoya University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[PEM19-06] Detection and energy derivation of nano-flares based on deep learning

*Toshiki Kawai[1], Shinsuke Imada[1] (1.Institute for Space-Earth Environmental Research, Nagoya University)

[J] Oral | P (Space and Planetary Sciences)：P-AE Astronomy & Extrasolar Bodies

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 105 1F

[P-AE20] Exoplanet

convener:Masahiro Ikoma(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Norio Narita(University of Tokyo), Chairperson:Norio Narita(University of Tokyo), Masahiro Ikoma(The University of Tokyo)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[PAE20-01] Gravitational Microlensing Surveys for Exoplanets

★Invited Papers

*Daisuke Suzuki[1] (1.Institute of Space and Astronautical Science / Japan Aerospace Exploration Agency)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[PAE20-02] Doppler planet searches targeting stars in solar neighborhood

★Invited Papers

*Bunei Sato[1] (1.Tokyo Institute of Technology)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[PAE20-03] Development of MuSCAT3 for ground-based follow-up observations of TESS candidate exoplanets

*Norio Narita[1,2,3], Akihiko Fukui[2], Masahiro Ikoma[2], Motohide Tamura[1,2], Nobuhiko Kusakabe[1], Mayuko Mori[2], Tomoyasu Yamamuro[4] (1.Astrobiology Center, 2.University of Tokyo, 3.JST, 4.OptCraft)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[PAE20-04] Effect of metallicity and eddy diffusion on transmission spectra of hazy exoplanet atmospheres

*Yui Kawashima[1], Masahiro Ikoma[2] (1.SRON Netherlands Institute for Space Research, 2.The University of Tokyo)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[PAE20-05] Mineral clouds of fluffy aggregates: how they form in exoplanetary atmospheres and influence transmission spectra

*Kazumasa Ohno[1], Satoshi Okuzumi[1], Ryo Tazaki[2] (1.Department of Earth and Planetary Science, Tokyo Institute of Technology, 2.Astronomical Institute, Tohoku University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[PAE20-06] Orbital Architecture of Planetary Systems Formed by Giant Impacts

★Invited Papers

*Eiichiro Kokubo[1] (1.Division of Theoretical Astronomy, National Astronomical Observatory of Japan)

[J] Oral | P (Space and Planetary Sciences)：P-AE Astronomy & Extrasolar Bodies

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 105 1F

[P-AE20] Exoplanet

convener:Masahiro Ikoma(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Norio Narita(University of Tokyo), Chairperson:Masahiro Ikoma(The University of Tokyo), Norio Narita(University of Tokyo)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[PAE20-07] Thermal convection in the mantle of super-Earths

★Invited Papers

*Takehiro Miyagoshi[1], Masanori Kameyama[2], Masaki Ogawa[3] (1.Japan Agency for Marine-Earth Science and Technology, 2.Ehime University, 3.University of Tokyo)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[PAE20-08] Atmospheric escape from M-dwarf exoplanets and implications for habitability

*Chuanfei Dong[1] (1.Princeton University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[PAE20-09] Theoretical emission spectra of hot rocky super-Earths: Lack of alkali metals due to atmospheric escape

*Yuichi Ito[1,2], Masahiro Ikoma[2] (1.Department of Cosmosciences, Graduate school of Science, Hokkaido University, 2.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[PAE20-10] Hot Rocky Super-Earths atmospheres, a revision of gas phase metal chemistry and the relevance of reverse chemistry

*Sebastian Danielache[1,2], Takahashi Yuta[1], Miguel Yamila[3], Simoncini Eugenio[4], Grassi Tommaso[5] (1.Department of Materials & Life Sciences, Faculty of Science & Technology, Sophia University, 2.Tokyo Institute of Technology, Earth-Life Institute , 3.Leiden Observatory, Leiden University, 4.Simoncini Telai Gambassi Terme, 5.University Observatory Munich, Ludwig-Maximilians-University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[PAE20-11] A Climate of tidally locked terrestrial exoplanets

*Takanori Kodama[1] (1.University of Bordeaux)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[PAE20-12] Current status of WSO-UV/UVSPEX for discovery of Earth-like planets

*Shingo Kameda[1], Osada Naoya[1], Takanori Kodama[2], Go Murakami[3], Keigo Enya[3], Masahiro Ikoma[4], Norio Narita[5], Naoki Terada[6], Hitoshi Fujiwara[7] (1.School of Science, Rikkyo University, 2.University of Bordeaux, 3.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 4.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 5.National Astronomical Observatory of Japan, 6.Graduate School of Science, Tohoku University, 7.Faculty of Science and Technology, Seikei University)

[J] Poster | P (Space and Planetary Sciences)：P-AE Astronomy & Extrasolar Bodies

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_4

[P-AE20] Exoplanet

convener:Masahiro Ikoma(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Norio Narita(University of Tokyo)

[PAE20-P01] An interpretation of exoplanet masses and orbital radii with a theoretical model of gas giant formation

*Kiyoka Murase[1], Hidekazu Tanaka[1] (1.TOHOKU UNIVERSITY)

[PAE20-P02] Impact of resonance trapping of planetesimals during planetary migration on metallicities of close-in gas giants

*Sho Shibata[1], Masahiro Ikoma[1] (1.Graduate School of Science, The University of Tokyo)

[PAE20-P03] Theoretical modeling of hydrogen line emission from accreting gas giants: comparison with observations of LkCa15b and PDS70b

*Yuhiko Aoyama[1], Masahiro Ikoma[1], Gabriel-Dominique Marleau[2], Christoph Mordasini[3] (1.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 2.Institute for Astronomy and Astrophysics, Eberhard Karls University of Tubingen, 3.Physics Institute, University of Bern)

[PAE20-P04] Design of a Lyman alpha telescope LAICA2 for exoplanetary exploration

*Toru Muraoka[1], Go Murakami[2], Shingo Kameda[1] (1.Rikkyo University, 2.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

[PAE20-P05] Numerical experiments on thermal convection of highly compressible fluids: Influences for mantle convection of super-Earths

*Masanori Kameyama[1,2] (1.Geodynamics Research Center, Ehime University, 2.Japan Agency for Marine-Earth Science and Technology)

[PAE20-P06] Impact of Stellar Superflares on Planetary Habitability

*Yosuke Alexandre Yamashiki[1], Hiroyuki Maehara[2], Vladimir Airapetian[5], Yuta Notsu[3], Tatsuhiko Sato[4], Shota Notsu[3], Ryusuke Kuroki[1], keiya murashima[8], Hiroaki Sato[7], Kosuke Namekata[3], Takanori Sasaki[3], Thomas Scott[9], Hina Bando[3], Subaru Nashimoto[8], Fuka Takagi[6], Cassandra Ling[1], Daisaku Nogami[3], Kazunari Shibata[10] (1.Earth & Planetary Water Resources Assessment Laboratory Graduate School of Advanced Integrated Studies in Human Survivability Kyoto University, 2.National Astronomical Observatory of Japan, 3.Department of Astronomy, Kyoto University, 4.Japan Atomic Energy Agency, 5.NASA / GSFC, 6.Faculty of Agriculture, Kyoto University, 7.Faculty of Engineering, Kyoto University, 8.Faculty of Science, Kyoto University, 9.Interface Analysis Centre, University of Bristol, 10.Astronomical Observatory, Kyoto University)

[PAE20-P07] Studies of atmospheric structure in new very-hot Jupiter with high-resolution transmission spectroscopy

*Kiyoe Kawauchi[1], Bun'ei Sato[1], Norio Narita[2], Teruyuki Hirano[1], Yui Kawashima[3] (1.Tokyo Institute of Technology, 2.Tokyo University, 3.SRON - Netherlands Institute for Space Research)

[PAE20-P08] Doppler Tomographic Analysis for the Planetary Orbital Precession of WASP-33b

*Noriharu Watanabe[1], Norio Narita[2], Marshall C. Johnson[3] (1.The Graduate University for Advanced Studies, 2.The University of Tokyo, 3.The Ohio State University)

[PAE20-P09] TESS Follow-up Observation with IRSF/SIRIUS

*Mayuko Mori[1], Norio Narita[1,2], Jerome Pitogo de Leon[1], Taku Nishiumi[3], Akihiko Fukui[1], Motohide Tamura[1,2], Nobuhiko Kusakabe[2], Kumiko Morihana[4] (1.The University of Tokyo, 2.Astrobiology Center, NINS, 3.Kyoto Sangyo University, 4.Nagoya University)

[PAE20-P10] Status of the Multi-band Cameras for Transiting Exoplanets MuSCAT1,2 and New Results in 2018

*Akihiko Fukui[1], Norio Narita[2], Nobuhiko Kusakabe[2], Motohide Tamura[2,1], Kiyoe Kawauchi[1], John Livingston[1], Jerome de Leon[1], Noriharu Watanabe[3], Yuka Terada[1], Mayuko Mori[1], Taku Nishiumi[4] (1.The University of Tokyo, 2.Astrobiology Center, 3.SOKENDAI, 4.Kyoto Sangyo University)

[J] Poster | P (Space and Planetary Sciences)：P-AE Astronomy & Extrasolar Bodies

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_7

[P-AE20] Exoplanet

[E] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A01 TOKYO BAY MAKUHARI HALL

[P-CG21] Future Missions and instrumentation for space and planetary science

convener:Mitsunori Ozaki(Faculty of Electrical and Computer Engineering, Institute of Science and Engineering, Kanazawa University), Satoshi Kasahara(The university of Tokyo), Shingo Kameda(School of Science, Rikkyo University), Kazuo Yoshioka(Graduate School of frontier Science, The University of Tokyo), Chairperson:Kazuo Yoshioka(The University of Tokyo), Mitsunori Ozaki(Kanazawa University)

9:00 AM - 9:20 AM JST | 12:00 AM - 12:20 AM UTC

[PCG21-01] Current status and instrument development plan for future lunar exploration missions

★Invited Papers

*Makiko Ohtake[1] (1.Japan Aerospace Exploration Agency)

9:20 AM - 9:35 AM JST | 12:20 AM - 12:35 AM UTC

[PCG21-02] Development of a Neutral Particle TOF-MS for Future Solar System Explorations

*Daichi Fukuyama[1], Yoshifumi Saito[2], Kazushi Asamura[2], Shoichiro Yokota[3] (1.The university of Tokyo, 2.ISAS/JAXA, 3.Osaka University)

9:35 AM - 9:50 AM JST | 12:35 AM - 12:50 AM UTC

[PCG21-03] Development of Orbitrap Mass Spectrometer for in-situ measurements in solar system explorations

*Oya Kawashima[1], Satoshi Kasahara[1], Yoshifumi Saito[4], Shoichiro Yokota[2], Masafumi Hirahara[3], Seiji Sugita[1] (1.The university of tokyo, 2.Osaka University, 3.Nagoya University, 4.ISAS / JAXA)

9:50 AM - 10:05 AM JST | 12:50 AM - 1:05 AM UTC

[PCG21-04] A high-voltage pulsed power supply for on-site mass spectrometry in future solar system explorations

*Shoichiro Yokota[1], Yosuke Kawai[1], Jun Aoki[1], Yoshifumi Saito[2], Makiko Ohtake[2], Tatsuaki Okada[2] (1.Graduate School of Science, Osaka University, 2.ISAS/JAXA)

10:05 AM - 10:20 AM JST | 1:05 AM - 1:20 AM UTC

[PCG21-05] Development of DESTINY$^+$ Dust Analyzer and its expected science return

*Takayuki Hirai[1], Masanori Kobayashi[1], Tomoko Arai[1], Hiroshi Kimura[1], Ralf Srama[2], Harald Krueger[3] (1.Chiba Institute of Technology, Planetary Exploration Research Center, 2.University of Stuttgart, 3.Max Planck Institute for Solar System Research)

[E] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A01 TOKYO BAY MAKUHARI HALL

[P-CG21] Future Missions and instrumentation for space and planetary science

convener:Mitsunori Ozaki(Faculty of Electrical and Computer Engineering, Institute of Science and Engineering, Kanazawa University), Satoshi Kasahara(The university of Tokyo), Shingo Kameda(School of Science, Rikkyo University), Kazuo Yoshioka(Graduate School of frontier Science, The University of Tokyo), Chairperson:Satoshi Kasahara , Mitsunori Ozaki(Kanazawa University)

10:45 AM - 11:05 AM JST | 1:45 AM - 2:05 AM UTC

[PCG21-06] Satellite mission: PhoENiX (Physics of Energetic and Non-thermal plasmas in the X (= magnetic reconnection) region)

★Invited Papers

*Noriyuki Narukage[1], Mitsuo Oka[2], Yasushi Fukazawa[3], Keiichi Matsuzaki[4], Shin Watanabe[4], Taro Sakao[4], Sin-nosuke Ishikawa[5], Kouichi Hagino[6], Ikuyuki Mitsuishi[5], Tsunefumi Mizuno[3], Iku Shinohara[4], Masumi Shimojo[1], Shinsuke Takasao[5], Hiroshi Tanabe[7], Munetaka UENO[8], Tadayuki Takahashi[9], Takeshi Takashima[4], Masayuki Ohta[4] (1.National Astronomical Observatory of Japan, 2.Space Sciences Laboratory, The University of California, Berkeley, 3.Hiroshima University, 4.Japan Aerospace Exploration Agency, 5.Nagoya University, 6.Tokyo University of Science, 7.The University of Tokyo, 8.Kobe University, 9.Kavli Institute for the Physics and Mathematics of the Universe)

11:05 AM - 11:20 AM JST | 2:05 AM - 2:20 AM UTC

[PCG21-07] Development of ion drift velocity analyzer for sounding rocket and low-altitude satellite

*Takumi Abe[1], Shigeto Watanabe[2], Akinori Saito[3] (1.Department of Solar System Sciences, Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2.Hokkaido Information University, 3.Graduate School of Science, Kyoto University)

11:20 AM - 11:35 AM JST | 2:20 AM - 2:35 AM UTC

[PCG21-08] **SS-520-3 Sounding Rocket Experiment Targeting the Ion Outflow in the Polar Cusp / Aurora**

*Yoshifumi Saito[1], Yasunobu Ogawa[2], Hirotsugu Kojima[3] (1.Department of Solar System Science, Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2.National Institute of Polar Research, 3.Research Institute for Sustainable Humanosphere, Kyoto University)

11:35 AM - 11:50 AM JST | 2:35 AM - 2:50 AM UTC

[PCG21-09] **Development of the chip implemented as high-speed current detection circuits for particle sensors**

*Motoyuki Kikukawa[2], Takahiro Zushi[2], Hirotsugu Kojima[2], Yoshifumi Saito[1] (1.JAXA, 2.Kyoto University)

11:50 AM - 12:10 PM JST | 2:50 AM - 3:10 AM UTC

[PCG21-10] GEO-X (GEOspace X-ray imager) : Imaging the dayside solar wind-terrestrial magnetosphere interaction

★Invited Papers

*Yuichiro Ezoe[1], Yoshizumi Miyoshi[2], Satoshi Kasahara[3], Ryu Funase[3], Harunori Nagata[4], Hiroshi Nakajima[5], Kumi Ishikawa[6], Atsushi Yamazaki[6], Hiroshi Hasegawa[6], Junko Hiraga[7], Masaki Fujimoto[6], Kazuhisa Mitsuda[6], Munetaka Ueno[8], Hiroyuki Koizumi[3], Yasuhiro Kawakatsu[6], Takahiro Iwata[6], Hironori Sahara[1] (1.Tokyo Metropolitan University, 2.Nagoya University, 3.University of Tokyo, 4.Hokkaido University, 5.Kanto Gakuin University, 6.ISAS/JAXA, 7.Kansei Gakuin University, 8.Kobe University)

[E] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A01 TOKYO BAY MAKUHARI HALL

[P-CG21] Future Missions and instrumentation for space and planetary science

convener:Mitsunori Ozaki(Faculty of Electrical and Computer Engineering, Institute of Science and Engineering, Kanazawa University), Satoshi Kasahara(The university of Tokyo), Shingo Kameda(School of Science, Rikkyo University), Kazuo Yoshioka(Graduate School of frontier Science, The University of Tokyo), Chairperson:Shingo Kameda, Mitsunori Ozaki(Kanazawa University)

1:45 PM - 2:05 PM JST | 4:45 AM - 5:05 AM UTC

[PCG21-11] **Debye: a multi-spacecraft mission to solve the electron energization problem in the solar wind**

★Invited Papers

*Fouad Sahraoui[2], Robert T Wicks[1], Daniel Verscharen[1], The Debye The Debye Team (1.Mullard Space Science Laboratory, Department of Space and Climate Physics, University College London, UK, 2.LPP CNRS Ecole Polytechnique)

2:05 PM - 2:25 PM JST | 5:05 AM - 5:25 AM UTC

[PCG21-12] Comet Interceptor mission to a dynamically new comet

★Invited Papers

*Shinnaka Yoshiharu[1], Shingo Kameda[2], Satoshi Kasahara[3], Hideyo Kawakita[1], Masanori Kobayashi[4], Ryu Funase[3], Ichiro Yoshikawa[3], Jones H Geraint[5], Colin Snodgrass[6] (1.Kyoto Sangyo University, 2.Rikkyo University, 3.The University of Tokyo, 4.Chiba Institute of Technology, 5.UCL, 6.The Open University)

2:25 PM - 2:45 PM JST | 5:25 AM - 5:45 AM UTC

[PCG21-13] The concept of AI3 and impactors

★Invited Papers

*Koji Wada[1], Jakob Deller[2], Jessica Agarwal[2], Hans Martin Braun[3], Kieran Carroll[4], Hannah Goldberg[5], Martin Jutzi[6], Özgür Karatekin[7], Tomáš Kohout[8], Sampsa Pursiainen[9], Birgit Ritter[7], Olaf Roders[2], Francisco da Silva Pais Cabral[10], Fredrik Sjoberg[11], Mika Takala[9], Esa Vilenius[2], Patrick Bambach[2], Ryo Ishimaru[1], Yutaka WADA[1], Masahiko Arakawa[12], Takanao Saiki[13] (1.Planetary Exploration Research Center, Chiba Institute of Technology, 2.Max Planck Institute, Göttingen, 3.RST Radar System Technik, 4.Gedex Systems Inc, 5.GOMSpace, 6.University of Bern, 7.Royal Observatory of Belgium, 8.University of Helsinki, 9.Tampere University of Technology, 10.GMV, 11.OHB, 12.Kobe University, 13.JAXA)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[PCG21-14] Observational Techniques for Energy Transport Verification in Space Plasmas and Waves Developed in the FACTORS Mission

*Masafumi Hirahara[1], Hirotsugu Kojima[2], Naritoshi Kitamura[3], Kazushi Asamura[4], Yoshifumi Saito[4] (1.Institute of Space-Earth Environmental Research, Nagoya University, 2.Research Institute of Sustainable Humanosphere, Kyoto University, 3.Graduate School of Science, The University of Tokyo, 4.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[PCG21-15] Current status of Life Detection Microscope (LDM) for Mars surface exploration

*Yoshitaka Yoshimura[1], Akihiko Yamagishi[2], Takehiko Satoh[3], Atsuo Miyakawa[2], Eiichi Imai[4], Satoshi Sasaki[5], Kensei Kobayashi[6], Yoko Kebukawa[6], Tomoka Okada[6], Keigo Enya[3], Hikaru Yabuta[7], Takeshi Naganuma[7], Hajime Mita[8], Kazuhisa Fujita[3], Tomohiro Usui[3] (1.College of Agriculture, Tamagawa University, 2.Tokyo University of Pharmacy and Life Science, 3.Japan Aerospace Exploration Agency, 4.Nagaoka University of Technology, 5.Tokyo University of Technology, 6.Yokohama National University, 7.Hiroshima University, 8.Fukuoka Institute of Technology)

[E] Poster | P (Space and Planetary Sciences)：P-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_5

[P-CG21] Future Missions and instrumentation for space and planetary science

convener:Mitsunori Ozaki(Faculty of Electrical and Computer Engineering, Institute of Science and Engineering, Kanazawa University), Satoshi Kasahara(The university of Tokyo), Shingo Kameda(School of Science, Rikkyo University), Kazuo Yoshioka(Graduate School of frontier Science, The University of Tokyo)

[PCG21-P01] Visible and ultraviolet imagers for auroral and airglow observations by FACTORS - a future satellite mission for understanding the coupling and transportation processes in the upper atmosphere

*Takeshi Sakanoi[1], Masafumi Hirahara[2], Takuo T. Tsuda[3], Kazushi Asamura[4], Yoshizumi Miyoshi[2], Tomo-Hiko Watanabe[5], Takanori Nishiyama[6], Shin-ichiro Oyama[2,7], Yoshifumi Saito[4], Keisuke Hosokawa[3], Hirotsugu Kojima[8], Naritoshi Kitamura[9], Yasunobu Ogawa[5], Masatoshi Yamauchi[10], Ayako Matsuoka[4], Naoshi Yagi[1], Fukizawa Fukizawa[1], Genki Ishizawa[11] (1.Planetary Plasma and Atmospheric Research Center, Graduate School of Science, Tohoku University, 2.ISEE, Nagoya University, 3.Graduate School of Informatics and Engineering, School of Informatics and Engineering, The University of Electro-Communications, 4.ISAS/JAXA, 5.Graduate School of Science, Nagoya University, 6.National Institute for Polar Research, 7.University of Oulu, Finland, 8.RISH, Kyoto University, 9.Graduate School of Science, the University of Tokyo, Tokyo, 10.IRF Kiruna, Sweden, 11.Graduate School of Science, Tohoku University)

[PCG21-P02] Spatio-temporal analysis of flash aurora using Convolutional Neural Network

*Toki Genda[1], Takumi Inoue[1], Mitsunori Ozaki[1], Satoshi Yagitani[1], Imamura Kousuke[1], Kazuo Shiokawa[2], Yoshizumi Miyoshi[2], Shin-ichiro Oyama[2], Ryuho Kataoka[3], Yusuke Ebihara[4], Keisuke Hosokawa[5] (1.Kanazawa Univ., 2.Nagoya Univ., 3.NIPR, 4.Kyoto Univ., 5.UEC)

[PCG21-P03] Study on the pulse noise removal technique for Pc1 geomagnetic pulsations on the ground by signal processing

*Fumiya Komase[1], Tomohiro Inoue[1], Mitsunori Ozaki[1], Satoshi Yagitani[1], Kazuo Shiokawa[2], Masahito Nose[2], Tsutomu Nagatsuma[3] (1.Kanazawa Univ., 2.Nagoya Univ., 3.NICT)

[PCG21-P04] Application of magneto-impedance sensor to geomagnetic field measurements

*Masahito Nose[1], Reiko Nomura[2], Kazushi Asamura[3], Hitoshi Aoyama[4], Takeshi Kawano[4], Ayako Matsuoka[3], Kentarou Kitamura[5], Yukinobu Koyama[6], Haruhisa Matsumoto[7], Masafumi Hirahara[1] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.National Astronomical Observatory of Japan, 3.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 4.Aichi Steel Corporation, 5.National Institute of Technology, Tokuyama College, 6.National Institute of Technology, Oita College, 7.Research and Development Directorate, Japan Aerospace Exploration Agency)

[PCG21-P05] Observation of the Ionospheric Currents by the CubeSat at the Low and Middle Latitude

*Kentarou Kitamura[1], Kazumasa Imai[2], Taku Takada[2], Manabu Shinohara[3], Makoto Wakabayashi[4], KOSEN Space Collaboration Group (1.National Institute of Technology, Tokuyama Collge, 2.National Institute of Technology, Kochi Collge, 3.National Institute of Technology, Kagoshima Collge, 4.National Institute of Technology, Niihama Collge)

[PCG21-P06] Basic study on miniaturization of electric field instrument for plasma wave observations by ASIC technology

*Yuya Tokunaga[1], Mitsunori Ozaki[1], Keigo Ishisaka[2], Hirotsugu Kojima[3], Satoshi Yagitani[1], Takahiro Zushi[3] (1.Kanazawa University, 2.Toyama Prefectural University, 3.Kyoto University)

[PCG21-P07] Evaluation of radiation tolerance of electronics parts used for the ultra-small mission

*Riku Katsuse[1], Kazuo Yoshioka[1], Masaki Kuwabara[2], Reina Hikida[1], Shogo Arao[1], Ichiro Yoshikawa[1] (1.The university of Tokyo , 2.Institute of Space and Astronautical Science)

[PCG21-P08] A method to quantitatively evaluate Non-evaporable-getter pump for use in space science mission

*Seiya Nishimura[1], Ichiro Yoshikawa[1], Kazuo Yoshioka[1], Shogo Arao[1], Zhang Tianxu[1] (1.The university of tokyo)

[PCG21-P09] Interpretation on slight asymmetry of analyzer characteristics of MIA onboard the Mio by means of a model calculation of 3-D potential distribution

*Wataru Miyake[1], Yoshifumi Saito[2], Shoichiro Yokota[3] (1.Tokai University, 2.ISAS, 3.Osaka University)

[PCG21-P10] Construction of impact testing machine for small satellites and evaluation of mechanical resistance of MCPs by the impact test

*Junya Fukuba[1] (1.Graduate school of Tokyo)

[PCG21-P11] Innovative design of double-shell type energy analyzer for simultaneous electron and ion measurements in space

*Tomomi Takei[1], Masafumi Hirahara[1] (1.Institute for space-earth environmental research, Nagoya university)

[PCG21-P12] Microsatellite Development and Education of Space Science and Technology at Kanazawa University

*Tomohiko Imachi[1], Satoshi Yagitani[1], Daisuke Yonetoku[1], Yoshiya Kasahara[1], Tatsuya Sawano[1], Makoto Arimoto[1], Yoshitaka Goto[1], Mitsunori Ozaki[1], Ryuichi Fujimoto[1] (1.Kanazawa University)

[PCG21-P13] Attitude Control System for Kanazawa-SAT3 Microsatellite

Takuya Nakajima[1], Yuuki Yasuda[1], Hirofumi Segawa[1], *Tomohiko Imachi[1], Satoshi Yagitani[1], Yoshiya Kasahara[1], Daisuke Yonetoku[1], Tatsuya Sawano[1], Makoto rimoto[1] (1.Kanazawa University)

[PCG21-P14] Communications System and Antennas for Kanazawa-SAT3 Microsatellite

Teruya Minamoto[1], Koyo Ina[1], Kohei Kawagoshi[1], *Tomohiko Imachi[1], Satoshi Yagitani[1], Yoshitaka Goto[1], Daisuke Yonetoku[1], Yoshiya Kasahara[1], Tatsuya Sawano[1], Makoto Arimoto[1] (1.Kanazawa University)

[PCG21-P15] Development of micrometeoroid impact sensor within a multi-layered insulation (CLOTH) onboard 6U deep-space explorer EQUULEUS

*Takayuki Hirai[1], Hajime Yano[2], Ritsuko Jitsukawa[3], Eigo Ishioka[3], Haruki Nakano[3], Kazuyoshi Arai[3], Sunao Hasegawa[2] (1.Planetary Exploration Research Center, Chiba Institute of Technology, 2.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 3.Faculty of Science and Engineering, Hosei University)

[PCG21-P16] Breadboard model of asteroid tracking system for DESTINY$^+$ mission

*Peng Hong[1], Ko Ishibashi[1], Shunsuke Sato[2], Kazutoshi Takemura[3], Kotaro Fujiwara[4], Kanako Machii[5], Hiroyuki Toyota[2], Kazutaka Nishiyama[2], Masatsugu Otsuki[2], Osamu Okudaira[1], Takeshi Takashima[2] (1.Planetary Exploration Research Center, Chiba Institute of Technology, 2.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 3.Department of Applied Mechanics, Graduate School of Fundamental Science and Engineering, Waseda University, 4.Division of Mechanical and Space Engineering, Graduate School of Engineering, Hokkaido University, 5.Department of Mechanical Engineering and Intelligent Systems, Faculty of Informatics and Engineering, The University of Electro-Communications)

[PCG21-P17] Development of telescopic camera (TENGOO) performance evaluation device in MMX

*Hiroki Kato[1], Shingo Kameda[1], Keigo Enya[2], Osada Naoya[1] (1.Rikkyo University, 2.Japan Aerospace Exploration Agency)

[PCG21-P18] Observation Plans in the Cruising-Phase of the Solar Power Sail: OKEANOS

*Takahiro Iwata[1], Shuji Matsuura[2], KOHJI TSUMURA[3], Hajime Yano[1], Takayuki Hirai[4], Ayako Matsuoka[1], Daisuke Yonetoku[5], Tatehiro Mihara[6], Tatsuaki Okada[1], Osamu Mori[1], Toshihiro Chujo[1] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2.Kwansei Gakuin University, 3.Tohoku University, 4.Chiba Institute of Technology, 5.Kanazawa University, 6.RIKEN)

[E] Poster | P (Space and Planetary Sciences)：P-CG Complex & General

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_8

[P-CG21] Future Missions and instrumentation for space and planetary science

convener:Mitsunori Ozaki(Faculty of Electrical and Computer Engineering, Institute of Science and Engineering, Kanazawa University), Satoshi Kasahara(The university of Tokyo), Shingo Kameda(School of Science, Rikkyo University), Kazuo Yoshioka(Graduate School of frontier Science, The University of Tokyo)

[PCG21-P01] Visible and ultraviolet imagers for auroral and airglow observations by FACTORS - a future satellite mission for understanding the coupling and transportation processes in the upper atmosphere

*Takeshi Sakanoi[1], Masafumi Hirahara[2], Takuo T. Tsuda[3], Kazushi Asamura[4], Yoshizumi Miyoshi[2], Tomo-Hiko Watanabe[5], Takanori Nishiyama[6], Shin-ichiro Oyama[2,7], Yoshifumi Saito[4], Keisuke Hosokawa[3], Hirotsugu Kojima[8], Naritoshi Kitamura[9], Yasunobu Ogawa[5], Masatoshi Yamauchi[10], Ayako Matsuoka[4], Naoshi Yagi[1], Fukizawa Fukizawa[1], Genki Ishizawa[11] (1.Planetary Plasma and Atmospheric Research Center, Graduate School of Science, Tohoku University, 2.ISEE, Nagoya University, 3.Graduate School of Informatics and Engineering, School of Informatics and Engineering, The University of Electro-Communications, 4.ISAS/JAXA, 5.Graduate School of Science, Nagoya University, 6.National Institute for Polar Research, 7.University of Oulu, Finland, 8.RISH, Kyoto University, 9.Graduate School of Science, the University of Tokyo, Tokyo, 10.IRF Kiruna, Sweden, 11.Graduate School of Science, Tohoku University)

[PCG21-P02] Spatio-temporal analysis of flash aurora using Convolutional Neural Network

*Toki Genda[1], Takumi Inoue[1], Mitsunori Ozaki[1], Satoshi Yagitani[1], Imamura Kousuke[1], Kazuo Shiokawa[2], Yoshizumi Miyoshi[2], Shin-ichiro Oyama[2], Ryuho Kataoka[3], Yusuke Ebihara[4], Keisuke Hosokawa[5] (1.Kanazawa Univ., 2.Nagoya Univ., 3.NIPR, 4.Kyoto Univ., 5.UEC)

[PCG21-P03] Study on the pulse noise removal technique for Pc1 geomagnetic pulsations on the ground by signal processing

*Fumiya Komase[1], Tomohiro Inoue[1], Mitsunori Ozaki[1], Satoshi Yagitani[1], Kazuo Shiokawa[2], Masahito Nose[2], Tsutomu Nagatsuma[3] (1.Kanazawa Univ., 2.Nagoya Univ., 3.NICT)

[PCG21-P04] Application of magneto-impedance sensor to geomagnetic field measurements

*Masahito Nose[1], Reiko Nomura[2], Kazushi Asamura[3], Hitoshi Aoyama[4], Takeshi Kawano[4], Ayako Matsuoka[3], Kentarou Kitamura[5], Yukinobu Koyama[6], Haruhisa Matsumoto[7], Masafumi Hirahara[1] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.National Astronomical Observatory of Japan, 3.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 4.Aichi Steel Corporation, 5.National Institute of Technology, Tokuyama College, 6.National Institute of Technology, Oita College, 7.Research and Development Directorate, Japan Aerospace Exploration Agency)

[PCG21-P05] Observation of the Ionospheric Currents by the CubeSat at the Low and Middle Latitude

*Kentarou Kitamura[1], Kazumasa Imai[2], Taku Takada[2], Manabu Shinohara[3], Makoto Wakabayashi[4], KOSEN Space Collaboration Group (1.National Institute of Technology, Tokuyama Collge, 2.National Institute of Technology, Kochi Collge, 3.National Institute of Technology, Kagoshima Collge, 4.National Institute of Technology, Niihama Collge)

[PCG21-P06] Basic study on miniaturization of electric field instrument for plasma wave observations by ASIC technology

*Yuya Tokunaga[1], Mitsunori Ozaki[1], Keigo Ishisaka[2], Hirotsugu Kojima[3], Satoshi Yagitani[1], Takahiro Zushi[3] (1.Kanazawa University, 2.Toyama Prefectural University, 3.Kyoto University)

[PCG21-P07] Evaluation of radiation tolerance of electronics parts used for the ultra-small mission

*Riku Katsuse[1], Kazuo Yoshioka[1], Masaki Kuwabara[2], Reina Hikida[1], Shogo Arao[1], Ichiro Yoshikawa[1] (1.The university of Tokyo , 2.Institute of Space and Astronautical Science)

[PCG21-P08] A method to quantitatively evaluate Non-evaporable-getter pump for use in space science mission

*Seiya Nishimura[1], Ichiro Yoshikawa[1], Kazuo Yoshioka[1], Shogo Arao[1], Zhang Tianxu[1] (1.The university of tokyo)

[PCG21-P09] Interpretation on slight asymmetry of analyzer characteristics of MIA onboard the Mio by means of a model calculation of 3-D potential distribution

*Wataru Miyake[1], Yoshifumi Saito[2], Shoichiro Yokota[3] (1.Tokai University, 2.ISAS, 3.Osaka University)

[PCG21-P10] Construction of impact testing machine for small satellites and evaluation of mechanical resistance of MCPs by the impact test

*Junya Fukuba[1] (1.Graduate school of Tokyo)

[PCG21-P11] Innovative design of double-shell type energy analyzer for simultaneous electron and ion measurements in space

[J] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 201B 2F

[P-CG23] Origin and evolution of materials in space

convener:Hitoshi Miura(Graduate School of Natural Sciences, Department of Information and Basic Science, Nagoya City University), Hideko Nomura(Department of Earth and Planetary Sciences, Tokyo Institute of Technology), Takafumi Ootsubo(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Aki Takigawa(Division of Earth and Planetary Science, Kyoto University), Chairperson:Ryo Tazaki, Aoi Takahashi

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[PCG23-01] Origin of cosmic dust: Galaxy-scale perspective

★Invited Papers

*Akio Inoue[1,2] (1.Osaka Sangyo University, 2.Waseda University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[PCG23-02] SPICA and future infrared observations of cosmic matters

★Invited Papers

*Issei Yamamura[1] (1.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[PCG23-03] Engineering first light of a new mid-infrared instrument MIMIZUKU

*Takafumi Kamizuka[1], Takashi Miyata[1], Shigeyuki Sako[1], Ryou Ohsawa[1], Masahito S. Uchiyama[1], Tomohiro Mori[1], Yutaka Yoshida[1] (1.Institute of Astronomy, School of Science, the University of Tokyo)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[PCG23-04] Properties and space exposure of Quenched Nitrogen-included Carbonaceous Composite (QNCC)

*Izumi Endo[1], Itsuki Sakon[1], Takashi Onaka[1], Yoko Kebukawa[2], Kensei Kobayashi[2], MITA Hajime[4], Hajime Yano[3] (1.University of Tokyo, 2.Yokohama National University, 3.ISAS/JAXA, 4.Fukuoka Institute of Technology)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[PCG23-05] Shape dependence of dust absorption opacity in the Rayleigh domain

*Ryo Tazaki[1], Hidekazu Tanaka[1] (1.Astronomical Institute, Tohoku University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[PCG23-06] Modeling of the H_2 ortho-para spin conversion on grain surfaces in star- and planet-forming regions

*Kenji Furuya[1], W. M. C. Sameera[2], Tetsuya Hama[2], Naoki Watanabe[2], Yuri Aikawa[3] (1.Center for Computer Sciences, University of Tsukuba, 2.Institute of Low Temperature Science, Hokkaido University,, 3.The University of Tokyo)

[J] Oral | P (Space and Planetary Sciences)：P-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 201B 2F

[P-CG23] Origin and evolution of materials in space

convener:Hitoshi Miura(Graduate School of Natural Sciences, Department of Information and Basic Science, Nagoya City University), Hideko Nomura(Department of Earth and Planetary Sciences, Tokyo Institute of Technology), Takafumi Ootsubo(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Aki Takigawa(Division of Earth and Planetary Science, Kyoto University), Chairperson:Kenji Furuya, Yuki Hibiya

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[PCG23-07] Thermal processes of primary silicate dust in protoplanetary disk: Constraints from oxygen isotope exchange kinetics between amorphous silicate and water vapor

★Invited Papers

*Daiki Yamamoto[1], Shogo Tachibana[2], Noriyuki Kawasaki[1], Minami Kuroda[1], Naoya Sakamoto[3], Hisayoshi Yurimoto[1,4] (1.Department of Natural History Sciences ,Hokkaido University, 2.UTokyo Organization for Planetary Space Science, The University of Tokyo , 3.Creative Research Institution, Hokkaido University , 4.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[PCG23-08] Birth-place of comet 17P/Holmes from its mass fractions of minerals

★Invited Papers

*Shinnaka Yoshiharu[1], Takafumi Ootsubo[2], Hideyo Kawakita[1], Mitsuru Yamaguchi[1], Mitsuhiko Honda[3], Jun-ichi Watanabe[4] (1.Kyoto Sangyo University, 2.JAXA/ISAS, 3.Kurume University, 4.NAOJ)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[PCG23-09] Comparison of grain properties in interplanetary dust from different types of parent bodies by mid-infrared spectroscopic observations with AKARI

*Aoi Takahashi[1], Takafumi Ootsubo[2], Hideo Matsuhara[2], Fumihiko Usui[3], Itsuki Sakon[4], Hiroki Chihara[5] (1.The Graduate University for Advanced Studies, 2.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 3.Kobe University, 4.University of Tokyo, 5.Osaka Sangyo University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[PCG23-10] Formation of forsterite crystal induced by ultraviolet irradiation of water ice ice on amorphous Mg_2SiO_4 particles

*Akira Kouchi[1], Yuki Kimura[1], Yasuhiro Oba[1], Tetsuya Hama[1], Naoki Watanabe[1], Shogo Tachibana[2], Akira Tsuchiyama[3], Satomi Enju[3], Takafumi Ootsubo[4] (1.Institute of Low Temperature Science, Hokkaido University, 2.UTokyo Organization for Planetary and Space Science, University of Tokyo, 3.Graduate School of Science, Kyoto University, 4.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[PCG23-11] Condensation experiments in the sytem Fe-Mg-Si-O-S using induction thermal plasma: implication to GEMS forming condition

*Satomi Enju[1], Hayate Kawano[1], Hisashi Komaki[2], Akira Tsuchiyama[1] (1.Department of Earth and Planetary Sciences, Graduate School of Science, Kyoto University, 2.JEOL Ltd.)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[PCG23-12] **The initial abundance of ^{92}Nb in the outer solar system.**

*Yuki Hibiya[1,2], Tsuyoshi Iizuka[2], Hatsuki Enomoto[2] (1.Japan Agency for Marine-Earth Science and Technology, 2.The University of Tokyo)

[J] Poster | P (Space and Planetary Sciences)：P-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_6

[P-CG23] Origin and evolution of materials in space

convener:Hitoshi Miura(Graduate School of Natural Sciences, Department of Information and Basic Science, Nagoya City University), Hideko Nomura(Department of Earth and Planetary Sciences, Tokyo Institute of Technology), Takafumi Ootsubo(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Aki Takigawa(Division of Earth and Planetary Science, Kyoto University)

[PCG23-P01] Infrared spectrum of planetary-nebula analyzed by pure-carbon graphene molecule

*Norio Ota[1] (1.University of Tsukuba,Graduate school of pure and applied sciences)

[PCG23-P02] Theory of Self-induced Desorption of Molecules from Cold Dust Surface

Tetsuo Yamamoto[1], *Hitoshi Miura[2], Osama M. Shalabiea[3] (1.Hokkaido University, 2.Graduate School of Natural Sciences, Department of Information and Basic Science, Nagoya City University, 3.Cairo University)

[PCG23-P03] Synthesis of GEMS analogue particles by condensation experiments in the system Mg-Fe-Si-S-Al-Ca-Ni-O

*Yuto Imura[1], Satomi Enju[1], Hayate Kawano[1], Akira Tsuchiyama[1] (1. Division of Earth and Planetary Sciences, Graduate School of Science, Kyoto University)

[J] Oral | A (Atmospheric and Hydrospheric Sciences)：A-AS Atmospheric Sciences, Meteorology & Atmospheric Environment

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 301A 3F

[A-AS06] Progress in dense observation and numerical modeling of micro-scale meteorology

convener:Junshi Ito(Atmosphere and Ocean Research Institute, The University of Tokyo), Kentaro Araki(Meteorological Research Institute), Jun-ichi Furumoto(Research Institute for Sustainable Humanosphere, Kyoto University), Kuniaki Higashi(Research Institute for Sustainable Humanosphere, Kyoto University Metroweather Co., Ltd.), Chairperson:Junshi Ito(The University of Tokyo), Kentaro Araki(Meteorological Research Institute)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[AAS06-01] A Linear Array of Wind and Pressure Sensors for High Resolution in situ Measurements in Winter Tornadoes

★Invited Papers

*Kusunoki Kenichi[1], Hanako Inoue[1], Naoki Ishitsu[2], Chusei Fujiwara[3] (1.Meteorological Research Institute, 2.Alpha-denshi Co., Ltd. / Meteorological Research Institute, 3.East Japan Railway Company)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[AAS06-02] Mesoscale fixed point weather observation architecture by Drone fleet

*Yuichi Yaguchi[1], Masayuki Itaha[4], Shuzo Nakano[3], Kazuhiko Yamagishi[2], Tatsuya Iyobe[5] (1.The University of Aizu, 2.e-Robotics Fukushima Co., Ltd., 3.East-Japan Accounting Center Co., Ltd., 4.Japan Environment Research Co., Ltd., 5.Iyobe Shoji Ltd.)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[AAS06-03] Potential of dense weather event observation using surface optical fiber cable and DAS technology

*Tsunehisa KIMURA[1] (1.Schlumberger)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[AAS06-04] Case study of environmental conditions and cloud microphysical properties of winter convective clouds developed in the Kanto plain

*Kentaro Araki[1], Shinsuke Satoh[2], Takuya Tajiri[1] (1.Meteorological Research Institute, 2.National Institute of Information and Communications Technology)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[AAS06-05] Numerical simulation of the urban effect on the atmospheric boundary layer structure in Tokyo using the SPUC urban canopy scheme

*Naoko Seino[1] (1.Meteorological Research Institute)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[AAS06-06] Surface layer model for instantaneous wind speeds designed by deep learning

*Junshi Ito[1,2], Hideaki Mouri[2] (1.Atmosphere and Ocean Research Institute, The University of Tokyo , 2.Meteorological Research Institute)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 303 3F

[A-OS09] Ocean Mixing Processes: Impact on Biogeochemistry, Climate and Ecosystem

convener:Ichiro Yasuda(Atmosphere and Ocean Research Institute, The University of Tokyo), Toshiyuki Hibiya(Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo), Jun Nishioka(Hokkaido University, Institute of low temperature sciences), Shin-ichi Ito(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:Ichiro Yasuda(Atmosphere and Ocean Research Institute, The University of Tokyo)

9:10 AM - 9:30 AM JST | 12:10 AM - 12:30 AM UTC

[AOS09-01] **Model Spectra for Turbulence Below and Above the Ozmidov Wavenumber**

★Invited Papers

*Eric L Kunze[1] (1.NorthWest Research Associates Redmond)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[AOS09-02] **A new parameterization of turbulent mixing caused by tidal flow over abyssal rough bathymetry**

*Toshiyuki Hibiya[1] (1. Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[AOS09-03] Development of CTD-attached microstructure measurements and basin-scale turbulence distribution in the North Pacific

*Ichiro Yasuda[1], Yasutaka Goto[2], Maki Nagasawa[1], Koenjong Lee[1], Toshiya Nakano[2], Shinya Kouketsu[3] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Japan Meterolorogical Agency, 3.Japan Agency of Marine-Earth Science and Technology)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[AOS09-04] The deep Pacific meridional overturning circulation simulated by a low-resolution ocean model

★Invited Papers

*Takao Kawasaki[1], Hiroyasu Hasumi[1] (1.Atmosphere and Ocean Research Insitutute, the University of Tokyo)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[AOS09-05] The Role of Mixing and Geothermal Heating in Altering AABW and NADW Pathways

★Invited Papers

*Qianjiang Xing[1], Stephanie Downes[1], Kate Snow[2] (1.IMAS, Univ of Tasmania, AU, 2.School of GeoSciences, Univ of Edinburgh, UK)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 303 3F

[A-OS09] Ocean Mixing Processes: Impact on Biogeochemistry, Climate and Ecosystem

convener:Ichiro Yasuda(Atmosphere and Ocean Research Institute, The University of Tokyo), Toshiyuki Hibiya(Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo), Jun Nishioka(Hokkaido University, Institute of low temperature sciences), Shin-ichi Ito(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:Jun Nishioka(Institute of low temperature science, Hokkaido University)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[AOS09-06] **Longterm changes in heat content, salinity and stratification over the Pacific Arctic and Subarctic continental shelves**

★Invited Papers

*Seth L Danielson[1] (1.University of Alaska Fairbanks)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[AOS09-07] **Important roles of marginal seas and intermediate water for micro- and macro-nutrients circulation in the North Pacific**

*Jun Nishioka[1], Hajime Obata[2], Hiroshi Ogawa[2], Ichiro Yasuda[2] (1.Hokkaido University, Institute of low temperature sciences, 2.The University of Tokyo, Atmosphere and Ocean research institute)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[AOS09-08] An insight into chemical speciation of dissolved iron in the intermediate water of the North Pacific

*Youhei Yamashita[1], Jun Nishioka[2], Hajime Obata[3], Hiroshi Ogawa[3] (1.Faculty of Environmental Earth Science, Hokkaido University, 2.Institute of Low Temperature Science, Hokkaido University, 3.Atmosphere and Ocean Research Institute, The University of Tokyo)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[AOS09-09] Change in lower trophic level ecosystem and its complex mechanism in the North Pacific

★Invited Papers

Naomi Harada[1], Fujiki Tetsuichi[1], *Maki Noguchi Aita[1], Makio Honda[1], Minoru Kitamura[1], Takuhei Shiozaki[1], Yoshihisa Mino[3], Akira Kuwata[2], Kazuaki Tadokoro[2], Osamu Seki[4], Megumi Chikamoto[5] (1.Japan Agency for Marine-Earth Science and Technology, 2.Tohoku National Fisheries Research Institute, Japan Fisheries Research and Education Agency, 3.Institute for Space-Earth Environmental Research, Nagoya University, 4.Institute of Low Temperature Science, Hokkaido University, 5.International Pacific Research Center, University of Hawaii at Manoa)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[AOS09-10] Numerical simulation of iron cycle in the North Pacific

*Kazuhiro Misumi[1], Jun Nishioka[2], Hajime Obata[3], Daisuke Tsumune[1], Tsubono Takaki[1], Matthew C Long[4], Keith Lindsay[4], J. Keith Moore[5] (1.Environmental Science Research Laboratory, Central Research Institute of Electric Power Industry, 2.Institute of Low Temperature Science, Hokkaido University, 3.Atmosphere and Ocean Research Institute, The University of Tokyo, 4.Climate and Global Dynamics Laboratory, National Center for Atmospheric Research, 5.Department of Earth System Science, University of California at Irvine)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[AOS09-11] Influence of tide on the growth and migration of walleye pollock (*Gadus chalcogrammus*) in the Oyashio region

*Shin-ichi Ito[1], Zi-jian Wang[1], Hatsumi Nishikawa[3], Humio Mitsudera[3], Mitsuhiro Ishino[2] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Fisheries Research and Education Agency Japan, 3. Hokkaido University)

[E] Oral | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 303 3F

[A-OS09] Ocean Mixing Processes: Impact on Biogeochemistry, Climate and Ecosystem

convener:Ichiro Yasuda(Atmosphere and Ocean Research Institute, The University of Tokyo), Toshiyuki Hibiya(Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo), Jun Nishioka(Hokkaido University, Institute of low temperature sciences), Shin-ichi Ito(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:Shin-Ichi Ito(The University of Tokyo)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[AOS09-12] What can horizontal stirring tell us about vertical mixing?

★Invited Papers

*Sylvia T Cole[1] (1.Woods Hole Oceanographic Institution)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[AOS09-13] Acoustic remote sensing of ocean mixing

★Invited Papers

*Tetjana Ross[1], Andone Lavery[2], Doris Leong[3], Rolf Lueck[4] (1.Institute Of Ocean Sciences, Fisheries and Oceans Canada, 2.Woods Hole Oceanographic Institution, 3.British Columbia Ministry of Forests, Lands, Natural Resource Operations and Rural Development, 4.Rockland Scientific International)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[AOS09-14] Assessment of the effectiveness of the global ocean state estimation using tide-induced mixing parameterizations

*Satoshi Osafune[1], Shuhei Masuda[1], Nozomi Sugiura[1], Doi Toshimasa[1], Tadashi Hemmi[1] (1.JAMSTEC)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[AOS09-15] **Energetics of Eddy-Mean Flow Interactions in Western Boundary Currents: The Kuroshio and the Gulf Stream**

★Invited Papers

*Enrique N Curchitser[1], Dujuan Kang[1], Xiaomei Yan[2] (1.Rutgers University New Brunswick, 2.Institute of Oceanology, Chinese Academy of Sciences)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[AOS09-16] Mixing Processes in the Kuroshio region and their influence on the low-trophic ecosystem

★Invited Papers

*Xinyu Guo[1], Takeshi Matsuno[2], Tomoharu Senju [2], Kaoru Ichikawa[2], Takahiro Endoh[2], Eisuke Tsutsumi[2], Ayako Nishina[3], Hirohiko Nakamura[3], JING ZHANG[4], Daisuke Hasegawa[5], Naoki Yoshie[1], Toru Kobari[3] (1.Center for Marine Environmental Studies, Ehime University, 2.Research Institute for Applied Mechanics, Kyushu University,, 3.Faculty of Fisheries, Kagoshima University, 4.Graduate School of Science and Engineering, University of Toyama, 5.Tohoko National Fisheries Research Institute)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[AOS09-17] Very strong turbulent mixing over 30-km and 200-m lateral and vertical scales in the Kuroshio near the continental slope in Hyuganada Sea

*Takeyoshi Nagai[1], Silvana Duran[2], Diego Otero[2], Yasutaka Mori[1], Naoki Yoshie[3], Kazuki Ohgi[3], Daisuke Hasegawa[4], Ayako Nishina[5], Toru Kobari[5] (1.Department of Ocean Sciences, Tokyo University of Marine Science and Technology, 2.Facultad de Pesquería, Universidad Nacional Agraria La Molina, Peru, 3.Center for Marine Environmental Studies, Ehime University, 4.Tohoku National Fisheries Research Institute, Japan Fisheries Research and Education Agency, 5.Faculty of Fisheries Kagoshima University)

[E] Poster | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_7

[A-OS09] Ocean Mixing Processes: Impact on Biogeochemistry, Climate and Ecosystem

convener:Ichiro Yasuda(Atmosphere and Ocean Research Institute, The University of Tokyo), Toshiyuki Hibiya(Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo), Jun Nishioka(Hokkaido University, Institute of low temperature sciences), Shin-ichi Ito(Atmosphere and Ocean Research Institute, The University of Tokyo)

[AOS09-P01] Correction method of fast-response thermistors data to estimate turbulence intensity

*kimura shino[1], Yasutaka Goto[2], Koenjong Lee[1], Ichiro Yasuda[1] (1.The Univercity of Tokyo, 2.Meteorological Agency)

[AOS09-P02] Observation of turbulent mixing using a deep float with microstructure sensors

*Shuo Zhai[1], Ichiro Yasuda[1], Masaaki Kikuchi[1], Yasutaka Goto[1], Koenjong Lee[1], Takahiro Tanaka[2], Ken Yamaki[3], Yutaka Imamura[4] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Japan Fisheries Research Agency, 3.TSK Tsurumi-Seiki Co., Ltd., 4.Aomori Prefectural Industrial Thechnology Research Center, Fisheries Research Insititute)

[AOS09-P03] Evaluation of the underwater glider flight model using the electromagnetic current sensor

*Takahiro Tanaka[1], Daisuke Hasegawa[1], Takeshi Okunishi[1], Ichiro Yasuda[2] (1.Tohoku National Fisheries Research Institute, Japan Fisheries Research and Education Agency, 2.Atmosphere and Ocean Research Institute, University of Tokyo)

[AOS09-P04] Mixing processes observed by a slocum glider at the Oyashio-TWC front

*Daisuke Hasegawa[1], Takahiro Tanaka[1], Takeshi Okunishi[1], Ichiro Yasuda[2] (1.Tohoku National Fisheries Research Institute, Japan Fisheries Research and Education Agency, 2.Atmosphere and Ocean Research Institute, The University of Tokyo)

[AOS09-P05] Impact of the astronomical lunar 18.6-yr tidal cycle on El-Niño and Southern Oscillation

*Ichiro Yasuda[1] (1.Atmosphere and Ocean Research Institute, The University of Tokyo)

[AOS09-P06] The effect of 18.6-year period lunar nodal cycle on Pacific Decadal Oscillation (PDO)

*Masaki Hamamoto[1], Ichiro Yasuda[1] (1.Atmosphere and Ocean Research Institute, The University of Tokyo)

[AOS09-P07] A comparison of ocean deoxygenation between CMIP5 models and an observational dataset

*Yumi Abe[1], Shoshiro Minobe[1,5], Takamitsu Ito[2], Curtis Deutsch[3], Matthew C. Long[4] (1.Department of Natural History Sciences, Graduate School of Science,Hokkaido University, Sapporo, Japan, 2.School of Earth and Atmospheric Sciences, Georgia Institute of Technology, Atlanta, Georgia, USA, 3.School of Oceanography, University of Washington, Seattle, Washington, USA, 4.Climate and Global Dynamics Laboratory, National Center for Atmospheric Research, Boulder, Colorado, USA, 5.Department of Earth and Planetary Sciences, Faculty of Science, Hokkaido University, Sapporo, Japan)

[AOS09-P08] Pacific Ocean State Estimation and Clarification of Mechanism of Ocean Circulation by Data Synthesis of Global Observations

*Shuhei Masuda[1] (1.Japan Agency for Marine-Earth Science and Technology)

[AOS09-P09] Impact of Tidal Vertical Mixing to Barotropic Water Exchange between the Sea of Okhotsk and Pacific through Diffusive Adjustment with Turbulent Closure Scheme

*Hung Wei Chou[1], Humio Mitsudera[1], Hatsumi Nishikawa[1], Kaihe Yamazaki[2] (1.Hokkaido University, Institute of Low Temperature Science, 2.Hokkaido University, Graduate School of Environmental Science)

[AOS09-P10] Distributions of organic Fe-binding ligands in the eastern and western subarctic North Pacific

*Yoshiko Kondo[1,2], Yudai Sunahara[2], Jun Nishioka[3], Hajime Obata[4], Shigenobu Takeda[1,2] (1.Graduate School of Fisheries and Environmental Sciences, Nagasaki University, 2.Faculty of Fisheries, Nagasaki University, 3.Institute of Low Temperature Science, Hokkaido University, 4.Atmosphere and Ocean Research Institute, The University of Tokyo)

[HGG02-P05] Hydrogeomorphological and environmental geographical land condition of groundwater use areas along the coast of Lake Victoria, west Kenya

*Yoshinori OTSUKI[1] (1.Institute of Geography, Graduate School of Science, Tohoku University)

[J] Oral | H (Human Geosciences)：H-QR Quaternary research

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 102 1F

[H-QR05] Quaternary, Diachronic dynamics of human-environment interactions

convener:Mamoru Koarai(Earth Science course, College of Science, Ibaraki University), Ken Ikehara(Institute of Geology and Geoinformation, National Institute of Advanced Industrial Science and Technology), Masayuki Hyodo(Research Center for Inland Seas, Kobe University), Chairperson:Ken Ikehara(AIST), Kaori Aoki

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[HQR05-01] Disturbance of sea floor by large earthquake and formation of earthquake-induced event deposit: Where is a suitable location for deep-sea turbidite paleoseismology

★Invited Papers

*Ken Ikehara[1] (1.Institute of Geology and Geoinformation, National Institute of Advanced Industrial Science and Technology)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[HQR05-02] The Diatom Assemblages as the Indicators for Huge Tsunami Sedimentations and Recover Processes of Environment at Kesennuma Bay, Tohoku, Japan

*Kaoru Kashima[1], Ryozo Shiomi, Yu Fukumoto[3], Tsuyoshi Haraguchi[2] (1.Department of Earth and Planetary Sciences, Kyushu University, 2.Department of Geosicneces, Graduate School of Science, Osaka City University, 3.Ritsumeikan University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[HQR05-03] **Niger Delta dynamic phase in the Gulf of Guinea during the last 20 ka: Panacea for the sustainable development of the region**

*Onema Christopher Adojoh[1], Marret-Davies Fabienne[2], Tetsuji Muto[3] (1.Missouri Univetrsity of Science and Technology, Rolla, USA, Dept of Geoscience, Geological and Petroleum Engineering, 1400 North Bishop, Post Code 65401, 2.School of Environmental Sciences, University of Liverpool, L69 7ZT, UK, 3.Nagasaki University, Japan, Dept of Environmental Science and Fisheries, 1-14 Bunkyomachi, Nagasaki, 8528521)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[HQR05-04] K-feldspar post-IR IRSL ages suggest the presence of MIS 5a–c marine terraces in the eastern margin of the Kanto Plain, central Japan

★Invited Papers

*Toru Tamura[1,2], Hiroko Okazaki[3], Hiroomi Nakazato[4], Tomonori Naya[1], Rei Nakashima[1] (1.Geological Survey of Japan, AIST, 2.Graduate School of Frontier Sciences, University of Tokyo, 3.Natural History Museum and Institute, Chiba, 4.National Agriculture and Food Research Organization)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[HQR05-05] Tephrostratigraphy of drilled core C9010E off the Boso Peninsula: as a preliminary report

*Kaori Aoki[1], Makoto Kobayashi[1], Masanori Murata[1], Takehiko Suzuki[1] (1.Research Center for Volcanic Hazards and Their Mitigation, Tokyo Metropolitan University)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[HQR05-06] Late Quaternary fluvial terraces and piracies in the Tanagura area, along the upper reaches of Kuji River, NE Japan

*Yuichi Kato[1], Takehiko Suzuki[1] (1.Graduate school of Urvan Environmental Sciences, Tokyo Metropolitan University)

[J] Oral | H (Human Geosciences)：H-QR Quaternary research

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 102 1F

[H-QR05] Quaternary, Diachronic dynamics of human-environment interactions

convener:Mamoru Koarai(Earth Science course, College of Science, Ibaraki University), Ken Ikehara(Institute of Geology and Geoinformation, National Institute of Advanced Industrial Science and Technology), Masayuki Hyodo(Research Center for Inland Seas, Kobe University), Chairperson:Mamoru KOARAI(Ibaraki University), Tomonori Naya(産業技術総合研究所)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[HQR05-07] Landform features of Okinoshima of Munakata city

*Takahito Kuroki[1] (1.Faculty of Education, Univ. of Teacher Edu. Fukuoka)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[HQR05-08] Revision of geomorphology and geology of Tokyo Upland and Lowland, based on boring data and precise landform analysis

★Invited Papers

*Kunihiko Endo[1], Yusuke Suginaka[2], Shinzaburo Hori[2], Toshihiko Sugai[3], Takehiko Suzuki[4], Shigeko Ishiwata, Yo Uesugi, Reisuke Kondo[5], Tatsuro Chiba[6], Toshio Nakayama[7], Shigeto Osato[8], Marie Noguchi[9], Akio Sato[3], Takato Takemura[10] (1.Nihon University, 2.Research Center of Computational Mechanics, Inc., 3.Graduate School of Frontier Science, The University of Tokyo, 4.Faculty of Urban Environmental Sciences, Tokyo Metropolitan University, 5.Educational Development Center, Kogakkan University, 6.Asia Air Survey, 7.Civil Engineering Support & Training Center, Tokyo Metropolitan Government,, 8.Doshitsu Research Corporation, 9.Paleo Labo co.,ltd., 10.College of Humanities and Sciences, Nihon University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[HQR05-09] Sedimentological characteristics of the Ome Formation exposed on the western margin of Musasino Upland, central Japan

*Takako UTSUGAWA[1], Masaaki Shirai[2], Hiroka Kato[2], Sayuri Kato[3] (1.Department of Geography, Rissho University, 2.Department of Geography, Tokyo Metropolitan University, 3.Hamura City)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[HQR05-10] Stratigraphy of Tokyo Formation: re-examination of Kita-Ku Central Park core

*Tomonori Naya[1], Kentaro Sakata[1], Tsutomu Nakazawa[1], Takehiko Suzuki[2], Toshio Nakayama[3] (1.Geological Survey of Japan, AIST, 2.Tokyo Metropolitan University, 3.Tokyo Metropolitan Government)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[HQR05-11] S-wave veolocity structure and ground motion characteristics of "loam terraces": Examples from the eastern part of Utsunomiya City, Tochigi Prefecture, central Japan

★Invited Papers

*Tsutomu Nakazawa[1], Ikuo Cho[1], Kentaro Sakata[1] (1.Geological Survey of Japan, AIST)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[HQR05-12] The relationship between liquefaction distribution and microtopography classification during the 1948 Fukui earthquake - Toward improvement of liquefaction hazard map -

*Haruka Tani[1], Masanobu Shishikura[2] (1.Housei University, 2.Institute of Earthquake and Volcano Geology, National Institute of Advanced Industrial Science and Technology)

[J] Poster | H (Human Geosciences)：H-QR Quaternary research

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_9

[H-QR05] Quaternary, Diachronic dynamics of human-environment interactions

convener:Mamoru Koarai(Earth Science course, College of Science, Ibaraki University), Ken Ikehara(Institute of Geology and Geoinformation, National Institute of Advanced Industrial Science and Technology), Masayuki Hyodo(Research Center for Inland Seas, Kobe University)

[HQR05-P01] Local marine reservoir age variability at Luzon Strait and Ryukyu Islands during the Holocene

*Shoko Hirabayashi[1,2,3], Yusuke Yokoyama[2,3], Atsushi Suzuki[4], Tezer Esat[5], Yosuke Miyairi[2], Takahiro AZE[2], Fernando Siringan[6], Yasuo Maeda[7], Hironobu Kan[1] (1.Graduate School of Social and Cultural Studies, Kyushu University, 2.Atmosphere and Ocean Research Institute The University of Tokyo, 3.Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 4.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST), 5.Research School of Physics and Engineering, The Australian National University , 6.Marine Science Institute, University of the Philippines, 7.Institute of Natural and Environmental Sciences, University of Hyogo)

[HQR05-P02] Holocene sea-level and paleoenvironmental reconstruction using radiocarbon local marine reservoir age and geophysical modeling in Tongatapu, Kingdom of Tonga

*Naoto Fukuyo[1,2], Anthony Purcell[3], Geoffrey Clark[4], Phillip Parton[4], Yusuke Yokoyama[1,2], Yosuke Miyairi[1] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.Department of Earth and Planetary Sciences, Faculty of Science, University of Tokyo, 3.Research School of Earth Sciences, The Australian National University, 4.College of Asia and the Pacific, Australian National University)

[HQR05-P03] The environmental change from lagoon sediment along Nakai Trough in Japan during the past 2000 years.

*Cho Ara[1], Kaoru Kashima[1], Jonathan D Woodruff[3], Koji Seto[2], Kazuyoshi Yamada[4], Kota Katsuki[2], Takumi Sato[2], Caroline Ladlow[3] (1.Kyushu University, 2.Shimane University, 3.University of Massachusetts, 4.Museum of Natural and Environmental History)

[HQR05-P04] Discovery and these sources of drift pumices interbedded in coastal sediments at Sekinehama, in the northern part of Shimokita peninsula, Aomori prefecture

*Reona Hiramine[1], Kaori Aoki[2], Daisuke Ishimura[1,2], Makoto Kobayashi[2] (1.Department of Geography, Tokyo Metropolitan University, 2.Research Center for Volcanic Hazards and Their Mitigation, Tokyo Metropolitan University)

[HQR05-P05] Comparison of geological stratigraphy between three drilling cores and analysis of shallow geological structure in the Koriyama Basin, Northeast Japan

*Takeshi ISHIHARA[1], Takehiko Suzuki[2] (1.Advanced Industrial Science and Technology, 2.Tokyo Metropolitan University)

[HQR05-P06] Holocene geomorphic development of the Kinu river system constrained by the dissected river valleys formed after MIS 5.

*Taiga Kimori[1], Toshihiko Sugai[2] (1.The University of Tokyo,Graduate School of Frontier Sciences,Dept. of Natural Environmental Studies, 2.The University of Tokyo)

[HQR05-P07] Depositional stratigraphy based on XRF, tephras and particle size analysis of core drilled in the central part of the Kanto plain, Sakai town, Ibaraki prefectural and Kuki city, Saitama prefecture (preliminary report)

*Tatsuki Miyamoto[1], Toshihiko Sugai[2], Kunihiko Endo[3], Natsuki Sasaki[2], Marie Noguchi[4], Sayuri Mitsuhashi[5] (1.Department of Earth and Planetary Environmental Science, The University of Tokyo, 2.Department of Natural Environmental Studies, Institute of Environmental Studies, Graduate School of Frontier Science, The University of Tokyo, 3.Nihon University, 4.Paleo Labo co.,ltd., 5.the Tone River Upstream River Office)

[HQR05-P08] Spatial distribution of Musashino Gravel in Tokyo using an automated program analyzing geological sequence from a vast number of boring data.

*Suginaka Yusuke[1], Kunihiko Endo[2], Shigeko Ishiwata, Toshihiko Sugai[3], Tatsuro Chiba[4], Taro Funatsu[3], Toshio Nakayama[5], Shinzaburo Hori[1] (1.Research Center of Computational Mechanics, Inc., 2.Nihon University, 3.Department of Natural Environmental Studies, Institute of Environmental Studies, Graduate School of Frontier Science, The University of Tokyo, 4.Asia air survay , 5.Tokyo metropolitan)

[HQR05-P09] Sedimentological features of Fuji-Sagamigawa Lahar deposits from the upper reaches of Sagami River, central Japan

*Masaaki Shirai[1], Mika Takehara[2], Takako UTSUGAWA[3] (1.Tokyo Metropolitan University, 2.Hachioji-City Office, 3.Rissho University)

[HQR05-P10] Terrace classification and geomorphological development process around Shinano river and Uono river junction area in Niigata prefecture

*Koseki Toshifumi[1], Mamoru Koarai[1] (1.Department of Earth Sciences, College of Science, Ibaraki University)

[HQR05-P11] Estimation of the Source of Sand Beach Sediment in Tsuruga Bay, Fukui Prefecture: Focusing on Grain Size Analysis and Composition of Clastics

*Akiko MATSUMOTO[1], Kiyokazu KAWAJIRI[2], Sumiko KUBO[1] (1.School of Education, Waseda Univ., 2.Sagamihara City Museun)

[HQR05-P12] Characteristics of Latest Pleistocene to Holocene deposits of two cores obtained from the inner part of the Nobi Plain, central Japan

*Kodai Hasada[1] (1.Faculty of Letters, Hosei University)

[HQR05-P13] Subsurface distribution of marine deposits during the MIS 5e and vertical displacement inferred from microfossil evidences and borehole logs in northern Ise Plain, central Japan

*Yoshiki Sato[1] (1.Advanced Industrial Science and Technology, Geological Survey of Japan)

[HQR05-P14] Detection of the Amagi-Kawagori tephra (Kg) in the Shijima lowland, the Shima Peninsula, and its significance to reconstruct tsunami history

Saki Yoshida[1], *Masanobu Shishikura[2], Hideaki Maemoku[1], Shigehiro Fujino[3] (1.Hosei University, 2.Institute of Earthquake and Volcano Geology, National Institute of Advanced Industrial Science and Technology, 3.University of Tsukuba)

[HQR05-P15] Holocene paleoenvironmental changes based on biomarker analysis at the western part of the Kawachi plain, Osaka, Japan

*Yukiko Ishino[1], Hideto Nakamura[1], Muneki Mitamura[1] (1.Osaka City University)

[HQR05-P16] Environmental change before and after Kikai-Akahoya tephra descent in the Miyazaki plain, Southern Kyushu

★Invited Papers

Mitsuhiro Kuwahata[2,7], Tatsuro Adachi[2], Yoshinori Tajiri[2], *Futoshi Nanayama[1,8], Shinji Sugiyama[6], Nakanishi Toshimichi[3], Ken'ichi Ohkushi[5], Tatsuhiko Yamaguchi[4] (1.Geological Survey of Japan, AIST, 2.Kyushu Univ., 3.Kyoto Univ., 4.Kochi Univ., 5.Kobe Univ., 6.Paleoenvironment Research Center Co. Ltd., 7.School board of Miyakonojyo City, 8.CWMD, Kumamoto University)

[HQR05-P17] The history of volcanic eruption based on tephrochronology at Plio-Pleistocene in Japan :2 Chronology of pyroclastic flow deposits in southern Kyushu

*Itoko Tamura[1], Kiyohide Mizuno[2] (1.Department of Geography,Graduate School of Urban Environmental Science,Tokyo Metropolitan University, 2.Research Institute of Geology and Geoinformation, Geological Survey of Japan, AIST)

[HQR05-P18] Identification of Ks5 tephra and similar tephras based on trace element composition of volcanic glass shards

*Hiroomi Nakazato[1], Futoshi Nanayama[2], Hisatoshi Ito[3], Shimpei Uesawa[3], Akira Furusawa[4], Kiyohide Mizuno[2] (1.National Agriculture and Food Research Organization, 2.National Institute of Advanced Industrial Science and Technology, 3.Central Research Institute of Electric Power Industry, 4.FURUSAWA Geological Survey)

[HQR05-P19] **Climate, vegetation and fire history of the last ~100 ka from archaeological sites of Belan valley, north-central India**

*Deepak Kumar Jha[1], Rahul Samrat[1], Prasanta Sanyal[1] (1.Department of Earth Scienes, Indian Institute of Science Education and Research Kolkata, Mohanpur -741246, India)

[HTT20-05] Assessment of numerous Data Assimilation Approaches in Regional Retrieval of Ground NO_2 Spatial Distribution via Remote Sensing products

*Hugo Wai Leung MAK[1,2], Jimmy Chi-Hung FUNG[1,2] (1.Department of Mathematics, Hong Kong University of Science and Technology, 2.Division of Environment and Sustainability, Hong Kong University of Science and Technology)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[HTT20-06] Spectro-polarimetric BRF measurement of leaves and model of individual leaf

*Begzsuren Tumendemberel[1], Yukihiro Takahashi[1], Tetsuro Ishida[1], Junichi Kurihara[1], Nobuyasu Naruse[2] (1.Hokkaido University, 2.Shiga University of Medical Science)

[E] Poster | H (Human Geosciences)：H-TT Technology & Techniques

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_11

[H-TT20] Environmental Remote Sensing

convener:Wei Yang(Chiba University), Akihiko Kondoh(Center for Environmental Remote Sensing, Chiba University)

[HTT20-P01] **Classification of Winter Wheat using high spatial resolution data in North China Plain**

*Chunyang Wang[1,2], Wei Yang[2], Xifang Wu[3], Zhichao Chen[1], Junjun Lu[1], Zongze Zhao[1], Hebing Zhang[1] (1.School of Surveying and Land Information Engineering, Henan Polytechnic University, 2.Center for Environmental Remote Sensing, Chiba University, 3.Graduate School of Science and Engineering, Chiba University)

[HTT20-P02] Normalized Difference Greenness Index (NDGI): A new vegetation index for improved estimation of vegetation phenology

*Wei Yang[1], Hideki Kobayashi[2], Akihiko Kondoh[1] (1.Chiba University, 2.JAMSTEC)

[HTT20-P03] ***Characteristics of manual and automatically tree species classification in mixed forest (Yamagata University Research Forest)***

*Sarah Kentsch[1,2], Larry Maximo Lopez Caceres[1], Yago Diez[1], Motohisa Fukuda[1] (1.Yamagata University, 2.United Graduate School of Agricultural Sciences)

[HTT20-P04] Land subsidence detection by SBAS-InSAR technology and its factor analysis in the inland area of Chiba Prefecture

*HALIPU AYIHUMAIER[1], Richa Bhattarai[1], Wen - LIU[1], Akihiko - Kondoh[1,2] (1.Graduate School of Science and Engineering, 2.Center for Environmental Remote Sensing, Chiba University)

[HTT20-P05] Development of a novel data fusion model to generate high spatiotemporal resolution NDVI time series

*Wei Yang[1], Jin Chen[2] (1.Chiba University, 2.Beijing Normal University)

[E] Poster | H (Human Geosciences)：H-TT Technology & Techniques

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_18

[H-TT20] Environmental Remote Sensing

convener:Wei Yang(Chiba University), Akihiko Kondoh(Center for Environmental Remote Sensing, Chiba University)

*Wei Yang[1], Jin Chen[2] (1.Chiba University, 2.Beijing Normal University)

[J] Poster | H (Human Geosciences)：H-TT Technology & Techniques

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_12

[H-TT24] Environmental Remote Sensing

convener:Hiroto Shimazaki(National Institute of Technology, Kisarazu College), Akihiko Kondoh(Center for Environmental Remote Sensing, Chiba University), HASEGAWA Hitoshi(Kokushikan University), Teppei Ishiuchi(Miyagi University)

[HTT24-P01] A comparison and practical use of the landcover classification using ALOS/PALSAR and LANDSAT8/OLI

*Keiji Kimura[1] (1.Department of Geography, Nara University)

[HTT24-P02] A possibility of the identification of bottom sediment in shallow-water area using ALOS-3 image from a point of view for the environmental monitoring and protection in coastal areas

*YOSEI MIZUKAMI[1] (1.Japan Aerospace Exploration Agency)

[HTT24-P03] Evaluation of the impact of nomadism and settlement on grassland based on GPS observation data

*Deni Eer[1], Qinxue Wang[1], Tomohiro Okadera[1], Batkhishig Ochirbat[2] (1.National Institute for Environmental Studies, 2.Institute of Geography-Geoecology, Mongolian Academy of Sciences, Mongolia)

[J] Poster | H (Human Geosciences)：H-TT Technology & Techniques

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_19

[H-TT24] Environmental Remote Sensing

convener:Hiroto Shimazaki(National Institute of Technology, Kisarazu College), Akihiko Kondoh(Center for Environmental Remote Sensing, Chiba University), HASEGAWA Hitoshi(Kokushikan University), Teppei Ishiuchi(Miyagi University)

[HTT24-P01] A comparison and practical use of the landcover classification using ALOS/PALSAR and LANDSAT8/OLI

[HTT24-P03] Evaluation of the impact of nomadism and settlement on grassland based on GPS observation data

*Deni Eer[1], Qinxue Wang[1], Tomohiro Okadera[1], Batkhishig Ochirbat[2] (1.National Institute for Environmental Studies, 2.Institute of Geography-Geoecology, Mongolian Academy of Sciences, Mongolia)

[J] Poster | H (Human Geosciences)：H-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_4

[H-CG29] Coastal wetlands: geomorphologic, biologic and anthropogenic processes

convener:Kiyoshi Fujimoto(Nanzan University)

[HCG29-P01] Progressing influences of rapid sea-level rise in the mangrove peat depositional area: Relationship between tree density of *Rhizophora* species and ground level dynamics

*Kiyoshi Fujimoto[1], Kenji Ono[2], Shin Watanabe[3], Shingo Taniguchi[3], Keita Furukawa[4], Yasumasa Hirata[2], Kodai Hasada[5], Saimon Lihpai[6] (1.Nanzan University, 2.Forestry and Forest Products Research Institute, 3.University of the Ryukyus, 4.Yokohama National University, 5.Hosei University, 6.Pohnpei State Government, FSM)

[HCG29-P02] Preliminary measurement of surface erosion and sedimentation in mangrove forests

*Keita Furukawa[1] (1.Graduate School Education Center, Yokohama National University)

[HCG29-P03] Estimation of fine root productivity of mangroves based on ingrowth core method on *Avicennia* forest in Panay Island, Philippines

*ONO Kenji[1], Rempei SUWA[2], Rene ROLLON[3], Ariel C. BLANCO[3], Giannina MARIE G. ALBANO[3], Green ANN A. CRUZ[3], Yasumin H. PRIMAVERA-TIROL[4], Ronald J. MALIO[4], Kazuo NADAOKA[5] (1.Forestry and Forest Products Research Institute, 2.Japan International Research Center for Agricultural Science, 3.University of the Philippines, 4.Aklan State University, 5.Tokyo Institute of Technology)

[HCG29-P04] The impact of reconstruction work for the ecosystem of marshes which appeared after Great East Japan Earthquake. A case of Nonoshima island, Shiogama, Miyagi prefecture.

*Rin Yamaguchi[1] (1.KyotoUniversity Faculty of letters)

[J] Poster | H (Human Geosciences)：H-CG Complex & General

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_20

[H-CG29] Coastal wetlands: geomorphologic, biologic and anthropogenic processes

convener:Kiyoshi Fujimoto(Nanzan University)

[HCG29-P01] Progressing influences of rapid sea-level rise in the mangrove peat depositional area: Relationship between tree density of *Rhizophora* species and ground level dynamics

[HCG29-P04] The impact of reconstruction work for the ecosystem of marshes which appeared after Great East Japan Earthquake. A case of Nonoshima island, Shiogama, Miyagi prefecture.

*Rin Yamaguchi[1] (1.KyotoUniversity Faculty of letters)

[J] Poster | H (Human Geosciences)：H-CG Complex & General

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_5

[H-CG30] Safety of nuclear power plants against inland earthquakes

convener:Daisuke Suetsugu(Department of Deep Earth Structure and Dynamics Research, Japan Agency for Marine-Earth Science and Technology), Satoshi Kaneshima(Department of Earth and Planetary Sciences, Kyushu University), Takeshi Sagiya(Disaster Mitigation Research Center, Nagoya University), Kohta Juraku(Department of Humanities, Social and Health Sciences, School of Engineering, Tokyo Denki University)

[HCG30-P01] Lessons from recent inland earthquakes in the Japan Islands

*Takeshi Sagiya[1] (1.Disaster Mitigation Research Center, Nagoya University)

[HCG30-P02] A review of inland earthquakes unlinked to active faults

*Daisuke Suetsugu[1] (1.Department of Deep Earth Structure and Dynamics Research, Japan Agency for Marine-Earth Science and Technology)

[HCG30-P03] Summary of 2018 JPGU session about the high-level radioactive waste disposal program

*Satoshi Kaneshima[1] (1.Department of Earth and Planetary Sciences, Kyushu University)

[HCG30-P04] Calculation Automates the Decision?: Socio-Technical Perspectives of Simulation Technology for Nuclear Risk Evaluation

*Kohta Juraku[1] (1.Department of Humanities, Social and Health Sciences, School of Engineering, Tokyo Denki University)

[J] Poster | H (Human Geosciences)：H-CG Complex & General

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_21

[H-CG30] Safety of nuclear power plants against inland earthquakes

convener:Daisuke Suetsugu(Department of Deep Earth Structure and Dynamics Research, Japan Agency for Marine-Earth Science and Technology), Satoshi Kaneshima(Department of Earth and Planetary Sciences, Kyushu University), Takeshi Sagiya(Disaster Mitigation Research Center, Nagoya University), Kohta Juraku(Department of Humanities, Social and Health Sciences, School of Engineering, Tokyo Denki University)

[HCG30-P01] Lessons from recent inland earthquakes in the Japan Islands

*Takeshi Sagiya[1] (1.Disaster Mitigation Research Center, Nagoya University)

[HCG30-P02] A review of inland earthquakes unlinked to active faults

*Daisuke Suetsugu[1] (1.Department of Deep Earth Structure and Dynamics Research, Japan Agency for Marine-Earth Science and Technology)

[HCG30-P03] Summary of 2018 JPGU session about the high-level radioactive waste disposal program

*Satoshi Kaneshima[1] (1.Department of Earth and Planetary Sciences, Kyushu University)

[HCG30-P04] Calculation Automates the Decision?: Socio-Technical Perspectives of Simulation Technology for Nuclear Risk Evaluation

*Kohta Juraku[1] (1.Department of Humanities, Social and Health Sciences, School of Engineering, Tokyo Denki University)

[J] Oral | H (Human Geosciences)：H-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 104 1F

[H-CG30] Safety of nuclear power plants against inland earthquakes

convener:Daisuke Suetsugu(Department of Deep Earth Structure and Dynamics Research, Japan Agency for Marine-Earth Science and Technology), Satoshi Kaneshima(Department of Earth and Planetary Sciences, Kyushu University), Takeshi Sagiya(Disaster Mitigation Research Center, Nagoya University), Kohta Juraku(Department of Humanities, Social and Health Sciences, School of Engineering, Tokyo Denki University), Chairperson:Daisuke Suetsugu, Kohta Juraku

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[HCG30-01] Thickness of the seismogenic layer beneath the Japanese Islands and its relation to crustal earthquakes

*Junichi Nakajima[1] (1.Department of Earth and Planetary Sciences, Tokyo Institute of Technology)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[HCG30-02] Problems with active fault evaluation in nuclear safety regulation

*Yasuhiro Suzuki[1] (1.Nagoya University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[HCG30-03] The longer active fault is, is the larger ground motion generated? – Surface and buried rupture earthquakes-

*Takao Kagawa[1] (1.Tottori University Graduate School of Engineering)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[HCG30-04] Seismic safety of nuclear power plants against inland crustal earthquakes and the "science vs. engineering problem"

*Katsuhiko Ishibashi[1] (1.Emeritus Professor, Kobe University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[HCG30-05] Challenges to Seismic Safety of Nuclear Power Plants

*Tatsuya Itoi[1] (1.The University of Tokyo)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[HCG30-06] Strong motion at Ooi nuclear power plant

*Kunihiko Shimazaki[1] (1.University of Tokyo)

[J] Poster | H (Human Geosciences)：H-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_5

[H-CG32] Interdisciplinary approach to earth surface processes related to deposition, erosion and sediment transport

convener:Koji Seike(Geological Survey of Japan, AIST), Naofumi Yamaguchi(Center for Water Environment Studies, Ibaraki University), Hajime Naruse(Department of Geology and Mineralogy, Graduate School of Science, Kyoto University), Hideko Takayanagi(Institute of Geology and Paleontology, Graduate School of Science, Tohoku University)

[HCG32-P01] Abration process of gravel considered from shape change of beach gravel in Joetsu region, Niigata Prefecture,central Japan

*Jun Matsukaze[1], Masaaki Shirai[1], Takako UTSUGAWA[2] (1.Tokyo Metropolitan University, 2.Rissho University)

[HCG32-P02] A meander bar in the upper Koito River changed by floods

*Hiroko Okazaki[1] (1.Division of ecology & environmentology, Natural History and Institute, Chiba)

[HCG32-P03] Depositional environment based on grain size of surface sediments around Okinoerabu-jima, Tokuno-shima and Amami-oshima Islands

*Atsuko Amano[1] (1.National institute of Advanced Industrial Science and Technology)

[HCG32-P04] Effect of organic matter input on bioturbation in submarine channel-levee deposits: an example of the Izaki Olistolith in the Oligocene Nichinan Group

*Kazuki Kikuchi[1], Hajime Naruse[1] (1.Division of Earth and Planetary Sciences, Guraduate School of Science, Kyoto University)

[HCG32-P05] Effect of Freeze-Thaw Cycles on Bank Erosion Rate of Bedrock

*Jagriti Mishra[1], Takuya Inoue[1] (1.Civil Engineering Research Institute for Cold Region, Sapporo - Hokkaido, Japan)

[HCG32-P06] Implications for paleoenvironment and tectonic setting of Khujirt area, Northern Mongolia

*Bat-Orshikh Erdenetsogt[1], Ariunbold Erdene[2] (1.National University of Mongolia, 2.ErdGeo LLC)

[HCG32-P07] Petrographic characteristics of Middle Permian sandstones in Southern Mongolia and their geological implications

*Enkhbayar Bolormaa[1], Dashpuntsag Nansalmaa[1], Bat-Orshikh Erdenetsogt[1], Baigalmaa Norov[1], Bat Bold[1], Luvsanchultem Jargal[1], Avirmed Tulga[1] (1.National Unniversity of Mongolia)

[J] Poster | H (Human Geosciences)：H-CG Complex & General

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_22

[H-CG32] Interdisciplinary approach to earth surface processes related to deposition, erosion and sediment transport

convener:Koji Seike(Geological Survey of Japan, AIST), Naofumi Yamaguchi(Center for Water Environment Studies, Ibaraki University), Hajime Naruse(Department of Geology and Mineralogy, Graduate School of Science, Kyoto University), Hideko Takayanagi(Institute of Geology and Paleontology, Graduate School of Science, Tohoku University)

[HCG32-P01] Abration process of gravel considered from shape change of beach gravel in Joetsu region, Niigata Prefecture,central Japan

*Jun Matsukaze[1], Masaaki Shirai[1], Takako UTSUGAWA[2] (1.Tokyo Metropolitan University, 2.Rissho University)

[HCG32-P02] A meander bar in the upper Koito River changed by floods

*Hiroko Okazaki[1] (1.Division of ecology & environmentology, Natural History and Institute, Chiba)

[HCG32-P03] Depositional environment based on grain size of surface sediments around Okinoerabu-jima, Tokuno-shima and Amami-oshima Islands

*Atsuko Amano[1] (1.National institute of Advanced Industrial Science and Technology)

[HCG32-P04] Effect of organic matter input on bioturbation in submarine channel-levee deposits: an example of the Izaki Olistolith in the Oligocene Nichinan Group

*Kazuki Kikuchi[1], Hajime Naruse[1] (1.Division of Earth and Planetary Sciences, Guraduate School of Science, Kyoto University)

[HCG32-P05] Effect of Freeze-Thaw Cycles on Bank Erosion Rate of Bedrock

*Jagriti Mishra[1], Takuya Inoue[1] (1.Civil Engineering Research Institute for Cold Region, Sapporo - Hokkaido, Japan)

*Enkhbayar Bolormaa[1], Dashpuntsag Nansalmaa[1], Bat-Orshikh Erdenetsogt[1], Baigalmaa Norov[1], Bat Bold[1], Luvsanchultem Jargal[1], Avirmed Tulga[1] (1.National Unniversity of Mongolia)

[J] Oral | H (Human Geosciences)：H-CG Complex & General

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 105 1F

[H-CG32] Interdisciplinary approach to earth surface processes related to deposition, erosion and sediment transport

convener:Koji Seike(Geological Survey of Japan, AIST), Naofumi Yamaguchi(Center for Water Environment Studies, Ibaraki University), Hajime Naruse(Department of Geology and Mineralogy, Graduate School of Science, Kyoto University), Hideko Takayanagi(Institute of Geology and Paleontology, Graduate School of Science, Tohoku University), Chairperson:Koji Seike

1:50 PM - 2:20 PM JST | 4:50 AM - 5:20 AM UTC

[HCG32-01] Long-term beach observation and future shoreline prediction

★Invited Papers

*Masayuki Banno[1] (1.Port and Airport Research Institute)

2:20 PM - 2:35 PM JST | 5:20 AM - 5:35 AM UTC

[HCG32-02] Migration of sand waves observed in Okinose area of Osaka Bay

*Kojima Hibiki[1], Tetsuo Matsuno[2,3], Mamoru Sano[2], Nobukazu Seama[3,2], Noritaka Endo[4], Ken'ichi Ohkushi[1], Atsushi Tani[1] (1.Graduate School of Human Development and Environment, Kobe University, 2.Kobe Ocean Bottom Exploration Center(KOBEC), Kobe University, 3.Graduate School of Science / Faculty of Science, Kobe University, 4.School of Geoscience and Civil Engineering College of Science and Engineering, Kanazawa University)

2:35 PM - 2:50 PM JST | 5:35 AM - 5:50 AM UTC

[HCG32-03] Inverse analysis of lobe/gully on Mars: examination by 2D Voellmy fluid model

Kyohei Noumura[1], *Hajime Naruse[1] (1.Department of Geology and Mineralogy, Graduate School of Science, Kyoto University)

2:50 PM - 3:05 PM JST | 5:50 AM - 6:05 AM UTC

[HCG32-04] Development of provenance study using quartz shapes and surface microtextures

*Hiromi Itamiya[1], Ritsuko Sugita[1], Toshihiko Sugai[2] (1.National Research Institute of Police Science, 2.The University of Tokyo)

[J] Oral | H (Human Geosciences)：H-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 105 1F

[H-CG32] Interdisciplinary approach to earth surface processes related to deposition, erosion and sediment transport

convener:Koji Seike(Geological Survey of Japan, AIST), Naofumi Yamaguchi(Center for Water Environment Studies, Ibaraki University), Hajime Naruse(Department of Geology and Mineralogy, Graduate School of Science, Kyoto University), Hideko Takayanagi(Institute of Geology and Paleontology, Graduate School of Science, Tohoku University), Chairperson:Hideko Takayanagi(Tohoku University), Koji Seike

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[HCG32-05] Detrital heavy mineral record and Nd-Sr isotopic signature in Bengal Fan

*Kohki Yoshida[1], Cruz Jarrett[2], Manoj M.C.[3], Nozomi Hatano[5], Christian France-Lanord[4], Takeshi Kuritani[6] (1.Department of Geology, Faculty of Science, Shinshu University, 2.Florida State University, 3.Birbal Sahni Institute of Palaeosciences, 4.CNRS- Universite de Lorraine, 5.Graduate School of Science and Technology, Shinshu University, 6.Hokkaido University)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[HCG32-06] Evaluation of plant-fragment concentration mechanism in the turbiditic sediments in the Bouma Sequence by biomarker analysis in the Kawabata Formation, Yubari area, central Hokkaido, Japan.

*Hiroyasu Asahi[1], Satoshi Furota[2], Ken Sawada[3] (1.Graduate School of Science, Hokkaido University, 2.Japan Agency for Marine-Earth Science and Technology, 3.Department of Earth and Planetary Sciences, Faculty of Science, Hokkaido University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[HCG32-07] Tectonic behavior of a forearc basin reconstructed using turbidites: an example from the Plio-Pleistocene Kakegawa Group, central Japan

*Sone Haruki[1] (1.Graduate school of Shimane University, Natural Science and Technology, Major in Science of Environmental systems, Geoscience corse)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[HCG32-08] Most benthos floats up in liquefied sandy substrates: quantitative evaluation by measuring living-organism density

*Koji Seike[1], Shinji Sasa[2], Kotaro Shirai[3], Kaoru Kubota[4] (1.Geological Survey of Japan, AIST, 2.Port and Airport Research Institute, 3.AORI, The University of Tokyo, 4.Kochi Institute for Core Sample Research, JAMSTEC)

[J] Poster | H (Human Geosciences)：H-CG Complex & General

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_6

[H-CG33] Useful life-support systems in closed bio-ecosystems

convener:Kaori Tomita-Yokotani(Faculty of Life and Environmental Sciences University of Tsukuba), Masanori Shinohara(Teikyo University of Science), Shunta Kimura(Graduate School of Life and Environmental Sciences, University of Tsukuba)

[HCG33-P01] The important matter of food production for long term habitation in extraterrestrial environments

*Kaori Tomita-Yokotani[1] (1.Faculty of Life and Environmental Sciences University of Tsukuba)

[HCG33-P02] Functional evaluation of extracellular polymer substance (EPS) produced by cyanobacterium *Arthrospira platensis*

*Satoru Watanabe[1], Takumi Iwasaki[1], Yutaka Sakamaki[1], Yu Kanesaki[2], Masayuki Ohmori[3] (1.Dept. of Biosci., Tokyo Univ. of Agric., 2.RIGST, Shizuoka Univ., 3.Tokyo Univ.)

[HCG33-P03] The uniqueness of the dry heat tolerance of akinetes of terrestrial cyanobacterium *Nostoc* sp. HK-01

*Shunta Kimura[1,2,3], Kaori Tomita-Yokotani[3] (1.Graduate School of Agricultural and Life Sciences, The University of Tokyo, 2.Japan Society for the Promotion of Science, 3.Faculty of Life and Environmental Sciences, University of Tsukuba)

[HCG33-P04] Potential application of cyanobacteria estimated by gene analysis of terrestrial cyanobacterium, *Nostoc* sp. HK-01, in closed-environment

*Hiroshi Katoh[1], Shunta Kimura[2,3], Kaori Tomita-Yokotani[2] (1.Mie University, 2.University of Tsukuba, 3.The University of Tokyo)

[HCG33-P05] Analysis of macromolecular substances involved in the process of dehydration in a terrestrial cyanobacterium, *Nostoc* sp. HK-01.

*Tomoko Abe[1], Yuka Takazawa[1], Ryusuke Honda[1], Kouga Ichikawa[1], Natsumi Yoshida[1], Shunta Kimura[2,4], Hiroshi Katoh[3], Kaori Tomita-Yokotani[2] (1.School of Science and Engineering, Tokyo Denki University, 2.Faculty of Life and Environmental Sciences, University of Tsukuba, 3.Mie University, 4.Graduate School of Agricultural and Life Sciences, The University of Tokyo)

[J] Poster | H (Human Geosciences)：H-CG Complex & General

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_23

[H-CG33] Useful life-support systems in closed bio-ecosystems

convener:Kaori Tomita-Yokotani(Faculty of Life and Environmental Sciences University of Tsukuba), Masanori Shinohara(Teikyo University of Science), Shunta Kimura(Graduate School of Life and Environmental Sciences, University of Tsukuba)

[HCG33-P01] The important matter of food production for long term habitation in extraterrestrial environments

*Hiroshi Katoh[1], Shunta Kimura[2,3], Kaori Tomita-Yokotani[2] (1.Mie University, 2.University of Tsukuba, 3.The University of Tokyo)

[HCG33-P05] Analysis of macromolecular substances involved in the process of dehydration in a terrestrial cyanobacterium, *Nostoc* sp. HK-01.

*Tomoko Abe[1], Yuka Takazawa[1], Ryusuke Honda[1], Kouga Ichikawa[1], Natsumi Yoshida[1], Shunta Kimura[2,4], Hiroshi Katoh[3], Kaori Tomita-Yokotani[2] (1.School of Science and Engineering, Tokyo Denki University, 2.Faculty of Life and Environmental Sciences, University of Tsukuba, 3.Mie University, 4.Graduate School of Agricultural and Life Sciences, The University of Tokyo)

[J] Oral | H (Human Geosciences)：H-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 202 2F

[H-CG33] Useful life-support systems in closed bio-ecosystems

convener:Kaori Tomita-Yokotani(Faculty of Life and Environmental Sciences University of Tsukuba), Masanori Shinohara(Teikyo University of Science), Shunta Kimura(Graduate School of Life and Environmental Sciences, University of Tsukuba), Chairperson:Shunta Kimura

3:32 PM - 3:47 PM JST | 6:32 AM - 6:47 AM UTC

[HCG33-01] Closed bio-ecosystems in extraterrestrial environments-Research in closed bio-ecosystems

*Kaori Tomita-Yokotani[1] (1.Faculty of Life and Environmental Sciences University of Tsukuba)

3:47 PM - 4:07 PM JST | 6:47 AM - 7:07 AM UTC

[HCG33-02] Concept and Studies of Aquaculture in Space -In the Past and Future-

★Invited Papers

*Masato Endo[1] (1.Tokyo University of Marine Science and Technology)

4:07 PM - 4:27 PM JST | 7:07 AM - 7:27 AM UTC

[HCG33-03] Protection effects of gasotransmitters against oxidation damager in vascular endothelial cells

★Invited Papers

*Shigeki Yoshida[1] (1.University of Tsukuba)

4:27 PM - 4:42 PM JST | 7:27 AM - 7:42 AM UTC

[HCG33-04] Study on nutrition intake and food selection to maintain health for habitation in space

*Yasuko Kimura[1], Shunta Kimura[2,3], Hiroshi Katoh[4], Kaori Tomita-Yokotani[2] (1.Jumonji University, 2.University of Tsukuba, 3.The University of Tokyo, 4.Mie University)

4:42 PM - 4:57 PM JST | 7:42 AM - 7:57 AM UTC

[HCG33-05] Limit of "rational optimism", Earth as CELSS, and sustainability of human-being

*Masanori Shinohara[1] (1.Teikyo University of Science)

[E] Oral | S (Solid Earth Sciences)：S-SS Seismology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 301B 3F

[S-SS04] New methods for seismicity characterization

convener:Francesco Grigoli(ETH-Zurich, Swiss Seismological Service), Aitaro Kato(Earthquake Research Institute, the University of Tokyo), Yosuke Aoki(Earthquake Research Institute, University of Tokyo), Claudio Satriano(Institut de Physique du Globe de Paris), Chairperson:Francesco Grigoli(ETH-Zurich; Swiss Seismological Service)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SSS04-01] MyShake: A global smartphone seismic network to characterize urban earthquakes

*Richard M Allen[1], Qingkai Kong[1], Sarina Patel[1], Robert Martin-Short[1] (1.University of California Berkeley)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SSS04-02] Full waveform-based automatic monitoring of microseismic activity using high sampling rate records: application to Garpenberg mine (Sweden)

★Invited Papers

*Natalia Poiata[1,2], Kadek Hendrawan Palgunadi[3], Jannes Kinscher[4], Pascal Bernard[1], Francesca De Santis[4], Emmanuelle Klein[4] (1.Institut de Physique du Globe de Paris, France, 2.National Institute for Earth Physics, Romania, 3.King Abdullah University of Science and Technology, Thuwal, Saudi Arabia, 4.Institut National de l'Environnement Industriel et des Risques Ineris, Nancy, France)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SSS04-03] A deep convolutional neural network for localizing and detecting earthquake swarm activity based on full waveforms: Chances, challenges and questions

★Invited Papers

*Marius Kriegerowski[1,2], Gesa Maria Petersen[1,2], Hannes Vasyura Bathke[2], Matthias Ohrnberger[2] (1.German Research Centre for Geosciences Potsdam, Germany, 2.Inst. of Geosciences, University of Potsdam, Germany)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SSS04-04] **Fast Location Parameters Determination of Seismic Events from Few Seconds of P Wave Recorded at a Single Seismological Station Using Support Vector Machine Regression**

*Luis Hernan Ochoa Gutierrez[1], Carlos Alberto Vargas Jimenez[1], Luis Fernando Niño Vasquez[1] (1.Universidad Nacional de Colombia)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SSS04-05] Foreshock activity detection by a threshold-free matched-filter technique

*Shiro Hirano[1], Hironori Kawakata[1], Issei Doi[2] (1.Department of Physical Science, College of Science and Engineering, Ritsumeikan University, 2.Disaster Prevention Research Institute, Kyoto University)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SSS04-06] Automated seismic event detection and localization: An application to long-period seismicity at Aso Volcano influenced by large earthquake

*Andri Hendriyana[1,3], Takeshi Tsuji[1,2] (1.International Institute for Carbon-Neutral Energy Research, 2.Kyushu University, 3.Bandung Institute of Technology)

[E] Poster | S (Solid Earth Sciences)：S-SS Seismology

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_13

[S-SS04] New methods for seismicity characterization

convener:Francesco Grigoli(ETH-Zurich, Swiss Seismological Service), Aitaro Kato(Earthquake Research Institute, the University of Tokyo), Yosuke Aoki(Earthquake Research Institute, University of Tokyo), Claudio Satriano(Institut de Physique du Globe de Paris)

[SSS04-P01] **Constraint of focal mechanisms of induced seismicity by using misfit angles based on known *in-situ* stress**

*Yusuke Mukuhira[1], Makoto Naoi[2], Michael C Fehler[3], Hirokazu Moriya[5], Takatoshi Ito[1], Hiroshi Asanuma[4], Markus O Häring[6] (1.Institute of Fluid Science, Tohoku University, 2.Disaster Prevention Research Institute, Kyoto University, 3.Earth Resources Laboratory, MIT, 4.FREA, AIST, 5.School of Engineering, Tohoku University, 6.Häring GeoProject)

[SSS04-P02] Kinematic slip imaging of the Mw 3.3 earthquake in the St. Gallen 2013 geothermal reservoir, Switzerland, using an isochrone back projection approach

*Claudio Satriano[1], Eszter Király-Proag[2], Pascal Bernard[1], Stefan Wiemer[2] (1.Institut de Physique du Globe de Paris, France, 2.ETH Swiss Federal Institute of Technology Zurich, Switzerland)

[SSS04-P03] **Monitoring induced seismicity with a single seismic station by combining coda wave interferometry with distance geometry solvers**

*Francesco Grigoli[1], Simone Cesca[2], Alessandro Vuan[3], Filippo Broggini[1], John Clinton[1], Stefan Wiemer[1] (1.ETH-Zurich, Switzerland, 2.GFZ-Potsdam, Germany, 3.OGS-Trieste, Italy)

[SSS04-P04] Automatic Earthquake Locating by Stacking Characteristic Functions in a Source Scanning Method

★Invited Papers

*Hilary Chang[1], Alison Malcolm[1], Frédérick Massin[2], Francesco Grigoli[2] (1.Memorial University of Newfoundland, Earth Sciences, Canada, 2. ETH Zurich, Department of Earth Sciences, Zürich, Switzerland)

[SSS04-P05] Earthquake nowcasting: further development and application to Japan

*Kazuyoshi Nanjo[1], John B. Rundle[2], Tetsuo Sakurada[3] (1.University of Shizuoka, 2.University of California at Davis, 3.SAKURADA&Company)

[E] Poster | S (Solid Earth Sciences)：S-SS Seismology

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_24

[S-SS04] New methods for seismicity characterization

convener:Francesco Grigoli(ETH-Zurich, Swiss Seismological Service), Aitaro Kato(Earthquake Research Institute, the University of Tokyo), Yosuke Aoki(Earthquake Research Institute, University of Tokyo), Claudio Satriano(Institut de Physique du Globe de Paris)

[SSS04-P01] **Constraint of focal mechanisms of induced seismicity by using misfit angles based on known *in-situ* stress**

*Yusuke Mukuhira[1], Makoto Naoi[2], Michael C Fehler[3], Hirokazu Moriya[5], Takatoshi Ito[1], Hiroshi Asanuma[4], Markus O Häring[6] (1.Institute of Fluid Science, Tohoku University, 2.Disaster Prevention Research Institute, Kyoto University, 3.Earth Resources Laboratory, MIT, 4.FREA, AIST, 5.School of Engineering, Tohoku University, 6.Häring GeoProject)

[SSS04-P02] Kinematic slip imaging of the Mw 3.3 earthquake in the St. Gallen 2013 geothermal reservoir, Switzerland, using an isochrone back projection approach

*Claudio Satriano[1], Eszter Király-Proag[2], Pascal Bernard[1], Stefan Wiemer[2] (1.Institut de Physique du Globe de Paris, France, 2.ETH Swiss Federal Institute of Technology Zurich, Switzerland)

[SSS04-P03] **Monitoring induced seismicity with a single seismic station by combining coda wave interferometry with distance geometry solvers**

*Francesco Grigoli[1], Simone Cesca[2], Alessandro Vuan[3], Filippo Broggini[1], John Clinton[1], Stefan Wiemer[1] (1.ETH-Zurich, Switzerland, 2.GFZ-Potsdam, Germany, 3.OGS-Trieste, Italy)

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A04 TOKYO BAY MAKUHARI HALL

[S-SS05] Induced and triggered seismicity: case-studies, monitoring and modeling techniques

convener:Luca Urpi(Swiss Seismological Service - ETH Zurich), Bogdan Enescu(Department of Geophysics, Kyoto University), Yosuke Aoki(Earthquake Research Institute, University of Tokyo), Francesco Grigoli(ETH-Zurich, Swiss Seismological Service), Chairperson:Luca Urpi(ETH-Zurich; Swiss Seismological Service), Bogdan Enescu(Graduate Schoold of Science, Kyoto University), Francesco Grigoli(ETH-Zurich; Swiss Seismological Service), Yosuke Aoki

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SSS05-01] **Causality between induced seismicity b-value reduction and stress state of existing fractures**

★Invited Papers

*Yusuke Mukuhira[1], Michael C Fehler[2], Takatoshi Ito[1], Hiroshi Asanuma[3], Markus O Häring[4] (1.Institute of Fluid Science, Tohoku University, 2.ERL, Massachusetts Institute of Technology , 3.FREA, AIST, 4.Häring GeoProject)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SSS05-02] Micromechanical model connecting earthquake statistics and observed spatiotemporal changes in source parameters of fluid induced seismicity

*Daisuke Sato[1], Keisuke Yoshida[2] (1.Disaster Prevention Research Institute, Kyoto University, 2.Tohoku University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SSS05-03] Seismicity induced by Multi-cycle operation of Hutubi underground gas storage, Xinjiang, China

*Baoshan Wang[1,2], Bo Zhang[2], Zhanbo Ji[2], Jinxin Hou[2], Lu Li[2] (1.University of Science and Technology of China, 2.Institute of Geophysics, China Earthquake Administration)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SSS05-04] Investigating the origin of the Mw 5.4 Pohang, Korea, earthquake of November 15, 2017: the investigations and conclusions of the Overseas Research Advisory Committee (ORAC)

*Toshihiko Shimamoto[1], William Ellsworth[2], Shermin Ge[3], Domenico Giardini[4], John Townend[5] (1. Institute of Geology, China Earthquake Administration, 2.Stanford University, 3.University of Colorado Boulder, 4.ETH, Zurich, 5.Victoria University of Wellington)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SSS05-05] **Seismic Anisotropy Measured before and after the 2016 Kumamoto and Kaikoura earthquakes**

*Martha K Savage[1], Kenny Graham[1], Yosuke Aoki[2], Richard Arnold[1], Tomomi Okada[3], Yoshihisa Iio[4], Satoshi Matsumoto[5] (1.Victoria University of Wellington, 2.Earthquake Reserach Institute, University of Tokyo, 3.Tohoku University, Sendai 980-8578, Japan, 4.Kyoto University, Uji 611-0011, Japan, 5.Kyushu University, 2-5643-29 Shin'yama, Shimabara, Nagasaki, 855-0843, Japan)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SSS05-06] Long-term behavior of induced seismicity in the Val d'Agri basin (Southern Apennines, Italy).

★Invited Papers

*Luisa Valoroso[1], Luigi Improta[1], Samer Bagh[1], Davide Piccinini[1], Pasquale De Gori[1] (1.Istituto Nazionale di Geofisica e Vulcanologia)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | Convention Hall A 2F

[S-SS13] Strong Ground Motion and Earthquake Disaster

convener:Masayuki Kuriyama(Central Research Institute of Electric Power Industry), Kazuhiro Somei(Geo-Research Institute), Chairperson:Yoshinari Hayashi(Faculty of Safety Science, Kansai University), Dianshu Ju(Ohsaki Research Institute, Inc.)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SSS13-01] Investigation of the effect of jog deviations on Riedel fractures by three-dimensional elasto-plastic analysis

*Tomohiro Toyoda[1], Toshihiro Noda[2], Shotaro Yamada[1], Akira Asaoka[3] (1.Nagoya University, Graduate School of Engineering, 2.Nagoya University, Disaster Mitigation Research Center, 3.Association for the development of earthquake prediction)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SSS13-02] A survey on earthquake prediction and public warning in seismological community

*Yoshinari Hayashi[1] (1.Faculty of Societal Safety Sciences, Kansai University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SSS13-03] Long-period strong ground motion of the Tokyo Bay area during the events occurred in the plate triple junction area

*Tomiichi Uetake[1] (1.R&D Department, TEPCO research Institute, Tokyo Electric Power Company)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SSS13-04] **Time-frequency and engineering characteristics on offshore ground motion**

*CHEN Su[1], FU Lei[1], LI Xiaojun[1] (1.Institute of Geophysics, China Earthquake Administration)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SSS13-05] **Long-period Ground Motion from Hypothetical Megathrust Earthquakes along the Nankai Through using the Ambient Seismic Field**

*Loic Viens[1], Tomotaka Iwata[1] (1.Disaster Prevention Research Institute, Kyoto University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SSS13-06] Fault model and strong ground motion evaluation for the Nankai megathrust earthquake

*Dianshu Ju[1], Hiroyuki Fujiwara[2], Nobuyuki Morikawa[2] (1.Ohsaki Research Institute, Inc., 2.National Research Institute for Earth Science and Disaster Resilience)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | Convention Hall A 2F

[S-SS13] Strong Ground Motion and Earthquake Disaster

convener:Masayuki Kuriyama(Central Research Institute of Electric Power Industry), Kazuhiro Somei(Geo-Research Institute), Chairperson:Susumu Kurahashi(Aichi Institute of Technology), Masahiro Korenaga(Railway Technical Research Institute)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SSS13-07] One cause of the strong ground motion characteristics in Mukawa town during the 2018 Hokkaido eastern Iburi earthquake

*Nobuo TAKAI[1], Michiko Shigefuji[2], Takahiro Maeda[3], Masayoshi Ichiyanagi[1], Hiroaki Takahashi[1] (1.Hokkaido University, 2.Kyushu University, 3.NIED)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SSS13-08] Estimation of SMGA source model during the 2018 Hokkaido Eastern Iburi (Mw6.6) earthquake

*Susumu Kurahashi[1], Kojiro Irikura[1] (1.Aichi Institute of Technology)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SSS13-09] Strong ground motion prediction for the source fault model of Futagawa and Hinagu active fault zones (1) -Construction of the basin velocity structure model-

*Kimiyuki Asano[1], Tomotaka Iwata[1], Masayuki Yoshimi[2], Hiroe Miyake[3], Haruko Sekiguchi[1], Shinichi Matsushima[1], Hiroshi Kawase[1], Fumiaki Nagashima[1], Hiroaki Yamanaka[4], Kosuke Chimoto[4], Nobuyuki Yamada[5], Tatsuo Kanno[6], Michiko Shigefuji[6], Shigeki Senna[7], Takahiro Maeda[7], Atsushi Wakai[7], Asako Iwaki[7], Kaoru Jin[9], Hidetaka Saomoto[2], Seiji Tsuno[8], Masahiro Korenaga[8], Takeshi Sugiyama, Haruhiko Suzuki[9], Hisanori Matsuyama[9], Shunpei Manabe[9], Atsushi Yatagai[9], Shigeru Okamoto[10], Masaki Suehiro[10] (1.Disaster Prevention Research Institute, Kyoto University, 2.Geological Survey of Japan, AIST, 3.University of Tokyo, 4.Tokyo Institute of Technology, 5.Kochi University, 6.Kyushu University, 7.National Research Institute for Earth Science and Disaster Resilience, 8.Railway Technical Research Institute, 9.OYO Corporation, 10.Hanshin Consultants Co., Ltd.)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SSS13-10] Strong ground motion prediction for the source fault model of Futagawa and Hinagu active fault zones (2)-Strong ground motion prediction -

*Tomotaka Iwata[1], Kimiyuki Asano[1], Masayuki Yoshimi[2], Hiroe Miyake[3], Haruko Sekiguchi[1], Shinichi Matsushima[1], Hiroshi Kawase[1], Fumiaki Nagashima[1], Hiroaki Yamanaka[4], Kosuke Chimoto[4], Nobuyuki Yamada[5], Tatsuo Kanno[6], Michiko Shigefuji[6], Shigeki Senna[7], Takahiro Maeda[7], Asako Iwaki[7], Kaoru Jin[7], Hidetaka Saomoto[2], Seiji Tsuno[8], Masahiro Korenaga[8], Syunpei Manabe[9], Haruhiko Suzuki[9], Hisanori Matsuyama[9], Yatagai Atsushi[9] (1.Disaster Prevention Research Institute, Kyoto University, 2.Geological Survey of Japan, AIST, 3.University of Tokyo, 4.Tokyo Institute of Technology, 5.Kochi University, 6.Kyushu University, 7.National Research Institute for Earth Science and Disaster Resilience, 8.Railway Technical Research Institute, 9.OYO Corporation)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SSS13-11] Near-surface geophysical survey and hearing survey of housing damages at Yasunaga district, Mashiki Town stricken by the 2016 Kumamoto Earthquakes

*Tomio INAZAKI[1], Takanori Ogahara[1], Hiroshi Kisanuki[2] (1.Public Works Research Institute, Tsukuba Central Institute, 2.PWRI (Present Address: OYO Corporation))

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SSS13-12] Evaluation on Influence of Shallow Subsurface Structures to Earthquake Ground Motions in the Kumamoto Plain, Using the Borehole Seismic Data

*Masahiro Korenaga[1], Seiji Tsuno[1], Hiroaki Yamanaka[2], Kosuke Chimoto[2] (1.Railway Technical Research Institute, 2.Tokyo Institute of Technology)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | Convention Hall A 2F

[S-SS13] Strong Ground Motion and Earthquake Disaster

convener:Masayuki Kuriyama(Central Research Institute of Electric Power Industry), Kazuhiro Somei(Geo-Research Institute), Chairperson:Kentaro Kasamatsu(Kajima Corporation), Kazuhito Hikima(Tokyo Electric Power Company Holdings, Inc.)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SSS13-13] Factors of large amplitude ground motions excited by small to moderate earthquakes
- Examination of KiK-net Kuriyama-nishi of the 2013 Tochigi-ken Hokubu Earthquake (Mj6.3) -

*Kentaro Kasamatsu[1], Kenichi Kato[2], Tetsushi Watanabe[2], Tetsuo Shiota[3] (1.Kajima Corporation, 2.Kobori Research complex inc., 3.Shikoku Electric Power CO.,Inc.)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SSS13-14] Source modeling and strong ground motion simulation in the Tokyo metropolitan area of the 1923 Kanto earthquake based on seismic intensity inversion analysis

*Fumino Suzuki[1], Kenichi Kato[1], Katsuhisa Kanda[1], Takashi Ikeda[1] (1.KOBORI RESEARCH COMPLEX INC.)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SSS13-15] A Simple Fault Model to Calculate Strong Ground Motions Including Fling Steps for the Main Shock of the 2016 Kumamoto Earthquake

*Atsushi Nozu[1], Yosuke Nagasaka[1], Shuanglan Wu[1] (1.Port and Airport Research Institute)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SSS13-16] Fling-steps displacements by the discrete wavenumber method

*SHUANGLAN WU[1], Atsushi Nozu[1], Yosuke Nagasaka[1] (1.PORT AND AIRPORT RESEARCH INSTITUTE)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SSS13-17] Extension of characterized source model for long-period strong motions near surface-rupture-earthquakes

*Kojiro Irikura[1], Susumu Kurahashi[1], Yasuhiro Matsumoto[2] (1.Aichi Institute of Technology, 2.KOZO_KEIKAKU Engineering, Inc.)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SSS13-18] A Study for the cause of earthquake damages by the 2014 Nakagano-ken Hokubu earthquake (M_J6.7) – consideration using the strong motion simulation –

*Kazuhito Hikima[1], Ryoichi Nakamura[2], Tomiichi Uetake[1] (1.Tokyo Electric Power Company Holdings, Inc., 2.Earthquake Research Institute, Univ. of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Convention Hall A 2F

[S-SS13] Strong Ground Motion and Earthquake Disaster

convener:Masayuki Kuriyama(Central Research Institute of Electric Power Industry), Kazuhiro Somei(Geo-Research Institute), Chairperson:Yosuke Nagasaka(Port and Airport Research Institute), Masumi Yamada(Disaster Prevention Research Institute, Kyoto University)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SSS13-19] Strong ground motion simulation of the Northern Osaka earthquake of June 18, 2018

*Yosuke Nagasaka[1], Atsushi Nozu[1] (1.Port and Airport Research Institute)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SSS13-20] **Strong Motion of the 2018 Mw 6.4 Hualien, Taiwan Earthquake and Its Impact on Seismic Design Code in Taiwan**

*Chun-Hsiang Kuo[1], Jyun-Yan Huang[1], Che-Min Lin[1], Kuo-Liang Wen[2] (1.NCREE National Center for Research on Earthquake Engineering of Taiwan, 2.NCU National Central University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SSS13-21] Simulation of Rupture Directivity Effect for the February 6, 2018 Hualien, Taiwan Earthquake

*Cheng-Feng Wu[1], Huey-Chu Huang[1] (1.Department of Earth and Environmental Sciences, National Chung Cheng University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SSS13-22] Strong motions and estimation of the sursurface soil structure for the 2018 Hualien earthquake in Taiwan

*Masumi Yamada[1], Ikuo Cho[2], Chun-Hsiang Kuo[3], Che-min Lin[3], Ken Miyakoshi[4], Yujia Guo[4], Takumi Hayashida[5], Yasuhiro Matsumoto[6], James Mori[1], Yin-Tung Yen[7], Keng-Chang Kuo[8] (1.Disaster Prevention Research Institute, Kyoto University, 2.National Institute of Advanced Industrial Science and Technology , 3.National Center for Research on Earthquake Engineering, 4.Geo-Research Institute, 5.Building Research Institute, 6.Kozo Keikaku Engineering, 7.Sinotech Engineering Consultants, 8.Kaohsiung university of Science and Technology)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SSS13-23] **Effect of Near Surface Geology on the Recorded Ground Motion of the Nepal Earthquake in Kumaon Himalaya**

*SOHAN LAL[1], Anand Joshi[1], M.L. Sharma[1] (1.Indian Institute of Technology Roorkee)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[SSS13-24] Broadband Source Modeling for the Himalayan Collision Zone

*Hiroe Miyake[1], Babita Sharma[2], Kazuki Koketsu[1], Soma Nath Sapkota[3] (1.Earthquake Research Institute, University of Tokyo, 2.National Centre for Seismology, Ministry of Earth Sciences, India, 3.Department of Mine and Geology, Nepal)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A03 TOKYO BAY MAKUHARI HALL

[S-SS16] Crustal Deformation

convener:Mako Ohzono(Institute of Seismology and Volcanology, Graduate School of Science, Hokkaido University), Tadafumi Ochi(Institute of Earthquake and Volcano Geology, Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology), Masayuki Kano(Graduate school of science, Tohoku University), Chairperson:Yoshiyuki Tanaka(Earth and Planetary Science, The University of Tokyo), Masayuki Kano(東北大学 大学院理学研究科 地球物理学専攻)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SSS16-01] Development of New GEONET Analysis Strategy

*yasuaki kakiage[1], satoshi abe[1], kazuyuki ohashi[1], hideo hamazaki[1], kazuyuki tanaka[1], satoshi kawamoto[1], yuki hatanaka[1] (1.GSI of Japan)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SSS16-02] Relationship between deformation of the forearc wedge of Southwest Japan and the 1707 Hoei earthquake

*Yukinobu Okamura[1], Masanobu Shishikura[1] (1.Research Institute of Earthquake and Vocano Geology, National Institute of Advanced Industrial Science and Technology)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SSS16-03] A possible slow slip event beneath the Kii Peninsula inferred from historical tilt records in 1970's

*Masayuki Kano[1], Yasuyuki Kano[2] (1.Graduate school of science, Tohoku University, 2.Earthquake Research Institute, The University of Tokyo)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SSS16-04] The effect of the steady plate subduction in the case of southwest Japan

*Yuto Iwase[1], Takeo Ito[1] (1.Graduate School of Environmental Science, Nagoya University)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SSS16-05] Development of Mechanical Coupling Model on Subducting Plate Interfaces

*Hiroshi Kimura[1], Takeo Ito[1], Keiichi Tadokoro[1], Ryohei Sasajima[2] (1.Department of Earth and Planetary Sciences, Nagoya University, 2.Research Center For Earthquake Prediction, Disaster Prevention Research Institute, Kyoto University)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SSS16-06] Monitoring vertical deformation with optical lattice clock –an application of relativistic geodesy

*Yoshiyuki Tanaka[1], Yuichi Imanishi[2], Yoshiaki Tamura[3] (1.Earth and Planetary Science, The University of Tokyo, 2.Earthquake Research Institute, The University of Tokyo, 3.Mizusawa VLBI Observatory, National Astronomical Observatory of Japan)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A03 TOKYO BAY MAKUHARI HALL

[S-SS16] Crustal Deformation

convener:Mako Ohzono(Institute of Seismology and Volcanology, Graduate School of Science, Hokkaido University), Tadafumi Ochi(Institute of Earthquake and Volcano Geology, Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology), Masayuki Kano(Graduate school of science, Tohoku University), Chairperson:Yuji Himematsu(Graduate School of Science, Hokkaido University), Atsushi Mukai(Faculty of Urban Management, Fukuyama City University)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SSS16-07] Surface Deformation before and after the 2016 Kumamoto Earthquake Detected by SAR

*Manabu Hashimoto[1] (1.Disaster Prevention Research Institute, Kyoto University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SSS16-08] Co- and post-seismic crustal deformations associated with the 2016 Kumamoto earthquake sequence using ALOS-2/PALSAR-2 data

*Yuji Himematsu[1], Masato Furuya[1] (1.Graduate School of Science, Hokkaido University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SSS16-09] GNSS time series analysis of postseismic deformation induced by 2016 Kumamoto earthquake (M7.3)

*Satoshi Fuwa[1], Mako Ohzono[1] (1.Hokkaido University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SSS16-10] **The viscoelastic crustal response to the magma discharge/recharge in the upper crust: implications for the uplift of the Aira caldera before and after the 1914 eruption of the Sakurajima volcano**

*Tadashi Yamasaki[1], Freysteinn Sigmundsson[2], Masato Iguchi[3] (1.Geological Survey of Japan, AIST, 2.Nordic Volcanological Center, University of Iceland, 3.DPRI, Kyoto University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SSS16-11] Factors controlling annual changes in groundwater migration in the fault fracture zone of Manpukuji fault

*Atsushi Mukai[1], Shigeaki Otsuka[2], Yoichi Fukuda[3] (1.Faculty of Urban Management, Fukuyama City University, 2.Kobe Gakuin University, 3.Graduate School of Science, Kyoto Univ.)

[J] Oral | S (Solid Earth Sciences)：S-SS Seismology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A03 TOKYO BAY MAKUHARI HALL

[S-SS16] Crustal Deformation

convener:Mako Ohzono(Institute of Seismology and Volcanology, Graduate School of Science, Hokkaido University), Tadafumi Ochi(Institute of Earthquake and Volcano Geology, Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology), Masayuki Kano(Graduate school of science, Tohoku University), Chairperson:Takao Tabei(Department of Global Environment and Disaster Prevention, Faculty of Science and Technology, Kochi University), Takeo Ito

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SSS16-12] Rapid uplift in SW Taiwan caused by fold growth

*Yoshiki Takei[1], Youichiro Takada[2] (1.Department of Natural History Sciences, Graduate School of Science, Hokkaido University, 2.Hokkaido University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SSS16-13] Construction of GNSS monitoring system in Nepal for the earthquake potential evaluation in the Himalayan Frontal Zone

*Takao Tabei[1], Mako Ohzono[2], Kazuki Koketsu[3], Hiroe Miyake[3], Rajendra Bhandari[4], Janak B. Chand[4], Bishow R. Silwal[4], Soma N. Sapkota[4] (1.Department of Global Environment and Disaster Prevention, Faculty of Science and Technology, Kochi University, 2.Institute of Seismology and Volcanology, Graduate School of Science, Hokkaido University, 3.Earthquake Researech Institute, University of Tokyo, 4.Department of Mines and Geology, Nepal)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SSS16-14] The kinematic model along the Sumatran fault using a new dense GNSS observation (AGNeSS+) in Banda Aceh

*Takeo Ito[1], Takao Tabei[2], Fumiaki Kimata[3], Makoto OKUBO[2], Tadashi Yamashina[2], Cecep Pratama[4], Didik Sugiyanto[5], Mukusin Umar[5], Nazli Ismail[5], Irwandi Nurdin[5] (1.Nagoya Univ, 2.Kochi Univ, 3.Tono Research Institute of Earthquake Science, 4.Gadjah Mada University, 5.Syiah Kuala University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SSS16-15] Mechanical modeling of interseismic deformation in the Central Andes: implications for back-arc shortening

*Shaoyang Li[1,2], Fuqiang Shi[3], Marcos Moreno[4], Jun'ichi Fukuda[1] (1.Earthquake Research Institute, University of Tokyo, Tokyo, Japan, 2.Department of Earth and Environmental Sciences, The University of Iowa, Iowa City, IA, USA, 3.Shaanxi Earthquake Agency, Xi'an, China, 4.Departamento de Geofísica, Facultad de Ciencias Físicas y Matemáticas, Universidad de Concepción, Concepción, Chile)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SSS16-16] Inferring regional stress field based on SAR analysis and dynamic simulation of the 2018 Palu earthquake

*Takafumi Yokota[1], Ryosuke Ando[1], Yosuke Aoki[2] (1.Graduate School of Science, University of Tokyo , 2.Earthquake Research Institute, University of Tokyo)

[J] Poster | S (Solid Earth Sciences)：S-SS Seismology

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_14

[S-SS16] Crustal Deformation

convener:Mako Ohzono(Institute of Seismology and Volcanology, Graduate School of Science, Hokkaido University), Tadafumi Ochi(Institute of Earthquake and Volcano Geology, Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology), Masayuki Kano(Graduate school of science, Tohoku University)

[SSS16-P01] Earthquake Potential in Central Costa Rica based on Geodetic Observations

*Luis Alejandro Carvajal Soto[1], Takeo Ito[1], Hiroshi Kimura[1], Marino Protti Quesada[2] (1.Nagoya University, Earthquake and Volcano Research Center, 2.Observatorio Vulcanológico y Sismológico de Costa Rica, Universidad Nacional)

[SSS16-P02] Crustal deformation along the Liupanshan fault zone derived from GPS

*Weitao Chen[1,2], Weijun Gan[2], Genru Xiao[3], Shiming Liang[2] (1.Development Research Center, China Earthquake Administration, 2.Institute of Geology, China Earthquake Administration, 3.East China University of Technology)

[SSS16-P03] Convergence boundary and velocity between Amur and Okhotsk plates in northern Hokkaido inferred by GNSS velocity data

*Chihiro Ito[1], Hiroaki Takahashi[2], Mako Ohzono[2] (1.Graduate School of Science, Hokkaido University, 2.Institute of Seismology and Volcanology, Graduate School of Science, Hokkaido University)

[SSS16-P04] Vertical deformation and repeating earthquakes in southeastern Hokkaido in the last 100 years

*Hiroaki Kobayashi[1,2], Kazuki Koketsu[1], Hiroe Miyake[1] (1.Earthquake Research Institute, The University of Tokyo, 2.Now at Kobori Research Complex. Inc.)

[SSS16-P05] Simple estimation of interplate coupling in the Kushiro-oki and the Nemuro-oki regions, eastern Hokkaido in Japan from onshore GNSS data

*Hiroki Aota[1], Mako Ohzono[2], Fumiaki Tomita[3], Hiroaki Takahashi[2] (1.Department of Earth and Planetary Sciences, School of Science, Hokkaido University. , 2.ISV, Faculty of Science, Hokkaido University, 3.Graduate School of Science, Hokkaido University)

[SSS16-P06] Estimation of the early afterslip location of the 2011 Tohoku-Oki earthquake using onshore GNSS and offshore pressure data

*Putra Maulida[1], Yusaku Ohta[1], Ryota Hino[1] (1.Graduate School of Science, Tohoku University)

[SSS16-P07] Heterogeneous rheology structure estimated by the postseismic deformation following the 2011 Tohoku-Oki earthquake (M_w9.0)

*Yoshiaki Ito[1,2], Satoshi Miura[2], Jun Muto[2], Yusaku Ohta[2], Takeshi Iinuma[3], James Daniel Paul Moore[4] (1.Mitsubishi Space Software Co., Ltd., 2.Graduate School of Science, Tohoku University, 3.Japan Agency for Marine-Earth Science and Technology, 4.Nanyang Technological University)

[SSS16-P08] Contribution of linear and non-linear viscoelastic relaxation as postseismic deformation following an earthquake

*Hiroyuki Hoshino[1], SHINICHI MIYAZAKI[2,1], Kazuro Hirahara[2] (1.Graduate school of science, Kyoto University, 2.Institute of Education, Research and Regional Cooperation for crisis Management Shikoku, Kagawa University)

[SSS16-P09] Estimation of fault parameter with maximum ΔCFS based on GNSS data

*Shuntaro Fukaya[1], Mako Ohzono[2] (1.School of Science, Hokkaido University, 2.ISV, Faculty of Science Hokkaido University)

[SSS16-P10] Coseismic deformation of the 2018 Lombok earthquake, Indonesia, revealed through InSAR measurements

*ERLAN SUMANJAYA[1], MASATO FURUYA[1] (1.Hokkaido University)

[SSS16-P11] Recent crustal deformations around Mt. Azuma revealed by InSAR time-series analysis

*Hiroshi Munekane[1], Tomokazu Kobayashi[1] (1.GSI of Japan)

[SSS16-P12] The Fault model of the 2017 earthquake (M5.6) in the Eastern flank of Mt. Ontake estimated from precise leveling survey data

*Masayuki Murase[1], Naoka Kitazume[1], Yoshiko Yamanaka[2], Takeshi Matsushima[3], Fumiaki Kimata[7], Hitoshi Yamashita Mori[1], Takamasa Hase[1], Yang Li[1], Kazuki Ofuchi[1], Takahiro Kunitomo[2], Yuta Maeda[2], Shinichiro Horikawa[2], Takashi OKUDA[2], Kenjiro Matsuhiro[2], Kazushi Tanoue[2], Kazunari Uchida[3], Yoshiko Teguri[3], Rintaro Miyamachi[3], Kaori Morita[3], Yoshikawa Shin[4], Hiroyuki Inoue[4], Isao Kageyama[5], Syuichi Hosokawa[5], Takahiro Yanada[5], Rinah Tanaka[1], Ryosuke Doke[6] (1.Department of Earth and Environmental Sciences, College of Humanities and Sciences, NIHON University, 2.Graduate School of Environmental Studies, Nagoya University, 3.Graduate School of Sciences, Kyushu University, 4.Graduate School of Sciences, Kyoto University, 5.Japan Meteorological Agency, 6.Hot Springs Research Institute of Kanagawa Prefecture, 7.Tono Research Institute of Earthquake Science)

[SSS16-P13] Detection ability of Crustal deformation by Slow Slip Events along the Nankai Trough subduction zone

*Kazuki Miyaoka[1], Reiko Kai[1], Takeshi Kimura[2], Takahiro Tsuyuki[3] (1.Japan Meteorological Agency, 2.National Research Institute for Earth Science and Disaster Resilience, 3.Meteorological Research Institute)

[SSS16-P14] An investigation into slow-slip detection capability of the Tokai Strainmenter Network

*Kazuyoshi Nanjo[1] (1.University of Shizuoka)

[SSS16-P15] A Study on Trend Component Estimation Method of Strain Time Series Data Using State Space Model

*Takahiro Tsuyuki[1] (1.Meteorological Research Institute)

[SSS16-P16] Rainfall correction of strainmeter data in consideration of the flow from the upper reaches (2)

Kazuhiro Kimura[1], *Akio Kobayashi[2] (1.Japan Meteorological Agency, 2.Meteorological Research Institute, Japan Meteorological Agency)

[SSS16-P17] Long-term slow slip event beneath the Shima Peninsula from 2017 to 2018

*Akio Kobayashi[1], Takahiro Tsuyuki[1] (1.Meteorological Research Institute, Japan Meteorological Agency)

[SSS16-P18] non- fault slip source components of long-term SSE and the relation to interseismic process preparing for large earthquake generation

*Noa Mitsui[1], Takeo Ito[2] (1.Tono Research Institute of Earthquake Science, 2.Earthquake and Volcano Research Center, Graduate School of Environmental Studies, Nagoya University)

[SSS16-P19] **Restart of the long-term slow slip events along the Nankai trough after the 2016 Kumamoto earthquake, Japan**

*Shinzaburo Ozawa[1], Hiroshi Yarai[1] (1.Geographical Survey Institute of Japan)

[SSS16-P20] Crustal deformation in the San-in Shear Zone as observed by a dense GNSS network

*Angela Meneses-Gutierrez[1], Takuya NISHIMURA[1] (1.Disaster Prevention Research Institute, Kyoto University)

[SSS16-P21] Two-dimensional Fourier series representation of surface deformation: Different scales of crustal deformation

*Akemi Noda[1], Tatsuhiko Saito[1] (1.National Research Institute for Earth Science and Disaster Resilience)

[SSS16-P22] GNSS observation around the shear zone in southern Kyushu (The third report)

*Tsuyoshi Watanabe[1], Atsushi Saiga[2], Koichi Asamori[1], Hiroki Ogawa[1], Akiomi Shimada[1], Koji Umeda[3] (1.JAEA, Tono Geoscience Center, 2.JAEA, Horonobe Underground Research Center, 3.Hirosaki University)

[SSS16-P23] Post-seismic deformation of 2016 Kumamoto Earthquake by continuous GNSS network (3)

*Shigeru Nakao[1], Takeshi Matsushima[2], Takao Tabei[3], Makoto OKUBO[3], Tadashi Yamashina[4], Takahiro Ohkura[5], Takuya NISHIMURA[7,6], Takuo Shibutani[6], Masahiro Teraishi[6], Takeo Ito[7], Takeshi Sagiya[8], Kenjiro Matsuhiro[7], Teruyuki Kato[9], Jun'ichi Fukuda[9], Atsushi Watanabe[9], Satoshi Miura[10], Yusaku Ohta[10], Tomotsugu Demachi[10], Hiroaki Takahashi[11], Mako Ohzono[11], Teruhiro Yamaguchi[11], Kazumi Okada[11] (1.Department of Earth and Environmental Sciences, Graduate School of Science and Engineering, Kagoshima University, 2.Institute of Seismology and Volcanology, Faculty of Sciences, Kyushu University, 3.Department of Global Environment and Disaster Prevenction, Faculty of Science and Technology, Kochi University,, 4.Kochi Earthquake Observatory, Faculty of Science and Technology ,Kochi University, 5.Aso Volcanological Laboratory, Institute for Geothermal Sciences, Graduate School

of Science, Kyoto University, 6.Disaster Prevention Research Institute, Kyoto University, 7.Earthquake and Volcano Research Center, Graduate School of Environmental Studies, Nagoya University, 8.Disaster Mitigation Research Center, Nagoya University, 9.Earthquake Research Institute, University of Tokyo, 10.Research Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University,, 11.Institute of Seismology and Valcanology, Graduate School of Science, Hokkaido University)

[J] Poster | S (Solid Earth Sciences)：S-SS Seismology

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_26

[S-SS16] Crustal Deformation

convener:Mako Ohzono(Institute of Seismology and Volcanology, Graduate School of Science, Hokkaido University), Tadafumi Ochi(Institute of Earthquake and Volcano Geology, Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology), Masayuki Kano(Graduate school of science, Tohoku University)

[SSS16-P01] Earthquake Potential in Central Costa Rica based on Geodetic Observations

*Luis Alejandro Carvajal Soto[1], Takeo Ito[1], Hiroshi Kimura[1], Marino Protti Quesada[2] (1.Nagoya University, Earthquake and Volcano Research Center, 2.Observatorio Vulcanológico y Sismológico de Costa Rica, Universidad Nacional)

[SSS16-P02] Crustal deformation along the Liupanshan fault zone derived from GPS

*Weitao Chen[1,2], Weijun Gan[2], Genru Xiao[3], Shiming Liang[2] (1.Development Research Center, China Earthquake Administration, 2.Institute of Geology, China Earthquake Administration, 3.East China University of Technology)

[SSS16-P03] Convergence boundary and velocity between Amur and Okhotsk plates in northern Hokkaido inferred by GNSS velocity data

*Chihiro Ito[1], Hiroaki Takahashi[2], Mako Ohzono[2] (1.Graduate School of Science, Hokkaido University, 2.Institute of Seismology and Volcanology, Graduate School of Science, Hokkaido University)

[SSS16-P04] Vertical deformation and repeating earthquakes in southeastern Hokkaido in the last 100 years

*Hiroaki Kobayashi[1,2], Kazuki Koketsu[1], Hiroe Miyake[1] (1.Earthquake Research Institute, The University of Tokyo, 2.Now at Kobori Research Complex. Inc.)

[SSS16-P05] Simple estimation of interplate coupling in the Kushiro-oki and the Nemuro-oki regions, eastern Hokkaido in Japan from onshore GNSS data

*Hiroki Aota[1], Mako Ohzono[2], Fumiaki Tomita[3], Hiroaki Takahashi[2] (1.Department of Earth and Planetary Sciences, School of Science, Hokkaido University. , 2.ISV, Faculty of Science, Hokkaido University, 3.Graduate School of Science, Hokkaido University)

[SSS16-P06] Estimation of the early afterslip location of the 2011 Tohoku-Oki earthquake using onshore GNSS and offshore pressure data

*Putra Maulida[1], Yusaku Ohta[1], Ryota Hino[1] (1.Graduate School of Science, Tohoku University)

[SSS16-P23] Post-seismic deformation of 2016 Kumamoto Earthquake by continuous GNSS network (3)

*Shigeru Nakao[1], Takeshi Matsushima[2], Takao Tabei[3], Makoto OKUBO[3], Tadashi Yamashina[4], Takahiro Ohkura[5], Takuya NISHIMURA[7,6], Takuo Shibutani[6], Masahiro Teraishi[6], Takeo Ito[7], Takeshi Sagiya[8], Kenjiro Matsuhiro[7], Teruyuki Kato[9], Jun'ichi Fukuda[9], Atsushi Watanabe[9], Satoshi Miura[10], Yusaku Ohta[10], Tomotsugu Demachi[10], Hiroaki Takahashi[11], Mako Ohzono[11], Teruhiro Yamaguchi[11], Kazumi Okada[11] (1.Department of Earth and Environmental Sciences, Graduate School of Science and Engineering, Kagoshima University, 2.Institute of Seismology and Volcanology, Faculty of Sciences, Kyushu University, 3.Department of Global Environment and Disaster Prevenction, Faculty of Science and Technology, Kochi University,, 4.Kochi Earthquake Observatory, Faculty of Science and Technology ,Kochi University, 5.Aso Volcanological Laboratory, Institute for Geothermal Sciences, Graduate School

of Science, Kyoto University, 6.Disaster Prevention Research Institute, Kyoto University, 7.Earthquake and Volcano Research Center, Graduate School of Environmental Studies, Nagoya University, 8.Disaster Mitigation Research Center, Nagoya University, 9.Earthquake Research Institute, University of Tokyo, 10.Research Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University,, 11.Institute of Seismology and Valcanology, Graduate School of Science, Hokkaido University)

[J] Oral | S (Solid Earth Sciences)：S-EM Earth's Electromagnetism

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[S-EM18] Geomagnetism, paleomagnetism and rock magnetism

convener:Hisayoshi Shimizu(Earthquake Research Institute, University of Tokyo), Masahiko Sato(Department of Earth and Planetary Science, The University of Tokyo), Chairperson:Masahiko Sato(Department of Earth and Planetary Science, University of Tokyo), Akira Baba(山梨県富士山科学研究所)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SEM18-01] On the formation process of the Mt.Hoei, Fuji volcano. A scenario based on the emplacement temperature inferred from paleomagnetic method.

*Akira Baba[1], Hidetoshi Shibuya[2], Toshitsugu Fujii[1], Tatsuro Chiba[3] (1.Mount Fuji Research Institute, 2.Department of Earth and Environmental Sciences, Faculty of Advanced Science and Technology, Kumamoto University, 3.Asia Air Survey Co., Ltd.)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SEM18-02] Reconstruction of paleointensity during 5 to 9 th century from Mt. Fuji lavas

Hiromichi Komatsu[2], *Tadahiro Hatakeyama[1,4], Akira Baba[3] (1.Information Processing Center, Okayama University of Science, 2.Faculty of Biosphere-Geosphere Science, Okayama University of Science, 3.Mount Fuji Research Institute, Yamanashi Prefecture, 4.Graduate School of Biosphere-Geosphere Science, Okayama University of Science)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SEM18-03] Reconstruction of full-vector archaeomagnetic reference curve in East Asia from 200 CE to 1100 CE

*Yu Kitahara[1], Daiki Nishiyama[2], Masao Ohno[1], Yuhji Yamamoto[3], Tadahiro Hatakeyama[4] (1.Faculty of Social and Cultural Studies, Kyushu University, 2.Faculty of Science, Kochi University, 3.Center for Advanced Marine Core Research, Kochi University, 4.Information Processing Center, Okayama University of Science)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SEM18-04] A high resolution paleomagnetic record across and around the Matuyama-Brunhes polarity transition from the Chiba composite section

*Makoto Okada[1], Yuki Haneda[2], Yusuke Suganuma[3,4] (1.Department of Earth Sciences, Faculty of Science, Ibaraki University, 2.Graduate School of Scinece and Engineering, Ibaraki Univeristy, 3.National Institute of Polar Research, 4.Graduate University for Advanced Studies)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SEM18-05] Brunhes-Matuyama contact aureole surrounding the Kurobegawa Granite

*Koji Fukuma[1], Hisatoshi Ito[2], Mami Takehara[3], Ryuji Yamada[4], Takashi Kubo[5] (1.Department of Environmental System Science, Faculty of Science and Engineering, Doshisha University, 2.Central Research Institute of Electric Power Industry, 3.National Institute of Polar Research, 4.National Research Institute for Earth Science and Disaster Prevention, 5.MAIBUNKAN)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SEM18-06] Paleomagnetic study of the IODP Site U1335 sediments in the eastern equatorial Pacific - relative paleointensity and inclination anomaly over the last 8 Myr

*Yuhji Yamamoto[1], Toshitsugu Yamazaki[2] (1.Center for Advanced Marine Core Research, Kochi University, 2.Atmosphere and Ocean Research Institute, University of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-EM Earth's Electromagnetism

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[S-EM18] Geomagnetism, paleomagnetism and rock magnetism

convener:Hisayoshi Shimizu(Earthquake Research Institute, University of Tokyo), Masahiko Sato(Department of Earth and Planetary Science, The University of Tokyo), Chairperson:Yu Kitahara(Graduate School of Social and Cultual Studies, Kyushu University), Hisayoshi Shimizu(The University of Tokyo)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SEM18-07] Sensor Response Estimate and Calibration of Superconducting Rock Magnetometers

*Hirokuni Oda[1], Chuang Xuan[2] (1.Institute of Geology and Geoinformation, Geological Survey of Japan, AIST, 2.University of Southampton)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SEM18-08] Magnetic separation of ordinary solid particles using a pokcet size magnetic circuit

*Chiaki Uyeda[1] (1.Institute of earth and Space Science Graduate School of Science Osaka University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SEM18-09] Experimental evaluation of remanence carriers in coercivity-blocking temperature diagram

*Masahiko Sato[1], Takuma Terada[2], Nobutatsu Mochizuki[3], Ayako Ito[2], Hideo Tsunakawa[2] (1.The University of Tokyo, 2.Tokyo Institute of Technology, 3.Kumamoto University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SEM18-10] **Mineralogical study on magnetite exsolution and host plagioclase crystal**

*Yujiro Tamura[1], Ryoichi Nakada[2], Masahiko Sato[3], Shinji Yamamoto[4] (1.Graduate schoole of Environment and Information Sciences, Departmennt of Natural Environment, Yokohama National University, 2.Kochi Institute of Core Sample Reserch, Japan Agency for Marine-Earth Science and Technology, 3.Department of Earth and Planetary Science, The University of Tokyo, 4.Graduate schoole of Environment and Information Sciences, Yokohama National University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SEM18-11] Numerous nano-sized magnetite and hematite inclusions in muscovite in loess

*Masayuki Hyodo[1], Takuro Sano[2], Megumi Matsumoto[3], Yusuke Seto[2], Kota Suzuki[2], Tianshui Yang[4] (1.Research Center for Inland Seas, Kobe University, 2.Graduate School of Science, Kobe University, 3.Graduate School of Science, Tohoku University, 4.China University of Geosciences)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SEM18-12] Density separation and magnetic measurements of magnetotactic bacteria *Magnetospirillum magnetotacticum* MS-1

*Kohei Masaoka[1], Yuki Morono[2], Naotaka Tomioka[2], Go-Ichiro Uramoto[1], Yuhji Yamamoto[1] (1.Kochi University, 2.Kochi Institute for Core Sample Research, Japan Agency for Marine-Earth Science and Technology)

[J] Oral | S (Solid Earth Sciences)：S-EM Earth's Electromagnetism

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A08 TOKYO BAY MAKUHARI HALL

[S-EM18] Geomagnetism, paleomagnetism and rock magnetism

convener:Hisayoshi Shimizu(Earthquake Research Institute, University of Tokyo), Masahiko Sato(Department of Earth and Planetary Science, The University of Tokyo), Chairperson:Masahiko Sato(Department of Earth and Planetary Science, University of Tokyo), Hisayoshi Shimizu(The University of Tokyo)

1:45 PM - 2:05 PM JST | 4:45 AM - 5:05 AM UTC

[SEM18-13] Effects of the intrinsic magnetic field on the atmospheric escape from terrestrial planets

★Invited Papers

*Kanako Seki[1], Shotaro Sakai[1], Shogo Inui[1], Ryoya Sakata[1], Naoki Terada[2], Hiroyuki Shinagawa[3], David A. Brain[4] (1.Graduate School of Science, University of Tokyo, 2.Graduate School of Science, Tohoku University, 3.NICT, 4.LASP, University of Colorado, Boulder)

2:05 PM - 2:20 PM JST | 5:05 AM - 5:20 AM UTC

[SEM18-14] Numerical modeling of a lunar dynamo and its long-term evolution

*Fumi Hyodo[1], Futoshi Takahashi[2], Satoshi Kaneshima[2], Hisayoshi Shimizu[3], Hideo Tsunakawa[4] (1.Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University, 2.Department of Earth and Planetary Sciences, Kyushu University, 3.Earthquake Research Institute, University of Tokyo, 4.Deparment of Earth and Planetary Sciences, Tokyo Institute of Technology)

2:20 PM - 2:40 PM JST | 5:20 AM - 5:40 AM UTC

[SEM18-15] Investigation of sub-grid scale (SGS) model in dynamo simulations with small Ekman and magnetic Prandtl numbers

★Invited Papers

*Hiroaki Matsui[1] (1.Dept. of Earth and Planetary Sciences, University of California, Davis)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SEM18-16] Growth rates of kinematic dynamos in a finite domain

*Ataru Sakuraba[1] (1.Department of Earth and Planetary Science, University of Tokyo)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SEM18-17] Detection of jerk-like magnetic field variation in a numerical dynamo model using wavelet analysis

*Futoshi Takahashi[1], Yoshiki Manabe[2] (1.Faculty of Sciences, Kyushu University, 2.Department of Earth and Planetary Sciences, Kyushu University)

[J] Poster | S (Solid Earth Sciences)：S-EM Earth's Electromagnetism

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_15

[S-EM18] Geomagnetism, paleomagnetism and rock magnetism

convener:Hisayoshi Shimizu(Earthquake Research Institute, University of Tokyo), Masahiko Sato(Department of Earth and Planetary Science, The University of Tokyo)

[SEM18-P01] Analyzing the early 19th cenytury's geomagnetic declination in Japan from Tadataka Inoh's Santou-Houi-Ki the 13th roeport.

*Motohiro Tsujimoto[1], Akitoshi Omotani[2] (1.Japan Cartographers Association, 2.San-in System Consultant)

[SEM18-P02] Forecasting geomagnetic secular variation based on magnetic diffusion at the core-mantle boundary

*Masaki Matsushima[1], Hisayoshi Shimizu[2], Futoshi Takahashi[3], Takuto Minami[2], Shin ya Nakano[4], Hiroaki Toh[5] (1.Department of Earth and Planetary Sciences, School of Science, Tokyo Institute of Technology, 2.Earthquake Research Institute, University of Tokyo, 3.Faculty of Science, Kyushu University, 4.Institute of Statistical Mathematics, 5.Data Analysis Center for Geomagnetism and Space Magnetism, Graduate School of Science, Kyoto University)

[SEM18-P03] Candidate models of IGRF13-SV from Japanese team

*Hisayoshi Shimizu[1], Takuto Minami[1], Shin ya Nakano[2], Futoshi Takahashi[3], Masaki Matsushima[4], Hiroaki TOH[5] (1.Earthquake Research Institute, University of Tokyo, 2.Institute of Statistical Mathematics, 3.Department of Earth and Planetary Sciences, Faculty of Science, Kyushu University, 4.Department of Earth and Planetary Sciences, School of Science, Tokyo Institute of Technology , 5.Data Analysis Center for Geomagnetism and Space Magnetism, Kyoto University)

[SEM18-P04] Preliminary report on the paleointensity variation during 38-50 Ma deduced from the marine sediments recovered from the northwest Atlantic

*Yuhji Yamamoto[1], Hiroto Fukami[1,2], Wakana Taniguchi[1], Peter C. Lippert[3] (1.Center for Advanced Marine Core Research, Kochi University, 2.Sanyo Techno Marine Co., Ltd., 3.Department of Geology and Geophysics, University of Utah)

[SEM18-P05] The Gauss-Matuyama polarity transition record from the Plio-Pleistocene marine sequence of the Mera Formation, Chikura Group, in the southernmost part of the Boso Peninsula

*Makoto Okada[1], Yosuke Hiraoka[2], Daisuke Hasegawa[2] (1.Department of Earth Sciences, Faculty of Science, Ibaraki University, 2.Graduate School of Science and Engineering, Ibaraki University)

[SEM18-P06] Holocene paleomagentic secular variation recorded in sediments from Lake Tazawa in Akita Prefecure, Northeast Japan

*Ryo Yasuda[1], Akira Hayashida[1], Kazuyoshi Yamada[2], Hiromi Matsuoka[3], Makoto Okamura[3], Daizo Ishiyama[4] (1.Doshisha University, 2.Museum of Natural and Environmental history, Shizuoka, 3.Kochi University, 4.Akita University)

[SEM18-P07] Geomagnetic excursions observed in Lake Suigetsu varved sediments during the latest stage of the last glacial period

*Shota Tanabe[1], Masako Miki[1], Masayuki Hyodo[2], Takeshi Nakagawa[3], Ikuko Kitaba[3], Keitaro Yamada[3], Junko Kitagawa[4], Suigetsu 2014 Project Members[5] (1.Kobe University, 2.Research Center for Inland Seas, Kobe University, 3.Ritsumeikan University, 4.Fukui Prefectural Satoyama-Satoumi Research Institute, 5.www.suigetsu.org)

[SEM18-P08] Geo-electromagnetic research at a spreading center of a divergent plate boundary in Afar depression, Ethiopia

*Naoto Ishikawa[1], Ryokei Yoshimura[2], Tesfaye Kidane[11], Shin-ichiro Higashino[3], Shin-ichi Kagashima[4], Nobutatsu Mochizuki[6], Ameha A. Muluneh[5], Kirika Kitagawa[4], Mamoru Kadoya[7], Noriaki Obara[10], Yo-ichiro Otofuji[9], Minoru Funaki, Tetsu Kogiso[1], Masakazu Fujii[8] (1.Graduate School of Human and Environmental Studies, Kyoto University, 2.Disaster Prevention Research Institute, Kyoto University, 3.Graduate School of Engineering, Kyushu University, 4.Yamagata University, 5.Addis Ababa University, 6.Kumamoto University, 7.X-TREME COMPOSITE JAPAN, 8.National Institute of Polar Research, 9.Japan Geochronology Network, 10.Robotista, 11.University of KwaZulu Natal)

[SEM18-P09] Verification of reducitive chemical demagnetization effect on the sedimentary rocks from the Kokumoto Formation, Kazusa Group, Boso Peninsula

*Takahiro Kitamura[1], Makoto Okada[1], Yuki Haneda[1], Chisato Anai[2], Hidetoshi Shibuya[2] (1.Ibaraki University, 2.Dep't Earth & Env. Sci., Kumamoto Univ.)

[SEM18-P10] Hole surface survey monitoring test using by rock magnetic analysis

*Noriko Kawamura[1], Naoto Ishikawa[2] (1.Japan Coast Guard Academy, 2.Graduate School of Human and Environmental Studies, Kyoto University)

[SEM18-P11] Rock magnetic measurements of Miocene dikes at the western margin of the Shitara Igneous Complex, central Japan

*Kohei Yamamoto[1], Hiroyuki Hoshi[2] (1.Graduate School of Education, Aichi University of Education, 2.Aichi University of Education)

[SEM18-P12] Eliminating spurious magnetic phases of sedimentary rocks using reductive chemical treatments – A thermomagnetic experiment study on the Upper Cretaceous Yezo Group-

*Chisato Anai[1], Hidetoshi Shibuya[1], Nobutatsu Mochizuki[1] (1.Kumamoto University)

[SEM18-P13] Rock-magnetic studies on seafloor hydrothermal deposits in the Okinawa Trough

*Chie Kato[1], Masao Ohno[1], Tadahiro Hatakeyama[2], Jun-ichiro Ishibashi[3], Shuhei Totsuka[4], Kazuhiko Shimada[3] (1.Department of Environmental Changes, Faculty of Social and Cultural Studies, Kyushu University, 2. Information Processing Center, Okayama University of Science, 3.Department of Earth and Planetary Sciences, Faculty of Science, Kyushu University, 4. Department of Earth and Planetary Sciences, Graduate School of Sciences, Kyushu University)

[SEM18-P14] Rock-magnetic study of fresh dunite in the Horoman peridotite complex, Hokkaido, Japan

*Nobutatsu Mochizuki[1], Satoko Ishimaru[1], Shoji Arai[2] (1.Department of Earth and Environmental Science, Faculty of Advanced Science and Technology, Kumamoto University, 2.Department of Earth Sciences, Faculty of Science, Kanazawa University)

[SEM18-P15] Improvements of sensitivity and utility in the scanning superconducting quantum interference device (SQUID) microscope

*Yusuke Kubota[1], Joseph Kirschvink[2,1], Isaac Hilburn[2], Jennifer Buz[3], Atsuko Kobayashi[1,2], Chie Kato[4] (1.Tokyo Institute of Technology, 2.California Institute of Technology, 3.Northern Arizona University, 4.Kyushu University)

[J] Poster | S (Solid Earth Sciences)：S-EM Earth's Electromagnetism

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_27

[S-EM18] Geomagnetism, paleomagnetism and rock magnetism

convener:Hisayoshi Shimizu(Earthquake Research Institute, University of Tokyo), Masahiko Sato(Department of Earth and Planetary Science, The University of Tokyo)

[SEM18-P01] Analyzing the early 19th cenytury's geomagnetic declination in Japan from Tadataka Inoh's Santou-Houi-Ki the 13th roeport.

*Motohiro Tsujimoto[1], Akitoshi Omotani[2] (1.Japan Cartographers Association, 2.San-in System Consultant)

[SEM18-P02] Forecasting geomagnetic secular variation based on magnetic diffusion at the core-mantle boundary

*Masaki Matsushima[1], Hisayoshi Shimizu[2], Futoshi Takahashi[3], Takuto Minami[2], Shin ya Nakano[4], Hiroaki Toh[5] (1.Department of Earth and Planetary Sciences, School of Science, Tokyo Institute of Technology, 2.Earthquake Research Institute, University of Tokyo, 3.Faculty of Science, Kyushu University, 4.Institute of Statistical Mathematics, 5.Data Analysis Center for Geomagnetism and Space Magnetism, Graduate School of Science, Kyoto University)

[E] Oral | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A09 TOKYO BAY MAKUHARI HALL

[S-IT20] Property and role of liquids inside terrestrial planets

convener:Tatsuya Sakamaki(Department of Earth Science, Tohoku University), Yoichi Nakajima(Kumamoto University, Priority Organization for Innovation and Excellence), Chairperson:Tatsuya Sakamaki(Tohoku University), Yoichi Nakajima(Kumamoto University)

10:45 AM - 11:15 AM JST | 1:45 AM - 2:15 AM UTC

[SIT20-01] Ultrahigh pressure structure change in SiO_2 glass with coordination number >6

★Invited Papers

*Yoshio Kono[1], Yu Shu[2], Curtis Kenney-Benson[2], Yanbin Wang[3], Guoyin Shen[2] (1.Geodynamics Research Center, Ehime University, 2.Argonne National Laboratory, 3.The University of Chicago)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SIT20-02] **Scaling pseudotachylytes from the lab to the field**

*Thomas P. Ferrand[1], Alexandre Schubnel[2], Nadège Hilairet[3], Loïc Labrousse[4], Stefan Nielsen[5] (1.Earthquake Research Institute, 2.Ecole Normale Supérieure, Paris, France, 3.Unité Matériaux et Transformations, Université de Lille, France, 4.Sorbonne Université, Institut des Sciences de la Terre Paris, France, 5.Department of Earth Sciences, Durham University, United Kingdom)

11:30 AM - 12:00 PM JST | 2:30 AM - 3:00 AM UTC

[SIT20-03] *Ab initio* molecular dynamics study of atomic diffusion in covalent liquid under high pressure

★Invited Papers

*Satoshi Ohmura[1], Taku Tsuchiya[2] (1.Hiroshima Institute of Technology, 2.Ehime University)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SIT20-04] **Pressure-induced structural change in magnesium silicate melts**

*Toshiaki Iitaka[1], Nguyen Van Hong[2] (1.RIKEN, 2.Hanoi University of Science and Technology)

[E] Poster | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_16

[S-IT20] Property and role of liquids inside terrestrial planets

convener:Tatsuya Sakamaki(Department of Earth Science, Tohoku University), Yoichi Nakajima(Kumamoto University, Priority Organization for Innovation and Excellence)

[SIT20-P01] Melting relations in the Fe-P system at high pressures

*Yoichi Nakajima[1,2], Haruki Obata[2], Daisuke Kinoshita[2], Shigehiko Tateno[3], Kei Hirose[3,4], Naohisa Hirao[5], Saori I. Kawaguchi[5], Yasuo Ohishi[5] (1.Priority Organization for Innovation and Excellence, Kumamoto University, 2.Department of Phsyics, Kumamoto University,, 3.Earth-Life Science Institue, Tokyo Institute of Technology, 4.Department of Earth and Planertary Science, The University of Tokyo, 5.JASRI)

[SIT20-P02] Elastic property and structure of pyrope glass at high pressure

*Naoki Hisano[1], Tatsuya Sakamaki[1], Tomonori Ohashi[1], Ken-ichi Funakoshi[2], Yuji Higo[3], Yuki Shibazaki[4], Akio Suzuki[1] (1.Department of Earth Science, Graduate School of Science, Tohoku University, 2.Neutron Science & Technology Center, Comprehensive Research Organization for Science and Society (CROSS), 3.Japan Synchrotron Radiation Research Institute, 4.International Center for Young Scientists, National Institute for Materials Science)

[SIT20-P03] The effect of water and redox state on melting at the top of the lower mantle

*Ayano Nakajima[1], Tatsuya Sakamaki[1], Akio Suzuki[1] (1.Tohoku University)

[SIT20-P04] Sound velocity measurements on liquid Fe-P alloy up to 80 GPa

*Daisuke Kinoshita[1], Yoichi Nakajima[1,2], Yasuhiro Kuwayama[2,3], Kei Hirose[3], Daisuke Ishikawa[2,4], Baron Q.R. Alfred[2] (1.Kumamoto University, 2.RIKEN MDL, 3.Tokyo University, 4.JASRI)

[SIT20-P05] High-pressure structural investigations for hydrous sodium silicate melts

*Tomonori Ohashi[1], Tatsuya Sakamaki[1], Ken-ichi Funakoshi[2], Miki Muranushi[1], Chikara Shito[1], Yuki Shibazaki[3], Akio Suzuki[1] (1.Department of Earth Science, Tohoku University, 2.Neutron Science and Technology Center, Comprehensive Research Organization for Science and Society (CROSS), 3.National Institute for Materials Science (NIMS))

[SIT20-P06] Inelastic X-ray scattering measurements of liquid Fe-N alloy under high pressure

*Asaki Iwamoto[1], Yoichi Nakajima[1,2], Daisuke Kinoshita[1], Yasuhiro Kuwayama[2,3], Kei Hirose[3], Daisuke Ishikawa[2,4], Alfred Q.R. Baron[2] (1.Kumamoto University, 2.RIKEN MDL, 3.The University of Tokyo, 4.JASRI)

[SIT20-P07] Formation of highly pure anorthite crust on the low-volatile astral bodies by low-viscous magma ocean

*Tatsuya Sakamaki[1], Yoshio Kono[2] (1.Graduate School of Science, Tohoku University, 2.Geodynamics Research Center, Ehime University)

[E] Poster | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_28

[S-IT20] Property and role of liquids inside terrestrial planets

convener:Tatsuya Sakamaki(Department of Earth Science, Tohoku University), Yoichi Nakajima(Kumamoto University, Priority Organization for Innovation and Excellence)

[SIT20-P01] Melting relations in the Fe-P system at high pressures

*Yoichi Nakajima[1,2], Haruki Obata[2], Daisuke Kinoshita[2], Shigehiko Tateno[3], Kei Hirose[3,4], Naohisa Hirao[5], Saori I. Kawaguchi[5], Yasuo Ohishi[5] (1.Priority Organization for Innovation and Excellence, Kumamoto University, 2.Department of Phsyics, Kumamoto University,, 3.Earth-Life Science Institue, Tokyo Institute of Technology, 4.Department of Earth and Planertary Science, The University of Tokyo, 5.JASRI)

[SIT20-P02] Elastic property and structure of pyrope glass at high pressure

*Naoki Hisano[1], Tatsuya Sakamaki[1], Tomonori Ohashi[1], Ken-ichi Funakoshi[2], Yuji Higo[3], Yuki Shibazaki[4], Akio Suzuki[1] (1.Department of Earth Science, Graduate School of Science, Tohoku University, 2.Neutron Science & Technology Center, Comprehensive Research Organization for Science and Society (CROSS), 3.Japan Synchrotron Radiation Research Institute, 4.International Center for Young Scientists, National Institute for Materials Science)

[SIT20-P03] The effect of water and redox state on melting at the top of the lower mantle

*Ayano Nakajima[1], Tatsuya Sakamaki[1], Akio Suzuki[1] (1.Tohoku University)

[SIT20-P04] Sound velocity measurements on liquid Fe-P alloy up to 80 GPa

*Daisuke Kinoshita[1], Yoichi Nakajima[1,2], Yasuhiro Kuwayama[2,3], Kei Hirose[3], Daisuke Ishikawa[2,4], Baron Q.R. Alfred[2] (1.Kumamoto University, 2.RIKEN MDL, 3.Tokyo University, 4.JASRI)

[SIT20-P05] High-pressure structural investigations for hydrous sodium silicate melts

*Tomonori Ohashi[1], Tatsuya Sakamaki[1], Ken-ichi Funakoshi[2], Miki Muranushi[1], Chikara Shito[1], Yuki Shibazaki[3], Akio Suzuki[1] (1.Department of Earth Science, Tohoku University, 2.Neutron Science and Technology Center, Comprehensive Research Organization for Science and Society (CROSS), 3.National Institute for Materials Science (NIMS))

[SIT20-P06] Inelastic X-ray scattering measurements of liquid Fe-N alloy under high pressure

*Asaki Iwamoto[1], Yoichi Nakajima[1,2], Daisuke Kinoshita[1], Yasuhiro Kuwayama[2,3], Kei Hirose[3], Daisuke Ishikawa[2,4], Alfred Q.R. Baron[2] (1.Kumamoto University, 2.RIKEN MDL, 3.The University of Tokyo, 4.JASRI)

[SIT20-P07] Formation of highly pure anorthite crust on the low-volatile astral bodies by low-viscous magma ocean

*Tatsuya Sakamaki[1], Yoshio Kono[2] (1.Graduate School of Science, Tohoku University, 2.Geodynamics Research Center, Ehime University)

[E] Poster | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_7

[S-IT23] Structure and Dynamics of Earth and Planetary Mantles

convener:Takashi Nakagawa(Department of Earth Sciences, The University of Hong Kong), Takashi Yoshino(Institute for Planetary Materials, Okayama University), Dapeng Zhao(Department of Geophysics, Tohoku University)

[SIT23-P01] Interaction between volcanisms inland and the spreading center: example of Galápagos archipelago

*Walid Ben Mansour[1], Guust Nolet[2], Mario Ruiz[3], Juan Carlos Afonso[1] (1.Department of Earth and Planetary Sciences, Macquarie University, Sydney (Australia), 2.Geoazur, Université Cote d'Azur, Sophia Antipolis (France), 3.Instituto Geofisco, Escuela Politecnica Nacional, Quito (Ecuador))

[SIT23-P02] **Effect of iron content on thermal conductivity of olivine with implications for cooling history of rocky planets**

*Youyue Zhang[1], Takashi Yoshino[1], Akira Yoneda[1], Masahiro Osako[2] (1.Institute for Planetary Materials, Okayama University, 2.Division of Physical Sciences, National Museum of Nature and Science)

[SIT23-P03] **The distribution of Cenozoic conglomerates and its sedimentological constraint on the uplift of the South Tianshan, NW China**

*SUN HAITAO[1] (1.China University of Petroluem-Beijing)

[SIT23-P04] **Electrical conductivity of diaspore, δ-AlOOH and ε-FeOOH**

*Ran Wang[1] (1.Institute for Planetary Materials, Okayama University)

[SIT23-P05] Multi-mode surface wave tomography for azimuthal anisotropy in the Australasian upper mantle

*Yuka Nishimura[1], Kazunori Yoshizawa[2] (1. Graduate School of Science, Hokkaido University, 2.Faculty of Science, Hokkaido University)

[SIT23-P06] Mapping multi-mode surface wave phase speeds in North America using mode-branch waveforms decomposed by linear Radon transform

*Hitoshi Matsuzawa[1], Kazunori Yoshizawa[2] (1.Graduate School of Science, Hokkaido University, 2.Faculty of Science, Hokkaido University)

[SIT23-P07] Radial anisotropy in the upper mantle using multi-mode surface waves incorporating the η_K parameter: Application to the Pacific and Australian regions

Shuya Okuyama[1], *Kazunori Yoshizawa[1,2], Hitoshi Kawakatsu[3], Takehi Isse[3] (1.Graduate School of Science, Hokkaido University, 2.Faculty of Science, Hokkaido University, 3.Earthquake Research Institute, University of Tokyo)

[SIT23-P08] Pure to impure and dry to wet olivine rheology based on high temperature dependency of diffusion creep

*Kosuke Yabe[1], Takehiko Hiraga[1] (1.School of Science, The University of Tokyo)

[SIT23-P09] Finite frequency S wave tomography model beneath the Ontong Java Plateau using data recorded by broadband ocean bottom seismographs

*Misaki Horiuchi[3], Hiroko Sugioka[3], Masayuki Obayashi[1], Daisuke Suetsugu[1], Hajime Shiobara[2], Aki Ito[1], Yasushi Ishihara[1], Satoru Tanaka[1], Takehi Isse[2], Takashi Tonegawa[1], Junko Yoshimitsu[1], Takumi Kobayashi[3] (1.Japan Agency for Marine-Earth Science and Technology, Yokosuka, Japan, 2.Earthquake Research Institute, The University of Tokyo, Tokyo, Japan, 3.The University of Kobe, Hyogo, Japan)

[SIT23-P10] Shear wave structure of the upper mantle beneath the Ontong Java Plateau

*Takehi Isse[1], Daisuke Suetsugu[2], Hajime Shiobara[1], Hiroko Sugioka[3], Aki Ito[2], Yasushi Ishihara[2], Satoru Tanaka[2], Masayuki Obayashi[2], Takashi Tonegawa[2], Junko Yoshimitsu[2], Takumi Kobayashi[3], Kazunori Yoshizawa[4] (1.Earthquake Research Institute University of Tokyo, 2.Japan Agency for Marine-Earth Science and Technology, 3.Kobe University, 4.Faculty of Science, Hokkaido University)

[SIT23-P11] Effect of impurity on post-post-perovskite transition of $MgSiO_3$ by first principles

*Koichiro Umemoto[1] (1.Earth-Life Science Institute, Tokyo Institute of Technology)

[SIT23-P12] Unsusual high-Ti corundum recovered from the Horoman peridotites, Hokkaido, Japan

*oosawa takumi[1], Shinji Yamamoto[1] (1.yokohama national university)

[SIT23-P13] Deformation experiments on akimotoite

*Longli Guan[1], Daisuke Yamazaki[1], Noriyoshi Tsujino[1] (1.Institute for Planetary Materials, Okayama University, Misasa, Japan)

[SIT23-P14] Fate of water in subducted hydrous sediments deduced from stability fields of FeOOH and AlOOH up to 20 GPa

*Takashi Yoshino[1], Edward Baker[2], Kyle Duffey[3] (1.Institute for Planetary Materials, Okayama University, 2.Department of Earth Sciences, University of Oxford, 3.Department of Geosciences, Princeton University)

[E] Poster | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_29

[E] Oral | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A09 TOKYO BAY MAKUHARI HALL

[S-IT23] Structure and Dynamics of Earth and Planetary Mantles

convener:Takashi Nakagawa(Department of Earth Sciences, The University of Hong Kong), Takashi Yoshino(Institute for Planetary Materials, Okayama University), Dapeng Zhao(Department of Geophysics, Tohoku University), Chairperson:Takashi Yoshino(Okayama University)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SIT23-01] In search of recycled continental crust in the Mantle Transition Zone using geoneutrino measurements

*William F McDonough[1], Bedrich Roskovec[2], Ondrej Sramek[3] (1.Tohoku University, Sendai, Japan, 2.Universidad Catolica de Chile, Santiago, Chile, 3.Charles University, Praha 8, Czech Republic)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SIT23-02] Tectonic plates in 3D-numerical models of mantle convection with stress-history-dependent viscosity

*Takehiro Miyagoshi[1], Masanori Kameyama[2], Masaki Ogawa[3] (1.Japan Agency for Marine-Earth Science and Technology, 2.Ehime University, 3.University of Tokyo)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SIT23-03] Denoising S-Net Data to Image the Japan Trench: Comparisons to Alaska and Cascadia

*Claire Diane Doody[1,2], Qingkai Kong[1,2], William Scott[3], William Bythewood Hawley[1,2], Robert Martin-Short[1,2], Richard M Allen[1,2] (1.UC Berkeley, 2.Berkeley Seismo. Lab, 3.Imperial Coll. London)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SIT23-04] **Experimental confirmation of a spineloid transitional olivine polymorph using ultrafine-grained aggregates of Mg_2GeO_4**

*Thomas P. Ferrand[1], Takehiko Hiraga[1] (1.Earthquake Research Institute)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SIT23-05] Effects of fine-scale laminated heterogeneity on seismic anisotropy from long-period surface waves: Evaluation with two-dimensional waveform modelling

*Xu Yunao[1], Kazunori Yoshizawa[1,2], Takashi Furumura[3] (1.Department of Natural History Sciences, Graduate School of Science, Hokkaido University, Japan , 2.Department of Earth and Planetary Sciences, Faculty of Science, Hokkaido University, Japan, 3.Earthquake Research Institute, The University of Tokyo, Japan)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SIT23-06] **Redox kinetics of olivine revealed by diffusion profile of oxygen fugacity and its implication to the redox evolution of the uppermost mantle**

*Chengcheng Zhao[1], Takashi Yoshino[1] (1.Institute for Study of the Earth's Interior, Okayama University)

[E] Oral | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A09 TOKYO BAY MAKUHARI HALL

[S-IT23] Structure and Dynamics of Earth and Planetary Mantles

convener:Takashi Nakagawa(Department of Earth Sciences, The University of Hong Kong), Takashi Yoshino(Institute for Planetary Materials, Okayama University), Dapeng Zhao(Department of Geophysics, Tohoku University), Chairperson:Dapeng Zhao(Tohoku University)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SIT23-07] Reactive Melt Channelization in the Earth's Mantle

*Matej Pec[1], Benjamin Holtzman[3], Mark Zimmerman[2], David Kohlstedt[2] (1.Massachusetts Institute of Technology, 2.University of Minnesota, 3.Lamont-Doherty Earth Oservatory, Columbia University)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SIT23-08] Deep structure and origin of the intraplate volcanoes in Northeast Asia

*Dapeng Zhao[1] (1.Department of Geophysics, Tohoku University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SIT23-09] 3D passive-source reverse-time migration imaging of mantle discontinuities

*Yang Shen[1], Jiahang Li[1], Hitoshi Kawakatsu[2] (1.Graduate School of Oceanography, University of Rhode Island, USA, 2.Earthquake Research Institute, University of Tokyo)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SIT23-10] Configuration of slab beneath Ogasawara Islands and P-wave time differences between high and low frequencies

*Keiko Kuge[1] (1.Department of Geophysics, Graduate School of Science, Kyoto University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SIT23-11] Cool lower mantle transition zone inferred from seismic anisotropy of deformed ringwoodite

*Takaaki Kawazoe[1,2], Florian Heidelbach[2], Nobuyoshi Miyajima[2], Takayuki Ishii[2] (1.Hiroshima Univ., 2.Univ. Bayreuth)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[SIT23-12] Crystal chemistry and compressibility of $Fe_{0.5}Mg_{0.5}Al_{0.5}Si_{0.5}O_3$ and $FeMg_{0.5}Si_{0.5}O_3$ silicate perovskites at pressures up to 95 GPa.

*Iuliia Koemets[1], Zhaodong Liu[2], Egor Gennadievich Koemets[1], Catherine McCammon[1], Artem Chanychev[1], Tomoo Katsura[1], Michael Hanfland[3], Aleksandr Chumakov[3] (1.Bayerisches Geoinstitut, Universitat Bayreuth, Bayreuth, Germany, 2.Jilin University, Changchun, China , 3.European Synchrotron Radiation Facility (ESRF), Grenoble Cedex, France.)

[E] Oral | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A09 TOKYO BAY MAKUHARI HALL

[S-IT24] Attenuation from crust to core: in situ experiments, observaions and implications

convener:Konishi Kensuke(Institute of Earth Sciences, Academia Sinica), Ikuo Katayama(Department of Earth and Planetary Systems Science, Hiroshima University), Takashi Yoshino(Institute for Planetary Materials, Okayama University), Alexandre Schubnel(CNRS), Chairperson:Kensuke Konishi(Institute of Earth Sciences)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SIT24-01] Anomalous Vp/Vs Ratios at Seismic Frequencies Might Evidence Highly Damaged Rocks in Subduction Zones

*Alexandre Schubnel[1], Lucas Pimienta[2], Marie Violay[2], Jérome Fortin[1], Hélène Lyon-Caean[1] (1.Laboratoire de Géologie, ENS PARIS, 2.EPFL, Switzerland)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SIT24-02] Imaging crustal seismic attenuation, central Taupo Volcanic Zone, New Zealand

*Stephen C Bannister[1], Sandra Bourguignon[1], Ted Bertrand[1], Cameron Asher[1] (1.GNS Science)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SIT24-03] New Constraints on Seismological Structures of the Oceanic Asthenosphere

★Invited Papers

*Nozomu Takeuchi[1], Hitoshi Kawakatsu[1], Hajime Shiobara[1], Takehi Isse[1], Hiroko Sugioka[2], Aki Ito[3], Hisashi Utada[1] (1.Earthquake Research Institute, University of Tokyo, 2.Kobe University, 3.JAMSTEC)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SIT24-04] Frequency effects on elastic properties of saturated porous rocks: Experimental investigations

★Invited Papers

*Jerome Fortin[1] (1.Laboratoire de Géologie, Ecole Normale Superieure - Paris)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SIT24-05] Rock anelasticity due to grain boundary premelting

★Invited Papers

*Yasuko Takei[1], Hatsuki Yamauchi[1], Akihiro Tsunoda[1] (1.Earthquake Research Institute, University of Tokyo)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SIT24-06] Experimental study of the effects of partial melting on anelasticity: toward quantitative interpretations of seismic high attenuation

*Hatsuki Yamauchi[1], Yasuko Takei[1] (1.Earthquake Research Institute, The University of Tokyo)

[E] Poster | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_17

[S-IT24] Attenuation from crust to core: in situ experiments, observaions and implications

convener:Konishi Kensuke(Institute of Earth Sciences, Academia Sinica), Ikuo Katayama(Department of Earth and Planetary Systems Science, Hiroshima University), Takashi Yoshino(Institute for Planetary Materials, Okayama University), Alexandre Schubnel(CNRS)

[SIT24-P01] **Attenuation of seismic wave in water-saturated granite during triaxial deformation**

*Ikuo Katayama[1], Keiya Yamada[1], Kanta Zaima[1] (1.Department of Earth and Planetary Systems Science, Hiroshima University)

[SIT24-P02] Waveform inversion for the radial elastic and anelastic structure of the lowermost mantle beneath Central America and the Caribbean

*Anselme F. E. Borgeaud[1,2], Frederic Deschamps[1], Kensuke Konishi[1], Kenji Kawai[2], Robert J. Geller[2] (1.Institute of Earth Sciences, Academia Sinica, 2.Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo)

[SIT24-P03] 3-D elastic and anelastic structure of the lowermost mantle beneath the western Pacific from finite-frequency tomography

*Konishi Kensuke[1], Nobuaki Fuji[2], Frederic Deschamps[1] (1.Institute of Earth Sciences, Academia Sinica, 2.Institut de Physique du Globe de Paris)

[SIT24-P04] **Inferring the lowermost mantle thermo-chemical structure beneath the Western Pacific with seismic attenuation and shear-wave speed anomalies**

*Frederic Deschamps[1], Kensuke Konishi[1], Nobuaki Fuji[2], Laura J Cobden[3] (1.Academia Sinica, 2.Institut de Physique du Globe de Paris, 3.Utrecht University)

[SIT24-P05] Intrinsic attenuation factor Q of partially molten Fe–S–O system

*Chao Liu[1], Takashi Yoshino[1] (1.Institute for Planetary Materials, Okayama University)

[SIT24-P06] Effect of pore pressure on attenuation of seismic waves in thermally cracked granite

*Keiya Yamada[1], Kazuki Sawayama[2], Ikuo Katayama[1] (1.Hiroshima University, 2.Kyushu University)

[E] Poster | S (Solid Earth Sciences)：S-IT Science of the Earth's Interior & Techtonophysics

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_30

[S-IT24] Attenuation from crust to core: in situ experiments, observaions and implications

convener:Konishi Kensuke(Institute of Earth Sciences, Academia Sinica), Ikuo Katayama(Department of Earth and Planetary Systems Science, Hiroshima University), Takashi Yoshino(Institute for Planetary Materials, Okayama University), Alexandre Schubnel(CNRS)

[SIT24-P01] **Attenuation of seismic wave in water-saturated granite during triaxial deformation**

*Ikuo Katayama[1], Keiya Yamada[1], Kanta Zaima[1] (1.Department of Earth and Planetary Systems Science, Hiroshima University)

[SIT24-P02] Waveform inversion for the radial elastic and anelastic structure of the lowermost mantle beneath Central America and the Caribbean

*Anselme F. E. Borgeaud[1,2], Frederic Deschamps[1], Kensuke Konishi[1], Kenji Kawai[2], Robert J. Geller[2] (1.Institute of Earth Sciences, Academia Sinica, 2.Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo)

[SIT24-P03] 3-D elastic and anelastic structure of the lowermost mantle beneath the western Pacific from finite-frequency tomography

*Konishi Kensuke[1], Nobuaki Fuji[2], Frederic Deschamps[1] (1.Institute of Earth Sciences, Academia Sinica, 2.Institut de Physique du Globe de Paris)

[SIT24-P04] **Inferring the lowermost mantle thermo-chemical structure beneath the Western Pacific with seismic attenuation and shear-wave speed anomalies**

*Frederic Deschamps[1], Kensuke Konishi[1], Nobuaki Fuji[2], Laura J Cobden[3] (1.Academia Sinica, 2.Institut de Physique du Globe de Paris, 3.Utrecht University)

*Keiya Yamada[1], Kazuki Sawayama[2], Ikuo Katayama[1] (1.Hiroshima University, 2.Kyushu University)

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A07 TOKYO BAY MAKUHARI HALL

[S-VC36] Volcanic and igneous activities, and these long-term forecasting

convener:Teruki Oikawa(GSJ, National Institute of Advanced Industrial Science and Technology), Takeshi Hasegawa(Department of Earth Sciences, College of Science, Ibaraki University), Daisuke MIURA(Department of Physical Science, Graduate School of Science, Osaka Prefecture University), Nobuo Geshi(Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology), Chairperson:Daisuke Miura, Nobuo Geshi(GSJ/AIST)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SVC36-01] The entire magmatic history of the Toba Caldera Complex that influenced human evolution, northern Sumatra, inferred from zircon U-Pb geochronology

*Hisatoshi Ito[1] (1.Central Research Institute of Electric Power Industry)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SVC36-02] Pre-eruptive magmatic processes of "Hakone Tokyo Pumice eruption"

*Ryo Tsujihara[1,2], Tetsu Kogiso[1], Takashi Sano[3], Hidemi Ishibashi[4] (1.Graduate School of Human and Environmental Studies, Kyoto University, 2.Asia Air Survey Co., Ltd., 3.National Museum of Nature and Science, 4.Faculty of Science, Shizuoka University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SVC36-03] Transition of magma plumbing system deduced from the melt inclusions contained in tephra minerals originated from Aso central cones.

*ryota nagaishi[1], Toshiaki Hasenaka[2], Masayuki Torii[2], ATSUSHI YASUDA[3], Natsumi Hokanishi[3] (1.Graduate of Science and Technology, Kumamoto University, 2.Center for water cycle, marin environment and disaster management , 3.Earthquake Reserach Institute, The University of Tokyo)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SVC36-04] Pre-eruptive magma dynamics of the climactic 110ka eruption of Toya caldera, Japan

*Akihiko Tomiya[1], Yoshihiko Goto[2], Tohru Danhara[3], Shanaka L de Silva[4] (1.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology, 2.Muroran Institute of Technology, 3.Kyoto Fission-Track Co., Ltd., 4.Oregon State University, College of Earth, Ocean and Atmospheric Sciences)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SVC36-05] Voluminous silicic magma formation for the 30 ka Aira catastrophic caldera-forming eruption: contributions of crust-derived mafic and felsic magmas

*Ayumu Nishihara[1], Yoshiyuki Tatsumi[2,1], Keiko Suzuki-Kamata[2,1], Katsuya Kaneko[1,2], Jun-Ichi Kimura[3], Qing Chang[3], Hironobu Hinata[4], Takashi Miyazaki[3], Bogdan Stefanov Vaglarov[3] (1.Department of Planetology, Graduate School of Science , Kobe University, 2.Kobe Ocean-Bottom Exploration Center, 3.Department of Solid Earth Geochemistry, Japan Agency for Marine-Earth Science and Technology, 4.Kobe Municipal Tarumi Junior High School)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SVC36-06] Stratigraphy and petrological relations of pre-Aso volcanic rocks in Tateno district, Minami-Aso village

*Shota Togawa[1], Toshiaki Hasenaka[2], Masayuki Torii[2], Yasushi Mori[3] (1.Graduate school of science and technology, 2.Center for Water Cycle, Marine Environment and Disaster management, Kumamoto University, 3.Kitakyushu Museum of Natural History and Human History)

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A07 TOKYO BAY MAKUHARI HALL

[S-VC36] Volcanic and igneous activities, and these long-term forecasting

convener:Teruki Oikawa(GSJ, National Institute of Advanced Industrial Science and Technology), Takeshi Hasegawa(Department of Earth Sciences, College of Science, Ibaraki University), Daisuke MIURA(Department of Physical Science, Graduate School of Science, Osaka Prefecture University), Nobuo Geshi(Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology), Chairperson:Nobuo Geshi(GSJ/AIST), Daisuke Miura

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SVC36-07] Caldera structure delineated by airborne gravity gradiometry

*Atusi NINOMIYA[1], Hiromasa ISHIKAWA[1], Shunsuke NOGAMI[1], Yoshio NAKASATO[1] (1.Sumiko Resources Exploration and Development Co., Ltd.)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SVC36-08] The initial fine ash deposit of the Shikotsu caldera-forming eruption at ca. 45 ka

*Chiharu Tomijima[1], Daisuke MIURA[1], Shimpei Uesawa[2], Mizuho Amma-Miyasaka[3] (1.Department of Physical Science, Graduate School of Science, Osaka Prefecture University, 2.Central Research Institute of Electric Power Industry, 3.Graduate School of Sciences, Hokkaido University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SVC36-09] Characterization of the Small-volume Pyroclastic Flows from the Kuchinoerabu-jima Volcano during 2018-2019, Southwest Japan

*Ryuta FURUKAWA[1], Teruki Oikawa[1], Nobuo Geshi[1] (1.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SVC36-10] An explanation of size and position of Mt. Fuji

*Yasushi Harada[1], Miyu Takahashi[1] (1.School of Marine Science and Technology, Tokai University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SVC36-11] Arc magmatism in the northernmost part of Kamchatka caused by the aseismic subducted Bering slab

*Tatsuji Nishizawa[1], Hitomi Nakamura[2,3,4,5], Tatiana Churikova[6,7], Boris Gordeychik[6,8], Maria Pevzner[9], Osamu Ishizuka[2,10], Hikaru Iwamori[3,4,11] (1.Volcanic Fluid Research Center, School of Science, Tokyo Institute of Technology, 2.Institute of Earthquake and Volcano Geology, Geological Survey of Japan, AIST, 3.Department of Solid Earth Geochemistry, Japan Agency for Marine-Earth Science and Technology, 4.Depeartment of Earth and Planetary Sciences, School of Science, Tokyo Institute of Technology, 5.ORCeNG, Chiba Institute of Technology, 6.GZG, Abt. Geochemie, Universität Göttingen, 7.Institute of Volcanology and Seismology, Far East Branch, Russian Academy of Sciences, 8.Institute of Experimental Mineralogy, Russian Academy of Sciences, 9.Geological Institute, Russian Academy of Sciences, 10.R & D Center for Ocean Drilling Science, Japan Agency for Marine-Earth Science and Technology, 11.Earthquake Research Institute, The University of Tokyo)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SVC36-12] Redox state of magma in the deep crust beneath NE Japan arc: constraints from cumulate xenoliths from Ichinomegata Maar

*Naoya Tsushima[1], Michihiko Nakamura[1], Yasuhiro Yanagida, Takeyoshi Yoshida[1] (1.Division of Earth and Planetary Materials Science, Department of Earth Science, Graduate School of Science, Tohoku University)

[J] Oral | S (Solid Earth Sciences)：S-VC Volcanology

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A07 TOKYO BAY MAKUHARI HALL

[S-VC36] Volcanic and igneous activities, and these long-term forecasting

convener:Teruki Oikawa(GSJ, National Institute of Advanced Industrial Science and Technology), Takeshi Hasegawa(Department of Earth Sciences, College of Science, Ibaraki University), Daisuke MIURA(Department of Physical Science, Graduate School of Science, Osaka Prefecture University), Nobuo Geshi(Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology), Chairperson:RYUTA FURUKAWA, Teruki Oikawa

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SVC36-13] Deformation of a rhyolite lava below the Curie temperature: the Sanukayam lava in Kouzusima Island, Japan

*Takuma Kamio[1], Kuniyuki Furukawa[2], Tatsuo Kanamaru[3], Koji Uno[1] (1.Okayama University, 2.Aichi University, 3.Nihon University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SVC36-14] Evolution of magmatic chemistry for the Asama-Maekake volcano since 10ka revealed by whole-rock chemical analysis of pumice obtained by the trenching of air-fall tephra deposits

*Masaki Takahashi[1], Maya Yasui[1], Tatsuo Kanamaru[1] (1.Department of Earth and Environmental Sciences, College of Humanities and Sciences, Nihon University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SVC36-15] Late Pleistocene–Holocene tephra ejecta in the trench log at the southern apron of Esan volcanic complex, Japan

*Daisuke MIURA[1], Ryuta FURUKAWA[2], Kenichi Arai[3] (1.Graduate School of Science, Osaka Prefecture University, 2.Institute of Earthquake and Volcano Geology, GSJ/AIST, 3.Asia Air Survey)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SVC36-16] **Transition of eruption sequence and magma plumbing system at the 1.4 ka Nakamachineshiri eruption of Me-Akandake volcano, eastern Hokkaido, Japan.**

*Kosuke Ishige[1,2], Mitsuhiro Nakagawa[1] (1.Department of Natural History Sciences, Graduate School of Science, Hokkaido University, 2.Mitsubishi Materials Corporation)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SVC36-17] Kilo-year-evolution of magma plumbing system with dominant modes of eruption at Suwanosejima volcano, Southwest Japan

*Taketo Shimano[1], ATSUSHI YASUDA[2] (1.Graduate School of Environment and Disaster Research, Tokoha University, 2.Earthquake Research Institute, University of Tokyo)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SVC36-18] Temporal variation of the magma compositions of the Miyakejima volcano during the last 2700 years

*Nobuo Geshi[1], Teruki Oikawa[1] (1.Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology)

[J] Poster | S (Solid Earth Sciences)：S-VC Volcanology

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_18

[S-VC36] Volcanic and igneous activities, and these long-term forecasting

convener:Teruki Oikawa(GSJ, National Institute of Advanced Industrial Science and Technology), Takeshi Hasegawa(Department of Earth Sciences, College of Science, Ibaraki University), Daisuke MIURA(Department of Physical Science, Graduate School of Science, Osaka Prefecture University), Nobuo Geshi(Geological Survey of Japan, The National Institute of Advanced Industrial Science and Technology)

[SVC36-P01] Reinvestigation of the eruptive history of Me-akan volcano, eastern Hokkaido, using trench survey

*Eiichi Sato[1], Keiji Wada[2], Yusuke Minami[3], Yoshihiro Ishizuka[3], Mitsuhiro Nakagawa[4], Yoshiko Adachi[4] (1.Institute for Promotion of Higher Education, Kobe University, 2.Earth Science Laboratory, Hokkaido University of Education at Asahikawa, 3.Geological Survey of Japan, AIST, 4.Department of Earth and Planetary Sciences, Graduate School of Science, Hokkaido University)

[SVC36-P02] Eruptive history at Ponmachineshiri in Meakan volcano during the last 1000 years: Implication from trench surveys

*Yusuke Minami[1], Mitsuhiro Nakagawa[2], Eiichi Sato[3], Keiji Wada[4], Yoshihiro Ishizuka[1], Yoshiko Adachi[2] (1.Geological Survey of Japan, AIST, 2.Department of Earth and Planetary Sciences, Graduate School of Science, Hokkaido University, 3.Institute for Promotion of Higher Education, Kobe University, 4.Earth Science Laboratory, Hokkaido University of Education at Asahikawa)

[SVC36-P03] **Transition of magma plumbing system during the past 14 thousand years of Mashu volcano, eastern Hokkaido**

*Keiji Wada[1], Eiichi Sato[2], Kyohei Sano[3], Yuya Okada[1] (1.Earth Science Laboratory, Hokkaido University of Education at Asahikawa, 2.Institute for Promotion of Higher Education, Kobe University, 3.Shirataki-Geopark)

[SVC36-P04] Eruption sequence of 7.6 ka caldera-forming eruption from Mashu-volcano eastern Hokkaido, japan

*Shibata Shohei[1], Takeshi Hasegawa[1] (1.Department of Earth Sciences, College of Science, Ibarbki University)

[SVC36-P05] Geological study of the 1000 yBP Ma-b eruption, Mashu volcano, eastern Hokkaido: Especially for the change of eruption style.

*Kenta Ueno[1], Mitsuhiro Nakagawa[1] (1.Depatment of Natural History of Sciences, Graduate School of Science, Hokkido University)

[SVC36-P06] Petrology of the caldera-forming eruption of Nigorikawa Caldera, Southwest Hokkaido, Japan

*Yasuaki Kaenda[1], Takeshi Hasegawa[1] (1.University of Ibaraki)

[SVC36-P07] Textual analyses for pumice from precursory Plinian eruption of Aira caldera forming eruption

*Miki Ogata[1], Atsushi Toramaru[2] (1.Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University, 2.Department of Earth and Planetary Sciences, Faculty of Science, Kyushu University)

[SVC36-P08] Long-term input rate of mafic magma inferred from a long-term heat balance model of silicic magma reservoir

*Shimpei Uesawa[1] (1.Central Research Institute of Electric Power Industry)

[SVC36-P09] Outgassing and Oxidation processes of viscous magmas inferred from micro-Raman and IR spectroscopy

*Kyohei Sano[1], Eiichi Sato[2], Keiji Wada[3], Motohiro Tsuboi[4], Reina NAKAOKA[5] (1.Shirataki-Geopark, 2.Kobe University Institute for Promotion of Higher Education, 3.Hokkaido University of Education at Asahikawa, 4.School of Science and Technology, Kwansei Gakuin University, 5.Kobe Ocean-Bottom Exploration Center, Kobe University)

[SVC36-P10] Distribution of ballistic blocks during the 2014 eruption of Ontake Volcano, central Japan

*Teruki Oikawa[1], Mitsuhiro Yoshimoto[2], Yoshihiro Takeshita[3], Fukashi Maeno[4], Jiro Komori[5], Setsuya Nakada[9], Taketo Shimano[10], Hisashi Sasaki[6], Kishimoto Hiroshi[6], Tatsuro Chiba[6], Yasuhiro Ishimine[7], Kae Tsunematsu[8], Yoshihiro Ishizuka[1] (1.GSJ, National Institute of Advanced Industrial Science and Technology , 2.Mt. Fuji Reserch Institute,

Yamanashi Prifectural Goverment, 3.Faculty of Education, Shinshu University, 4.Earthquake Reserch Institute, University of Tokyo, 5.Teikyo Heisei University, 6.Asia Air Survey Co., Ltd., 7.Reserch and Education Center for Natural Hazards, Kagoshima University, 8.Yamagata University, 9.National Reserch Insitute for Earth Science and Disaster Resilience, 10.Graduate School of Environment and Disaearch, Tokoha University)

[SVC36-P11] After 2014 eruption, The volcanic crustal deformation around Mt. Ontake

*Haruno Koike[1], Takeo Ito[2], Kenjiro Matsuhiro[2], Shinichiro Horikawa[2], Takashi OKUDA[2], Takahiro Kunitomo[2], kazushi tanoue[2], Yuto Iwase[1], Koki Kumagai[1] (1.Graduate School of Environmental Studies, Nagoya University, 2.Earthquake and Volcano Research Center, Graduate School of Environmental Studies, Nagoya University)

[SVC36-P12] Geological and petrological study of Kariba volcanic group: Elucidation of the volcanic history and changes of magma

*Shota Taji[1], Mitsuhiro Nakagawa[2] (1.Graduate School of Science, Hokkaido University, 2.Faculty of Science, Hokkaido University)

[SVC36-P13] Stratigraphy and evolutionary mechanism for the low-K tholeiitic magmas at Kotakakura volcano in the Sengan geothermal field, Northeast Japan arc

*Goto Yoshiaki[1], Akihiko Fujinawa[2] (1.Graduate school of Science and Engineering, Ibaraki University, 2.Faculty of Science, Ibaraki University)

[SVC36-P14] Pre-eruptive magmatic processes of upper part of Goshikidake pyroclastic rocks, Zao volcano

*Motohiro Sato[1], Masao Ban[1] (1.Graduate School of Science and Technology, Yamagata University)

[SVC36-P15] Geology and petrology of Futamata volcano, Nasu volcano group, NE Japan

*Shota Watanabe[1], Takeshi Hasegawa[1] (1.Ibaraki Univ.)

[SVC36-P16] Magma of the Haruna-Caldera forming eruption in view of Shirakawa pyroclastic flow deposits-

*Goro Kitani[1], Yuki Suzuki[2], Masayuki Oishi[3] (1.Department of Earth Sciences, School of Education , Waseda University, 2.Department of Earth Sciences, Faculty of Education and Integrated Arts of Sciences, Waseda University, 3.Sendai Regional Headquarters, Japan Meteorological Agency)

[SVC36-P17] Magma plumbing system in the caldera-forming eruption of Haruna volcano indicated by Satomi pyroclastic flow deposit

*Momoka Okano[1], Yuki Suzuki[2] (1.Department of Earth Sciences, School of Education, Waseda University, 2.Department of Earth Sciences, Faculty of Education and Integrated Arts of Sciences, Waseda University)

[SVC36-P18] Petrology of the Minamiryu-ga-banba in Hakusan Volcano

*Taichiro Miyashita[1], Susumu Umino[1], Yuzuki Ibaraki[2] (1.Kanazawa University, 2.Chuken Consultant Co., Ltd)

[SVC36-P19] Tephrochronological relations of Middle-Pleistocene tephra derived from Myoko Volcanic Group and the pumice and scoria fall deposits found in Kosha Volcano, Central Japan

*Naoaki TAKASUGI[1], Takeshi Saito[1], Kuniaki Makino[1], Takehiko Suzuki[2] (1.Shinshu University, 2.Tokyo Metropolitan University)

[SVC36-P20] Geologic and petrologic study of the Kamo monogenetic volcanic field,Southern Kyushu,Japan

*Linus Anye Nche[1], Takeshi - Hasegawa[1], Tetsuo - Kobayashi[2], Károly - Németh[3], Festus Tongwa Aka[4] (1. Ibaraki Univ., 2.Kagoshima Univ., 3. Massey Univ., 4.IRGM)

[SVC36-P21] **Investigation on Lava Tube Caves in Manno lava flow of Mt.Fuji**

*Tsutomu Honda[1] (1.Vulcano-speleological Society)

[J] Poster | S (Solid Earth Sciences)：S-VC Volcanology

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_31

convener:Hitoshi Mikada(Kyoto University), Yoshihisa Iio(Disater Prevention Research Institute, Kyoto University), Nobukazu Seama(Department of Planetology, Graduate School of Science, Kobe University), Junichi Takekawa(Graduate School of Science, Kyoto University), Chairperson:Junichi Takekawa(Graduate School of Engineering, Kyoto University), Yusuke Watanabe(Graduate School of Engineering, Kyoto University)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[STT42-07] The observation of active source and ambient noise signals with telecommunication fiber-optic cable in urban area

*Baoshan Wang[1], Xiangfang Zeng[2], Xiaobin Li[3], Weiwei Xu[4], Shanhui Xu[4], Zhenghong Song[1] (1.School of Earth and Space Sciences, University of Science and Technology of China, 2.State Key Laboratory of Geodesy and Earth's Dynamics, Institute of Geodesy and Geophysics, Chinese Academy of Sciences, 3.Earthquake Agency of Yunnan Province, 4.Institute of Geophysics, China Earthquake Administration)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[STT42-08] Comparison of RTM results of time-lapse imaging in foam-assisted EOR

*Rei Tamura[1], Hitoshi Mikada[1], Junichi Takekawa[1] (1.Kyoto University)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[STT42-09] The estimation of physical properties of buried targets using the Cole-Cole equation in fictitious wave domain method

*Kohshi Kimura[1], Hitoshi Mikada[1], Junichi Takekawa[1] (1.Kyoto University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[STT42-10] Numerical investigation of permeability anisotropy in porous media using a particle method

*Ryo Masumura[1], Hitoshi Mikada[1], Junichi Takekawa[1] (1.Kyoto University)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[STT42-11] **Numerical Description of Flow Channel in Pipe Conduits Considering Solid-fluid Phase Shift with Lattice Boltzmann Method**

*Masaki Iwata[1], Hitoshi Mikada[1], Junichi Takekawa[1] (1.Kyoto University)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[STT42-12] Evaluation of anisotropic parameters using virtual cross-dipole data with full waveform approach

*YUSUKE WATANABE[1], Hitoshi Mikada[1], Junichi Takekawa[1] (1.Kyoto Univesity)

[E] Poster | S (Solid Earth Sciences)：S-TT Technology & Techniques

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_19

[S-TT42] Recent Advances in Exploration Geophysics 2019

convener:Hitoshi Mikada(Kyoto University), Yoshihisa Iio(Disater Prevention Research Institute, Kyoto University), Nobukazu Seama(Department of Planetology, Graduate School of Science, Kobe University), Junichi Takekawa(Graduate School of Science, Kyoto University)

[STT42-P01] DISCRIMINATION OF HYDRATE BEARING MARINE SEDIMENTS BY USING FREQUENCY BASED ATTENUATION

*Nisar Ahmed[1], Mubasher Ahmad[1], Perveiz Khalid[1] (1.Institute of Geology, University of the Punjab, Lahore 54590, Pakistan)

[STT42-P02] Evaluation of methane hydrate based on attenuation parameter in seismic exploration

*Mizuki Kawabe[1], Hitoshi Mikada[1], Junichi Takekawa[1] (1.Kyoto Unibercity)

[STT42-P03] Estimating the earthquake source mechanism using full waveform inversion

*Jang Iktae[1], Hitoshi Mikada[1], Junichi Takekawa[1] (1.Kyoto University)

[STT42-P04] A quantitative analysis of the passive seismic emission tomography using the lattice Boltzmann method

*Sakemi Yuichi[1], Hitoshi Mikada[1], Junichi Takekawa[1] (1.Kyoto University)

[STT42-P05] A feasibility study for supercritical geothermal energy in enhanced geothermal system

*Tatsuki Ueda[1], Hitoshi Mikada[1], Junichi Takekawa[1] (1.Kyoto University)

[E] Poster | S (Solid Earth Sciences)：S-TT Technology & Techniques

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_32

[S-TT42] Recent Advances in Exploration Geophysics 2019

convener:Hitoshi Mikada(Kyoto University), Yoshihisa Iio(Disater Prevention Research Institute, Kyoto University), Nobukazu Seama(Department of Planetology, Graduate School of Science, Kobe University), Junichi Takekawa(Graduate School of Science, Kyoto University)

[STT42-P01] DISCRIMINATION OF HYDRATE BEARING MARINE SEDIMENTS BY USING FREQUENCY BASED ATTENUATION

*Nisar Ahmed[1], Mubasher Ahmad[1], Perveiz Khalid[1] (1.Institute of Geology, University of the Punjab, Lahore 54590, Pakistan)

[STT42-P02] Evaluation of methane hydrate based on attenuation parameter in seismic exploration

*Mizuki Kawabe[1], Hitoshi Mikada[1], Junichi Takekawa[1] (1.Kyoto Unibercity)

[STT42-P03] Estimating the earthquake source mechanism using full waveform inversion

*Jang Iktae[1], Hitoshi Mikada[1], Junichi Takekawa[1] (1.Kyoto University)

[STT42-P04] A quantitative analysis of the passive seismic emission tomography using the lattice Boltzmann method

*Sakemi Yuichi[1], Hitoshi Mikada[1], Junichi Takekawa[1] (1.Kyoto University)

[STT42-P05] A feasibility study for supercritical geothermal energy in enhanced geothermal system

*Tatsuki Ueda[1], Hitoshi Mikada[1], Junichi Takekawa[1] (1.Kyoto University)

[J] Oral | S (Solid Earth Sciences)：S-TT Technology & Techniques

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A07 TOKYO BAY MAKUHARI HALL

[S-TT44] Airborne surveys and monitoring of the Earth

convener:Shigekazu Kusumoto(Graduate School of Science and Engineering for Research, University of Toyama), Takao Koyama(Earthquake Research Institute, University of Tokyo), Yuji Mitsuhata(AdvancedIndustrial Science and Technology), Shigeo Okuma(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST)), Chairperson:Shigekazu Kusumoto, Takao Koyama(東京大学 地震研究所 火山センター), Shigeo Okuma(産業技術総合研究所), Yuji Mitsuhata(国立研究開発法人　産業技術総合研究所)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[STT44-01] A Case Study on the Application of a Magnetic Survey Using Magnetometers Carried by Multicopter-type Drones

★Invited Papers

*Shiga Nobuhiko[1], Harada Haruo[1], Wada Kazushige[1] (1.Mitsui Mineral Development Engineering Co., Ltd.)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[STT44-02] Development for upgrading the generalization capability of the seismic damage detection of building based on the deep-learning utilizing aerial photographs

★Invited Papers

*Shohei Naito[1], Hiromitsu Tomozawa[2], Yuji Mori[2], Naokazu Monma[3], Hiromitsu Nakamura[1], Hiroyuki Fujiwara[1] (1.National Research Institute for Earth Science and Disaster Resilience, 2.Mizuho Information and Research Institute, Inc., 3.Pasco Corporation)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[STT44-03] The resistivity distribution under the ground on bedrock creep slopes in Kii mountain area by the airborne electromagnetic survey

*Atsuhiko Kinoshita[1,2], Yasutaka Tanaka[2], Wataru Sakurai[1], Taro Uchida[1], Koichiro Hayashi[3], Katsushi Kawato[4], Minoru Okumura[4] (1.National Institute for Land and Infrastructure Management, 2.Sediment Disaster Prevention Technology Center, Kinki Developing Regional Bureau, Ministry of Land, Infrastructure, Transport and Tourism , 3.OYO Corporation, 4.NIPPON ENGINEERING CONSULTANTS CO.,LTD.)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[STT44-04] Study of UAV photogrammetry toward efficiently grasping volcanic landform

*Yuichi Iwasa[1], Takeshi Matsushima[2] (1.department of earth and planetary sciences, graduate school of sciences, Kyushu University, 2.SEVO, Kyushu Univ.)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[STT44-05] Volcanic gas measurements using UAVs

*Takeshi Hashimoto[1], Akihiko Terada[2], Toshiya Mori[3], Ryo Tanaka[1] (1.Institute of Seismology and Volcanology, Graduate School of Science, Hokkaido University, 2.Volcanic Fluid Research Center, Tokyo Institute of Technology, 3.Geochemical Research Center, Graduate School of Science, The University of Tokyo)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[STT44-06] Repeated Drone Magnetic Survey over Usu Volcano, Hokkaido Japan

*Shigeo Okuma[1], Masahiko Makino[2], Tadashi Nakatsuka[1], Ayumu Miyakawa[1], Makoto Yanagida[3], Minoru Okumura[4] (1.Institute of Geology and Geoinformation, Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST), 2.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST), 3.Hanshin Consultants Co., Ltd., 4.Nippon Engineering Consultants Co., Ltd.)

[J] Poster | S (Solid Earth Sciences)：S-TT Technology & Techniques

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_33

[S-TT44] Airborne surveys and monitoring of the Earth

convener:Shigekazu Kusumoto(Graduate School of Science and Engineering for Research, University of Toyama), Takao Koyama(Earthquake Research Institute, University of Tokyo), Yuji Mitsuhata(AdvancedIndustrial Science and Technology), Shigeo Okuma(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST))

[STT44-P01] Development of an optical remote sensing technique for volcanic surface phenomena observation to estimate hyperspectral data from multispectral data

*Tetsuya Jitsufuchi[1] (1.National Research Institute for Earth Science and Disaster Resilience)

[STT44-P02] Geomagnetic total intensity change before and after the eruptions at Shinmoedake volcano in 2018 detected by aeromagnetic surveys

*Takao Koyama[1], Takayuki Kaneko[1], Takao Ohminato[1], Atsushi Watanabe[1], Fukashi Maeno[1] (1.Earthquake Research Institute, University of Tokyo)

[STT44-P03] Droneborne resistivity mapping for a shallow ground investigation

*Yuji Mitsuhata[1], Tishiyuki Yokota[1] (1.AdvancedIndustrial Science and Technology)

[STT44-P04] Improvement test and field application applicability of airborne electromagnetic survey using drone

*Youichi Yuuki[1], Akira Jomori[2], Atsuyoshi Jomori[2], Takashi Kondoh[2] (1.Oyo corporation, 2.NEOSCIENCE)

[STT44-P05] Special Techniques for Airborne Laser Scanning Using Unmanned Helicopters

*Tomoya Hayakawa[1], Mio Kasai[2], Junro Imai[3], Akihiko Tani[4], Takatoshi Mikami[4] (1.NIPPON KOEI CO., LTD., 2.Hokkaido University Institute of Earth Surface Processes and Land Management, 3.YAMAHA MOTORCYCLE CO., LTD., 4.Obihiro Development and Construction Dept., Hokkaido Regional Development Bureau)

[J] Oral | S (Solid Earth Sciences)：S-TT Technology & Techniques

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 304 3F

[S-TT47] Creating future of solid Earth science with high performance computing (HPC)

convener:Takane Hori(R&D Center for Earthquake and Tsunami, Japan Agency for Marine-Earth Science and Technology), Yuji Yagi(Graduate School of Life and Environmental Sciences, University of Tsukuba, Tsukuba), Katsuhiko Shiomi(National Research Institute for Earth Science and Disaster Resilience), Chairperson:Takane Hori

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[STT47-01] Expectations to more realistic Green's function with modeling errorfor the real-time estimation of the coseismic fault model

*Yusaku Ohta[1] (1.Research Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[STT47-02] Development of high-performance low order unstructured implicit finite-element solvers for solid earth science problems

★Invited Papers

*Kohei Fujita[1], Tsuyoshi Ichimura[1], Takuma Yamaguchi[1] (1.Earthquake Research Institute, The University of Tokyo)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[STT47-03] Optimal spectral element method for elastic wave computation

*Kei Hasegawa[1], Nobuaki Fuji[2], Kensuke Konishi[3] (1.Earthquake Research Institute, University of Tokyo, 2.Institut de Physique du Globe de Paris, 3.Institute of Earth Sciences, Academia Sinica)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[STT47-04] Multi scale tsunami simulation from earthquake initiation to tsunami run-up into the coastal area and high performance particle simulator

*Mitsuteru Asai[1], Mikito Furuichi[2], Daisuke Nishiura[2] (1.Kyushu University, 2.JAMSTEC)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[STT47-05] Digital-Ensemble Concept for Making Resilient Society against Natural Hazard

*Satoru Oishi[1] (1.RIKEN Center for Computational Science)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[STT47-06] Expected Role of High Performance Computing to Promote Earthquake Research

★Invited Papers

*Naoshi Hirata[1] (1.Earthquake Research Institute, the University of Tokyo)

[J] Poster | S (Solid Earth Sciences)：S-TT Technology & Techniques

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_20

[S-TT47] Creating future of solid Earth science with high performance computing (HPC)

convener:Takane Hori(R&D Center for Earthquake and Tsunami, Japan Agency for Marine-Earth Science and Technology), Yuji Yagi(Graduate School of Life and Environmental Sciences, University of Tsukuba, Tsukuba), Katsuhiko Shiomi(National Research Institute for Earth Science and Disaster Resilience)

[STT47-P01] Prototype of Green's function library for geodetic slip inversion based on an integrated velocity structure model of Japan

*Ryoichiro Agata[1], Tsuyoshi Ichimura[2,3,4], Kohei Fujita[2,3], Takuma Yamaguchi[2], Takeshi Iinuma[1], Takane Hori[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.Earthquake Research Institute, The University of Tokyo, 3.Center for Computational Science, RIKEN, 4.Center for Advanced Intelligence Project, RIKEN)

[STT47-P02] The Smoothed Particle Hydrodynamics on modern architectures

*Natsuki Hosono[1,2], Mikito Furuichi[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.RIKEN Center for Computational Science)

[STT47-P03] Development of Monitoring and Forecasting Methods for Crustal Activity Utilizing Large-Scale High-Fidelity Finite Element Simulations with 3D Heterogeneous Medium

*Takane Hori[1], Tsuyoshi Ichimura[2], Kohei Fujita[2], Takuma Yamaguchi[2], Ryoichiro Agata[1], Takeshi Iinuma[1] (1.R&D Center for Earthquake and Tsunami, Japan Agency for Marine-Earth Science and Technology, 2.Earthquake Research Institute, The University of Tokyo)

[J] Poster | S (Solid Earth Sciences)：S-TT Technology & Techniques

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_34

[S-TT47] Creating future of solid Earth science with high performance computing (HPC)

convener:Takane Hori(R&D Center for Earthquake and Tsunami, Japan Agency for Marine-Earth Science and Technology), Yuji Yagi(Graduate School of Life and Environmental Sciences, University of Tsukuba, Tsukuba), Katsuhiko Shiomi(National Research Institute for Earth Science and Disaster Resilience)

[STT47-P01] Prototype of Green's function library for geodetic slip inversion based on an integrated velocity structure model of Japan

*Ryoichiro Agata[1], Tsuyoshi Ichimura[2,3,4], Kohei Fujita[2,3], Takuma Yamaguchi[2], Takeshi Iinuma[1], Takane Hori[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.Earthquake Research Institute, The University of Tokyo, 3.Center for Computational Science, RIKEN, 4.Center for Advanced Intelligence Project, RIKEN)

[STT47-P02] The Smoothed Particle Hydrodynamics on modern architectures

*Natsuki Hosono[1,2], Mikito Furuichi[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.RIKEN Center for Computational Science)

[STT47-P03] Development of Monitoring and Forecasting Methods for Crustal Activity Utilizing Large-Scale High-Fidelity Finite Element Simulations with 3D Heterogeneous Medium

*Takane Hori[1], Tsuyoshi Ichimura[2], Kohei Fujita[2], Takuma Yamaguchi[2], Ryoichiro Agata[1], Takeshi Iinuma[1] (1.R&D Center for Earthquake and Tsunami, Japan Agency for Marine-Earth Science and Technology, 2.Earthquake Research Institute, The University of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-CG56] Ocean Floor Geosciences

convener:Kyoko Okino(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:shuhei Totsuka, Ayanori Misawa

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[SCG56-01] The restoration of precipitation record of iron hydroxide about seven years in Nagahama Bay, Satsuma Iwo-jima, Kagoshima.

*Naoya Sakamoto[1], Shoichi Kiyokawa[2] (1.Department of Earth and Planetary Sciences, Graduate School of Science, Kyushu University, 2.Department of Earth and Planetary Sciences, Faculty of Science, Kyushu University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[SCG56-02] Mineralogical and geochemical study of hydrothermal deposits beneath the seafloor at the Gondou field in the Okinawa Trough

*Shuhei Totsuka[1], Jun-ichiro Ishibashi[2], Kazuhiko Shimada[2], Kei Ikehata[3], Hideaki Machiyama[4], Koichi Iijima[4], Hirofumi Yamamoto[4], Hidenori Kumagai[4], Ken Ikehara[5], Toru Yamasaki[5], Yutaro Takaya[6], Toshiro Nagase[7], Thomas Tindell[8], Kotaro Yonezu[8], Yuki Tada[8] (1.Department of Earth and Planetary Sciences, Graduate School of Sciences, Kyushu University, 2.Department of Earth and Planetary Sciences, Faculty of Science, Kyushu University, 3.Faculty of Life and Environmental Sciences, University of Tsukuba, 4.Research and Development Center for Submarine Resources, JAMSTEC, 5.Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology, 6.Department of Resources and Environmental Engineering School of Creative Science and Enginerring, Waseda University, 7.Tohoku University Museum, 8.Department of Earth Resources Engineering, Faculty of Engineering, Kyushu University)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[SCG56-03] Strontium isotope study of sulfate minerals obtained by scientific drilling from seafloor hydrothermal fields in the Okinawa Trough

Akihi Tsutsumi[1], Naru Tsukamoto[1], Kazuhiko Shimada[1], *Jun-ichiro Ishibashi[1], Ryuichi Shinjo[2] (1.Department of Earth and Planetary Sciences, Kyushu University, 2.Faculty of Science, University of Ryukyus)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[SCG56-04] Numerical modeling of seafloor hydrothermal system in the Izena Caldron, Okinawa Trough

*Shohei Albert Tomita[1], Katsuaki Koike[1], Tada-nori Goto[1], Katsuhiko Suzuki[2], Takafumi Kasaya[2] (1.Graduate School of Engineering, Kyoto University, 2. Japan Agency for Marine-Earth Science and Technology)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[SCG56-05] Electrical conductivity and spectral IP characteristics in the rock samples obtained in seafloor hydrothermal area and interpretation of them

*Yusuke Ohta[1], Tada-nori Goto[1], Katsuaki Koike[1], Weiren Lin[1], Koki Kashiwaya[1], Tadai Osamu[3], Takafumi Kasaya[2], Toshiya Kanamatsu[2], Hidenori Kumagai[2], Hideaki Machiyama[2] (1.Kyoto University, 2.Japan Agency for Marine-Earth Science and Technology, 3.Marine Works Japan)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[SCG56-06] Geological structure north offshore Ishigaki-Jima estimated from seismic reflection survey

*Ayanori Misawa[1], Seishiro Furuyama[2,1], Masahiko Sato[3,1], Jih-Shin Chang[1], Takahiko Inoue[1], Kohsaku Arai[1] (1.Geological Survey of Japan, AIST, 2.Tokyo University of Marine Science and Technology, 3.The University of Tokyo)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-CG56] Ocean Floor Geosciences

convener:Kyoko Okino(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:Keishiro Azami, Erika Tanaka

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[SCG56-07] The first report of the evidence for hydrothermal activity in old oceanic plate

*Keishiro Azami[1], Shiki Machida[2], Naoto Hirano[3], Tetsu Kogiso[4], Yasuhiro Kato[1,2] (1.Department of System Innovation, School of Engineering, The University of Tokyo, 2.Ocean Resources Research Center for Next Generation, Chiba Institute of Technology, 3.Center for Northeast Asian Studies, Tohoku University, 4.Graduate School of Human and Environmental Studies, Kyoto University)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[SCG56-08] X-ray computed tomography characterization of the distribution of biogenic apatite and sedimentary structures in pelagic clay around Minamitorishima Island, western North Pacific

*Yoichi Usui[1], Koichi Iijima[1], Hideaki Machiyama[1], Yuji Ichiyama[2,1], Erika Tanaka[3], Koichiro Fujinaga[4,3], Kazutaka Yasukawa[3,4] (1.Japan Agency for Marine-Earth Science and Technology, 2.Chiba University, 3.The University of Tokyo, 4.Chiba Institute of Technology)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[SCG56-09] Geochemistry and distribution of REY-rich mud in the eastern off the Takuyo-Daigo Seamount within the Minamitorishima EEZ

*Koichiro Fujinaga[1,2], Kazutaka Yasukawa[3,1], Tatsuo Nozaki[4,2,1,5], Shiki Machida[1,2], Yutaro Takaya[6,2,1], Junichiro Ohta[1,2], Moei Yano[3], Ryo Shimomura[3], Erika Tanaka[3], Kazuhide Mimura[3], Koichi Horinouchi[3], Kenji Matsumoto[3], Yoichi Usui[4], Hirofumi Yamamoto[4], Kentaro Nakamura[3], Yasuhiro Kato[2,3,1], KM17-14C cruise members (1.Ocean Resources Research Center for Next Generation, Chiba Institute of Technology, 2.Frontier Research Centerfor Energy and Resources, School of Engineering, The University of Tokyo, 3.Department of Systems Innovation, School of Engineering, The University of Tokyo, 4.Japan Agencyfor Marine-Earth Science and Technology, 5.Department of Planetology, Graduate Schoolof Science, Kobe University, 6.Department of Resources and Environmental Engineering School of Creative Science and Engineering, Waseda University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[SCG56-10] Extended lateral correlation of deep-sea sediments around the Minamitorishima EEZ based on downhole variation of bulk chemical composition

*Erika Tanaka[1], Kentaro Nakamura[1], Kazutaka Yasukawa[1,2], Koichiro Fujinaga[2], Koichi Iijima[3], Shiki Machida[2], Yasuhiro Kato[1,2] (1.School of Engineering, The University of Tokyo, 2.ORCeNG, Chiba Institute of Technology, 3.JAMSTEC)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[SCG56-11] Tectonics of the abyssal basins surrounding the Ontong Java Plateau

*Masao Nakanishi[1], Shoka Shimizu[2], Daisuke Suetsugu[3], Takashi Sano[4] (1.Department of Earth Sciences, Graduate School of Science, Chiba University, 2.Department of Earth Sciences, Graduate School of Science and Technology, Chiba University, 3. Department of Deep Earth Structure and Dynamics Research, Japan Agency for Marine-Earth Science and Technology, 4.Department of Geology and Paleontology, National Museum of Nature and Science)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[SCG56-12] **The Cretaceous Normal Superchron: records from the Pacific, Indian and Atlantic oceanic crust**

*Nobukazu Seama[1,2], Jerome Dyment[3], Taichi Sato[4,5], Yves Gallet[6], Kyoko Okino[7], Roi Granot[8], Yoshifumi Nogi[9], Nobutatsu Mochizuki[10], Toshitsugu Yamazaki[7] (1.Department of Planetology, Kobe University, 2.KOBEC (Kobe Ocean-Bottom Exploration Center), Kobe University, 3.Institut de Physique du Globe de Paris, 4.National Institute of Advanced Industrial Science and Technology, 5.The Institute for Geoscience Research (TIGeR), Curtin University , 6.French Centre National de la Recherche Scientifique, 7.Atmosphere and Ocean Research Institute, The University of Tokyo, 8.Department of Geological and Environmental Sciences, Ben-Gurion University, 9.National Institute of Polar Research, 10.Priority Organization for Innovation and Excellence, Kumamoto University)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-CG56] Ocean Floor Geosciences

convener:Kyoko Okino(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:Chie Honsho, Tadashi Ishikawa

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[SCG56-13] Offshore Postseismic Deformation of the 2011 Tohoku Earthquake Revisited: Application of an Improved GPS-Acoustic Positioning Method Considering Sloping Sound Speed Structure

*Chie Honsho[1], Motoyuki Kido[2], Fumiaki Tomita[3], Naoki Uchida[1] (1.Research Center for Prediction of Earthquakes and Volcanic Eruptions, Graduate School of Science, Tohoku University, 2.International Research Institute of Disaster Science, Tohoku University, 3.Graduate School of Science, Hokkaido University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[SCG56-14] Comprehensive analysis for the forearc structure and dynamics by using the S-net data

*Naoki Uchida[1], Ryosuke Azuma[1], Akira Ishigami[1], Tomomi Okada[1], Ryota Takagi[1], Genti Toyokuni[1], Norihito Umino[1], Yusaku Ohta[1], Makiko Sato[1], Syuichi Suzuki[1], Hidenobu Takahashi[1], Kazuya Tateiwa[1], Dapeng Zhao[1], Takashi NAKAYAMA[1], Akira Hasegawa[1], Ryota Hino[1], Satoshi Hirahara[1], Toru Matsuzawa[1], Keisuke Yoshida[1] (1.Research Center for Prediction of Earthquakes and Volcanic Eruptions Graduate School of Science, Tohoku University)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[SCG56-15] Shallow slow slip event inferred from GNSS-A seafloor geodesy

*Tadashi Ishikawa[1], Yusuke Yokota[2] (1.Hydrographic and Oceanographic Department, Japan Coast Guard, 2.Institute of Industrial Science, the University of Tokyo)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[SCG56-16] Assessing strike-slip motion at the Shionomisaki Canyon along the Nankai oblique subduction zone using acoustic ranging system

*Motoyuki Kido[1], Eiichiro Araki[2], Takeshi Tsuji[3], Ryusuke Yamamoto[4], Yoshifumi Kawada[1] (1.International Research Institute for Disaster Science, Tohoku University, 2.JAMSTEC, 3.Dept. Earth Resources Engineering, Kyushu University, 4.School of Science, Tohoku University)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[SCG56-17] Development of seafloor realtime observation network for crustal deformation in the Nankai Trough: tiltmeter installation

*Eiichiro Araki[1], Takashi Yokobiki[1], Toshinori Kimura[1], Shuhei Nishida[1], Yuya Machida[1], Shuichi Kodaira[1] (1.Japan Agency for Marine-Earth Science and Technology)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[SCG56-18] Calibration of the DONET pressure sensor network in the Nankai trough seismogenic zone using a mobile pressure gauge

*Yuya Machida[1], Shuhei Nishida[1], Toshinori Kimura[1], Eiichiro Araki[1] (1.Japan Agency for Marine-Earth Science and Technology)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | A05 TOKYO BAY MAKUHARI HALL

[S-CG56] Ocean Floor Geosciences

convener:Kyoko Okino(Atmosphere and Ocean Research Institute, The University of Tokyo), Chairperson:Misae Imano, Tetsuo No

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[SCG56-19] Analysis of GNSS/Acoustic geodetic data including the period of the transponder replacement

*Ikuta Ryoya[1], Koto Mizuno[1], Horng-Yue Chen[3], Masataka Ando[2], Takeru Komi[1] (1.Faculty of Science, Shizuoka University, 2.Center for Integrated Research and Education of Natural Hazards, Shizuoka University, 3.Institute of Earth Science, Academia Sinica)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[SCG56-20] IPR (Indirect Path Ranging): a new approach for long-distance acoustic ranging with a moored relay node

*Ryusuke Yamamoto[1], Ryota Hino[1], Motoyuki Kido[2] (1.Graduate School of Science, Tohoku University, 2.International Research Institute of Disaster Science, Tohoku University)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[SCG56-21] Development of a kinematic GNSS-A positioning method using the extended Kalman-filter to detect precise vertical displacement

*Fumiaki Tomita[1], Motoyuki Kido[2], Chie Honsho[3], Ryo Matsui[3] (1.Graduate School of Science, Hokkaido University, 2.International Research Institute of Disaster Science, Tohoku University, 3.Graduate School of Science, Tohoku University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[SCG56-22] DOP-based accuracy evaluation of GNSS-A positioning on a drifting moored buoy quantified using sea trial observation data

*Misae Imano[1], Motoyuki Kido[2,3], Chie Honsho[3], Yusaku Ohta[3], Ryota Hino[3] (1.Graduate School of Science, Tohoku University, 2.nternational Research Institute for Disaster Science, Tohoku University, 3.Reserch Center for Prediction of Earthquakes and Volcanic Eruptions Graduate School of Science, Tohoku University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[SCG56-23] Analysis for GNSS/acoustic ocean bottom crustal deformation considering the heterogeneity of sound speed structure in ocean

*Natsuki Kinugasa[1], Keiichi Tadokoro[1], Yukihiro Terada[2], Teruyuki Kato[3] (1.Graduate School of Environmental Studies, Nagoya University, 2.National Institute of Technology, Kochi College, 3.Hot Springs Research Institute of Kanagawa Prefectural Government)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[SCG56-24] Seismic imaging using ocean bottom nodes in the Ishikari Basin, Japan Sea

*Tetsuo No[1], Takeshi Sato[1], Shuichi Kodaira[1], Satoshi Shimizu[2], Tetsuya Yokota[2], Karl Hosgood[3], Masako Robb[3], Tetsuro Tsuru[4] (1.JAMSTEC, 2.Nippon Marine Enterprises, 3.Emerson E&P Software, 4.Tokyo University of Marine Science and Technology)

[J] Oral | S (Solid Earth Sciences)：S-CG Complex & General

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 304 3F

[S-CG62] Potentiality of Machine Learning in Solid Earth Sciences

convener:Takahiko Uchide(Research Institute of Earthquake and Volcano Geology, Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST)), Hirokuni Oda(Institute of Geology and Geoinformation, Geological Survey of Japan, AIST), Chairperson:Takahiko Uchide(Geological Survey of Japan, AIST), Hirokuni Oda

9:00 AM - 9:20 AM JST | 12:00 AM - 12:20 AM UTC

[SCG62-01] The Promise of Machine Learning in Solid Earth Geoscience: Examples from Seismology

★Invited Papers

*Gregory C Beroza[1], Mostafa Mousavi[1], Weiqiang Zhu[1], Karianne J Bergen[2], Paul A Johnson[3], Maarten V De Hoop[4] (1.Stanford University, 2.Harvard University, 3.Los Alamos National Laboratory, 4.Rice University)

9:20 AM - 9:35 AM JST | 12:20 AM - 12:35 AM UTC

[SCG62-02] **Automatic Approach to Low-Frequency Earthquakes Detection in Southwest Japan Based on Deep Learning Technique**

*Yu Junyu[1], Yuji Yagi[1], Takanori Matsuzawa[2], Ryo Okuwaki[1] (1.Graduate School of Life and Environmental Sciences,University of Tsukuba, Tsukuba, 2.National Research Institute for Earth Science and Disaster Resilience)

9:35 AM - 9:50 AM JST | 12:35 AM - 12:50 AM UTC

[SCG62-03] Broadband ground motion waveform synthesis utilizing AI-based upsampling technique (2)

*Takahiro Maeda[1], Asako Iwaki[1], Hiroyuki Fujiwara[1], Kazutoshi Matsuzaki[2], Hiromitsu Tomozawa[2], Yuji Mori[2], Misato Tsuchiya[2], Naofumi Miyata[2] (1.National Research Institute for Earth Science and Disaster Resilience, 2.Mizuho Information & Research Institute, Inc.)

9:50 AM - 10:05 AM JST | 12:50 AM - 1:05 AM UTC

[SCG62-04] Forecast trial of postseismic deformetion after the 2011 Tohoku-Oki earthquake by recurrent neural network

*Norifumi Yamaga[1], Yuta Mitsui[2] (1.Graduate School of Science and Technology, Shizuoka University, 2.Shizuoka University)

10:05 AM - 10:25 AM JST | 1:05 AM - 1:25 AM UTC

[SCG62-05] Deep Learning Approaches for Eruption Prediction of Sakurajima

★Invited Papers

*Tsuyoshi Murata[1] (1.Tokyo Institute of Technology)

[J] Poster | S (Solid Earth Sciences)：S-CG Complex & General

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_21

[S-CG62] Potentiality of Machine Learning in Solid Earth Sciences

convener:Takahiko Uchide(Research Institute of Earthquake and Volcano Geology, Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST)), Hirokuni Oda(Institute of Geology and Geoinformation, Geological Survey of Japan, AIST)

[SCG62-P01] Earthquake Magnitude Prediction with Seismic Nucleation Phase based on Machine Learning

*Kangming Wu[1], Hiroe Miyake[2] (1.GSII, The University of Tokyo, 2.III, The University of Tokyo)

[SCG62-P02] Automatic signal classification for continuous seismic waveform records based on an unsupervised learning algorithm: Application to artificial noises and low-frequency tremors

*Yuki Kodera[1], Shin'ichi Sakai[2], Takahito Nishimiya[1] (1.Meteorological Research Institute, Japan Meteorological Agency, 2.Earthquake Research Institute, the University of Tokyo)

[SCG62-P03] Detection of Gas Bubble signals recorded at the OBS Stations by Machine-Learning

*emmy TY CHANG[1] (1.Institute of Oceanography, National Taiwan University)

[SCG62-P04] Automatic Phase Picking of Seismograms by Deep Neural Network

*Takahiko Uchide[1] (1.Research Institute of Earthquake and Volcano Geology, Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology (AIST))

[SCG62-P05] **Seismic event detection in time-frequency domain with CNN and phase picking with HED**

*Liping Fan[1] (1.Institute of Geophysics, China Earthquake Administration)

[SCG62-P06] Broadband ground-motion synthesis using embeddig machine learning

*Tomohisa Okazaki[1], Hirotaka Hachiya[1], Naonori Ueda[1], Asako Iwaki[2], Takahiro Maeda[2], Hiroyuki Fujiwara[2] (1.Center for Advanced Intelligence Project, RIKEN, 2.National Research Institute for Earth Science and Disaster Resilience)

[SCG62-P07] LSTM and CNN Applications to Forecast Earthquake Magnitude Probability Distribution

*Qi Liu[1], Hiroe Miyake[2], Hiroshi Tsuruoka[3] (1.GSII, The University of Tokyo, 2.III, The University of Tokyo, 3.ERI, The University of Tokyo)

[SCG62-P08] *FORCsensei*: A machine learning framework to estimate optimized first-order reversal curve distributions

David Heslop[1,2], Andrew Roberts[1,2], *Hirokuni Oda[2], Xiang Zhao[1,2], Richard Harrison[3], Adrian Muxworthy[4], Pengxiang Hu[1,2], Tetsuro Sato[2] (1.Australian National University, 2.Institute of Geology and Geoinformation, Geological Survey of Japan, AIST, 3.University of Cambridge, 4.Imperial College London)

[E] Oral | B (Biogeosciences) : B-PT Paleontology

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 201A 2F

[B-PT04] Biomineralization and the Geochemistry of Proxies

convener:Takashi Toyofuku(Japan Agency for Marine-Earth Science and Technology (JAMSTEC)), Hiroshi Kitazato(Tokyo University of Marine Science and Technology (TUMSAT)), Jelle Bijma(Alfred-Wegener-Institut Helmholtz-Zentrum f?r Polar- und Meeresforschung), Kotaro Hirose(Faculty of Science & Engineering, Waseda University), Chairperson:Kotaro Hirose(Waseda University School of Creative Science and Engineering), Takashi Toyofuku

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[BPT04-01] Long term size changes of the Middle Miocene planktonic foraminifera in the eastern equatorial Pacific

★Invited Papers

*Takuma Suzuki[1], Hiroki Hayashi[1] (1.Shimane University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[BPT04-02] Mathematical models for the geochemical composition of foraminiferal calcium carbonate

*Jelle Bijma[1], Dieter Wolf-Gladrow[1] (1.Alfred-Wegener-Institut Helmholtz-Zentrum für Polar- und Meeresforschung)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[BPT04-03] Response of structurally substituted sulfur in foraminifera shells to glacial-interglacial changes: a 1.0-million-year record from the Ontong-Java Plateau

*Toshihiro Yoshimura[1], Yusuke Tamenori[2], Junichiro Kuroda[3], Azumi Kuroyanagi[4], Naohiko Ohkouchi[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.Japan Synchrotron Radiation Research Institute, 3.Atmosphere and Ocean Research Institute, The University of Tokyo, 4.Tohoku University Museum, Tohoku University)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[BPT04-04] Transcript assembly and quantification identify candidate genes for foraminiferal calcification

*Yurika Ujiie[1], Yoshiyuki Ishitani[2], Shun'ichi Ishii[3], Yukiko Nagai[3], Yoshihiro Takaki[3], Tetsuro Ikuta[3], Takashi Toyofuku[3] (1.Center for Advanced Marine Core Research, Kochi University, 2.Center for Computational Sciences, University of Tsukuba, 3.Japan Agency for Marine-Earth Science and Technology)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[BPT04-05] Characterization of cogwheel structures in foraminifera

★Invited Papers

*Inge van Dijk[1], Markus Raitzsch[2], Gernot Nehrke[1], Jelle Bijma[1] (1.Alfred-Wegener-Institut Helmholtz-Zentrum für Polar- und Meeresforschung, Am Handelshafen 12, Bremerhaven 27570, Germany, 2.MARUM - Zentrum für Marine Umweltwissenschaften, Universität Bremen, Leobener Str., 28359 Bremen, Germany)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[BPT04-06] Benthic foraminiferal characterizations from the seascape point of view

*Hiroshi Kitazato[1] (1.Tokyo University of Marine Science and Technology (TUMSAT))

[E] Oral | B (Biogeosciences)：B-PT Paleontology

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 201A 2F

[B-PT04] Biomineralization and the Geochemistry of Proxies

convener:Takashi Toyofuku(Japan Agency for Marine-Earth Science and Technology (JAMSTEC)), Hiroshi Kitazato(Tokyo University of Marine Science and Technology (TUMSAT)), Jelle Bijma(Alfred-Wegener-Institut Helmholtz-Zentrum f?r Polar- und Meeresforschung), Kotaro Hirose(Faculty of Science & Engineering, Waseda University), Chairperson:Jelle Bijma(AWI), 北里 洋

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[BPT04-07] Skeleton microstructures of aposymbiotic scleractinian coral cultured in seawater with various Mg/Ca ratios

*Satoko Motai[1], Naotaka Tomioka[1], Jun Kawano[2], Saki Harii[3], Takaya Nagai[2], Tsuyoshi Watanabe[2], Yu Kodama[4], Motoo Ito[1] (1.Japan Agency for Marine-Earth and Technology, 2.Hokkaido University, 3.University of the Ryukyus, 4.Marine Works Japan)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[BPT04-08] Skeletal formation of scleractinian corals in response to Mg/Ca fluctuation

*Tomihiko Higuchi[1], Ikuko Yuyama[2] (1.Atmosphere and Ocean Research Institute, The University of Tokyo, 2.University of Tsukuba)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[BPT04-09] **Inter-specific variations in trace element concentrations of modern brachiopod shells collected from Otsuchi Bay, Japan**

*Takuya Nishio[1], Hideko Takayanagi[1], Ryuji Asami[1], Ryuichi Shinjo[2], Koshi Yamamoto[3], Yasufumi Iryu[1] (1.Institute of Geology and Paleontology, Graduate School of Science, Tohoku University, 2.Graduate School of Engineering and Science, University of the Ryukyus, 3.Graduate School of Environmental Studies, Nagoya University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[BPT04-10] Trace element concentrations of sub-tropical modern brachiopod *Basiliola lucida* collected off Okinawa-jima, Japan

*Hideko Takayanagi[1], Tomoko Tochigi[1], Ryuji Asami[1], Ryuichi Shinjo[2], Takuya Itaki[3], Yasufumi Iryu[1] (1.Tohoku University, 2.University of the Ryukyus, 3.Advanced Industrial Science and Technology (AIST))

11:45 AM - 12:05 PM JST | 2:45 AM - 3:05 AM UTC

[BPT04-11] Structural difference between phaeodarians and radiolarians (unicellular zooplankton)

★Invited Papers

*Yasuhide Nakamura[1], Rie Hori, S.[2], Akihiro Tuji[1], Hiroaki Ohfuji[2], Noritoshi Suzuki[3], Katsunori Kimoto[4] (1.National Museum of Nature and Science, 2.Ehime University, 3.Tohoku University, 4.JAMSTEC)

[MIS01-P04] Analysis and prediction of hazardous hydrometeorological phenomena in the coastal areas of the Arctic

*Irina Repina[1,2] (1.A.M.Obukhov Institute of Atmospheric Physics RAS, 2.Lomonosov Moscow State University)

[MIS01-P05] Recent baric and climatic conditions over East Europe with a focus on Belarus

*Irina Danilovich[1], Vladimir Loginov[1], Pavel Groisman[2] (1. Institute for Nature Management National Academy of Science, Minsk, Belarus, 2. NC State University at NOAA National Centers for Environmental Information, Asheville, USA)

[MIS01-P06] Assessment of climatic and environmental conditions along the track of projected Kyzyl-Kuragino railway line (the Western Sayan Mountains)

★Invited Papers

*Aleksandra Alekseevna Mikheeva[1], Margarita Syromyatina[1], Yurii Kurochkin[1] (1.Institute of Earth Sciences, Saint Petersburg State University, Russia)

[MIS01-P07] Assessment of interlinkages among industrialization, climate change, and forest fire activity: Thematic study of the Republic of Sakha (Yakutia), Russia

*Kiunnei Kirillina[1], Wanglin Yan[1] (1.Graduate School of Media and Governance, Keio University SFC)

[MIS01-P08] Quantitative Evaluation of Winter Daily Precipitation over Northern Japan

*Minami Masuda[1], Akiyo Yatagai[1], Toshiyuki Nakaegawa[2], Kenji Kamiguchi[3] (1.Graduate School of Science and Technology, Hirosaki University, 2.Meteorological Research Institute/Japan Meteorological Agency, 3.Japan Meteorological Agency)

[MIS01-P09] Seasonal variation of wetland carbon dioxide and methane fluxes measured by automatic chambers at the Bakchar bog, West Siberia

*Shamil Maksyutov[1], Alexandre Fofonov[2], Denis Davydov[2], Oleg Krasnov[2], Tadanobu Nakayama[1], Mikhail Glagolev[3] (1.National Institute for Environmental Studies, 2.V.E. Zuev Institute of Atmospheric Optics, 3.M.V. Lomonosov Moscow State University)

[MIS01-P10] Climatic distances between origin and labor locations for migrants in a changing climate in Siberia by the end of the 21st century

*Elena I. Parfenova[1], Nadezhda M. Tchebakova[1] (1.V.N.Sukachev Institute of Forest SB RAS, FRC SB RAS)

[E] Poster | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_40

[M-IS01] Environmental, socio-economic and climatic changes in Northern Eurasia

convener:Pavel Groisman(NC State University Research Scholar at NOAA National Centers for Environmental Information, Asheville, North Carolina, USA), Shamil Maksyutov(National Institute for Environmental Studies), Evgeny P Gordov(Institute of Monitoring of Climatic and Ecological Systems SB RAS), Dmitry A Streletskiy(George Washington University)

[MIS01-P01] Effects of clear-cutting on carbon dioxide fluxes in a boreal forest ecosystem - results of numerical experiments with a three-dimensional turbulent exchange model

Yulia Mukhartova[3], Maria Dyachenko[3], Polina Mangura[3], Alexander Krupenko[3], *Alexander Olchev[1,2] (1.Faculty of Geography, Lomonosov Moscow State University, 2.A.N. Severtsov Institute of Ecology and Evolution, Russian Academy of Sciences, 3.Faculty of Physics, Lomonosov Moscow State University)

[MIS01-P02] Retrieving the forest species composition from remote sensing data using a three-dimensional radiative transfer model

*Alexander Olchev[1,2], Natalia Levashova[3], Dmitry Lukyanenko[3] (1.Faculty of Geography, Lomonosov Moscow State University , 2.Severtsov Institute of Ecology and Evolution, Russian Academy of Science, 3.Faculty of Physics, Lomonosov Moscow State University)

[MIS01-P03] Satellite-derived Burned Area for Siberia (1979 – 2000)

*Amber Jeanine Soja[1], Brian J. Stocks[2], Stefano Potter[3], Brendan Rogers[3], Donald R. Cahoon[4], Natasha Jurko[5], Susan G. Conard[6], William 'Bill' deGroot[5], Nadezhda Tchebakova[7] (1.National Iinstitute of Aerospace / NASA Langley Research Center, 2.B.J. Stocks Wildfire Investigations Ltd., 3.Woods Hole Research Center , 4.Terra Systems Research, 5.Canadian Forest Service/Service canadien des forêts, 6.George Mason University,Fairfax, VA, 7.Sukachev Institute of Forestry, Siberian Branch of the Russian Academy of Sciences)

[MIS01-P04] Analysis and prediction of hazardous hydrometeorological phenomena in the coastal areas of the Arctic

*Irina Repina[1,2] (1.A.M.Obukhov Institute of Atmospheric Physics RAS, 2.Lomonosov Moscow State University)

[MIS01-P05] Recent baric and climatic conditions over East Europe with a focus on Belarus

*Irina Danilovich[1], Vladimir Loginov[1], Pavel Groisman[2] (1. Institute for Nature Management National Academy of Science, Minsk, Belarus, 2. NC State University at NOAA National Centers for Environmental Information, Asheville, USA)

[MIS01-P06] Assessment of climatic and environmental conditions along the track of projected Kyzyl-Kuragino railway line (the Western Sayan Mountains)

★Invited Papers

*Aleksandra Alekseevna Mikheeva[1], Margarita Syromyatina[1], Yurii Kurochkin[1] (1.Institute of Earth Sciences, Saint Petersburg State University, Russia)

[MIS01-P07] Assessment of interlinkages among industrialization, climate change, and forest fire activity: Thematic study of the Republic of Sakha (Yakutia), Russia

*Kiunnei Kirillina[1], Wanglin Yan[1] (1.Graduate School of Media and Governance, Keio University SFC)

[MIS01-P08] Quantitative Evaluation of Winter Daily Precipitation over Northern Japan

*Minami Masuda[1], Akiyo Yatagai[1], Toshiyuki Nakaegawa[2], Kenji Kamiguchi[3] (1.Graduate School of Science and Technology, Hirosaki University, 2.Meteorological Research Institute/Japan Meteorological Agency, 3.Japan Meteorological Agency)

[MIS01-P09] Seasonal variation of wetland carbon dioxide and methane fluxes measured by automatic chambers at the Bakchar bog, West Siberia

*Shamil Maksyutov[1], Alexandre Fofonov[2], Denis Davydov[2], Oleg Krasnov[2], Tadanobu Nakayama[1], Mikhail Glagolev[3] (1.National Institute for Environmental Studies, 2.V.E. Zuev Institute of Atmospheric Optics, 3.M.V. Lomonosov Moscow State University)

[MIS01-P10] Climatic distances between origin and labor locations for migrants in a changing climate in Siberia by the end of the 21st century

*Elena I. Parfenova[1], Nadezhda M. Tchebakova[1] (1.V.N.Sukachev Institute of Forest SB RAS, FRC SB RAS)

[E] Oral | M (Multidisciplinary and Interdisciplinary) : M-IS Intersection

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 304 3F

[M-IS01] Environmental, socio-economic and climatic changes in Northern Eurasia

convener:Pavel Groisman(NC State University Research Scholar at NOAA National Centers for Environmental Information, Asheville, North Carolina, USA), Shamil Maksyutov(National Institute for Environmental Studies), Evgeny P Gordov(Institute of Monitoring of Climatic and Ecological Systems SB RAS), Dmitry A Streletskiy(George Washington University), Chairperson:Shamil Maksyutov(National Institute for Environmental Studies, Japan), Pavel Groisman(NC State University, USA), Yoshihiro Iijima(Mie University, Japan)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[MIS01-01] **Progress and Opportunities in Measurement and Modeling of Arctic Carbon Cycling under a Changing Climate**

★Invited Papers

*Qianlai Zhuang[1], Narasinha Shurpali[2], Torsten Sachs[3] (1.Purdue University, 2.University of Eastern Finland, 3.Helmholtz Centre Potsdam GFZ German Research Centre for Geosciences)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[MIS01-02] Potential climate change effects on biosystems in Siberia by the 2100s predicted from CMIP5

*Nadezhda Tchebakova[1], Elena Parfenova[1], Amber J Soja[2] (1.Sukachev Institute of Forests, Federal Research Center KSC, Siberian Branch, Russian Academy of Sciences, 2.National Institute of Aerospace, NASA Langley Research Center,)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[MIS01-03] Climate Change and Permafrost Degradation in Northern Eurasia: Geographic Impact Assesment

*Dmitry A Streletskiy[1] (1.George Washington University)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[MIS01-04] **Effects of deforestation of boreal forests on atmospheric fluxes and weather conditions at the local and regional scales**

*Alexander Olchev[1,2], Vadim Mamkin[2], Inna Rozinkina[3], Yulia Mukhartova[4], Mikhail Nikitin[3], Ekaterina Tatarinovich[3], Julia Kurbatova[2] (1.Lomonosov Moscow State University, Faculty of Geography , 2.A.N. Severtsov Institute of Ecology and Evolution, Russian Academy of Sciences, 3.Hydrometeorological Research Center of Russian Federation, 4.Lomonosov Moscow State University, Faculty of Physics)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[MIS01-05] **Changes in mountain glacier systems and the distribution of main climatic parameters on the territory of Russia (XX -XXI century)**

*Tatiana Khromova[1], Gennady Nosenko[1], Valeria Popova[1], Anton Muraviev[1], Stanislav Nikitin[1] (1.Institute of Geography Russian Academy of Sciences)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[MIS01-06] Projection of changes in water balance components across irrigated lands of Central Asia using a high-resolution modeling system

*Anastasiia Pikaleva[1], Ekaterina Nadyozhina[1], Alexandra Sternzat[1], Boris Egorov[1], Sergey Efimov[1], Igor Shkolnik[1] (1.Voeikov Main Geophysical Observatory)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 304 3F

[M-IS01] Environmental, socio-economic and climatic changes in Northern Eurasia

convener:Pavel Groisman(NC State University Research Scholar at NOAA National Centers for Environmental Information, Asheville, North Carolina, USA), Shamil Maksyutov(National Institute for Environmental Studies), Evgeny P Gordov(Institute of Monitoring of Climatic and Ecological Systems SB RAS), Dmitry A Streletskiy(George Washington University), Chairperson:Dmitry Streletskiy(George Washington University), Pavel Groisman(NC State University, USA), Tetsuya Hiyama(Nagoya University, Japan)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[MIS01-07] **Rises and Falls of the Socioeconomic-Ecological Systems along the Silk Road**

★Invited Papers

*Jiquan Chen[1], Zutao Ouyang[1], Changliang Shao[2], Ranjeet John[1], Geoffrey M Henebry[1], Pavel Groisman[3] (1.Center for Global Changes and Earth Observation, Department of Geography, Environment, and Spatial Sciences, Michigan State University, 2.Institute of Agricultural Resources and Regional Planning, Chinese Academy of Agricultural Sciences, 3.NC State University Research Scholar, NOAA National Centers for Environment Information)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[MIS01-08] **Interdisciplinary study of the mountain geosystems in the Altay-Sayan region**

*Margarita Syromyatina[1], Yurii Kurochkin[1], Mariia Andreeva[1], Kirill Chistyakov[1] (1.Institute of Earth Sciences, Saint Petersburg State University, Russia)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[MIS01-09] Where in High Mountain Pastures does Snow Seasonality Link Most Closely with Subsequent Land Surface Phenology?

*Geoffrey M Henebry[1], Monika A Tomaszewska[2] (1.Michigan State University, 2.South Dakota State University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[MIS01-10] Evaluation of orographic precipitation over Central Asia and its simulated change under a warming environment

*Akiyo Yatagai[1], Ayano Senda[1], Minami Masuda[1], Vinay Kumar[2] (1.Graduate School of Science and Technology/Hirosaki University, 2.Texas A&M University)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[MIS01-11] The impact factor of surface spectral albedo in an arid area

*Jiaxi Yang[1], Zhenchao Li[2], Xiaoqing Gao[2], Panmao Zhai[3] (1.University of Chinese Academy of Sciences, 2.Key Laboratory of Land Surface Process and Climate Change in Cold and Arid Regions, Cold and Arid Regions Environmental and Engineering Research Institute, CAS, Lanzhou, China, 3.Chinese Academy of Meteorological Sciences)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[MIS01-12] **Northern Eurasia Future Initiative (NEFI) Focus on Human-Associated Extreme Events**

*Pavel Groisman[1,2,3], Alexander Shiklomanov[4], Irina Yesserkepova[5], Sergey Gulev[2], Ildan Kaipov[6] (1. NC State University Research Scholar at NOAA National Centers for Environmental Information, Asheville, North Carolina, USA, 2. Shirshov Institute of Oceanology, Russian Academy of Sciences, Moscow, Russia , 3. Hydrology Science and Services Corporation, Asheville, North Carolina, USA, 4. University of New Hampshire, Durham, New Hampshire, USA , 5.Joint Stock Company "Zhasyl Damu", Almaty, Kazakhstan, 6. National Center for Space Research and Technologies, Almaty, Kazakhstan)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

9:00 AM - 10:30 AM JST | 12:00 AM - 1:30 AM UTC | 301B 3F

[M-IS24] Integrated Analysis of Geoscience Observations from the Floor to Surface of the Ocean

convener:Keisuke Ariyoshi(Japan Agency for Marine-Earth Science and Technology), Motoyuki Kido(International Research Institute for Disaster Science, Tohoku University), Daisuke Inazu(Tokyo University of Marine Science and Technology), Narumi Takahashi(National Research Institute for Earth Science and Disaster Resilience), Chairperson:Keisuke Ariyoshi, Motoyuki Kido

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[MIS24-01] Meteorological Observations at Shionomisaki in cooperation with “Chikyu”, Shinsei-maru and Seisui-maru

*Akira Kuwano-Yoshida[1], Keisuke Ariyoshi[2], Kosei Komatsu[3], Yoshihiro Tachibana[4], Mikiko Fujita[2], Masato I. Nodzu[5], Hatsumi Nishikawa[10], Yoshimi Kawai[2], Naoki Kishita[6], Lyndon Mark Olaguera[5], MIHARU KUBO[8], Kentaro Hase[7], Yuya Matsuyama[6], Minami Masuda[9], Kenta Irie[11], Tetsuji Yoshida[10], Yusuke Watanabe[7], Kosuke Matsuda[12], Syunsuke Aoki[7], Shingo Watanabe[2], Akira Kurisu[13], Shota Yamasaki[7], Hidetaka Hirata[14], Shizuka Akiyama[7], Yoshinori Shigeta[15], Akira Miyata[15], Kai Matsubara[15], Yoshitaka Tada[15], Yasushi Watarai[16], Yusuke Nakamura[16] (1.Disaster Prevention Research Institute, Kyoto University, 2.Japan Agency for Marine-Earth Science and Technology, 3.Graduate School of Frontier Sciences, The University of Tokyo, 4.Faculty of Bioresources, Mie University,, 5.Tokyo Metropolitan University, 6.Kyushu University, 7.Kyoto University, 8.University of The Ryukyus, 9.Hirosaki University, 10.Hokkaido University, 11.Tokyo Gakugei University, 12.Tokyo University of Marine Science and Technology, 13.Okayama University, 14.Nagoya University, 15.Tottori University of Environmental Studies, 16.Rissho University)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[MIS24-02] GNSS-A data analysis to estimate the sound speed profile

*Tadashi Ishikawa[1], Yusuke Yokota[2], Shun-ichi Watanabe[1] (1.Hydrographic and Oceanographic Department, Japan Coast Guard, 2.Institute of Industrial Science, the University of Tokyo)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[MIS24-03] Comparison of Ocean Bottom Pressure Observation Timeseries with Result of Real Ocean Estimating Models around the Pacific Rim Earthquake Zone

*Yoichiro Dobashi[1], Daisuke Inazu[2] (1.Tokyo University of Marine Science and Technology, 2.Tokyo University of Marine Science and Technology department of marine resouces and energy)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[MIS24-04] Experimental challenges for interpretation of in-situ observation of bottom pressure recorders (BPRs) at the seafloor

★Invited Papers

*Hiroyuki Matsumoto[1], Toshinori Kimura[1], Shuhei Nishida[1], Yuya Machida[1], Eiichiro Araki[1] (1.Japan Agency for Marine-Earth Science and Technology (JAMSTEC))

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[MIS24-05] Continuous bottom pressure observation by real-time buoy system for tsunami and crustal displacement

*Narumi Takahashi[1], Kentaro Imai[2], Motoyuki Kido[3], Yusaku Ohta[3], Tatsuya Fukuda[2], Yasuhisa Ishihara[2], Hiroshi OCHI[2], Kensuke Suzuki[2], Ryota Hino[3] (1.National Research Institute for Earth Science and Disaster Resilience, 2.Japan Agency for Marine-Earth Science and Technology, 3.Tohoku Univerisity)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[MIS24-06] Looking into the ocean and Earth’s interior from their boundary

★Invited Papers

*Yoshio Fukao[1] (1.CEAT / Japan Agency for Marine-Earth Science & Technology)

[J] Poster | M (Multidisciplinary and Interdisciplinary)：M-IS Intersection

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_25

[M-IS24] Integrated Analysis of Geoscience Observations from the Floor to Surface of the Ocean

convener:Keisuke Ariyoshi(Japan Agency for Marine-Earth Science and Technology), Motoyuki Kido(International Research Institute for Disaster Science, Tohoku University), Daisuke Inazu(Tokyo University of Marine Science and Technology), Narumi Takahashi(National Research Institute for Earth Science and Disaster Resilience)

[MIS24-P01] **A simultaneous observation from seafloor to atmosphere by using “Chikyu” and DONET**

*Keisuke Ariyoshi[1], Takeshi Iinuma[1], Shuhei Nishida[1], Yuya Machida[1], Yasumasa Miyazawa[1], Toru Miyama[1], Hiroshi Uchida[1], Akira Nagano[1], Masahide Wakita[1], Mikiko Fujita[1], Tatsu Kuwatani[1], Amane Fujiwara[1], Katsunori Kimoto[1], Yoshiyuki Nakano[1], Yoshimi Kawai[1], Kaoru Ichikawa[2], Takuya Hasegawa[5], Akira Kuwano-Yoshida[3], Akiko Toh[4] (1.Japan Agency for Marine-Earth Science and Technology, 2.Kyusyu University, 3.Kyoto University, 4.The University of Tokyo, 5.Tohoku University)

[MIS24-P02] Spatio-temporal variation of water pressure on the sea bottom in the Kuroshio region south of Kii Peninsula

*Kosei Komatsu[1,2], Akira Kuwano-Yoshida[3], Keisuke Ariyoshi[4] (1.Graduate School of Frontier Sciences, The University of Tokyo, 2.Atmosphere and Ocean Research Institute, The University of Tokyo, 3.Disaster Prevention Research Institute, Kyoto University, 4.Japan Agency for Marine-Earth Science and Technology)

[MIS24-P03] GPS-A measurement considering the existence of internal gravity wave

*Motoyuki Kido[1], Ryo Matsui[2], Yoshihiro Niwa[3], Chie Honsho[2] (1.International Research Institute for Disaster Science, Tohoku University, 2.School of Science, Tohoku University, 3.Ocean Alliance, the University of Tokyo)

[MIS24-P04] Measurement of precipitable water vapor using small and lightweight microwave radiometer

*Masahiro Minowa[1], Shigeaki Okumura[1], Shuhei Inoue[1], Yuya Takashima[1], Akira Kuwano-Yoshida[2], Satoru Oishi[3], Toshikazu Onishi[4], Hideo Ogawa[4] (1.FURUNO ELECTRIC CO., LTD., 2.Kyoto Univ., 3.Kobe Univ., 4.Osaka Pref. Univ.)

[MIS24-P05] Observation Across the Large-meander Path of the Kuroshio South of Japan by a Saildrone

★Invited Papers

*Akira Nagano[1], Kentaro Ando[1] (1.Japan Agency for Marine-Earth Science and Technology (JAMSTEC))

[MIS24-P06] Variations in ocean bottom pressure associated with the retreat of the Oyashio current off the southeastern coast of Hokkaido, Japan

*Takuya Hasegawa[1], Akira Nagano[2], Hiroyuki Matsumoto[2], Keisuke Ariyoshi[2], Masahide Wakita[2] (1.Tohoku University, 2.JAMSTEC)

[MIS24-P07] Detection of seafloor crustal deformation from ocean bottom pressure data after applying amplitude corrections on non-tidal components in Hikurangi subduction margin

*Tomohiro Inoue[1], Tomoya Muramoto[2], Daisuke Inazu[3], Yoshihiro Ito[4], Ryota Hino[5], Kazuaki Ohta[4], Syuichi Suzuki[5] (1.Kyoto University, 2.National Institute of Advanced Industrial Science and Technology, 3.Tokyo University of Marine Science and Technology, 4.Disaster Prevention Research Institute, 5.Tohoku University)

[M-GI31] Open Science in Action: Research Data Sharing, Infrastructure, Transparency, and International Cooperation

convener:Yasuhiro Murayama(Strategic Program Produce Office, National Institute of Information and Communications Technology), Yasuhisa Kondo(Research Institute for Humanity and Nature), Shelley Stall(American Geophysical Union), Baptiste Cecconi(LESIA, Observatoire de Paris, CNRS, PSL Research University), Chairperson:Yasuhiro Murayama(NICT)

9:00 AM - 9:15 AM JST | 12:00 AM - 12:15 AM UTC

[MGI31-01] WDS: International Coordination for Sustainable FAIR Data, for Science and Society

*Yasuhiro Murayama[1] (1.Strategic Program Produce Office, National Institute of Information and Communications Technology)

9:15 AM - 9:30 AM JST | 12:15 AM - 12:30 AM UTC

[MGI31-02] Japan Data Repository Network (JDARN): Community-based activities for improving the trustworthiness of data repositories

*Asanobu Kitamoto[1,2,4], Hiroko Kinutani[3] (1.National Institute of Informatics, 2.ROIS-DS Center for Open Data in the Humanities, 3.EDITORIA, The University of Tokyo, 4.SOKENDAI)

9:30 AM - 9:45 AM JST | 12:30 AM - 12:45 AM UTC

[MGI31-03] Data Sharing and Open Science: Practice, Expectation, Transparency, and Credit

*Shelley Stall[1] (1.American Geophysical Union)

9:45 AM - 10:00 AM JST | 12:45 AM - 1:00 AM UTC

[MGI31-04] Ethical issues in open science

*Yasuhisa Kondo[1] (1.Research Institute for Humanity and Nature)

10:00 AM - 10:15 AM JST | 1:00 AM - 1:15 AM UTC

[MGI31-05] The perspective of Open Science with consideration of the gap between the Integrated Innovation Strategy and the current state of scholarly communication

*Kazuhiro Hayashi[1] (1.National Institute of Science and Technology Policy)

10:15 AM - 10:30 AM JST | 1:15 AM - 1:30 AM UTC

[MGI31-06] Future evolution of open archives for preprints, posters, and presentations as a key component of open science in the Earth and space sciences

*Brooks Hanson[1] (1.American Geophysical Union)

[E] Oral | M (Multidisciplinary and Interdisciplinary)：M-GI General Geosciences, Information Geosciences & Simulations

10:45 AM - 12:15 PM JST | 1:45 AM - 3:15 AM UTC | 302 3F

[M-GI31] Open Science in Action: Research Data Sharing, Infrastructure, Transparency, and International Cooperation

convener:Yasuhiro Murayama(Strategic Program Produce Office, National Institute of Information and Communications Technology), Yasuhisa Kondo(Research Institute for Humanity and Nature), Shelley Stall(American Geophysical Union), Baptiste Cecconi(LESIA, Observatoire de Paris, CNRS, PSL Research University), Chairperson:Shelley Stall(American Geophysics Union)

10:45 AM - 11:00 AM JST | 1:45 AM - 2:00 AM UTC

[MGI31-07] Cloud Computing Needs for Earth Observation Data Analysis: EGI and the European Open Science Cloud

★Invited Papers

Björn Backeberg[1], Yin Chen[1], *Tiziana Ferrari[1], Pedro Gonçalves[4], Paolo Mazzetti[3], Anabela Oliveira[2], Diego Scardaci[1], Gergely Sipos[1] (1.EGI Foundation, 2.LNEC, 3.CNR, 4.Terradue)

11:00 AM - 11:15 AM JST | 2:00 AM - 2:15 AM UTC

[MGI31-08] Open third generation geostationary satellites accelerate environmental studies: Case studies of CEReS, Chiba University, Japan

*Atsushi Higuchi[1,3], Koichi Toyoshima[1], Hitoshi Hirose[1], Hideaki Takenaka[2,1] (1.Center for Environmental Remote Sensing (CEReS), Chiba University, Japan, 2.EORC, JAXA, 3.NICT)

11:15 AM - 11:30 AM JST | 2:15 AM - 2:30 AM UTC

[MGI31-09] Scientific data chain for better data publication and preservation

*Takeshi Horinouchi[1] (1.Faculty of Environmental Earth Science, Hokkaido University)

11:30 AM - 11:45 AM JST | 2:30 AM - 2:45 AM UTC

[MGI31-10] Current status and problems of geodetic observation data distribution

*Toshimichi Otsubo[1], Yusuke Yokota[2], Tadashi Ishikawa[3], Mamoru Sekido[4], Takayuki Miyazaki[5], Shinobu Kurihara[5] (1.Hitotsubashi University, 2.Institute of Industrial Science, the University of Tokyo, 3.Hydrographic and Oceanographic Department, Japan Coast Guard, 4.National Institute of Information and Communications Technology, 5.Geospatial Information Authority of Japan)

11:45 AM - 12:00 PM JST | 2:45 AM - 3:00 AM UTC

[MGI31-11] Recent activity of data publication and data citation in the international community of geomagnetism

*Masahito Nose[1], Yasuhiro Murayama[2] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.Strategic Program Produce Office, National Institute for Information Communications Technology)

12:00 PM - 12:15 PM JST | 3:00 AM - 3:15 AM UTC

[MGI31-12] IGSN: International Collaboration Makes Samples and Sample Data FAIR

*Kerstin Lehnert[1], Jens Klump[2], Lesley Wyborn[3], Sarah Ramdeen[4] (1.Columbia University, 2.CSIRO Kensington, Australia, 3.Australian National University, Canberra, Australia, 4.Ronin Institute, USA)

[E] Poster | M (Multidisciplinary and Interdisciplinary)：M-GI General Geosciences, Information Geosciences & Simulations

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_7

[M-GI31] Open Science in Action: Research Data Sharing, Infrastructure, Transparency, and International Cooperation

convener:Yasuhiro Murayama(Strategic Program Produce Office, National Institute of Information and Communications Technology), Yasuhisa Kondo(Research Institute for Humanity and Nature), Shelley Stall(American Geophysical Union), Baptiste Cecconi(LESIA, Observatoire de Paris, CNRS, PSL Research University)

[MGI31-P01] Open Science, Community Science, and AGU's Thriving Earth Exchange.

*Shelley Stall[1], Raj Pandya[1] (1.American Geophysical Union)

[MGI31-P02] RDUF (Research Data Utilization Forum): an arena for community discussion of international and regional research data sharing and management

Hideaki Takeda[2], *Yasuhiro Murayama[1], RDUF secretary office[3] (1.Strategic Program Produce Office, National Institute of Information and Communications Technology, 2.National Institute of Informatics, 3.Japan Science and Technology Agency)

[MGI31-P03] Query string-controlled web service for sharable and reproducible data visualization of earth, planetary and space sciences

*Koji Imai[1], Yasuhiro Murayama[1] (1.National Institute of Information and Communications Technology)

[MGI31-P04] Development of ground pipeline system for high-level scientific data products of the Hisaki satellite mission and its application to planetary space weather

*Tomoki Kimura[1], Atsushi Yamazaki[2], Kazuo Yoshioka[3], Go Murakami[2], Fuminori Tsuchiya[4], Hajime Kita[2], Chihiro Tao[5], Ichiro Yoshikawa[3], Atsushi Kumamoto[6], Yamauchi Chisato[7] (1.Frontier Research Institute for Interdisciplinary Sciences, Tohoku University, 2.Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 3.Department of Complexity Science and Engineering, University of Tokyo, 4.Planetary Plasma and Atmospheric Research Center, Tohoku University, 5.National Institute of Information and Communications Technology, 6.Space and Terrestrial Plasma Physics Laboratory, Tohoku University, 7.Misato Observatory)

[MGI31-P05] Recent activities of the IUGONET for accelerating the integrated solar terrestrial science

*Shuji Abe[1], Yoshimasa Tanaka[2], Norio Umemura[3], Atsuki Shinbori[3], Satoru UeNo[4], Masahito Nose[3] (1.International Center for Space Weather Science and Education, Japan, 2.National Institute of Polar Research, 3.Institute for Space-Earth Environmental Research, Nagoya University, 4.Kwasan & Hida Observatories, School of Science, Kyoto University)

[MGI31-P06] Attempt for Research Data Sharing and Citation in context of Open Science - Sharing Atmospheric MF Radar Observation Database as a Case Study

*Isoda Fusako[1], Yasuhiro Murayama[1], Koji Imai[1] (1.National Institute of Information and Communications Technology)

[MGI31-P07] A case example of sharing meteor radio observational data by small laboratory

*Yukinobu Koyama[1], Yusuke Miyanari[1] (1.National Institute of Technology, Oita College)

[MGI31-P08] Promotion of an Open-Science Activity of the Earth Science - Coordinated Observations and Data Analyses of meteor-associated Low-Frequency Radio Emission and Anomalous Hearing

*Takashi Watanabe[1] (1.ISC World Data System International Programme Office)

[MGI31-P09] Current status of minting DOIs for research data in JAMSTEC

*Kazuyo Fukuda[1], Hajime Kawakami[1], Tomoki Sasaki[1], Hiroki Horikawa[1], Hideaki Saito[1], Chizuru Saito[1], Sonoda Akira[1] (1.Japan Agency for Marine-Earth Science and Technology)

[MGI31-P10] Application of Web and GIS Technology to Develop Military's Differential Action Information Platform

*Chien Hao Chang[1], Ch Yu Liu[1], Chun Ta Wei[1] (1.Department of Computer Science and Information Engineering,CCIT)

[E] Poster | M (Multidisciplinary and Interdisciplinary)：M-GI General Geosciences, Information Geosciences & Simulations

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_43

[M-GI31] Open Science in Action: Research Data Sharing, Infrastructure, Transparency, and International Cooperation

convener:Yasuhiro Murayama(Strategic Program Produce Office, National Institute of Information and Communications Technology), Yasuhisa Kondo(Research Institute for Humanity and Nature), Shelley Stall(American Geophysical Union), Baptiste Cecconi(LESIA, Observatoire de Paris, CNRS, PSL Research University)

[MGI31-P01] Open Science, Community Science, and AGU's Thriving Earth Exchange.

*Shelley Stall[1], Raj Pandya[1] (1.American Geophysical Union)

[MGI37-P12] Real-Time Monitoring Technique of Earth Environment via Visual IoT

*Kazunori Yamamoto[1], Ken T. Murata[1], Takamichi Mizuhara[2], Praphan Pavarangkoon[1], Kazuya Muranaga[3], Toshiki Aoki[2] (1.National Institute of Information and Communications Technology, 2.CLEALINK TECHNOLOGY Co., Ltd., 3.Systems Engineering Consultants Co.,LTD.)

[MGI37-P13] International Deployment of real-time web of Himawari (meteorological satellite) data: A case of mirroring to Philippines

Kazuya Muranaga[1], Praphan Pavarangkoon[2], Kazunori Yamamoto[2], *Ken T. Murata[2], Atsushi Higuchi[3] (1.Systems Engineering Consultants Co., LTD., 2.National Institute of Information and Communications Technology, 3.Chiba University)

[MGI37-P14] Visualization of Himawari-8 observation data using high resolution animation: The case studies of CEReS, Chiba University, Japan

*Koichi Toyoshima[1], Atsushi Higuchi[1] (1.Center for Environmental Remote Sensing, Chiba University)

[MGI37-P15] Performance evaluation of inter-node MPI parallel TensorFlow for massive learning data

*Keiichiro Fukazawa[1] (1.Academic Center for Computing and Media Studies, Kyoto University)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-GI General Geosciences, Information Geosciences & Simulations

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 301B 3F

[M-GI37] Earth and planetary informatics with huge data management

convener:Ken T. Murata(National Institute of Information and Communications Technology), Rie Honda(Department of Science and Technology, System of Natual Science, Kochi University), Susumu Nonogaki(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Takeshi Horinouchi(Faculty of Environmental Earth Science, Hokkaido University), Chairperson:Susumu Nonogaki, Ken Murata(National Institute of Information and Communications Technology)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[MGI37-01] Exploration of the earth environment using meteorological satellite "Himawari"

*ryuta ando[1], Shigeto Watanabe[1], Ken T. Murata[2] (1.Hokkaido Information University, 2.National Institute of Information and Communications Technology)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[MGI37-02] Kochi radar network composed of compact X-band radars

*Koji Sassa[1], Toshiaki Takaki[2], Ken T Murata[3] (1.Natural Science Cluster, Kochi University, 2.Furuno Electric Co.,Ltd., 3.National Institute of Information and Communication Technology)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[MGI37-03] Rain Echo Classification by Deep Learning Using Observation Big Data of Phased Array Weather Radar

*Shinsuke Satoh[1], Hiroshi HANADO[1], Seiji Kawamura[1], Tomohiko Konno[1], Michiaki Iwazume[1], Shigenori Otsuka[2], Takemasa Miyoshi[2] (1.National Institute of Information and Communications Technology, 2.RIKEN Center for Computational Science)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[MGI37-04] Communication area map of LoRa in Chikuma city using community bus services

*Kohei Mizuani[1], Ken T. Murata[1], Yoshiaki Muroyama[1], Kazunori Yamamoto[1], Kazuya Muranaga[2], Takamichi Mizuhara[3], Praphan Pavarangkoon[1] (1.National Institute of Information and Communications Technology, 2.Systems Engineering Consultants Co., LTD., 3.CLEALINK TECHNOLOGY Co.,Ltd.)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[MGI37-05] Development of an inexpensive and small balloon observation device, and its application in observing the Earth's upper atmosphere

*Taku Takada[1], Yui Sasaoka[1], Shiya Ueta[1], Ken T. Murata[2], Hidehiko Suzuki[3] (1.National Institute of Technology, Kochi College, 2.National Institute of Information and Communications Technology, 3.Meiji University)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-GI General Geosciences, Information Geosciences & Simulations

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 301B 3F

[M-GI37] Earth and planetary informatics with huge data management

convener:Ken T. Murata(National Institute of Information and Communications Technology), Rie Honda(Department of Science and Technology, System of Natual Science, Kochi University), Susumu Nonogaki(Geological Survey of Japan, National Institute of Advanced Industrial Science and Technology), Takeshi Horinouchi(Faculty of Environmental Earth Science, Hokkaido University), Chairperson:Rie Honda, Ken Murata(National Institute of Information and Communications Technology)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[MGI37-06] Introduction of “ChOWDER”: A tiled display driver that augment large scale visualization of geoscience.

*Tomohiro Kawanabe[1], Kenji Ono[2], Atsushi Higuchi[3], Koichi Toyoshima[3], Kazunori Yamamoto[4], Kazuya Muranaga[5], Ken T. Murata[4] (1.RIKEN , 2.Kyushu Univ., 3.Chiba Univ., 4.NICT, 5.Systems Engineering Consultants Co.,LTD.)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[MGI37-07] Data archive and integrated data analysis tools developed by ERG Science Center

*Tomoaki Hori[1], Yoshizumi Miyoshi[1], Masafumi Shoji[1], Mariko Teramoto[1], Tzu-Fang Chang[1], Satoshi Kurita[1], Shoya Matsuda[2], Yasunori Tsugawa[1], Tomonori Segawa[1], Norio Umemura[1], Nozomu Nishitani[1], Takako Kondo[1], Hiroyasu Yonaha[1], Yukinaga Miyashita[3], Kunihiro Keika[4], Kanako Seki[4], Yoshimasa Tanaka[5], Iku Shinohara[2] (1.Institute for Space-Earth Environmental Research, Nagoya University, 2.Japan Aerospace Exploration Agency / Institute of Space and Astronautical Science, 3.Korea Astronomy and Space Science Institute, 4.Graduate School of Science, The University of Tokyo, 5.National Institute of Polar Research)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[MGI37-08] KOSEN-1 CubeSat mission for Jupiter's radio science

*Kazumasa Imai[1], Nobuto Hirakoso[2], Taku Takada[1], Kentarou Kitamura[3], Masafumi Imai[4], KOSEN-1 Team[5], Charles A. Higgins[6], James R. Thieman[7], NASA Radio JOVE Team[8] (1.Department of Social Design Engineering, National Institute of Technology, Kochi College, 2.Department of Mechanical Engineering, National Institute of Technology, Gunma College, 3.Department of Mechanical and Electrical Engineering, National Institute of Technology, Tokuyama College, 4.University of Iowa, 5.KOSEN-1 Team, 6.Middle Tennessee State University, 7.University of Maryland Baltimore County, 8.NASA Radio JOVE Team)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[MGI37-09] Problems of acquisition of auroral image data and data processing

*Ryuho Kataoka[1], Ken T. Murata[2], Yoshizumi Miyoshi[3], Herbert Akihito Uchida[1], Yoko Fukuda[4], Atsushi Yamashita[5], Masayuki Tanaka[6] (1.National Institute of Polar Research, 2.National Institute of Information and Communication Technology, 3.Nagoya University, 4.National Institute for Environmental Studies, 5.The University of Tokyo, 6.Tokyo Institute of Techonology)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[MGI37-10] Innovative progress in ground observation of snow crystals and weather conditions by citizen science

★Invited Papers

*Kentaro Araki[1] (1.Meteorological Research Institute)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[MGI37-11] Efforts of landslide susceptibility mapping for slope disaster risk evaluation

*Kazunori Hayashi[1], Akihiko Wakai[2], Go Sato[3], Takashi Kimura[4], Ken T. Murata[5], Akino Watanabe [2] (1.Okuyama Boring Co., Ltd., 2.Gunma University, 3.Teikyo Heisei University, 4.National Research Institute for Earth Science and Disaster, 5.National Institute of Information and Communications Technology)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-AG Applied Geosciences

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | 302 3F

[M-AG41] Dynamics of radionuclides emitted from Fukuchima Dai-ichi Nuclear Power Plant in the environment

convener:Yoshio Takahashi(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Kazuyuki Kita(Faculty of Science, Ibaraki University), Yuichi Onda(Center for Research on Isotopes and Environmental Dynamics, University of Tsukuba), Daisuke Tsumune(Central Research Institute of Electric Power Industry), Chairperson:Yoshio Takahashi(東京大学), Yuichi Onda(Center for Research on Isotopes and Environmental Dynamics, University of Tsukuba)

1:45 PM - 2:00 PM JST | 4:45 AM - 5:00 AM UTC

[MAG41-01] Investigation on basic physical and chemical properties of radio-Cs micro particles

*Yasuhito Igarashi[1], Kazuyuki Kita[2], Yukihiko Satou[3], Tomoaki Okuda[4], Yoshinari Abe[5], Keisuke Sueki[6], SHINOHARA ATSUSHI[7], Kazuhiko Ninomiya[7], Tsutomu Ohtshuki[1], Koichi Takamiya[1] (1.Institute for Integrated Radiation and Nuclear Science, Kyoto University, 2.Graduate School of Science and Engineering, Ibaraki University, 3.Collaborative Laboratories for Advanced Decommissioning Science, Japan Atomic Energy Agency, 4.Department of Applied Chemistry, Keio University, 5.Faculty of Science,Tokyo University of Science, 6.Center for Research in Isotopes and Environmental Dynamics, University of Tsukuba, 7.Graduate School of Science, Osaka University)

2:00 PM - 2:15 PM JST | 5:00 AM - 5:15 AM UTC

[MAG41-02] Dynamics of radioactive microparticles released from the Fukushima nuclear plant: heating and dissolution characteristics

★Invited Papers

*Taiga Okumura[1], Noriko Yamaguchi[2], Terumi Dohi[3], Kenso Fujiwara[3], Kazuki Iijima[3], Toshihiro Kogure[1] (1.The University of Tokyo, 2.National Agriculture and Food Research Organization, 3.Japan Atomic Energy Agency)

2:15 PM - 2:30 PM JST | 5:15 AM - 5:30 AM UTC

[MAG41-03] Dynamics of atmospheric ^{131}I just after the Fukushima accident related to ^{137}Cs by analysis of published data

*Haruo Tsuruta[1], Yuichi Moriguchi[2], Teruyuki Nakajima[3] (1.Remote Sensing Technology Center of Japan, 2.The University of Tokyo, 3.Japan Aerospace Exploration Agency)

2:30 PM - 2:45 PM JST | 5:30 AM - 5:45 AM UTC

[MAG41-04] Distribution of ^{237}Np and Plutonium isotope in terrestrial environment in Fukushima Prefecture

*Miho Fukuda[1], Zheng Jian[1], yamazaki Shinnnosuke[1], Tatsuo Aono[1] (1.National Institute for Quantum and Radiological Science and Technology, National Institute of Radiological Science)

2:45 PM - 3:00 PM JST | 5:45 AM - 6:00 AM UTC

[MAG41-05] Study on deposition of ^{134}Cs and ^{137}Cs from atmosphere to freshwater environment using a mountainous lake, Lake Haruna in Gunma Prefecture, Japan

*Seiya Nagao[1], Shouhei Miyasaka[2], Shun Watanabe[3], Kyuma Suzuki[3], Shinya Ochiai[1] (1.Institute of Nature and Environmental Technology, Kanazawa University, 2.Graduate School of Natural Science and Technology, Kanazawa University, 3.Gunma Prefectural Fisheries Experimental Station)

3:00 PM - 3:15 PM JST | 6:00 AM - 6:15 AM UTC

[MAG41-06] Spatial variability of radiocesium deposition through the tree canopy via branchflow and stemflow

*Zul Hilmi Saidin[1], Yuichi Onda[2], Hiroaki Kato[2], Momo Kurihara[2], Kazuki Nanko[3], Delphis F. Levia[4] (1.Graduate School of Life and Environmental Sciences, University of Tsukuba, Tsukuba, Ibaraki, Japan, 2.Center for Research in Isotopes and Environmental Dynamics, University of Tsukuba, Tsukuba, Ibaraki, Japan, 3.Department of Disaster Prevention, Meteorology and Hydrology, Forestry and Forest Products Research Institute, Tsukuba, Ibaraki, Japan, 4.Departments of Geography, University of Delaware, Newark, Delaware, USA)

[J] Oral | M (Multidisciplinary and Interdisciplinary)：M-AG Applied Geosciences

3:30 PM - 5:00 PM JST | 6:30 AM - 8:00 AM UTC | 302 3F

[M-AG41] Dynamics of radionuclides emitted from Fukuchima Dai-ichi Nuclear Power Plant in the environment

convener:Yoshio Takahashi(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Kazuyuki Kita(Faculty of Science, Ibaraki University), Yuichi Onda(Center for Research on Isotopes and Environmental Dynamics, University of Tsukuba), Daisuke Tsumune(Central Research Institute of Electric Power Industry), Chairperson:Kazuyuki Kita(Ibaraki University), Daisuke Tsumune(Central Research Institute of Electric Power Industry)

3:30 PM - 3:45 PM JST | 6:30 AM - 6:45 AM UTC

[MAG41-07] Temporal changes in vertical distributions of radiocesium in forest soils after the FDNPP accident

★Invited Papers

*Junko Takahashi[1], Daichi Hihara[1], Takuya Sasaki[1], Yuichi Onda[1] (1.Center for Research in Isotopes and Environmental Dynamics, University of Tsukuba)

3:45 PM - 4:00 PM JST | 6:45 AM - 7:00 AM UTC

[MAG41-08] Change of sediment sources in suspended sediments due to surface decontamination in the Niida river catchment area affected by the Fukushima Daiichi nuclear power plant accident

*Yuichi Onda[1], Yuki Yamanaka[1], Yoshifumi Wakiyama[2], Keisuke Taniguchi[3], Takaaki Kubo[1] (1.Center for Research on Isotopes and Environmental Dynamics, University of Tsukuba, 2.Institute of Environmental Radioactivity, Fukushima University, 3.Fukushima Prefectural Centre for Environmental Creation)

4:00 PM - 4:15 PM JST | 7:00 AM - 7:15 AM UTC

[MAG41-09] Neasrshore transport of suspended radiocesium In the Fuksima Coast derived from Niida River induced by Typhoon Wipha

*Natsuki Tokunaga[1], Yusuke Uchiyama[1], Daisuke Tsumune[2], Masatoshi Yamada[5], Yutaka Tateda[2], Yukari Ito[3], Takashi Ishimaru[3], Yutaka Watanabe[7], Ken Ikehara[4], Miho Fukuda[6] (1.Kobe University, 2.Central Research Institute of Electric Power Industry, 3.Tokyo University of Marine Science and Technology, 4.National Institute of Advanced Industrial Science and Technology, 5.Hirosaki University, 6.National Institute of Radiological Sciences, 7.Hokkaido University)

4:15 PM - 4:30 PM JST | 7:15 AM - 7:30 AM UTC

[MAG41-10] Particle size distribution and radiocesium concentration in suspended particles within the high turbidity layer at near sea bottom off Fukushima prefecture

*Hideki Kaeriyama[1], Naoki Furuichi[2], Kouichi Sugimatsu[3], Yuya Shigenobu[1], Shizuho Miki[1], Takami Morita[1], Daisuke Ambe[1], Tadafumi Ichikawa[1] (1.National Research Institute of Fisheries Science, Japan Fisheries Research and Education Agency, 2.National Research Institute of Fisheries Engineering, Japan Fisheries Research and Education Agency, 3.Seikai National Research Institute, Japan Fisheries Research and Education Agency)

4:30 PM - 4:45 PM JST | 7:30 AM - 7:45 AM UTC

[MAG41-11] Fukushima-derived radiocesium in the subarctic region of the North Pacific Ocean in the summer of 2017

★Invited Papers

*Yuichiro Kumamoto[1], Michio Aoyama[2], Yasunori Hamajima[3], Akihiko Murata[1] (1.Japan Agency for Marine-Earth Science and Technology, 2.Fukushima University, 3.Kanazawa University)

4:45 PM - 5:00 PM JST | 7:45 AM - 8:00 AM UTC

[MAG41-12] **Temporal and spatial variations of radiocaesium in the East China Sea and Sea of Japan until 2018**

*Michio Aoyama[1], Yayoi Inomata[2], Yasunori Hamajima[2] (1.Institute of Environmnetal Radioactivity, Fukushima University, 2.Institute of Nature and Environmental Technology, Kanazawa University)

[J] Poster | M (Multidisciplinary and Interdisciplinary)：M-AG Applied Geosciences

5:15 PM - 6:30 PM JST | 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_46

[M-AG41] Dynamics of radionuclides emitted from Fukuchima Dai-ichi Nuclear Power Plant in the environment

convener:Yoshio Takahashi(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Kazuyuki Kita(Faculty of Science, Ibaraki University), Yuichi Onda(Center for Research on Isotopes and Environmental Dynamics, University of Tsukuba), Daisuke Tsumune(Central Research Institute of Electric Power Industry)

[MAG41-P01] Discovering U particle with Zr from CsMP emitted from Unit 1 of FDNPP using synchrotron radiation X-ray analyses

*Hikaru Miura[1], Yuichi Kurihara[2], Masayoshi Yamamoto[3], Aya Sakaguchi[4], Kazuya Tanaka[2], Shogo Higaki[5], Yoshio Takahashi[5] (1.Central Research Institute of Electric Power Industry, 2.JAEA, 3.University of Kanazawa, 4.University of Tsukuba, 5.The University of Tokyo)

[MAG41-P02] Atmospheric re-emission of radio-cesium with bioaerosols and trial for estimateing their emission flux

★Invited Papers

*Kazuyuki Kita[1], Naho Hayashi[1], Koutaro Minami[1], Mao Kimura[1], Yasuhito Igarashi[1,7], Kouji Adachi[2], Teruya Maki[3], Atsuyuki Sorimachi[4], Ishizuka Masahide[5], Jun Furukawa[6], Kazuhiko Ninomiya[8], Atsushi Shinohara[8], Olivier Masson[9] (1.Graduate School of Science and Engineering, Ibaraki University, 2.Meteorological Research Laboratory, 3.Kanazakwa University, 4.Fukushima Medical Univeristy, 5.Kagawa University, 6.Tsukuba University, 7.Kyoto University, 8.Osaka University, 9.IRSN)

[MAG41-P03] The effect of canopy interception processes on radiocesium and dissolved matter concentrations in throughfall

*Tomoki Shinozuka[1], Hiroaki Kato[2], Satoru Akaiwa[1], Yuichi Onda[2] (1.College of Geoscience, School of Life and Environmental Sciences, University of Tsukuba, 2.Center for Research in Isotopes and Environmental Dynamics, University of Tsukuba)

[MAG41-P04] Effects of RCs concentration and dissolved organic matter on RCs migration in soil under flowing condition

*Takahiro Tatsuno[1], Shoichiro Hamamoto[1], Naoto Nihei[1], Taku Nishimura[1] (1.Deptartment of Biological and Environmental Engineering, Graduate School of Agricultural and Life Sciences, University of Tokyo)

[MAG41-P05] Behavior of dissolved radiocesium in the decay degree of organic matter of deciduous broad-leaved trees

*Yoshito Sasaki[1], Tadafumi Niizato[1], Katsuaki Mitachi[2], Satomi Ito[1], Takayoshi Watanabe[1] (1.Japan Atomic Energy Agency , 2.ATOM TRANSPORT SERVICE CO., LTD)

[MAG41-P06] Effect of Coarse Organic Matter on the Dissolved Radioactive Cesium Concentration in Stream Water from headwater catchment

*Satoru Akaiwa[1], Hiroaki Kato[2], Tomoki Shinozuka[1], Yuichi Onda[2] (1.College of Geoscience, School of Life and Environmental Sciences, University of Tsukuba, 2.Center for Research on Isotopes and Environmental Dynamics, University of Tsukuba)

[MAG41-P07] Eight-year monitoring study of radiocesium transfer in forest environments after the FDNPP accident

*Hiroaki Kato[1], Yuichi Onda[1], Zul Hilmi Saidin[1], Momo Kurihara[1], Tomoki Shinozuka[2], Satoru Akaiwa[2] (1.Center for Research in Isotopes and Environmental Dynamics, University of Tsukuba, 2.College of Geoscience, School of Life and Environmental Sciences, University of Tsukuba)

[MAG41-P08] Seasonal change of radiocaesium and its factor in the forest catchment contaminated by the Fukushima Dai-ichi Nuclear Power Station Accident

★Invited Papers

*Shota Kambayashi[1], Tatsuo Aono[1], Hiroki Hamajima[1], Hiroyuki Takahashi[1], Mitsuru Yamamura[2], Yutaka Yamada[1] (1.National Institute of Radiological Sciences, National Institutes for Quantum and Radiological Science and Technology, 2.Japan Conservation Engineers & Co.,LTD Inc.)

[MAG41-P09] Research of discharge radioactive Cs-bearing microparticles from a small forested catchment

*Satoshi Hadano[1], Shoichiro Hamamoto[1], Naoto Nihei[1], Taiga Okumura[1], Toshihiro Kogure[1], Taku Nishimura[1] (1.The University of Tokyo)

[MAG41-P10] Estimating impacts of direct release and riverine discharge on oceanic ^{137}Cs derived from the Fukushima Dai-ichi Nuclear Power Plant accident by an regional ocean model

★Invited Papers

*Daisuke Tsumune[1], Tsubono Takaki[1], Kazuhiro Misumi[1], Yutaka Tateda[1], Yuichi Onda[2], Michio Aoyama[3] (1.Central Research Institute of Electric Power Industry, 2.Center for Research in Isotopes and Environmental Dynamics, University of Tsukuba, 3.Institute of Environmental Radioactivity, Fukushima University)

[MAG41-P11] FNPP1 accident derived radiocaesium and tritium in Fukushima coast through the end of 2018

*Michio Aoyama[1], Yasunori Hamajima[2], Yayoi Inomata[2], Yuichiro Kumamoto[3], Tsubono Takaki[4], Daisuke Tsumune[4] (1.Institute of Environmnetal Radioactivity, Fukushima University, 2.Institute of Nature and Environmental Technology, Kanazawa university, 3.Japan Agency for Marine-Earth Science and Technology, 4.Environmental Science Research Laboratory, Central Research Institute of Electric Power Industry)

[MAG41-P12] Radiocesium in the swash zones off the coast of the Japan Sea

*Hyoe Takata[1], Mutsuo Inoue[2], Natsumi Kudo[1], Yuhei Shirotani[1] (1.Marine Ecoloy Research Institute, 2.Kanazawa Univ.)

[MAG41-P13] Numerical simulation of Cs-137 activity in the North Pacific using two atmospheric deposition fluxes estimated by atmospheric chemical transport models

*Tsubono Takaki[1], Kazuhiro Misumi[1], Daisuke Tsumune[1], Michio Aoyama[2], Katsumi Hirose[3] (1.Central Research Institute of Electric Power Industry, 2.Fukushima University, 3.Sophia University)

[MAG41-P14] Seasonal deposition of radiocesium in wooden houses from summer to winter seven years after the Fukushima nuclear accident

*Ryo Takakura[1], Katsumi Shozugawa[1], Mayumi Hori[1], Motoyuki Matsuo[1] (1.Graduate school of arts and sciences, the university of Tokyo)

[E] Poster | M (Multidisciplinary and Interdisciplinary)：M-SD Space Development & Earth Observation from Space

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_8

[M-SD42] A new era of international space collaboration using microsatellites

convener:Junichi Kurihara(Graduate School of Science, Hokkaido University), Joel Joseph Jr Marciano(Advanced Science and Technology Institute, Department of Science and Technology, Philippines), Huy Xuan Le(Vietnam National Space Center)

[MSD42-P01] A high spatial resolution multispectral remote sensing by the RISESAT microsatellite

*Junichi Kurihara[1], Toshinori Kuwahara[2], Shinya Fujita[2], Yuji Sakamoto[2], Yukihiro Takahashi[1] (1.Graduate School of Science, Hokkaido University, 2.Graduate School of Engineering)

[MSD42-P02] Initial check out and experiment plan of Very Small Optical Transmitter (VSOTA) on board a micro satellite RISESAT for Space-Ground Optical Communication

*Hiroo Kunimori[1], Hideki Takenaka[1], Toshinori Kuwahara[2], Yuji Sakamoto[2], Shinya Fujita[2], Hannah Tomio[2], MOROKOT SAKAL[2], Junichi Kurihara[3] (1.National Institute of Information and Communications Technology, 2.Tohoku Univ., 3.Hokkaido Univ.)

[MSD42-P03] Ten years history of Tohoku University ground station and operation system for micro and nano satellites

*Yuji Sakamoto[1], Toshinori Kuwahara[1], Shinya Fujita[1] (1.Tohoku University)

[MSD42-P04] Development of Thermal Infrared Sensor Camera on board LAPAN-A4 for Thunderstorm Cloud Observation

*Purwadi Purwadi[1,2], Yukihiro Takahashi[1], Junichi Kurihara[1], M. [U-01] JpGU-AGU-EGU Great Debate: Impact of research assessment and going forward

convener:Kazuaki Hori(Department of Geography, Graduate School of Environmental Studies, Nagoya University), Denis-Didier Rousseau(CNRS - ENS), Jonathan L Bamber(member), Chairperson:Yasuhiro Murayama(NICT)

Research assessment mainly based on indices that can be easily quantified such as the number of papers and citations, impact factor, research grant, is spreading among researchers and institutions. However, as typified by DORA (The Declaration on Research Assessment), there has been a movement to review and improve this situation. In this great debate, we discuss the impact of research assessment on researchers, research institutes, research funding agencies, publishers, and even society, based on the current problems of research assessment.

1:45 PM - 3:15 PM JST | 4:45 AM - 6:15 AM UTC

[U01-01] Panel discussion about research assessment

*Kazuaki Hori[1] (1.Department of Geography, Graduate School of Environmental Studies, Nagoya University)

Panel discussion about research assessment

[U-02] Advancing workplace: progress, challenges and strategies for improvement

convener:Chiaki T. Oguchi(Institute for Environmental Science and Technology, Graduate School of Science and Engineering, Saitama University), Rie Hori, S.(Department of Earth Science, Faculty of Science, Ehime University), Yukihiro Takahashi(Department of Cosmosciences, Graduate School of Science, Hokkaido University), Claudia Jesus-Rydin(European Research Council), Chairperson:Rie Hori, Chiaki Oguchi

We are inviting contributions form participants who is interested or has had personal experience in dealing with diversity issues, such as first-hand reports from role models (researchers at different stages of their carriers), as well as perspective views from leaders of research or educational institutions. We welcome submissions from researchers and students working in Japan, both Japanese and foreign, as well as from JpGU2019 participants from other countries. Contributions to this session will be synthesized to highlight the current state of workplace diversity in Japan, and to develop successful strategies and practices for improvement and maintaining diversity in Geosciences. This session is co-sponsored by the Union Symposium US 4 of EGU 2019 "Promoting and supporting equality of opportunities in geosciences" in order to share and exchange current status information with the EGU / AGU community.

Managing Diversity and Inclusiveness

*Jessica Federman[1]

1. California State University, Dominguez Hills

There is considerable interest in understanding the ways in which diversity can improve work processes and organizational outcomes (Gonzalez & DeNisi, 2009; Homan, Hollenbeck, Humphrey, van Knippenberg, Ilgen, & Van Kleef, 2008) as well as identifying how to attract, retain, and integrate diverse populations in various fields of science (Thomas & Ely, 1996). A promising area of research that's resolved to meet this objective is focused on creating work environments where diverse individuals feel included (Bilimoria, Joy, & Liang, 2008; Roberson, 2006), otherwise known as inclusiveness. The current paper discusses several studies and bodies of work that provide a collection of tools to retain and promote the notion of inclusiveness for underrepresented minorities in geoscience fields and in general, promote diversity in the workplace. The paper focuses on theory and empirical work on inclusiveness, diversity and discrimination in employment and highlights contextual and conceptual tools that address the needs of various fields (including cultural and geographically different environments) and the evolvement and progress of this literature moving forward.

Adina Paytan <apaytan@ucsc.edu> 12:36 PM (0 minutes ago) to me **Where Have All the Women Gone?**

*Adina Paytan[1]

1. University of California Santa Cruz

The representation of women in STEM (*Science, Technology, Engineering and Mathematics*) matters. Diversity in the workforce contributes to creativity, productivity, innovation, and success. The STEM fields in general and Earth Sciences in particular have long been plagued by the under-representation of women. Men tend to dominate in the field, and the numbers of women simply aren't growing the way one would hope. Although women iin most countries earn just over 40% of the bachelor's degrees in the field, they accounted on avarage for just 20% of faculty in 2015, with considerablle differences between countries. The troubling disparity has been attributed to a number of factors; including deeply embedded culture based psychological barriers and failures by elementary and high schools to spark girls' interests in math and science. In colleges, the reasons for high attrition rates of women from STEM majors often cite insufficient support, and a lack of female role models. At the department, college, or institutional level emerging research suggest that a "chilly climate" environment where gender stereotypes, bias and inequality prevail. Lack of mentoring and supportive policies (particularly for work–life balance) also contribute to the "leaky pipeline" a metaphor for the greater likelihood for women to leave STEM fields at every point, from recruitment to attrition after graduation; because of a significant amount of barriers. Institutional changes in policy and structure including increasing awareness and training to reducing bias, along with strategies like implementing mentoring programs and fostering social accountability, are some of the possible solutions. While some progress has been made and we are on the right track there is still a distance to the mark line and mountains to climb along the way.

Gender balance and diversity in the ocean and geosciences: IODP, research cruise, and laboratories

*Natsue Abe[1]

1. R&D Center for Ocean Drilling Science Japan Agency for Marine-Earth Science and Technology

Approximately 600 people from all over the world participated in the workshop in order to prepare scientific targets for the next decade of the Integrated Ocean Drilling Program (IODP) [1] held in Bremen in 2009 [2], of which about 30% were women. Meanwhile, among the 100 participants from Japan, there were only 6 women (6% !!). Why is there a big gap between Japan and other countries? Did this gap shrink over the past 10 years?

My research field is mainly in ocean science now. Female researchers were 17 –33 % of the science parties among my 8 times participations on drilling expeditions. However, even in the United States, people have been straggling to increase female researchers in this field [3]. Our outreach activities always include some contents targeting to female students [4]. Women for one ocean [4] has established among Japanese scientists, and start working and supporting for female workers in the ocean science.

I will talk about the international projects especially in the ocean sciences that I experienced through my career and diversity situation in overseas' research laboratory. Then I would like to have a discussion on why gender balance and diversity are difficult to progress in Japan.

Problem in paternity leave

*Yukihiro Takahashi[1]

1. Department of Cosmosciences, Graduate School of Science, Hokkaido University

I took childcare leave in 1999 and 2004 for half year and three months, respectively. At that time only 75 ppm of men took this leave for more than 3 months. Still only about 5 percent men take it (including very short one) now. There is a list of reasons why they didn’ t take it on the government web page. However, I think one of the most essential reason that cannot appear on such research is the lack of international common sense related to the gender issues.

Challenges in teaching interactive lectures with high student diversity using student response systems

*Thomas Parkner[1], Verena Pietzner[2]

1. University of Tsukuba, 2. University of Oldenburg

Interactive teaching is becoming increasing popular in higher education, as students who engage in the learning process learn more. Student response systems - also called clickers –are an engagement tool, which promotes such interactivity as students increase their engagement in lectures. In a globalizing world, student diversity has become greater in many institutions, while publications on clickers focus on courses with similar student background. In this study, the effect of clickers on the learning climate in lectures with high student diversity is analyzed to differentiate the clicker effect.

A questionnaire was developed containing 29 questions on learning climate categorized in the seven dimensions comprehensibility, opportunity to participate, subject relevance, class participation, willingness to participate, own performance, and satisfaction. In the first session of each lecture, students were asked to describe their ideal geoscience lectures. In the following session set, effects of clickers on learning climate was compared to lectures without clicker usage. Typically three of such sets were evaluated by the students per lecture followed by the final evaluation of the whole lecture. Statistical analyses were performed using the Mann–Whitney U test and Kruskal–Wallis H test.

For each clicker session, the question difficulty was staggered from recall questions, over conceptual understanding questions, over application questions, to critical thinking questions. The clicker sessions were performed at the end of the sessions with question numbers ranging between 7 and 12 questions.

In total 174 students participated in 12 undergraduate geoscience lectures at the University of Tsukuba. In terms of student type, students were classified into degree students in the Integrated Life & Environmental Sciences program in English (with majors in geoscience, biology and agro-biological resource science) from 34 countries with 64.9%, into geoscience in the Japanese program with 14.4%, and into exchange students with 20.7%. 59.4% of the students were female and 40.6% male.

In general, sessions with clicker usage were rated better in all dimensions. Using clicker, students ($n = 806$) feel more satisfied ($U = 71746.5$, $Z = -2.876$, $p = 0.004$), and they ($n = 805$) sense a higher relevance of the topics ($U = 73455.5$, $Z = -2.269$, $p = 0.023$). In addition, they ($n = 786$) think they have more possibilities to actively take part in the lecture ($U = 69468.0$, $Z = -2.446$, $p = 0.014$), and they ($n = 785$) also use this possibility significantly higher than in lectures without clicker ($U = 69432.5$, $Z = -2.403$, $p = 0.016$).

Gender-specific differences for the initial lecture and the usage of clickers became evident. For ideal lectures, student views differed tendentially in three dimensions. For female students ($n=82$), topic relevance is significantly more important ($U = 1717.000$, $Z = -1.903$, $p = 0.057$) than for male students ($n=52$). In addition, the participation of the whole class ($U = 1733.500$, $Z = -1.838$, $p = 0.066$) as well as the own participation ($U = 1763.500$, $Z = -1.697$, $p = 0.090$) is more important for female students. Gender differences were also shown for the usage of clickers. In sessions with clickers, female students ($n=239$) rate the dimensions of comprehension ($U = 14649.500$, $Z = -2.752$, $p = 0.006$) and course participation ($U = 15432.500$, $Z = -2.022$, $p = 0.043$) significantly higher than males ($n =147$). In sessions

©2019. Japan Geoscience Union. All Right Reserved.

without clicker, no gender-specific differences were found.

Comparing degree students enrolled in the English and Japanese program significant differences were identified. Regarding comprehension (U = 5426.500, Z = -2.415, p = 0.016) and own participation (U = 5761.000, Z = -1.799, p = 0.072), the students in the English program (n =235) rated the lectures with clicker better than the students in the Japanese program (n =58). In contrast, the students in the Japanese program rated the possibility to participate (U = 5403.000, Z = -2.157, p = 0.031) as well as the course participation (U = 5352.500, Z = -2.251, p = 0.024) significantly higher. Exchange students were less satisfied when clickers were used, possibly due to the difficulty to answer questions correctly.

These results on the learning climate in lectures with high student diversity indicate the clickers are not a guarantor for positive effects on learning climate. Aligning question difficulty with student level is a challenging task for lectures with high student diversity.

The AGU Ethics and Equity Center: New Resources for Advancing Workplace Excellence

Brooks Hanson[1], Christine McEntee[1], Robin Elizabeth Bell[1], *Billy M Williams[1]

1. American Geophysical Union

Issues associated with ethics, equity and diversity in the Earth and space sciences, including the issue of harassment and its impact on women scientists, are now well known and documented. Building on its earlier work of establishing an updated AGU Ethics Policy which defines harassment as scientific misconduct, the American Geophysical Union (AGU) has taken additional significant steps over the past 12 months to further advance ethics and equity practices, including steps to help prevent harassment. This presentation will highlight the unique role that professional societies can take to help change the culture in science, technology engineering and math (STEM) fields, and the AGU actions and results to-date, including the introduction of a new Ethics and Equity Resource Center, and the establishment of a formal coalition of more than fifty scientific societies in the U.S. to help address harassment and associated issues in science. Progress to date and remaining challenges to advance ethics and equity-related practices, and to track the impact of these changes, will be discussed.

[O-01] Exploring Buratamori - How to make science accessible

convener:Kazutaka Mannen(Hot Springs Research Institute of Kanagawa Prefecture), Takayuki Ogata(Disaster Prevention Research Center for Island Regions, University of the Ryukyus), Chairperson:Takayuki Ogata

Buratamori is a Saturday prime-time TV show of NHK (Japanese public broadcasting). Each episode features geoscience of a region including geography, geology, history and ecology, and local experts host a comedian named Tamori, who has a wide knowledge and a female announcer, who represents ordinary citizen. Such a style of the show has been popular among people in this decade and geoscience experts also highly regard the show. In this session, directors and previous hosts of the show describe its making process from each point of the view. Since the show needs to reach widely, bold simplification of complex scientific context is sometimes unavoidable, and this makes tension between the producers and experts. Through the session, we would like to discuss how the experts can make a simple but adequate explanation for geoscience issues to wide audience.

Lessons from Buratamori –An introduction to the session

*Kazutaka Mannen[1]

1. Hot Springs Research Institute of Kanagawa Prefecture

Buratamori, airing from 7:30 pm on every Saturday, is a TV program broadcasted by NHK (Japanese public broadcast). In the program, local experts on geology, geography and history host a well-known TV talent Tamori and a female announcer and stroll a location to reveal its history and development with them. This program originally started in 2008 as a late-night program featuring areas in Tokyo and its surrounding and won the Geographical Society of Japan Award in 2011. Since 2015, the TV program has been aired in the prime time as the present and began to feature locations all over Japan. After this time, the TV program has won awards from National Geographical Information Authority of Japan, Geological Society of Japan and Japanese Geotechnical Society. As implied from presenters of the awards, the Buratamori is highly recognized by earth scientists in Japan. In this session, we would like to reveal how the program, which satisfies even professional earth scientists, was made from diversified stand points including the TV producer, experts who host the show and the audience. The followings are my schedule and personal impression when I hosted the show.

I have hosted three episodes entitled “Hakone” (aired on April 22, 2017), “Hakone Sekisho (checkpoint)” (May 13, 2017), and “Hot springs in Hakone” (October 6, 2018), as a local geological expert. The preparation process for the episodes aired in 2017 began in the late December 2016 with a phone call from NHK to my office. The crew spent all January in 2017 to gather diverse information of the featuring area. The outlines of the episodes were fixed in the mid-February and I was requested to be the host by the directors. In the early March, the directors presented scripts for the episodes and a rehearsal without Tamori and the announcer was held. The shooting was held in the mid-March. After the filming, I was requested to review the the scripts of narration and animation movies that would be used in the episodes to help audience to understand until 2 weeks before the airing.

The preparation process of the program, which includes intensive information gathering by the crew members and detailed discussion with the experts, were interesting and very impressive for me. The effort made by crew to keep the cast members relax during filming was also impressive.

Recently, chances for scintist to explain his/her research to the taxpayers are increasing. Such a scientist can learn from the TV crews who have several specific capabilities including 1) extensive information gathering, 2) insight that extracts reality of the featuring area, 3) story making to convey the gathered information to the public and 4) efforts to keep the filming location relax and delightful.

On the other hand, the TV program simplifies scientific context boldly and this bothers experts in the show deeply. In my talk, my experience of such simplification will be also presented and discussed briefly.

The history of Buratamori

*Mikio Hayashi[1]

1. Japan Broadcasting Corporation

Development of the program

TV program “Buratamori” (City walking with Tamori’s view) started as a pilot late-night program in December 2008. At that time, NHK (Japan Broadcasting Corporation) had a unit named Program Development. Four members of the unit including the author created the program. The first episode of “Buratamori” was “Harajyuku and Omote-sando”. Even it was aired in the late night, the episode, which deeply read city sceneries looked by many people every day, received a lot of feedbacks from the audience.

Starting as a regular program

After the airing of the pilot version, the program started as a regular series including 15 episodes (October 2009 to Marth 2010) aired from 10:00 pm, each of which was 43 minutes long. Tamori hosted a regular program on NHK for the first time in the 20 years since he had hosted a show named “Watching”. After that, Buratamori had continued as a regular program of a season from October to March for 3 years. During this period, corners named “Delusion CG”, which created imaginal ancient view of a town using computer graphic, and “Buratamo photo studio”, which showed photos taken by Tamori, were popular. In the presentation, the author will show the materials used in the development of the program.

Making of the first Buratamori

The early program looks same as the present style from the audience’s view but there are differences. Most of the experts appeared in the program were researcher of civil engineering especially urban planning, development and renovation. The most significant difference of the making is the walking time by the directors. At that time, “riddle” given to Tamori in the present program does not exist. However, Tamori found “mysterious scenery” in the show and the background of the scenery was explained in the program. Since it was very difficult to find “mysterious scenery” and “topic” in the well-known Tokyo, the directors of the program walked a lot to search them until their shoes literary wearing out.

Present

The present regular broadcast from 19:30 pm every Saturday started from April 2015 has been watched by many people. Buratamori features joy of walking in the city; however, tend to focus on geology a lot recently. The present version continued 5 years. We would like to focus on not only geology but also history, geography, customs and culture depending on episodes to be an attractive TV program that

©2019. Japan Geoscience Union. All Right Reserved.

unlock the secret of city and history of the location.

Keywords: TAMORI, Buratamori

My experience as a geoscientific guide for the NHK-TV program Buratamori

*Masato Koyama[1]

1. Shizuoka Univ.

Buratamori is a popular NHK-TV program featuring a famous talent, Mr. Tamori, who visits various localities and tries to solve subjects about origins of local natural and social sceneries, products, and sightseeing resources. Many geoscientists, biologists, archeologists, historians, and other natural and social scientists appear as guides and lead Mr. Tamori to a final answer for each round of the program. The involving scientists do not only play touring guides but also make much efforts as advisors for selection of localities and contents. They also propose experiments showing natural processes and check scenarios, narration, and explanatory CG animations etc. The author reports experience as one of the geoscientific guides for the Buratamori and considers about how to explain complicated scientific knowledge simply, comprehensibly, and enjoyably.

A Visualized History by Buratamori

*Noriko Matsuda[1]

1. Kyoto Prefectural University

A lecturer is an urban and architectural historian researching history of development and origin of cities from geological, architectural, social and cultural point of view. Backgrounds and circumstances which have had brought the current situation of lands, our dwelling spaces or any other spaces and places related to our life, have being explored through out the research. Essential relationship between lands and human and its fundamental meanings are considered from these studies.
Buratamori sets a question about a location near around the beginning of the show. The question seems to be an easy question to answer so that television viewers and actors can casually imagine a plot of the show whether if he/she is for or against the question.
However, giving an appropriate answer to this “easy” question is actually not an easy thing even for experts. This is not just because the question was created by a production team referenced various fields of academic studies, but also it was intended to allow anyone who have heard the question would associate the phrase with the location. That is to say, the question is well-balanced between academic complexity and popular understandability.
After giving the question, a route of city/land walk is defined by the question. Several experts will describe the place in turn and turn about during the walk. This relay-style description gives plurality or gives diversified observation. Finding an answer to the question in such way is similar to method of field survey. In a field survey, an object that are huge scale things such as cities, mountains or civil engineered structures or a vast scale of time are physically comprehended through our hands, feet or eyes that are literally small human scaled subject.
Therefore, the route or the plot of the show tends to be something that is visually understandable due to its media, a TV show. For example, historical documents, pictures and photos or remains at the site will fulfill a role. On the other hand, things that are not clear at a glance or articles that are historically important requiring complicated description are omitted. Such topics will be examined in the symposium.

The role of experiment in NHK's entertainment / educational program "Buratamori"

*Shintaro Hayashi[1]

1. Akita University Graduate School of Education

What is "Buratamori"?

"Buratamori" is an entertainment / educational program that has been broadcast from NHK(Nippon Hoso Kyokai;Japan Broadcasting Corporation) TV since 2008, and its viewer rating sometimes exceeds 15%. In the program, both Tamori and NHK 's beautiful female announcer are thinking about various questions while walking around various places and discovering various things. Also, the program progresses according to the question of the guiding person. Something related to geology and geography often appears in the question, and it exerts a great effect on outreach of earth science. I appeared as the main guide person of "# 81 Towada Lake and Oirase: Why did Towada Lake become a mysterious lake?".

Guide person's responsibility

The Guide person of "Buratamori" is responsible for the scientific accuracy of the program.In order to guarantee the accuracy of the program, the guidance person takes a lot of time to investigate. In the case of a speaker, I referred to more than 100 books and papers related to Towada Lake and Oirase gorge. In addition to this, the guiding person also attends work of the location and rehearsals, to ensure the accuracy of the program.

Experiment in "Buratamori"

In the program of "Buratamori", experiments are often used as a means of explanation. In the program of "# 81 Towada Lake and Oirase: Why did Towada Lake become a mysterious lake?", I explained how to make Lake Caldera using cocoa and condensed milk.

Requirements for experiment to be adopted in "Buratamori"?

Actually, there are many experiments which were not adopted in the program. One example is "water cooled fractured lava experiment". I suggested it twice in other programs of "Buratamori", but both were rejected.Probably the reason for rejecting "water-cooled fractured lava experiment" is 1) it is not visual, 2) the materials such as glass and water are not very impressive.

"Buratamori" and outreach

Outreach activities in the field of earth science are important in three points: 1) acquisition of research funding; 2: training of successors; 3: recognition by the general public (Kamada, 2004). For that reason, it is necessary for scientists to transmit the results obtained by earth science in an easy-to-understand manner.

There are two outreaching effects of "Buratamori" . Firstly, "Buratamori" has a high viewer rating and outreach to many citizens is possible. Secondly, educational effect on scientists is great. Scientists learn how to make the program easier from the director.

Becoming a guide person of "Buratamori" is to use a lot of energy and time. However, as there is a large outreach effect, researchers should respond positively.

Keywords: "Buratamori", experiment, outreach

An attempt of field work for middle and high school students to comprehend an “area” in an integrated manner

*Takeshi Uemura[1], Shigeyuki Yokoi[2]

1. Osaka Prefectural Otemae Senior High School part-time course, 2. Kaijo Junior and Senior High School

In the school education, things in our daily life and society are subdivided into subjects to study. Specialized teachers teach in the classes of middle and high schools and students tend to attend a class passively. However, the real things are mixture of contents dealt in various subjects. To solve emerging problems in our society, we need an ability to cooperate perseveringly with people having various background.

Based on this perspective, the authors launched a course named “General Field Exercise” for students between third-year of middle school and second year of high school. Approximately 15 students voluntarily attended the course, which lasted for two years. In this course, we focused on an “area” as the study target. Participants who have various background explore the “area” to comprehend the “area” in an integrated manner. Teachers of various subjects including earth science, Japanese history, Japanese language and etc. in charge of the course tried to study with the students from their point of view. Before going out to the “area”, teachers and students had a discussion in the classroom to share targets to solve in the “area”. Based on the proposals and preferences of the students, we set “area” and made contents of the course. The first “area” set in the course was Shinagawa, where is adjacent of the school and the Shinagawa’s religious connection led us city of Fuchu where we had three excursions. During the summer break, we went Osaka to have a field excursion of three days and two nights.

In Osaka, we walked around the Uemachi Hills to watch its morphology and historical heritages and visited Shitenoji temple, which have a history longer than 1400 years. On the approach to the temple, the earth-science teacher explained the relationship with fault activity that uplifted the Uemachi Hills and a slope seen in west of the approach. After that, the teacher of Japanese history led students to watch historical building and a monument of Ansei Tokai Earthquake and tsunami (1854) in the temple. The monument was built by townspeople of the area to commemorate victims of the earthquake and tsunami. The students started to read epigraph on the monument and discuss on the content with teachers. A discussion on tsunami caused by the Ansei Earthquake was led by teachers of Japanese history and earth-science. After the visit to Shitenoji temple, someone proposed to walk and see other temples on the way down from the temple.

As shown in above, we eliminated barrier between subjects and the students realized that the things they were facing were mixture of history and morphology. The teachers gave general direction of the excursion; however, the teachers exchanged their roles with the students. The teachers and students both learned deeply and independently.

Desirable way of outreach activities in the Museum,learn by participating in the making process of "Buratamori".

*Inoue Motoko[1]

1. Saitama Museum of Natural History

To promote earth science,it's important to make the general public to feel familiar with earth science and see the fun of it .Promoting popular interest is one of the missions of Natural History Museum,but it is too difficult to satisfy all museum users who have various levels of geoscientific literacy.The stuff of TV show,"Buratamori”,gave me a clue to settle such problems.I learn 5 important viewpoint of outreach activities by participating in the making process of "Buratamori”.

1) We should understand the thinking process of the general public,who are not much interested in earth science.
2) We should summarize relevant information of various field (earth science,history,culture) in each local area,and associate it with the life of the general public.
3) We should focus more on familiar stories in the local area than theory to promote interest of the general public.
4) Simple and easy-to-understand explanation is more important than showing the accuracy of the study results.
5) It is important for us to show people that we enjoy learning earth science rather than showing our knowledge.

Methodology of Geoscientific Outreach of “Buratamori”

*Takayuki Ogata[1]

1. Disaster Prevention Research Center for Island Regions, University of the Ryukyus

Buratamori produced by NHK contributes especially to geoscientific outreach and lifelong education for leaning on various geographical and geological topics. Such geoscientific topics related seamlessly with other contents on history, biology, agricultural and engineering sciences. Seamless geoscientific stories (geostories) are also produced in geoparks as a method for geoconservation, geotourism and geoscience education. Geostories require well-selected and arranged contents targeting historical, vertical and/or horizontal phenomena based primarily on many geoscientific evidences. Much many Japanese geoscientists also watch Buratamori because various topics are interpreted by many specialists on geography and geology. Geoscientists interest scientific evidences and interpretations on each specialties, and multidisciplinary and interdisciplinary relationships to other disciplines. Comprehensive and seamless stories of Buratamori enhance educational effects as a methodology for outreach and science communications, which are supported by geoscientific knowledges of many scientists, directors, producers and Mr. Tamori.

The challenges of Asteroid Exploration Mission Hayabusa2 and its results up to now

*Makoto Yoshikawa[1]

1. Japan Aerospace Exploration Agency

As the follow-on mission of Hayabusa, the first asteroid sample return mission in the world, Hayabusa2 was launched in December 2014. While the main purpose of Hayabusa was demonstration of technology, the main purpose of Hayabusa2 is to do scientific researches. Particularly the important subject is to study water and organic matters that existed when the solar system was born. In addition to this, it is also an important purpose to establish more reliable technology for planet exploration based on the experience of Hayabusa, which had a lot of technological troubles.

After about three and half year space journey, Hayabusa2 arrived at Asteroid Ryugu in June 2018. At first, we observed Ryugu in detail by using remote sensing instruments on board, then we were successful to land small rovers and a lander on the surface of Ryugu. However, we postponed the touchdown to get the surface materials of Ryugu to February 2019 from October 2018 of the original plan. After the touchdown, we will carry out an experiment to make a small crater of the surface of Ryugu. Hayabusa2 will leave Ryugu at the end of 2019, and will return to the earth at the end of 2020.

The asteroid Ryugu, which has a shape of a spinning top and which is covered by a lot of boulders, is very interesting from the point of science. It is rather different from what we assume before the arrival.

In this presentation, we will talk about the challenges of Hayabusa2 based on Hayabusa and the scientific results up to now.

Earth's core revealed by ultrahigh-pressure experiments

*Kei Hirose[1,2]

1. Earth-Life Science Institute, Tokyo Institute of Technology, 2. Department of Earth and Planetary Science, The University of Tokyo

The interior of the Earth is under high pressure and high temperature. The condition at the center of the Earth is 364 gigapascals and about 5000 kelvins. Such extreme condition can be generated in a laser-heated diamond-anvil cell (DAC). Any materials existing inside our planet can be synthesized using this technique.

I will discuss the formation and evolution of the Earth’ s core on the basis of recent DAC experimental results. Our recent work has shown that the core composition has changed to a large extent since its formation by exsolving oxide and silicates. Such core-derived oxide and silicates may have caused “anomalies” presently observed in the deep mantle and core.

I will introduce the latest works on core formation and evolution as well as ultrahigh-pressure experimental techniques using a DAC.

Keywords: core, high-pressure, deep Earth

[O-03] Poster presentations by senior high school students

convener:Tatsuhiko Hara(International Institute of Seismology and Earthquake Engineering, Building Research Institute), Katsuyoshi Michibayashi(Department of Earth and Planetary Sciences, Nagoya University), Miwa Kuri(International Research Institute of Disaster Science, Tohoku University), Kou Yamada(Waseda University), Chairperson:Kou Yamada, Katsuyoshi Michibayashi, Hajime Naruse(Kyoto University), Keiko Konya, Miwa Kuri(東北大学災害科学国際研究所)

Senior high school students provide poster presentations on subjects in fields of earth and planetary sciences. This session provides an opportunity for senior high school students to give their presentations in the JpGU meeting and to have discussions with researchers. This session has been conducted as a public outreach session since 2006.

11:30 AM - 12:15 PM JST | 2:30 AM - 3:15 AM UTC

1. Ikedagakuen Ikeda Senior High School

Factors of the famine of Aomori in the Edo era viewed from the Hirosaki domain diarty

The motive for the study

We focused on the weather attached to the dates recorded in the historical documents and we have restored the weather from the description of the weather recorded in the four historical documents written in the Edo period.This year, we analyzed the Hirosaki domain diary.

The purpose of the research

(1)We will make a database together with the historical documents we examined in previous years.
(2)We will explore the effects of climate change that caused famines in the Edo period.

The research method

We defined the weather of days which were cloudy more than 90% of the day (more than 21.6 hours) as cloudy, and the weather of those cloudy for less than 90% of the dayas sunny.
Words that gave information on meteorological conditions other than the weather- “Thunder”, “Wind”, “Chilly・Cool” - were also counted.The data about the weather for 164 years (58, 781 days) has been gathered.

Data#1

We research the appearance rate of sunny days in the period of the Houreki famine suddenly fell.
It is said that the harm caused by the cold occurred in the Tohoku region as famine.
Also, the rate of rainy days in the Tenpoh famine period exceeded the appearance rate of fine weather.It is said that the cause of the Tempo famine was heavy rains, floods, and the accompanying cool summer.As shown in the graph, it is thought that the rain appearance rate was high and the amount of sunshine decreased, leading to famine.
The appearance rate of snow was at least 9.3% in 1768 and 29.9% in 1706.Mount Asama erupted in 1706.
The Kyoho famine and the Horeki famine are said to be famines caused by cool summers in western Japan, and the appearance rates of fine weather support it.

Data#2

Since the influence of,the “Yamase” - the cold, wet, east wind - was seen in the year of the Tenmei famine, 1787, it is considered to be a year when the impact of the Okhotsk Sea High Pressure was strong.

Data#3

If we look at the proportion of thunder in each season, “Heat thunder” occurs in the summers during the 30-year-period when the appearance rate of sunny weather was high.Because the proportion of thunder in winter was high in the 30 years of the Tenpoh famine, it is thought that thunder occurred because cold air flowed from the Siberian air masses.

Data#4

Between 1776 and 1789, when there was the Tenmei famine, the wind from the east, that is, the number of days of winds considered to be “yamase”, were many.Yamase is a cold,wet,east wind,that blows in summers mainly in the Tohoku region's Pacific side.

Date#5

We examined the record of “chilly” and “cool” days during the summers from June to August recorded in the Hirosaki domain diary.

©2019. Japan Geoscience Union. All Right Reserved.

There were 459 days in the summers from 1701 to 1864 that were reported as “chilly” or “cool”. The word “cold” was not written in the records.

Discussion

(1)It is said that the Kyoho famine was due to the occurrence of delphacidae insects and a long period of rain in west Japan, but this influence was not seen in Aomori, where the appearance rate of fine weather was high.
However, from data#1, it is considered that famine only occurred in the period of the Houreki famine as the appearance rate of sunny weather declined.
(2)From the data #2, #4, the background of the Tenmei famine is that the Okhotsk Sea High Pressure was strong, the “Yamase” wind blew, and the Okhotsk Sea air mass influenced the number of thunder occurrences.
(3)From the data #1,#3,the 30 years including the Tenpoh famine period are considered to have the highest rate of rain, and low temperatures.Especially in the winter, it was affected by the Siberian Air Masses.

Summary of the study

(1)It is said that the Kyoho famine was a famine mainly of western Japan, and considered that the fluctuation of weather in Aomori was small, as the appearance rate of sunny days in the 30 years was high.
(2)In addition to the high occurrence rate of sunshine, the five years of the Horeki famine were linked to frequent thunder as the cold air flowing in the upper regions of the sky caused an unstable atmosphere. This caused famine in addition to declining sunshine hours.
(3)During the period including the Tenmei famine, the high pressure of the Sea of Okhotsk developed and "Yamase“wind occurred. It is considered that the cause of the famine was that the summer temperatures did not rise.
(4)The rainfall rate of 30 years including the Tenpo famine exceeds the appearance rate of sunny days. Due to the decline in sunshine hours, temperature drops also resulted in famine.

1. Geoscience Club, Matsumoto Fukashi Senior High School

Matsumoto basin is a mountain basin located 180 kilometers west-northwest of Tokyo. The Northern Japan Alps is a mountain range which is located on the west side of the basin, and a river valley leads into the southern part of the basin. In this basin, east-west-lined shower clouds occasionally occur and move to the north, causing sudden showers. I decided to study the relationship between sudden showers and surface wind through long-term visual monitoring, in addition to analyzing AMeDAS (Automated Meteorological Data Acquisition System) data.

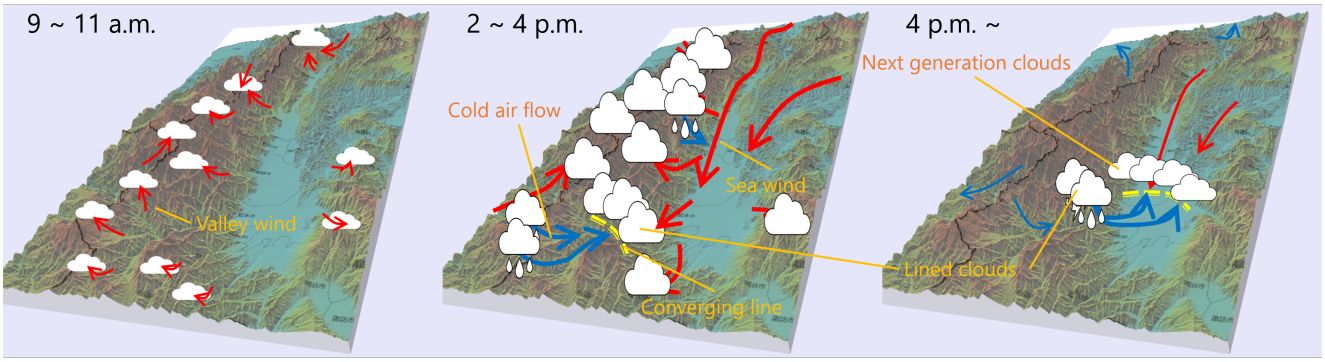
From July 11 to September 4, 2018, time lapse cameras at 5 points around the basin monitored the clouds. The surface wind patterns were classified using the shortest path algorithm from the data taken at 22 AMeDAS points around the basin from 2010 to 2017. The relationships between the states of clouds and the wind patterns have concluded that cloud formation on the ridge is caused by the valley wind.

From August 9 to August 16, 2018, daily changes in atmospheric instability were observed on the 2,310 meter high mountain ridge. These changes have shown that the development of the clouds on the ridge is caused by moist air brought by the sea and valley wind, which makes the atmosphere on the ridge unstable.

The monitored and radar-detected precipitation data showed that the cloud lines are caused by convergence of cold outflow from the clouds above the mountains and the warm, moist sea wind. This lined clouds moves to the north because it also causes cold outflow and form a new line toward the north, the direction from which the sea wind comes.

A similar pattern is also found in Phoenix, Arizona which is in a basin surrounded by mountains and also has effect of the sea wind in rainy season, with sudden showers caused by the same mechanism as in Matsumoto basin. Therefore, this mechanism can apply to showers in any other mountain basins.

Keywords: sudden shower, mountains, sea wind



A) Development of valley wind and Formation of clouds on the mountain ridges

B) Blowing of sea wind into Matsumoto basin and Beginning of sudden shower on the ridge

C) Cold air flow by lined shower clouds and sea wind cause new lined clouds.

The effect of coastal erosion on Shinmaikohama Beach

*Yuuto Yoshida[1], *Izuki Onoda[1], *Ayaka Saitou[1], *Issei Suzuki[1], *Haruto Komiya[1], *Toshiki Sasaki[1], *Daisuke Baba[1]

1. Fukushima Prefectural Iwaki High school

The treatise of Mr.Kobayashi Akio said that Shinmaikohama Beach in Fukushima is being eroded by waves.

So we examined to understand the situation there by measuring the altitude between points, and figuring out how to solve this problem.
We have been measuring the east and north-east from an object made of concrete.

Looking at the results we found that the north-eastern points were eroded more than the eastern ones.

There are blocks that clash with waves in the east.

There are not any these in the north-east.
In addition, after the spring tide, the influence of erosion is bigger than other things.

Keywords: Coastal erosion

Consideration by Grave seismology

*Yuito Kaji[1], Kosuke Kobayashi[1], Kaname Ishida[1], Yasuhiro Suzuki[1], Kyoichiro Uehara[1]

1. Yashiro High School

The gravestone seismology is the study that considered the mechanism of the earthquake by investigating the gravestone. We started the research because we thought we could understand the geology of the epicenter by using grave seismology. In particular, the points that we investigated are in the North of Osaka and Hokkaido Eastern Iburi.These points were damaged by very big earthquake. And we have some consideration through the fieldwork. The problem was how to treat relations of disaster situations of differences each regions and geology, and the geological features in our home town from the case past “Zenkoji Earthquake “. What we can learn from the past, how the present is, and what we should do in the future. These are our study that considered Grave seismology.

Analysis of metal ion concentration in the rivers of Yosemite Valley and comparison with Japanese rivers

*Kaname Ishida[1], Noa Harada[1], Michihiko Kondo[1]

1. Yashiro High School

At our high school, we had overseas training in the United States as SSH field study from 2011. One of the training places was Yosemite National Park. We gathered water in several places from rivers around the Merced River, which flow into it and analyzed the concentration of underwater metal ions. We cooperated with Shinshu University, Faculty of Engineering, and Mechanical Systems Engineering. We examined the connection between the length of rivers and the concentration of underwater metal ions and compared the metal ions that are included in Japanese rivers and Yosemite National Park’ s.

Magnetic measurement of basalt dikes in the Sara river of Tsuyama

*Hayate Madokoro[1], *Yuta Emi[1], *Syota Matano[1], *Naoyuki Washida[1]

1. Okayama prefectural Tsuyama High School

According to previous studies, there was a warm archipelago, like that of the subtropical zone, in Tsuyama city about 16~7million years ago. In this study, we call the archipelago "the Tsuyama Sea". However, no one has precisely examined factors and dates of the disappearance of the Tsuyama Sea. We measured paleomagnetism of the basalt dikes which are stretching north and south in the Tsuyama Sara River with our own astatic magnetometer. By this measurement, the paleomagnetism showed that magnetic north was shifted 2.4˚ north-west from the current magnetic north when the dikes had been formed. Therefore, we think that an increase of the north and south compression caused the rising of the backbone range, and after that, the disappearance of the Tsuyama Sea.

The Study of Seawalls Combined with Moats

*Toshiatsu Aoki[1]

1. Yokohama Science Frontier High School

Tsunami of The Great East Japan Earthquake caused a lot of damages to Tohoku area. Nowadays, people make very high seawalls which can prevent our town from tsunami. Those seawalls are very important for protecting our lives. However, by doing so, those seawalls destroy the scenery and damage to tourism. To solve this problem, my research suggests new seawalls that combined with moats.
I make seawall model by using Styrofoam and aquarium. And I generate wave and hit to the seawall. This experiment control depth of the moat.

EXPERIMENT 1
At first, I examined how much depth was effective. I changed depth (0,5,10,15cm) and corrected each 5 data. As a result, I couldn’ t get certain data that showed how much depth was the moat. However, it was found that the reaching distance of the wave can be reduced more if there is a moat than there is no moat.

EXPERIMENT 2
Second, I experimented on only5cm depth 48 times to increase the number of data. Using this result, I created a scatter plot(X : Height of wave Y : reaching distance of wave) and an approximate straight line (y=1.9592x-33.27 Correlation coefficient is 0.73).

I changed the effect of the moat to a lite size by using this formula. As a result, I could prove seawalls combined with moats were stronger than before.
However, this experiment have some problems. For example, this experiment have many variables. So it is difficult to expect the result when experimental condition is changed.
In the future, I’ m going to use PC to simulate a lot of case.

Relationship between the seismic moment release rate in the Nankai subduction zone and the 2011 Tohoku earthquake

*Yoko Kono[1]

1. Yokohama Science Frontier High School

To investigate the impact of the 2011 Tohoku earthquake to the slip at the transition zone on the plate interface in the Nankai subduction zone, we have examined the temporal variation in the seismic moment release rate in the periods with no long-term slow slip events before and after the 2011 Tohoku earthquake for six areas, the northern, the central and the southern Kii, and the eastern, the central and the western Shikoku. We used the data of the seismic moment of slow slips estimated by the empirical relationship between the apparent moment of deep low-frequency tremors and short-term slow slips during April 2002–July 2013 [Daiku et al., 2018] and newly analyzed data during August 2013–February 2017. We estimated the seismic moment release rates before and after the 2011 Tohoku earthquake using the nonparametric bootstrap method for each area.
We recognize no significant variations in the seismic moment release rate before and after the 2011 Tohoku earthquake for the northern and the southern Kii and the eastern, the central and the western Shikoku areas. These variations are coincident with no significant coulomb stress change induced by the 2011 Tohoku earthquake in the Nankai subduction zone [Toda et al., 2013]. On the other hand, for the central Kii area, the seismic moment release rate decreases significantly after the earthquake. However, the decrease is also observed even before the earthquake. We, therefore, consider that the decrease is not likely to be affected by the 2011 Tohoku earthquake.
From the results mentioned above, we conclude that the 2011 Tohoku earthquake does not affect the seismic moment release rate at the transition zone in the Nankai subduction zone. However, there is a possibility that, in the central Kii areas, together with the southern Kii area before the 2011 Tohoku earthquake, a frictional condition at the transition zone might have varied gradually with time.

Automation of the self-made pinhole type planetarium projector

*Masami Kanno[1], *Asahi Komori[1], *Haruhito Nakamura[1], Kano Makiyama[1], *Munehiro Asao[1], *Ryo Kakegami[1], Akika Shimizu[1], Tomoka Kawamoto[1]

1. Yokohama Science Frontier High School

In the “Seisakuhan” of our school's astronomy club, we project planetariums in school festivals and astronomical classrooms for the local residents, and have gained much popularity. However, there is a problem that it is difficult to perform various projections by changing the season or time zone in order to turn the projector manually. Therefore, in order to diversify the projection, we aimed to automatically rotate the projector using commercially available materials.
First, when rotating the projector automatically, it was decided at what speed to rotate it once. As an indicator, we manually turned the projector one turn at a speed that made us not uncomfortable. The results were averaged to set 28.7 s as the target time. Next, we discussed the mechanism to automate the projector. Got an idea from the movement of the caterpillar, we decided to rotate the projector using a motor-powered gearbox and belt. In order to rotate the projector at the target time, the gear ratio of the gearbox was changed and the time at each gear ratio was measured. By changing the gear ratio, it is thought that the rotational speed and rotational torque change, so that the power of the gearbox changes and the rotational speed of the projector changes.
As a result, in the gear box used this time, it became 8.5 s by gear ratio 1300.9: 1 which rotation speed becomes the smallest. This time was the longest time measured with other gear ratios. However, the target time of 28.7 s was not reached. Therefore, by changing the applied voltage from 3V to 1.5V with a gear ratio of 1300.9: 1, it was considered that the rotation time would be about 17s, which is doubled from 8.5s. As a result, the projector did not rotate and did not reach the target time.
This is considered to be due to the fact that the motor did not operate well at 1.5 V because the proper voltage of the motor was 3 V.
Future prospects include improvement of belt slack, measures for motor drive noise and discussion of how to reduce of rotational speed.

Capturing Blue-shift of Red Edge using the Spectrum of Earthshine -The Earth seen from the space-

*Noa Itou[1], *Ayami Yoshino[1]

1. Yokohama Science Frontier High School

The purpose of this study is to find out geochemical abnormality such as mineralization zones of the earth from the ground by observing the blue-shift thorough a spectrum of the earthshine.
The earthshine is the astronomical phenomenon of sunlight reflecting from the earth’ s surface and illuminating the dark side of the moon. Sudden increase in reflectance of the red wavelength in the reflection spectrum of the plant is called a red edge. Blue-shift means that a red edge shifts to the blue wavelength side when a plant felt stress.
In this study, observation of the earthshine using the telescope and a plant experiment on the ground were performed.
As a result , in the observation of the earthshine , detecting a red edge is succeeded but the blue-shift was indistinct. In the experiment of the plants , a blue-shift was seen in the red edge of the plant gave water stress. However a blue-shift was indistinct in the plant brought up with solution of the heavy metal salt.

Observation of Thundercloud

*Ayune Masuda[1]

1. Yokohama Science Frontier High School

Now, there are many methods to predict the thundercloud, but they are very abstract. I think if we can predict easily, it may lead to the awakening of lightning accidents. Then I observed a thundercloud by using electric waves. It’ s the system of observation. A thundercloud can reflect electric waves, and I can observe it by catching electric waves. I used the frequency of 53.755MHz and the AM radio. We can use those frequencies easily. There is a method to observe it as noise by the preceding study. But I think only noise is difficult to observe in a thundercloud, so noise are changed the image, it becomes easy to observe a thundercloud. I used a software called HROFFT.
It can change sound data into an image. This is the image. X axis is time and Y axis is frequency. The pattern other image is changed by something. For example, a dot is made by a shooting star and a curve line is made by an airplane. A thundercloud makes a bar line. In this way, if a bar line appears in this image, we can know that there is a thundercloud. I couldn’ t observe a thundercloud by using 53.755MHz in Yokohama because it didn’ t occur, but in Niigata Prefecture, I could observe it and identified on the image. The other hand, I couldn’ t observe it by using the AM radio in Yokohama because there were too much noise to identified on the image.
I found that the cause which I couldn’ t observe it is noise. Then I’ ll try to remove noise from the image. I have two kinds. First, I miss an extra electric current outside. Second, I control the receiver sensitivity. Eventually we will be able to use this system everywhere.

A Historical Review of the Sky in Yokohama 1965 to 2014

*Rikako akai[1]

1. Yokohama Science Frontier High School

This is the research of climate change in Yokohama to solve environmental issues in Yokohama.

First, I analyzed weather data of 1965 to 2014 in Yokohama. As a result, I found 4 points; the rise in the temperature and humidity; the increase in cloud cover and precipitation and the number of days of thunderbolts; the decline in the greenery rates; the decline in the number of days of fog. We can think these are because the temperature was raised. Because of these results, I thought the heat island phenomenon has been occurring in Yokohama.

Second, I thought making cool spots is the best idea to provide effects of the heat island phenomenon. So, I did an exmeriment to know the efficient way of locating cool spots. From the results of the experiment, I knew that putting cool spots separately is the efficient way.
In the future, I want to continue this experiment and looking for the places to put cool spots in Yokohama by using actual maps.

Seismic isolation system for furniture

*Tesshin Noma[1], *Syuntaro Hayashi[1]

1. Sakae-Higashi High school

Recently, seismic isolation systems are used many as an earthquakes measure for high-rise buildings. Then I thought that I wanted to show the good effects for tall furniture so I started this study.

According to Teraya and etal. (2015), the two bookshelves as shown in Table.1 turn over at 0.6Hz and 1.0Hz when the flooring is carpeted and in the case of flooring, acceleration tends to increase at 0.6Hz. So, the frequency that tall furniture falls easily is from 0.6Hz to 1.0Hz.

In this study, I used a seismic isolation system which replicated soft material and hard material. I thought that if an earthquake frequency is reduced them, furniture would not fall. This study’s goal is to find materials which can do that.

I used two kinds of seismic isolation systems as shown in Table.1. I put four seismic isolation systems under two different models of tall furniture. This is shown in Fig.1.

I measured acceleration with three smartphones like Fig.1 using the application: “Acceleration Logger” by Naoki Kisara. I moved the experimental equipment in the direction of the arrow in Fig.1, and used the Fourier formula to convert the data which I measured on each model. Then I made graphs of the magnification of the magnitude of the quake. I divided one data which one model used my seismic isolation system by another data didn’t. This is shown in Fig.2.

In Fig.2, when magnification of a certain frequency was more than 1, I substituted +1 for the frequency and if it was less than 1, I substituted -1 for the frequency. I measured them 30 times in this way. Fig.3 is the graph of the total of the values that I substituted for every frequency.We call this way SS method “Sign Sum”.

In the case of seismic isolation system 2, magnitude of the quake is reduced at 1.0Hz. This combination shows the good effect for tall furniture around 1,800 millimeters.

In the future I want to look for a better material or combinations from the viewpoint of hardness of the material.

How to use soil of school

*Hohoko Asahina[1], Honoka Oinuma[1]

1. Tokyo Metropolitan Tama High School of Science and Technology

More and more public schools are being abolished in recent years. The number of schools abolished is 6,811 from 2002 to 2015. Above 1,700 school facilities are unused . We started our research with the purpose of finding out how to utilize soil in schoolyards. To do so we make comparison between the soil of fields and of schoolyard using EDS and WDX. In conclusion the soil in schoolyards is short of nutrition so plants do not grow.

Measurement of Cloud Cover at Night by Brightness

*Soyoka Okano[1]

1. Tokyo Metropolitan Tama High School of Science and Technology

Background

The weather status in Japan is decided based on the cloud coverage. However, as cloud coverage is measured with our own eyes, it is not always accurate. Therefore, in order to improve the accuracy of weather forecast this research was conducted aiming at establishing a new method to measure cloud cover accurately using SQM (Sky Quality Mater: SQM is the observation equipment which measures night empty brightness. The higher than numerical value is the darker the sky is).

Also, safety increases when the night flight understands the thickness of the cloud beforehand. However, the thickness of the night cloud can be measured in only infrared rays. It is not correct. I thought measurement of the cloud coverage and thickness of the cloud at night by brightness.

Method

Experiment1, measurement of the cloud coverage and pollen at night by brightness.

The brightness at night was measured with SQM at two minutes interval. I set SQM on the roof of our school (Honnmachi, Koganei, Tokyo). Based on the data provided by the Japan Meteorological Agency, the sunny days (Cloud cover - 0), the cloudy days (Cloud cover - 10) and pollen’ s day of the day of the new moons were selected. Graphs were drawn using the data collected from 8 p.m. to 3 a.m. (the time with no influence of sunlight) on the days which met the conditions given above.

Experiment2, measurement of the cloud of the thickness.

I prepared two boxes different in the size. I assumed the name of the box A (300mm*300mm*300mm) or B (300mm*300mm*600mm). I put liquid nitrogen in a box and produced steam. I use a darkroom to make the situation same as a night town.

I set up light under the box.I measured volume of light that reflected in SQM.

Experiment 3:change of the brightness due to the pollen.

I put pollen of the ragweed in the box.

In the same way as experiment 2,I measured the light that pollen reflected.

Experiment 4:Transmission spectrum of the pollen

I checked whether a pigment of the pollen absorbed light. I smashed 1g of pollen of the ragweedwhich I used in experiment 3 in phosphate buffer solution.

©2019. Japan Geoscience Union. All Right Reserved.

I was multistoried on 2.3M sucrose and ran to a centrifuge (1, 000* g) for 20 minutes. I measured transmittancy of the light (250-550nm) with a spectrophotometer with a supernatant provided by centrifuging.

Result

Result 1

As for the clear weather, a high value was provided through the whole in comparison with cloudy weather. From this, I understood that it was dark in the clear weather night.

Result 2

Both boxes had a smaller numerical value of SQM than an empty box. The numerical value of box B had lower numerical value of SQM than box A. From this, I understood that a lot of box B reflected light.

Result 3

It was seen that the contained box of the pollen said that numerical value of SQM was higher than an empty box. From this, I understood that a contained box of the pollen was gloomier.

Result 4

The pigment of the pollen understood that it absorbs in a color (350-500nm) of the

blue of something. It is thought that the reason why pollen absorbed light by experiment 3 is that I used light of the white. In addition, it is thought that I am uneven in a change of the volume of light when the light of the night town measures the light of the night town using SQM in spring and summer.

Application of ion-exchange reaction in soil for desalination system

*Yushi Sato[1], Ryota Iizuka[1], Toya Nakano[1]

1. Tokyo Metropolitan Tama High School of Science and Technology

Nowadays, water shortage is serious problem around the world, so many countries use desalinating system to make fresh water from seawater. But it is not used in developing countries, because it takes very high cost. Therefore, to make a new desalinating system, we used peat and volcanic ash soil in my research. They have an ability of adsorbing ions and we thought that it might adsorb the sodium ion and chloride ion from sea water.

Investigation into agricultural utilization by the aluminum removal of the trass

*Yuto Miki[1]

1. Tokyo Metropolitan Tama High School of Science and Technology

In Japan, 25% of the land is volcanic ash soil. The main constituents of volcanic ash soil are Fe and Al, which are low in nutrients and microbes and tend to be acidic. Al is dissolved in acidity and chemically combined with P added as fertilizer to form AlPO 4. AlPO4 does not become nutritional. Also, Al damages plant roots. In order to solve this problem, this study aimed to remove Al from volcanic ash soil. This time, we investigated the basic survey of the soil and how much Al could be dissolved from the soil.

Construct quaking models by the geological structure varieties

*Kazuki Sugawara[1], *Hideto Sato[1], Shuya Yamaki[1], Masato Ono[1], Shun Suto[1]

1. Miyagi Rifu high school

The Rifu-Nagamachi fault is known as a huge active fault in Miyagi prefecture area. My school is just standing on the fault. Our school geoscience team searched the boling core samples which was taken when our school constructed. Then we found numerous volcanic ash layers among the sediment sand-grain layers.

After we observed the layers, in order to mention what would be happen when the earth quake with fault activity occur, we constructed the geologic model with some cookies and chocolate chips. Our seismic model has not only sediment simulation, but also constructed electric-controlled quaking model, and observed the soil breakings. We investigated the ground - building affection with thinking number of the ash layers.

We observed the quaked soils with numerous ash layers among the sediment sands are more break, but more stable sink condition.

Fe concentration measurement method in spring water

*Nozomi Kawaharata[1], *Yusuke Oba [1], Yuto Sasaki [1], *Tika Sakuma [1], *Rei Sato[1], *Siratake Kosuke [1], *Riku Sugawara [1], *Masaki Murayama [1]

1. Furukawa Reimi Junior and Senior High School

This research is to develop and verify a method to measure iron concentration in spring water using citric acid.Spring water is called "sekisui " because it contains a large amount of iron and turns red by the oxidation of soluble iron and iron ions in water.Sekisui has had effects such as crop growth failure and deterioration of river water quality.We know that iron and citric acid contained Sekisui will temporarily turn yellow due to the reaction, and we have arrived at this study because it is possible to measure the iron concentration by applying this method. Mix citric acid with sekisui to make it yellow. Then mix a commercially available yellow liquid with citric acid and light it to measure the illuminance. There is a difference in illuminance by changing the ratio of sekisui and yellow liquid. It is possible to generate regularity by generating the data in a graph. It is the research which measures the concentration of iron using the difference.

Cause of amateur radio failure in meteor radio observation and its substitution

*Shoki Yashima[1], *Kokoro Abe[1], *Azumi Sato[1], *Sora Endo[1], *Kokomi Sugawara[1]

1. Furukawa Reimei Junior and Senior High School

We observe radio waves of meteors using radio waves of the VHF omnidirectional radio signal VOR and radio waves of the amateur radio HRO. However, in the HRO we used conventionally, a large increase in meteor showers did not show a significant increase in the number of detections. Therefore, I tried to find out the cause of such a thing and did this research.
It was hypothesized that natural factors such as topography and the output of HRO radio waves and VOR radio waves might be different.
The VOR radio waves we use are from Asahikawa Airport. The radio waves of HRO are from Fukui Industrial High School in Sabae City, Fukui Prefecture.
The results were not examined in detail for the output. In addition, we did not obtain well-founded concrete data on natural factors. Therefore, as a future subject, I would like to carry out a control experiment of Komatsu Airport VOR and HRO where the distance and direction can be aligned.

Predicting the sea level change in the Ariake bay through analysis of diatoms and pollens

*Ayuto Yamashita[1], *Shino Furuta[1]

1. Kumamoto prefectural Amakusa High School

<Goal>
We set two goals for our study.
One goal is to research the sea level change in the Ariake bay in the past. The other goal is to predict the sea level rise in the Ariake bay in 50 years.

<Outline about the stratum>
We took 40 samples from the core bored in two spots, Aitsu and Amura, in every 10 cms. These two spots are both located in the mouth of the Ariake bay. We named the core in Aitsu “KZ”, and one in Amura “KM”. We found out the age of each layer of the core by radiocarbon rating and researching documentary records. It is shown in figure 1.

<Method>
In order to study the environment in the past, we analyzed diatoms and pollens in the samples. We draw diagrams after judging 200 fossil diatoms, and also 200 fossil pollens per sample, except pinus. Then, we calculated the temperature and precipitation in the past, using modern-analog method. We also investigated the data archaeologically with local historical records. Through these three processes, we learned about the paleo-environment of the land and sea. By examining how the environment has changed, we can clarify how it has affected our lives.

<Results>
The following is what we discovered through diatom analysis. We found a large amount of *Paralia sulcate* and *Cylotella Litoralis* in most samples. *Paralia sulcate* inhabits the seawater, which is known as an indicator species in bays. It is shown in figure 2. On the other hand, *Cylotella Litoralis*, inhabits the freshwater. *Tryblionella granulate,* which also inhabitants the brackish water, was found in all the samples. What we discovered through pollen analysis is as follows. Pollens of *Castanopsis sieboldii* and trees which belong to the *Quercoideae* family consist of as much as 80 –90 % of all pollens. It is shown in figure 3. The calculated temperature shifted between 16.0℃ and 17.4℃, and it rose 1.0℃ from KM-11 to KM-10. The precipitation changed between 1,800mm and 2,200mm.

<Considerations>
Analyzing pollens of the core bored in Amura, we assume there used to be broad-leaved evergreen forests there. The results we got with all the data we collected from the core and historical records are shown in figure 4. There are three assumable facts from this figure. The core of 7,700 –6,500 years ago contain the largest proportion of sea diatoms. It shows there was the Holocene glacial retreat in the *Jomon* period. Samples of 500 years ago contain small proportion of sea diatoms, and the temperature declined 0.7℃. It is because of little ice age then. In Amakusa, there was a period in which we had frequent heavy rains, floods, or droughts.

<The sea level change of Amakusa>
The observation of the sea level change of Amakusa. As mentioned before, we found *Tryblionella*

©2019. Japan Geoscience Union. All Right Reserved.

granulate in diatoms of all samples, which is known as an autochthonous indicator species of tidal flats. According to Sato (2014), the spots which *Tryblionella granulate* were found indicate the sea level of the time they die and accumulate. In short, they can tell us how the sea level has changed. The estimated could sea level in Amakusa.

<The future prediction>
We found the sea level by focusing on *Tryblionella granulate.* Referring to the sea level *Tryblionella granulate* show, we found that the sea level rose 0.18cm a year on average during the period between 93 to 500 years ago. Thus, we assumed the sea level rose 2.5cm during the period of KM-7 to the top of the core, which means it took 14 years from the time KM-7 accumulated to the time of the boring. We learned that the temperature from the time of KM-7 to the top of the core was 0.011℃ on an average, since the temperature rose for 0.15℃ in that period. Therefore, it can be said the sea level rises 16.7cm/℃. According to the IPCC report in 2018, if the temperature rises 0.5℃ by 2030, it will be 0.042℃ hotter every year, and in 50 years, the temperature will rise 2.1℃ in total. Combining this IPCC forecast and 16.7cm/℃ sea level rise, it can be said that the sea level will rise 34.7cm in 50 years. If the temperature rises more moderately, 0.5℃ by 2052, it will be 0.015℃ hotter every year, and the temperature will rise 0.73. This will make the sea level 12.2cm higher. There are shown in figure 5.

<Conclusions>
Our study can be concluded in the following three points. First, we revealed how the environment in the Ariake Bay has changed since 7,700 years ago. Secondly, we calculated 0.7℃ decline of temperature during the little ice age in Amakusa. Lastly, we forecasted the sea level in 50 years will be 34 cm higher at most.

<Our future study>
In our future study, we are to calculate the area of the sandy beaches which can disappear because of the sea level rise. We also would like to calculate the sea level rise of other areas by discovering how to apply our results to the area at different latitudes.

Altering unused irrigation ponds to mitigate flooding, maintain habitats, and reduce maintenance burden

*Rikuto Fukushima[1], Nao Maeda[1], Reo Yoneyama[1], Yuki Takahashi[1], Hiiro Tabata[1], Koutaro Hayashi[1]

1. Hyogo Prefectural Kakogawa Higashi High School

In recent years, many unused irrigation ponds have been reclaimed for building because of the difficulty in maintaining them and the decline in their use for agriculture. However irrigation ponds play an important role in not only agriculture but also flood prevention and maintaining ecosystem diversity. If irrigation ponds are reclaimed, these functions will be lost. In this research, we suggest a new maintenance method: low water level control. By keeping the water level in ponds low, we can better prevent flooding. Using this method, we can preserve the ecosystem. Also, we show that low water level control can be done automatically by using plugs on the bottom of irrigation ponds.

Keywords: irrigation pond, low water level control, flood prevention, ecosystem preservation

Development of the equatorial telescope for from the beginners to the advanced astrophotographer at low cost

*Jun Ikeda[1], *Shimpei Iwasaki[1]

1. Kaijo Senior High School

We made an equatorial telescope to turn camera and telescope so that they will track stars. It’s necessary for astrophotography. The stepping motor which I can set rotational speed in detail and a gear with 120 teeth enable stable rotation of heavy equipment and precise tracking. In the future, we’re going to improve the structure, realize intuitive operation with a smart phone, simplify the task of alignment to the Polaris so anyone can make it and use it. Then we will write down the procedure and share on the Internet. We will also try various things and write them on the procedure as options because the greatest advantage of a self-made machine is that it’s possible to select desired functions.

How ripples formation dependence on the size of sand grains and the amplitude of vibration cycle

*Tsuyoshi Enta[1], *Ryutaro Mitsui[1]

1. Kaijo Senior High School

How wave ripples can be formed? Using a plastic bottle which contains water and sand grains sorted by its size. We examined conditions by which wave ripples can be formed. We made a vibration apparatus using Lego Mindstorms to vibrate the plastic bottles horizontally and to control the amplitude and the period of the vibration. We count the number of tops of wave ripples each case and considered results.

Organizing the relation ship of the viscosity of lava flow and the shape of columnar joijnt

*Kanta Takakura[1]

1. Kaijo junior and senior high school

Columnar joints are topography formed by causing volume contraction when the lava flow that has erupted and flowed from the volcano is cooled by the atmosphere.
It is known that the cross section of the column joint is basically hexagonal, but the actual column joints often take five or seven other than hexagons. We at Kaijo Chugakuji Faculty made an assumption that the cause of the irregular shape may be related to the viscosity of the lava flow, and tried to prove the hypothesis from the experiment. In addition, I thought that I could find the relationship between the nature of lava flow and the shape of the cross section.
In order to investigate the above things, once dissolving the starch in the water and then evaporating the water, the volume of the starch is shrunk to reproduce the "columnar joint" created in the same process as the process of forming the column joints. We did research by conducting experiments. Also, in order to reproduce the difference in viscosity of lava, experiments were conducted by changing the weight ratio of water and starch.

Measurement of the geomagnetic horizontal component with a neodymium magnet

*Yushi Miyamoto[1], Hayato Ishiguro[1], Shun Takada[1], Kento Nakayama[1]

1. Sapporo Nihon University Senior High School

In this study, we aimed to establish a new way to measure the earth’s magnetic field without external power sources. When a neodymium magnet suspended by a sewing thread oscillates freely, the oscillation period is determined using the value of geomagnetic horizontal component, inertia moment, and magnetic moment. We determined the magnetic moment on the neodymium magnet through two different methods and measured the oscillation period with a smartphone all over the world. The results showed that geomagnetic horizontal component was inverse proportional to the oscillation period squared, which agreed with the prediction from the formula which we established based on simple harmonic oscillation. We found that the geomagnetic horizontal component could be measured without external power sources, using a neodymium magnet that has already known magnetic moment. This method can be applied to measure the magnetic field in the cosmic space.

Keywords: earth’s magnetic field, neodymium magnet, magnetic moment

Relationship between sun elevation and RGB values of sunlight color

*Shun Takada[1], Kotaro Takemura[1], Taio Koizumi[1], Hayato Ishiguro[1]

1. Sapporo Nihon University Senior High School

The color of sunlight can be quantified using RGB values and RGB values are known to change with the altitude of the sun. In this study, we aimed to investigate the relationship between solar altitude and RGB values in detail. The sun was photographed through a self-made light control plate with a 4-mm-diameter hole and the RGB values were analyzed using adobe photoshop, which is a bitmap image editing application software. The results showed that the ratio of R value increases and the ratio of B value decreases when the solar altitude is smaller than 9˚. We derived a theoretical formula that represents the relationship between the solar altitude and the thickness of the atmosphere through which sunlight passes. Assuming that the thickness of the earth's atmosphere is 100 km, the observation results and the theoretical formulas indicate that the thickness of the atmosphere through which sunlight passes is about 500 km when the solar altitude is 9˚. This means that when the thickness of the Earth's atmosphere is reduced to about 20 km, no red sunset will be observed all over the world.

Keywords: sunlight color, RGB value, sun elevation

Reserch about Dokuzawa mineral spring on Shimouswa hot spring

*Ryosuke Yanagisawa[1], *Yoshito Momoi[1], *Yoko Kamata[1], *Takumi Kamijyo[1]

1. Naganoken Suwa Seiryo Senior High School

Only Dokuzawa mineral springs in Shimosuwa hot spring, Nagano prefecture, are strongly acidic, and there are doubts that there is a large difference in spring quality from weak alkaline hot springs in the same area, and it is hypothesized that the sources of both hot springs are different. We conducted surveys and measured oxygen and hydrogen stable isotope ratios.
From the geology and water quality survey near the Dokuzawa mineral spring, there are several locations where the pH is low due to water quality investigations, hydrothermally altered rocks, sulfur adhering to the surface are commonly seen, and at some points the odor of hydrogen sulfide is also confirmed did it. In addition, it was found from the geological map that the fault is underground. From this, it can be inferred that Dokuzawa mineral spring produced sulfuric acid by mixing volcanic gas with groundwater under high temperature and high pressure underground. In addition, from the measurement results of the isotope ratio, it turned out that the source of both hot springs is Rain water.

Can you predict the weaather when you see the starry sky

*Aoi Takamori[1]

1. Naganoken Suwa Seiryo Senior High School

1, Introduction

Water vapor has a major effect in astronomical observation. Using that fact as an underhanded way, I thought that it was possible to predict the weather in the end by estimating the amount of water vapor in the sky according to the appearance (brightness) of the stars.

2, trial of observation

In the initial observation, I tried to measure the brightness of the star by the naked eye, but I thought that an error would occur, and improved it so that the brightness can be compared objectively by adjusting the brightness with the iPhone camera app.

3, result, summary

From the observation results this time, it has been confirmed that water vapor interferes with star observation.

We will continue to observe whether it is caused by differences in altitude, environment or season, compare it with meteorological observation data, and look for the cause of the difference in the appearance of stars.
In addition, there is a part where the appearance of stars clearly appears, so I would like to find out the cause other than the difference in elevation such as the difference with other points.

Fossil ophiuroid ossicles and ostracods from the Shimousa Group distributed around Magaki, Mihomura, Ibaraki Prefecture

*Asaka Yokobori[1], *Rin Mita[1]

1. Gunma Prefectural Ota Girls' High School

We have collected four sediment samples from the Shimousa group distributed around Magaki, Miho-mura, Ibaraki Prefecture. The depositional environment of the Shimousa Group at the study site was inner to middle bay area from the analysis of the ostracods fossils. In addition, in the process of processing, it was possible to pick out the fossils of ophiuroids ossicles. These fossils of ophiuroids ossicles were found to be part of the fragments that make the arm of the ophiuroids, the vertebraes and the lateral arm plates. These could be identified in the family Amphiuridae. The identification of this fossil ossicles genus and species is further study. Show the fossils of ophiuroids ossicles in the figure.

Conservation activities for bivalve fossils by Muroto High School Students

*Shuka Ishitani[1], Miku Ōno[1], Fukuoka Eri[1]

1. Muroto High School

Miocene deep-sea bivalve fossils are located at the coast of Muroto UNESCO Global Geopark (Muroto City, Kochi Prefecture). These are the one of the pieces of evidences of repeated uplifts of the land of Muroto. Although most parts of the coast of the city are designated as a quasi-national park and protected by the natural park law, we do not have the way to protect the fossils themselves. Therefore, we (high school students) submitted an application to the city, requesting these fossils be designated a City Natural Monument, in an attempt to get them widely known. We explain the significance of the conservation of the deep-sea bivalve fossils and our activities in this presentation.

Changes in Shinto Festivals in Muroto UNESCO Global Geopark

*Eri Fukuoka[1], Nanami Hashimoto[1], Yui Takemura[1], Hayato Nii[1], Taisei Hamada[1]

1. Muroto High School

We studied the current state of the traditional festival (Shinto festival) in Muroto UNESCO Global Geopark (Muroto City, Kochi Prefecture), in order to discuss what high school students can do in the age of declining birthrate. Each settlement in Muroto has traditional festivals and events. The festival in Ukitsu area, central Muroto, is held every October (October 6-7, 2018). Ukitsu area once flourished with whaling. Several ceremonies that originated from old-style whaling take place at the festival. The style of festival has been transformed to reflect changes in society. Population decline may make it difficult to inherit traditions. We, the young generation, need to cooperate with the adults, actively participate in the festival, and take over the tradition. We would like to call on the outside for participation.

The Study of Old Tottori sand dunes. Why the sand become hard ? Epilogue

*katsuki takana[1], *ren osaki[1], *ritsuki sugiura[1], satosi arita[1], syogo okayama[1], yuta sunaba[1], aoi hashikawa[1], ken hirooka[1]

1. Tottori Prefectural Tottorihigashi High School

Tottori is famous for the Tottori sand dunes. Statues of sand are netter formed by water and sand. But, when we make a statue of sand, old sand is more to fix a statue than new sand. As a result, there are various sizes of sand and it fill space with clay minerals. Clay minerals help to combine old sand with each other. The secret of sand is enjoyable to learn about.

Forest education by the making of a clay ball and a moss ball

*Yuna Miyachi[1], Arika Tsuji[1], Yuzuki Kobayashi[1], Sae Takami[1], Tatsuki Morikawa[1], Ryota Yamasaki[1], Yuto Umeda[1], Matsuki Rina[1], Nahoko Kubo[1], Yo Sayama[1]

1. Kyoto Prefectural Sagano High Scool

Recently, through direct experience, we learned about forests, which are the natural environment in our local region that fosters the recycling of resources, the cultivation of technologies, and attitudes related towards forests. These attitudes include sensibility, sociability, problem solving power, etc., and form our society and future education aimed at human resource education that will promote a sustainable social culture. In this study, we examined the making of clay balls and moss balls for forest education purposes. The purpose of our study was to study how to make the shine of the clay ball more easily and to clarify the conditions under which long-term nurturing was possible. One of the reasons why clay balls “glow” is explained by the orientation of the soil particles, and that tendency is strengthened by polishing. Although various materials were examined in this research, we were not able to make the ball shine when the soil particle shape or size was too small. Further study will be necessary in the future. For the moss ball, it is generally said that it is difficult to nurture moss balls indoors. Therefore, in this study, it was considered necessary to study the nutrient source of the moss in order to enjoy it for a long time. Regarding the health of moss, color changes when pure water and rainwater were given to the moss was compared using RGB values. As a result of using three types of moss from various sized communities, it was found that moss given pure water changed color in a relatively short time. From this, it can be inferred that there is a component contained in the rain water causes the moss to last longer, and it has been found that it is necessary to supply a certain amount of rainwater as a nutrient source.

The Roles of Clay Minerals in the Pedosphere of the Woods for Field Practice Owned by Sagano High School

*Nahoko Kubo[1], Yo Sayama[1], Yuna Miyachi[1], Arika Tsuji[1], Sae Takami[1], Yuzuki Kobayashi[1], Yuto Umeda[1], Tarsuki Morikawa[1], Ryota Yamasaki[1], Rina Matsuki[1]

1. Kyoto Prefectural Sagano High School

Soil is in the central feature of the forest ecosystem. Clay minerals which are one of the component positions of forest soils the soil have certain some characteristics. For example, they have a large specific surface area, and have a negative net charge, characteristic, are a source of supply of the nourishment for the plants, and have a high water holding capacity ability from like the adsorbed water and pore spaces for water. There are many kinds of clay minerals have many kinds and each one has characteristics of that greatly different. From the research by Okubo (2015), the clay minerals called Lepidocrocite that are involved in the characteristic reddish layer of soils were confirmed within the soil profile in the WFS. In this research study, we analyzed the clay minerals of the soil profile by using X-ray diffraction in a spot is different from the prior research. We revealed the role of clay minerals from the point of view of pedogenesis. As a result of X-ray diffraction, Vermiculite, Mica, Kaolinite, Gibbsite, Quartz, and Hydroxyl interlayered vermiculite were confirmed to be present. And from the examination of the soil profile, we confirmed a reddish layer but did not confirmed Lepidocrocite because of the difference in tree species and topography. For our next steps, we will compare Now, I am comparing weighing the data gathered by of Okubo(2015) and Matsuki (2019) against this study’ s data research’ s one.

For the development of brand-name products in WFS. ~ Selection of high quality Chamaecyparis and investigation of suitable drying method ~

*Yuzuki Kobayashi[1], Sae Takami[1], Rina Matsuki[1], Ryota Yamazaki[1], Yuto Umeda[1], Tatsuki Morikawa[1], Nahoko Kubo[1], Yo Sayama[1], Arika Tsuji[1], Yuna Miyachi[1]

1. Kyoto Prefectural Sagano High School

Trees in the Woods for Field Practice Owned by Sagano High School (WFS) woods for fieldwork owned by Sagano high school have been left untouched after they were planted about 65 years ago. Therefore, we decided to work on product development using materials. When we carefully process use timber whose pith is in the center, warping or cracking decreases during while in the drying process, and we can use beautiful quarter-sawn timber. In our research, we studied about the method of estimating the tree pith and the process of drying wood. We obtained I got the core samples from of six trees with various chest height diameters using an increment bore to estimate the pith without cutting down the trees. However, it was difficult to pierce the pith of the trees accurately. When we regarded the center of tree profile and tree pith, the form of the tree profiler received a natural impact and a human impact. Disagreement of the position tree pith and center of tree profile occur. Therefore it was extremely difficult to pierce the pith of the tree using the increment bore. We will next try to simplify the form of the tree rings and calculated the position of the pith of the trees mathematically now. On the other hand, is to last a long time and not to be broken. In our research, we evaluated the efficacy of the drying methods between of natural drying and natural drying after the exudation of sap. The items under examination we are the time required to dry, and understanding the conditions of warping and cracking after drying. We measured the mass and the volume of Cypress (*Chamaecyparis obtuse*) which we brought from WFS. We and I dried it all in four places on campus.

Grasping the human impact following a forest research and its recovery

*Yo Sayama[1], Yuna Miyachi[1], Arika Tsuji[1], Sae Takami[1], Yuzuki Kobayashi[1], Yuto Umeda[1], Tatsuki Morikawa[1], Ryota Yamasaki[1], Rina Matsuki[1], Nahoko Kubo[1]

1. Kyoto Prefectural Sagano High School

We have researched the forest environment using field surveys covering a five year span in the Woods for Field Practice Owned by Sagano High School (WFS). We discovered that pathways had become bare or were eroded. In this research study, we aimed to evaluate the change in the influences on the environment that the investigative actions have had on the WFS by our maintenance of walkways which we can make easily and use continuously during our fieldwork.

Therefore, we established three areas within the WFS and experimentally studied the gravel which is the natural groundcover material. We spread black rock that had a diameter from 3 to 4cm in the areas where the high school students usually go within the WFS. Then we waited while many researchers walked back and forth across the span where we left the rocks. After that time, we determined the proportion of gravel which remained in the areas and was not disturbed by all of the foot traffic. There were three defined zones within our area of study. The incline of area 1 is 4˚, area 2 is 27˚, and area 3 is 16˚. As a result, we found that the proportion of gravel which remained was 93% in area 1, 43% in area 2, and 75% in area 3. After the experiment, in area 2, the gravel was buried in the ground and it has been suggested that this area should be made available as the permanent walkway. From this study in the large-incline area, we have learned that we may need to spread the gravel out more until it is buried in the ground. However, carrying the gravel is too much work to maintain it easily in the future. We think that while it would be good in practice, it is an unrealistic goal. We will examine spreading the gravel with timber. Furthermore, we will guide people by using a guide rope. This was confirmed to be an effective method from two teachers who are experienced mountain climbers.

Considering the recent landslide disasters in Japan -Movement of water in pedosphere-

*Rina Matsuki[1], Nahoko Kubo[1], Yo Sayama[1], Arika Tsuji[1], Yuna Miyachi[1], Yuzuki Kobayashi[1], Sae Takami[1], Tatuki Morikawa[1], Ryota Yamasaki[1], Yuto Umeda[1]

1. Kyoto Prefectural Sagano High School

The importance and function of retaining water in that forests has been clearly stated in studies before said, and landslides are still occuring have continued to report. In researches performed by our school, the decreasing in understory vegetation by deer (Cervidae) was reported, and the water holding property of the soil was be decreased because of the possibility decrease of evapotranspiration and soil erosion. It means that rainwater reaches the rock layer directory and this condition cause will cause landslides. In this research study, We performed a soil profile, a soil three-phase distribution and a soil permeability investigation to measure the state of soil especially the water retention capacity within on the soil of the Woods for Field Practice Owned by Sagano High School (WFS). As a result of this soil profile, the WFS was found to have (the Woods for Field Practice Owned by Sagano H.S.) has Japanese general soil and the pedosphere was up is to 60 cm in depth. And the WFS’ s soil has a reasonable water retention capacity for plants. On the other hand, soil permeability was relatively good. It means that water will reach the rock layer when it have rains beyond the fixed quantity.

Comparison of GSI map data with the surveying data by targeting Woods for Field Practice Owned by Sagano High School

Yuto Umeda[1], Tatsuki Morikawa[1], Ryota Yamasaki[1], Rina Matsuki[1], Nahoko Kubo[1], Yo Sayama[1], Yuna Miyachi[1], *Arika Tsuji[1], Sae Takami[1], Yuzuki Kobayashi[1]

1. Kyoto Prefectural Sagano High School

We have performed over 50 research activities in the W.F.S. and researched about them. However, we have not analyzed rearranged all of the data yet. In this study, we wanted aimed to clarify how precise the Geographical Survey Institute (GSI). GSI map data of the area actually was, assuming that our surveying data of W.F.S was more accurate than altitude data available on GSI on GSI maps. We conducted a plane surveying and gathered all the latitude, longitude, and altitude data. Using this data, we ran a process within the GSI system were able to process them. Also, we created 3D models using a 3D printer. As a result, we confirmed that the surveying model was more accurate than the available GSIGSI map data. When we tried to create the model in three dimensions with the printer, we reviewed appropriate methods and considered which resin would be better to use. We modeled the wider area based on the GISGSI map mainly because there was a request from nearby local elementary school that requested a vast area model, but in the future it is anticipated that we could utilize the model for various research activities in the W.F.S. By using the large 3D model, we may be able to do many experiments such as research sediment disasters.

Summary of our activities and the future direction in the Woods for Field Practice Owned by Sagano High School

*Takeshi Fujimoto[1], Ako Kinoshita[1], Rina Matsuki[1], Yo Sayama[1]

1. Kyoto Prefectural Sagano High School

The purpose of this thesis is to summarize our research activities in the Woods for Field Practice Owned by Sagano High School (WFS) which is a forest in which more than 80 students have conducted research within over a 5-year span. We wanted to propose a future direction for the WFS. The location of the WFS is recognized as a “Local Forest Area”, which means a place that borders an urban area and a mountainous district. Since Japanese cedar and Japanese cypress were planted there around 70 years ago, proper forest management has not been conducted there at all. We have surveyed about half of the 1.9 ha WFS area and processed this data in Geographic Information System (GIS) software. Although the slant is 20 to 40 degrees, there is no clear soil outflow classified as “Moderately Moist Brown Forest Soil”. On the other hand, harmful animal damage by deer (*Cervus nippon*) is remarkable, and so we are concerned if, for example, soil erosion occurs due to a decline in understory vegetation. We cannot expect the soil to be a soil seed bank because the pH level of the soil is low and the germination inhibition effect is strong. According to aerial image videos taken by drone, we found the canopy was extremely dense and it is urgently necessary to thin the forest. From the viewpoint of recent landslide disasters within forests, we conducted research on both the soil profile and the soil permeability. As a result, it turned out that the soil can hold rainfall to a certain level. We considered, however, that landslide disasters are likely to happen in the case of heavy rain because the soil permeability is relatively high and the rain passes through the soil (or the pedosphere) and reaches to the lithosphere. In the future, we will approach our research from the viewpoints of both hydrology and forest information analysis in the WFS.

Our challenge, the frozen earth : soil formation under the maple forests in Quebec

Yo Sayama[1], Rina Matsuki[1], Yuzuki Kobayashi[1], *Sae Takami[1], Nahoko Kubo[1]

1. Kyoto Prefectural Sagano High School

In this research study, we wanted to establish the pedogenesis in a Maple artificial plantation which is one type of the representative forest vegetation in Quebec, Canada. The investigation spots included two locations are two, and the survey items included are a soil profile investigation, soil crackle strength, soil temperature, soil pH, soil EC, soil respiration, and a crown observation. We had 30-40 cm of the snow of 30 - 40 cm on the investigation day in (the end of March,) and we confirmed a freeze state in the LFH layer and the upper part of the A layer of the soil. However, in places deeper than the lower part of the A layer was in a drying state and we did not confirm a freeze state there. It was revealed that the soil was softer than typical the general Japanese forest soil in both investigations by using with boring stick and a Hasegawa-type soil penetrometer. Next, we perform a comparison to Japanese soils with the general Canadian forest soil.

Color of the moon at the umbra lunar eclipse

*Koudai Fujino[1], *Kotaro Saito[1], *Yoshiki Kujiraoka[1], *Hyate Doi[1], *Ibuki Yasuda[1]

1. Saitama Prefectural Urawa High School

It is well known that the moon in the lunar eclipse is not dark and looks reddish. Because the area around the edge of umbra appears in blue in the photo, it is called "turquoise fringe". However, this effect may have been emphasized by image processing. Then, we conducted spectrum observation and found that the color of umbra doesn’ t verge on turquoise but white.

Study on vegetation change and validity of eruption age based on pollen analysis of the strata containing volcanic ash

*Taiga Suzuki[1], *Haruki Otiai[1], *Keita Ueno[1], *Athushi Watanabe[1]

1. Nirayama HighSchool

I Research Overview

There are many studies that lead to the reconstruction of the paleoenvironment of the Izu Peninsula. We focused on volcanic ash, which is abundant in the stratum.

The strata of Izu Peninsula are composed of strata such as loam and various volcanic ash layers.

Since the age of the volcanic ash layer is already known, we can know the age of the adjacent loam layer. Since the loam layer contains pollen fossils of plants that were inhabited at that time, the proportion of pollen by type reflects the vegetation at that time. Therefore, we can estimate the vegetation at that time by pollen survey. By combining strata age and vegetation data, we are able to estimate vegetation transition and climate change. In addition, the validity of the eruption age of volcanoes can be confirmed.

II Research method

We sampled the loam according to the depth from one stratum, and estimate the age from a neighboring volcanic ash layer. Next, we extractd pollens from each sample using pollen extraction method. And we identified the species of the extracted pollen, counted it by type, calculated the ratio, and use it as the data of the vegetation at that time. Finally, based on these data, we tried to consider the appropriateness of the vegetation transition, climate change, and eruption age at that time.

III result

The mainly observed pollens were Sudajii, Pussy Willow and Ginkgo.

Sudajii is a plant distributed south of Niigata-Fukushima, which has disappeared since the eruption 125 thousand years ago, but has been revived since the eruption 103 thousand years ago.

Pussy willow is distributed in Hokkaido-Kyushu, and its habitat was confirmed in all plots.

Ginkgo inhabits in the range of annual average temperature 0-20 ˚C, and did not inhabit at first, but it appeared from 124 thousand years and increased.

VI consideration

Based on the we ratio fluctuation, we considered that the temperature dropped as cold as the Tohoku northern part or as the southern part of Hokkaido since the eruption of 125 thousand years ago, and rose around the 103 thousand years ago. This consideration was also consistent with the temperature variation data derived from the Antarctic ice sheet analysis.

©2019. Japan Geoscience Union. All Right Reserved.

We are currently analyzing the entire samples to investigate temperature changes in detail. At that time, in order to reduce individual differences in judgment in pollen, we aligined the judgment criteria firmly.

Statistical analysis of the columnar joints shape and study of its formation factor using high resolution 3D model by multicopter photos

*Akihito Oota[1], *Kouta Enomoto[1], *Maho Kubota[1], *Minako Nishijima[1], *Atsushi Watanabe[1]

1. Nirayama HighSchool

By the drone, we took the aerial photograph of the columnar joints outcropped on the coast of Tsumekizaki in Shimoda city, Izu Peninsula, and analyzed the statistical distribution of the columnar joint forms. In addition, we analyzed the varying factors by columnar joint using starch experiment and by the columnar joint simulation based on random points as contraction centers. According to the data of Tsumekizaki, the number of hexagons is the largest, followed by the number of pentagons and heptagons. the starch experiment, the number of hexagon was the largest, and the distribution was such that there were more pentagon and heptagons than the distribution of the columnar joints of Tsumekizaki. The columnar joints with random points were distributed from triangle to hendecagon, and had the less hexagons than that of Tumekizaki. In the ideal cooling, which is a case where the columnar joints were based on the contraction centers arranged at equal intervals, it becomes all hexagons. But, in the case of the random point columnar joints, the shapes other than hexagon increase. Accordingly, it is considered that the form variation of the columnar joint is related to the heterogeneity of cooling.

Restoration of the Paleo-Kano Bay

*Souta Kojima[1], *Mao Kubota[1], *Natsuki Yoneyama[1], *Takayuki Yamamoto[1], *Athushi Watanabe[1]

1. Nirayama HighSchool

I. Background of research

In the Tagata Plain in the northern part of the Izu Peninsula, the sea called "Old Kano Bay" was spread by the Jomon Transgression. There have been studies to restore its coastline, but we have done research to improve its accuracy. Although it is customary to restore the coastline from the results of the topography and boring investigations, we tried to restore the distribution of the ruins and the distribution of *Quercus. Phillyraeoides* (Ubamegasi).

In the preceding studies, they tried to distinguish the land stratification and the sea stratification, and to identify its coastline using the method of measuring the sulfur concentration of the soil, the method of examining the pieces of diatom and the electrical conductivity of soils.

In the Kanto Plain, which concentrated on the damage caused by the Kanto earthquake was similar to Tagata Plain in the terms of that it was the sea and the week ground. Therefore, it is possible to predict the existence of the weak ground in the underground several tens of meters by restoring the coastline at that time, it can be expected to be useful for disaster reduction.

Ⅱ. Research Theme

1.Restoration from ruins

We distribution of the ruins from the Jomon period to the Yayoi period and summarized it on a map.As the age progresses, it moves from the mountains to the plains. The important thing is that in the Jomon period, where the plains which had been the sea has no ruins, and the distribution moved to the plains when the resigning happened. It is presumed that Tagata Plain is a non-residential area in the Jomon period.

2. Restoration from *Q. phillyraeoides*

(1) Distribution Survey

Q. phillyraeoides is the weak plant in the flatland survival competition and prefer the rocky coastline. But the inland part of Tgata Plain, there is a place where *Q. phillyraeoides* colonies exist. So, we supposed that the *Q. phillyraeoides* which exist in the inland, advanced the inland when the Jomon Transregression happenedInland, and was stranded after resigining.

Fieldwork is conducted in Tagata Plain and the west coast of the Izu Peninsula. We picked 12 new samples in the inland area, and 27 new samples in the coastal area. Almost all inland, *Q. phillyraeoides* are similar to the coastal areas of the plant like cliffs and rocky habitat which is difficult environment to exist.

©2019. Japan Geoscience Union. All Right Reserved.

(2) **DNA Survey**

We assumed coastal colony have been isolated more than 6000 years. It could have caused some differences between DNA of both. To find the changes, we compared DNA of inland and those of coastal area. And tried to prove inland *Q. phillyraeoides* were left behind by the Jomon transgression. Frozen powdery sample DNeasy Plant Kits by DNA of extraction and try to amplify DNA by PCR

We used *Matk,* the *trnH-psbA* and the *atpB-rbcL* as primer. After the amplification we performed Electrophoresis and compared DNA by result of it. We couldn’ t put the band in a sample of all. But, it seems to be differing slightly between Moriyama in inland and Usibuseyama in coastal area. However, samples concentration is very small. we could not do comparison with other samples and reproduction of experiment. we do experiments, changing the DNA extraction Kit. we used Lysis Solution SLS for Six samples (kareno Park, suisyou Mountain, Siroyama-do, Koganezaki, nannzou, Nagahama castle), and extracted DNA. We do these samples confirmation experiment of DNA.

As a results in all of the samples DNA of a band indicates the presence.

DNA of failed to amplify all but succeeded in extracting the. Conceivable as a cause is concentration and turbidity of impurities. But there were some differences in DNA. Future tasks are further gene analysis such as nucleotide sequence and examine the conditions of PCR.

III Conclusion

Now that we have been able to find many *Q. phillyraeoides* colonies, we can estimate coastlines more finely. In previous researches, it was estimated that the area near Siroyamado would be the southern end, but because there are many *Q. phillyraeoides* living in the south of Siroyamado, the southern end of Kokano Bay is estimated near the Mt.Suisyozan or south of Mt.Suisyozan in this study . Also, from the previous research and this research result, it is considered that the coastline will be as shown in the figure.

From deep water circulation to the World's environment

*Taiga Kokubo[1], *Yuito Tsukada[1], *Hiroki Nakada[1], *Mitsuki Nakada[1], *Hikaru Fujita[1]

1. Zushi-Kaisei Senior High School

Professor Hibiya Toshiyuki, from the Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, reports on thermohaline circulation which is a part of the deep sea circulation transporting heat from surface layers to the deep.
This makes a livable environment for us, and it is affected by tidal water flow from the moon.
Tidal flow effects the seamount at the bottom of the sea, and turbulent water flow occurs in the oceans.
For four years, we have confirmed whether the process which causes the tidal current is caused by this moon is correct or not, so we focused on the turbulence generated in the ocean by the tidal current.
We modelled seamounts and the sea using plastic plates, gypsum, heaters, high-speed response temperature probes, ornamental aquariums, ice, salt, ink, and flushing to analyze temperature changes and visible flows, which I have been experimenting with.

Mystery of hot and cold Hatoyama

*Yohei Yamamoto[1], *Yusuke Yoshimura[1], *Atsuhide Machida[1], *Syotarou Shinoda[1]

1. Saitama prefectural Kumagaya High School

Hatoyama, a town placed on center of Saitama prefecture, has an inland climate, and it has a unique feature:

Hot in summer season, but also cold in winter season.

Recent years, it is often observed a lot in winter that the minimum temperature of Hatoyama is colder than Chichibu’ s one; a town on basin, which means a flat area, and high altitude.

We tried to solve this mystery by investigating the data from Amedas, experiments in topographic models, and measurements of temperature in reproduced state of different land uses.

A New Story for Saturn Satellite Dione's History seen in Crater Counting

*Shu Ishibashi[1], *Kyota Kono[1], *Kota Takeda[1]

1. Tennoji Senior High School Attached to Osaka Kyoiku University

The rotation and revolution period of Saturn’ s satellite Dione are synchronized. In this case, we assume (Area with many craters) = (Area where meteorite is likely to hit).

Meteorites are generally likely to hit the leading hemisphere of the satellite (Hirata 2016), however, from the whole image of Dione, the crater distribution on the trailing hemisphere seems to be more concentrated than on the leading hemisphere. We tried to make a new explanation for the surface history of Dione with our detailed crater counting.

Which Weather Proverbs are Suitable for The Weather Forecast in Osaka

*Haruto Shimada[1], *Nao Asahi[1], *Aki Yamamoto[1]

1. High School Attached to Osaka Kyoiku University (Tennoji Campus)

These days, weather is forecasted by supercomputers, but people in the old days anticipated the weather using the weather proverbs. We think that in the present age where climate change is occurring, the success rate is low. In this research, we observe and record the shape of clouds and changes in weather at school and calculate the success rate with the data measured by the Japan Meteorological Agency. From the result, we will select a highly desirable weather proverbs those are suitable for present Osaka.

An Effect on Seismic Waves Beneath Active Volcanoes

*Ten Hayashida[1], *Mitsuki Komeda[1], *Miku Yamamoto[1]

1. Tennoji Senior High School Attached to Osaka Kyoiku University

In this study, we would like to reveal ' ‘What is the influence of seismic waves passing thorough magma" There are two kinds of seismic waves, P-wave and S-wave. P-wave can pass through solid, liquid and gas, however S-wave can only travel through solid. So, if the seismic waves pass a liquid magma, their waveform should become unclear. Unclear waveform means that the distinction between P-wave and S-wave become unclear. There are various ways to estimate the existence of magma, however it still be uncertain. We try to find an evidence of magma using seismic wave analysis.

The Research Analyzes Structure of Ray with Crater

*Mayuko Suzuki[1], *Mirei Okada[1], Suzuka Kanazawa[1], *Natsuko Okude[1], *Mio Sawai[1], *Meika Minami[1]

1. Tennoji Senior High School Attached to Osaka Kyoiku University

1.Research Object

Ray is saw on the moon. It is a redial pattern of lines. We knew how to repeat example to make meteorite familial based the meteorite theory, and we thought repeat example is make ray too. This research, we used these way, and we researched to make ray in a variety of situations in moon.

2.Research Method

In our experiments, we used starch and baby powder as moon surface and falling meteorite. We chose these powders in consideration of scale effect.

We dropped in models of meteorite from the same height to calculate physical energy. Meteorite models were made by powder with two measuring spoons.

We try three patterns of experiments.

1. when we drop starch balls on the floor

1, Starch balls which were supposed to be falling meteorite models were made with two measuring spoons.

2,This balls are dropped on the floor from height of 25cm,50cm,75cm,100cm.We did this experiences five time a height.

3,Spreads of starch were recorded.

2. when we drop starch balls on the starch floor

1, Blue-colored starch and red-colored starch were made by using food coloring.

2,Red starch balls which were supposed to be falling meteorite models were made with two hemisphere spoons.

3,Blue-colored starch, which was supposed to be moon surface, was laid over a white sheet. The range of spread starch is four times as the radius of the balls.

4,The balls were dropped on the starch floor and recorded spreads of starch as photos.

3. when iron balls are dropped on the powdered floor

©2019. Japan Geoscience Union. All Right Reserved.

1, A plate with a hole was put on baby powder which had been filled a box as the same thickness. Which was supposed to be moon surface.

2,Iron balls which were supposed to be falling meteorite models were dropped into the hole.

3,Spreads of baby powder which scattered from the hole were recorded.

3.Experimental Result

In the experiment , we 1 found a positive correlation from the graph between physical energy of the meteorite model and diameter of the ray.

In the experiment 2 , we succeeded to reproduce similar pattern of ray. We intelligence our result and consideration in the poster session.

4.Examination

We thought that the ejectors of ray are considered with falling meteorite and moon surface, but most of powder consisted ray models were ground one. Therefore, we conclude surface powder have high influence.

5.Future issue

The experiments in this study were conducted in an environment different from the lunar surface due to air resistance and the gravity of the earth.

In experiments 1 and 2, it wasn’ t possible to mechanize the manual operation for dropping the powder. As a result, the conditions become uneven.

Conduct an experiment to drop the powder diagonally considering the falling angle of meteorites.

The result of experiment Ⅱ is visual judgment, and examines the correct information processing method such as quantification.

The Way of Improving Salt-Damaged Soil

Sezaki Kanon[1], Tamaki Ueno[1], *Ai Kitanishi[1]

1. Tennoji Senior High School Attached to Osaka Kyoiku University

If soils become damaged from salt because of tsunami, plants and vegetables do not grow well. In our last year's research, it was proved that we can improve the salt-damaged soils by adding calcium compounds. So we have tried to find a way of improving salt-damaged soils by adding natural calcium, such as shells. We examined the effects of natural calcium on the growth of radish sprouts and the relations between the amounts of calcium compounds and the remaining Na^{+}.

Prediction and survey of moonlight power generation amounts –Development of new electricity generation system “Mr. Nisshin Geppo”

*Takaaki Ishimoto[1], *Ryota Suzuki[1], *Koichi Sato[1], *Yuki Yonemura[1], *Hajime Yamamoto[1], *Tatsuya Amamiya[1], *Shinya Amamiya[1]

1. Chuo University Junior and Senior High School

We have developed "Mr. Nisshin Geppo", a device equipped with a solar panel on an equatorial mount for an astronomical telescope. It can generate power while tracking the sun and the moon automatically. In the previous studies, we created a predictive formula for the amount of moonlight power by using an LED bulb, which simulated the power of moonlight. However, the error between the actual amounts and the predicted amounts of moonlight power generation was 64.5%, so we thought that there were some problems regarding the accuracy of the predictive formula. In this study, we have improved on previous predictive formulas by creating a new kind of predictive formula.

Two experiments were carried out in this study:

Experiment 1) Simulated moonlight power experiment: We changed the color of the LED bulb’s light with cellophanes. We measured the amounts of generated power for each cellophane color. We found each wavelength of light had a different influence on the solar panel. The amounts obtained approximated the actual amounts with the relation between the wavelengths and the light’s energy (moonlight spectrums). We measured the laboratory’s brightness with a “Sky Quality Meter” (SQM) and also took the magnitude into consideration.

Experiment 2) Actual moonlight power experiment: We generated power with “Mr. Nisshin Geppo” and measured the amount of moonlight power. At the same time, we also measured the magnitudes of the night sky with SQM. We calculated the predicted amounts by considering the obtained magnitudes and the new predictive formula.

As a result, we calculated the error between the actual amounts and the predicted amounts. In addition, we considered further improvements for the accuracy of this new predictive formula. Details of this study will be presented during the poster session.

Filtering capability of fossil coral skeletons *Porites* sp. and *Favia* sp.

*Yuki Ishisaka[1]

1. Chuo University Senior High School

This study has focused on the filtration capacity of the fossil coral skeleton for resource utilization. Three experiments (water passing experiment, filtration experiments with chalk powder and black ink) were performed using fossil *Porites* sp. and fossil *Favia* sp. collected from Kikai Island, Kagoshima, Japan. Water passing experiment revealed that *Porites* skeleton passes distilled water. In the filtration experiments, *Porites* skeleton showed a filtration capacity, while, *Favia* skeleton did not show the capability. The chalk powder was filtered by *Porites* skeleton; however, the black ink was not filtered due to the particle size. This study suggests that fossil coral skeletons have the potential for effective resource utilization.

Relationship between the eclipse of partial eclipse and solar radiation and illumination intensity

*Satoshi Yamamoto[1]

1. Hongo senior high school

Partial solar eclipses were seen across the country in Japan for the first time in about three years from 8:40 to 11:30 on Sunday, January 6, 2019. So on January 6th and January 7th, we measured and compared the amount of solar radiation and illuminance every 10 minutes from 8 o'clock to 12 o'clock on the roof of the school. The amount of solar radiation was measured using solar panels, and the illuminance was measured manually using a luminometer. In addition, it was not possible to measure an accurate value because it became clouded after 10:20 on January 6. The ratio of the solar radiation and the illuminance on January 6 to the solar radiation and the illuminance on January 7 was determined and graphed. As a result, both the amount of solar radiation and the illuminance decreased gradually from around 9 o'clock, and the minimum value was recorded at 9:50. From the measurement results, it was thought that there is a relationship between the ratio of the missing area of the sun, the amount of solar radiation, and the change in illuminance. Therefore, we used the solar eclipse calculation software to calculate the diameter of the sun and the moon and the amount of food for each measurement time, and we conducted reproducible experiment from this data and considered it.

Keywords: Partial solar eclipses, Solar radiation , Illuminance

How much can the revolution of the moon be explained by the second law of Kepler?

*Kana Uchida[1], *Haruki Kobata[1], *Toa Hattori[1], Shuhei Asano[1], Mamiko Usui[1]

1. GIZAN SENIOR HIGH SCHOOL

We have been researching the phases of the moon since 2016 .
We researched with the ratio of the shining part of the moon which changes with the moon cycle.
We called this ratio “luminous rate”.
First, a model experiment was conducted to obtain a formula for explaining the change in the luminous surface ratio.
Then, the value obtained by this formula was compared with the light emission area obtained from the image of the actual moon.
As a result, we confirmed that the change of the distance between the earth and the moon was not constant.
It was thought that the cause was influenced by Kepler’s second law.
We hope to find a formula for each pattern, we compare the pattern of luminous rate per cycle for each moon cycle.
For that purpose, we compared the values of tha astronomical almac and the calculated values,
And also made a graph of the values of the astronomical almac and the distance.

The formation age and environment of the Tubo River outcrop,Seki in Gifu prefecture, Central Japan.

*Yuya Yamada[1], *Keisuke Ohno[1]

1. GIZAN SENIOR HIGH SCHOOL

In the research concluded until last year, the outcrop of Tubo River that flows through Shimokurachi in Seki city Gifu prefecture is stream deposit by the pumice Old Kiso River that erupted at Mt.Ontake about 60 to 90 thousand years ago.

This study, the pumice of this outcrop and several pumice collected in the standard outcrop of Mt.Ontake tephra in Ina city, Nagano prefecture are compared from the characteristics of heavy mineral composition and Hypersthene. As a result, this outcrop included pumice called On Pm- Ⅰ ,On-In, On-Mt. Also, From the deposition structure of this outcrop, the abandonment of the diversion toward the Seki city of the Old Kiso River is considered to have occurred about 60 to 55 thousand years ago, integrated with other previous research.

The change with time of the gigantic jet off the coast of Ibaraki on December 11, 2017 and comparison with the past jets

*Naoya Yamashita[1], *Shin Hirano[1], *Hayato Matsuyama[1], *Yuya Okubo[1]

1. Shizuoka Prefectural Iwata Minami High School

Our school and Aoyama Gakuin University observed a kind of gigantic jet of transient luminous events on December 11, 2017. The occurrence point is identified with Ibaraki prefecture off the coast by way of the triangulation from 2 points, and the upper altitude is 66.3km Also, we examined the gigantic jet by dividing it into five parts based on the characteristics of light emission. As a result, it becomes clear that the upper part emits light first, and after the light emission weakens, that of the lower part become stronger. Furthermore, it was considered that the gigantic jet was triggered by a discharge in the cloud due to the accumulation of a large amount of electrical charge in the troposphere, in comparison with the weather observation record and the previous research. In addition to them, we compared this jet with the three past gigantic jets and found out common and different points. As common points, all four jets occurred from late November to mid-December, and they almost didn’ t have rain. But their shape, altitude and light emission time are very different.

Reconstruction of Late Holocene environmental changes based on analysis ofcore sediments from Kaicho Temple

*Tomoya Ina[1], *Daisuke Suzuki[1], *Keito Tsutahara[1]

1. Shizuoka Prefectural Iwata Minami High School

1.Introduction

Studies of historical records show that many Mw 8 class earthquakes have occurred along the Nankai and Suruga troughs, central Japan, with a recurrence interval of 90–270 years since the AD 684 earthquake. Coseismic uplift did not recorded during the 1707 Hoei and 1498 Meio earthquakes, but the AD 1854 Ansei-Tokai earthquake caused coseismic uplift of ~1 m in coastal areas west of Suruga Bay, including the Shimizu Plain. Thus, we studied the environmental changes of late Holocene from the geological record of Kaicho Temple in Shimizu-ku, Shizuoka city, Shizuoka Prefecture, and examined the history of coseismic uplift prior to the 1498 Meio earthquake. The temple was built at AD 1011 in the beach ridge at an altitude of about 4 m. (Fig.1) This history can help to constraint age of emergence of land in the study area.

2.Method

We drilled two 14m boring cores, cut the core in the vertical direction, investigated deposits, took soft X-ray photographs and made columnar sections. (Fig.2) We used ^{14}C dating of leaves. We collected and preserve core samples every 1 cm. We analyzed the grain size and performed CNS elemental analysis.

3.Result

At site 1, deposits change upward from gravelly sand, through clay to alternations of sand and gravel beds. Gravelly sand and clay yield many intertidal molluscs such as *Umbonium moniliferum*. Foraminifera is not found from clay. The C/S ratio in clay deposit is ~0.7, except for the most upper part (6.3). The boundary between clay and well-sorted fine-grained sand is sharp. Alternations of sand and gravel beds yield wood fragments but not molluscs.^{14}C ages of leaves from the clay show AD 398 to 539.

At site 2, deposits change upward from sand, through clay to alternations of sand and gravel beds. Lower sand and clay beds yield molluscs. Foraminifera is not found from clay. The C/S ratio in clay deposit is 0.6-1.0. The boundary between clay and well-sorted fine-grained sand is sharp. In X-ray photograph, weak lamina can be observed in fine-grained sand. A woody debris bed with open matrix is found from sand and gravel beds. The ^{14}C age of leaves in woody debris bed represent AD 258 to 428.

4.Discussion

Based on occurrence of intertidal molluscs, we think that the clay bed at -0.45-0.25 m above sea level (core depth: 4.90-4.20 m) at site 1 and at -0.12-0.20 m above sea level (core depth: 3.92-3.60 m) at site 2 were deposited in muddy tidal flat. This interpretation is supported by C/S ratio. The clay bed is overline by alternation of sand and gravel beds. Sand beds are characterized by good size sorting and weak lamina. There is a woody debris bed in alternation of sand and gravel beds. These are commonly found in deposits in the backshore area which is only exposed to waves under extreme events with high tide and

©2019. Japan Geoscience Union. All Right Reserved.

storm surge. The uppermost gravel bed is interpreted as deposits of beach ridge.

It is noteworthy that sedimentary environment changed from intertidal muddy tidal flat to backshore area. Since shoreface area exists between both areas, a lack of shoreface deposit indicates that relative sea-level fell abruptly. Based on ^{14}C age of leaves, sea-level fall took place at AD 398-428. Because eustatic sea-level was stable in this interval, abrupt sea-level fall can be interpreted as coseismic uplift.

5.Conclusion

To clarify the history of large earthquakes along Suruga Trough, central Japan, we studied the sediment, fossil contents and TS contents of two sediment cores collected at Kaichoji Temple in the coastal area of the Shimizu Plain. The results can be summarized as follows.

1: We identified the sharp boundary in lithology between the clayey deposit and the overlying well-sorted sandy deposit at 0.20-0.25 m above sea level. This change indicates that sedimentary environments suddenly changed from tidal muddy flat to backshore area, suggesting coseismic uplift associated with rupture of Suruga Trough.

2: The results of ^{14}C dating show that the uplift took place at AD 398-428.

generation of 3D model on the coast of Samejima,the sea of Enshu and detection of coastline by drones

*Eito Takagi[1]

1. Shizuoka Prefectural Iwata Minami High School

1. Background・Purpose

It is clear from the past study of Iwata Minami High School area department that the coastal erosion on the coast of Samejima, the sea of Enshu(fig.1) is in progress. In order to study the coastal erosion, we perform leveling with auto level and hand level. However, leveling by human work requires much time and effort. So we focused on the drone we had on the headquarters club(fig.2). We thought, "Can we do surveying efficiently by using this drone", we decided to work on research activities with the goal of increasing the efficiency of surveying with drone.

2. 3-D point clouds

Last year ago, we conducted a 3-D reconstruction method using drone.

First, I captured videos of the coast of Samejima with a drone. After that, the image is extracted from the captured videos. 3-D point sets are generated from an image acquired using 3-D point set reconstruction processing software(fig.3). This makes it possible to create a reconstruction point group of the coast. However, the scale of the reconstruction point cloud is different from the actual coast. Therefore, based on the size of the actual blue sheet used for shooting, the blue sheet in the point cloud is subjected to enlargement and contraction processing. This allows the entire point cloud to be scaled to the actual scale.

We also performed leveling with auto level and hand level to check how accurate the acquired data are.

3. Detecting the coastline

This year, we detected coastlines from 3D point clouds(fig.5). First, the point cloud on the coast is divided into strips elongated in the y direction. Subsequently, each strip is divided in the z direction at regular intervals by processing by the program. Furthermore, for the cut ones, the variance is calculated in each range.

Finally, determine the threshold and record where the variance value exceeds the threshold. Then draw. As a result, the shoreline was successfully detected, and it was possible to identify the coast and the sea.

4. Discussions

©2019. Japan Geoscience Union. All Right Reserved.

This time, we succeeded in 3-D reconstruction of Samejima coast and detection of the coastline. First, comparisons were made using data of elevations measured using a surveying instrument and data of point clouds at the same points surveyed(fig.4). In addition, when performing comparison, it was based on the data acquired using a surveying instrument. When the two data were put together on the graph, it was possible to confirm the part where they coincide and the part where a large error occurred.

These errors were larger at the measurement start point and at the part near the shoreline.

Then, the coastline was also detected using the acquired 3-D point clouds. Since the threshold was artificially determined, it was possible to detect the coastline closer to the actual coast by freely changing the threshold. However, in the method performed this time, human work was very much.

Therefore, it is not completely applied to "to conduct surveying efficiently" which is the main purpose of this study.

5. Conclusion・Future outlook

In this study, we captured videos of a beach using a drone and succeeded in 3-D reconstruction on the coast of Samejima, the sea of Enshu. However, when comparing the data obtained from leveling and point cloud, a part where a large error occurs in the elevation was confirmed. Improvement is expected by improving the accuracy of reconstruction using a laser scanner. The operation of a drone equipped with a laser scanner also requires safety considerations.

We also succeeded in detecting the coastline from the acquired 3-D point clouds. As a result, it was possible to identify the beach and the sea. However, the method of coastline detection conducted this time has many artificial parts. Therefore, it is necessary to repeat the discovery of improvement points, the proposal of new methods, and the execution for the purpose of study “efficiency of surveying”.

Factors of beach change on the Ose coast in Ibaraki prefecture

*Kaito Kotsuti[1], *Kosuke Shimano[1], *Haruto Sakachi[1], *Fuyu Tokuda[1], *Syunsuke Nagayama[1], *Hiroki Nemoto[1], *Towa Murakami[1], *Yuki Mimori[1], *Yasushi Wada[1], Takemi Ogawa[1], Eri Yoshida[1]

1. Ibaraki Prefectural Hitachi First Senior High School

[Introduction]

In recent years, the impact of coastal erosion has been reported in the north of the coast of Ibaraki Prefecture (Uda etl,2008). We examined by using aerial photograghs the situation of shoreline of Ose coast in Hitachi City. As a result, it seemed that coastal erosion occurred on the Ose coast. So, we started this study.

[Purpose]

The purpose of this study is to examine the situation of the beach change on the Ose Coast and to examine the beach change factor.

[Overview of the Ose coast]

Ose coast is located about 1km away south from Hitachi Station. Ose coast lies between Ose fishing port and abrasion platform. Sea cliffs are located behind the coast. The length of the coast is about 100m of sandy beach. The sediments on the Ose coast were mainly medium sand and coarse sand.

[Experiments and results]

During the three year study period, the average elevation value fluctuated between 239.3 and 156.3 cm. And the foreshore part was the most fluctuating than the backshore .

[Consideration]

From the result of concentration of the fluctuating field in the coastal area, we consider points of "coastal flow".

coastal flow

We used ocean buoys located about 5 km off the Ose coast to examine the coastal flow over the past four years. As a result, three of the southeast (10%), the south (16%), the southwest (21%) are predominant, and we named them "south-facing coastal flow". The proportion of this "south-facing coastal flow" was inversely proportional to the increase and decrease of the average altitude. There was a slight negative correlation between coastal flow and average altitude.

El nino

The fluctuation of the coastal flow is not a seasonal. So we examined the relationship with the El Nino. As a result, correlation was seen that between the ratio of south-facing coastal currents and the El Nino

©2019. Japan Geoscience Union. All Right Reserved.

monitored area. Therefore, the topography change of the Ose coast may have something to do with the occurrence of the El Nino.

Hiraodai and Hirotani Wetland Research of soil hardness and water sources + Ramsar Convention

Mariko Hirota[1], *Yujin Ito[1], *Natsuki Abe[1]

1. Higashichikushi Gakuen High school

We are researching from the viewpoint of origin, increase and decrease, and regeneration of Hirotani Wetland which is the only karst plateau in Japan, located in Hiraodai. The research was conducted last year focusing on the following three points.

・ Quantification of wetland boundaries by soil hardness

・ Flow analysis of water by stable isotope

・ Ramsar Convention registration activities ... Conservation activities of Hiraodai + Hirotani Wetland

Hirotani Wetland, between 1994, when we started the survey, and 2010, more than 60% of its area was vanished. We think that artificial trail construction for conservation in 1998 lead devastation of the wetland. We thought it is human being' s responsibility to restore the damage done by human beings. We used Satoyama methods and started three restoration activities. First was maintenance of stone stackings to raise the underground water level. Second was adjustment of damming plate to make origin of underground water. Third was pulling up fallen reeds to revive seeds of wetland plants. By those activities, we succeeded to restore the wetland's area for 105% by 2017.

Wetlands are often considered from vegetation. However, the wetland boundary was quantified using soil hardness as a new wetland investigation method. I thought that the border between the grasslands and the wetlands in the Hirotani Wetland is about 7 mm, but in order to make it even more universal, surveys were also conducted in the Tadewara Marsh in Oita Prefecture and the Kushiro wetland in Hokkaido. The boundary value of the soil hardness of the grassland and the wetland is 8 to 9 mm, which proves the validity of the boundary value in the Hirotani Wetland. It is thought that wetland research by the geologic approach called surveying has made great progress.

Water was analyzed using stable isotopes to determine the origin of water in the Hirotani Wetland. From the results, a graph of the relative ratio between the celestial water line and the Hirotani Wetland was created, and when the approximate line of each measured point was taken, a straight line with almost the same slope as the celestial water line was found. Therefore, it turned out that the groundwater of the Hirotani Wetland originates from rainwater. Furthermore, from the intercept of the approximation line, it was considered that the water was seven months ago from March when it was sampled. However, for the first time to consider stable isotopes, we were taught by that who is studying stable isotopes at Tohoku University. It has been pointed out that dynamic classification is involved and complicated, and the width of this data can not be considered in detail. It seems that it was early to give concrete results. After all, I felt that it was difficult for high school students to study stable isotopes that could not handle analytical instruments.

In addition, as part of applied ecology, we are engaged in Ramsar Convention registration activities of Hiraodai and Hirotani Wetlands. The Ramsar Convention is a wide-ranging international treaty related to

©2019. Japan Geoscience Union. All Right Reserved.

biodiversity, and Akiyoshidai in Yamaguchi Prefecture is also registered, etc. The Ramsar Convention registration is the most important condition that local approval is agreed. Therefore we made a petition to Kitakyushu city council in addition to the presentation of the company and event hosted by prefecture, city. The petition of a high school student was the first time, was taken up by media companies, and local people were able to have a broad understanding of registration activities. With this petition, Kitakyushu City and Fukuoka Prefecture have also officially launched for Ramsar Convention registration. We will continue various appealing activities in the future, and want to convey the wonderfulness of Hiraodai + Hirotani Wetlands to more people. The challenge of the international treaty by high school students, which was not dealt with by anyone, is likely to bear fruit. And the Hirotani wetlands are also likely to make great strides in their conservation.

Ecological study on *Micrasterias hardyi* recently invaded to Lake Biwa: its dependency on water temperature

*Ayane Kawai[1], Michio Kumagai[2]

1. Shiga Prefectural Ishiyama High School, 2. Authorised NPO Biwako Trust

In August 2016, I saw *Micrasterias hardyi* at first, which is an invaded phytoplankton in Lake Biwa, and I was attracted by its beautiful microscopic shape. *Micrasterias hardyi* made a big bloom in Lake Biwa in 2016, and became in a comparative lull in 2017, but it increased rapidly again in 2018. I have studied the morphology, vertical distribution and settling velocity of *Micrasterias hardyi* since then. This time, as I made laboratory experiment to understand the dependency of *Micrasterias hardyi* on water temperature, I will show the results.

Changing environments on the earth –first termination of overturning in Lake Biwa

*Hinata So[1], Michio Kumagai[2]

1. Shiga Prefectural Zeze High School, 2. Authorized NPO Biwako Trust

Due to warm winter, overturning in Lake Biwa, which happens every year, has stopped this year for the first time. This sort of serious phenomena has not been reported during last 100 years. What is the cause of termination of overturning? How does it effect on the benthic animals and water quality in the deep water of the lake? What are coming on the environments next year or year after next year? We compare the present data with the filed data in the past and analyze them, and then discuss the possible change in future environments of Lake Biwa.

Let’ s solve the mystery of gyre drift toward north !

*Masaki Tsuji[1], Michio Kumagai[2]

1. Shiga Prefectural Zeze High School, 2. Authorized NPO Biwako Trust

There is a spiral current which moves to counterclockwise during stratified period in Lake Biwa. This is generally called gyre, and it is thought that the gyre is kept by balance with pressure gradient and rotation of the earth. We discussed the changes of gyre motion using the position information of gyre observed by two drifting buoys. The center of gyre shifted toward north about three kilometers during the field experiment. Also, we found that the wind blew from east to west during almost 24 hours at about four to five meters per second. From these results, we deduced the possibility of gyre movement toward north due to Ekman drift currents which were caused by east wind. In addition, we inspected the presence of geostrophic gyre which governs water quality distribution such as water temperature, chlorophyll-a, dissolved oxygen and so on.

Exploring Atmospheric Properties from Color Change Observation of the International Space Station

Kuroiwa Hiroaki[1], *Ishimura Daiki[1], *Kurohabaki Nanami[1], *Takizawa Shizuku[1], *Yamamoto Yuka[1]

1. Iiyama Senior High School

The purpose of this study is to attempt to make a low cost ozone map. The images of the ISS(the International Space Station) change their color from white to blue to red when the ISS appears and disappears. According to NASA’s Science News(Dec.2011) the blue hue becomes stronger when sunlight passes through the ozone layer. In this study, we assume that the blue hue reflected from the ISS deepens as the ozone layer thickens. First, we photographed the ISS’s light trails and measured RGB values, especially focusing on the B color code. Second, we estimated the ISS’s positions and distance traveled through our photographs by comparing our the times at the beginning and end of each exposure and the total time elapsed in the composite image with the JAXA *Kibo o miyo* ISS location map. From these data, we researched the relationship between the amount of ozone and observed color changes of the ISS in our photographs. In conclusion, it is likely possible to create an accurate ozone layer map by using amateur pictures of the ISS. This method could replace current costly observation techniques.

Re-examination of capillary phenomena with gravity as a variable : Second report

*Koushi Hashimoto[1], *Haruka Ono[1], *Riku Nakaima[1], *Takeo Matsuda[1], *Yoshie Sawazaki[1], *Takako Yamashita[1], *Takeru Wakabayashi[1]

1. Otemae Senior High School of Osaka prefecture : the evening course

Surface tension acts on the liquid to reduce its surface area. In a thin tube, the phenomenon that the liquid surface rises due to surface tension is well known as capillary phenomenon. According to theory, the height of this liquid level is inversely proportional to the radius of the tube and gravity. Experiments with varying tube radius have been made up to now, and it has been confirmed that the relationship between liquid level and tube radius follows a theoretical formula. We have an apparatus to change gravity. Therefore, we tried to confirm experimentally whether the relationship between gravity and the height of the liquid level also follows the theoretical formula. When water was used as the liquid sample, the height of the liquid level did not follow the theoretical formula, and the rise stopped at a certain gravity value. However, in the case of ethanol, the liquid level increased according to the theoretical formula. Based on this experimental result, we discuss the theoretical formula and the experimental method.

The Study of Kabutoyama

*Manami Nakazawa[1], *Masahiro Okuyama[1], Dai Iijima[1], Haruta Moriya[1], Ayato Watanabe[1]

1. Yamanashi prefectural Hikawa Highschool

”The Kabutoyama” of northern part of Kofu Basin are mountains of a helmet-shaped.
We studied Mizugamori volcano distributed over the northern part in the past. This study is intended to clarify it about the difference in characteristic in search of the border with the Mizugamori volcano.
We understand that mudstone and andesite are distributed by an investigation in the outdoors and make a geologic map now.

Proposal of GEO-KAMISHIBAI that enhances the appeal of SANRIKU Geopark and conveys it in an easy-to-understand.

*Keisei Yasuhara[1], *Kana Kato[1], *Mizuho Gondai[1], *Arisa Okubo[1], *Haruto Kawasaki[1], *Mai Kawabata[1], *Seiya Yoshida[1], *Hitomi Kimura[1]

1. Mariento Chikyu Tanken Club Senior

The Sanriku Geopark covers the area from Aomori Prefecture through the coast of Iwate Prefecture and down to Miyagi Prefecture. Hachinohe City Marine Science Museum is located on the northern edge of that and to that belongs to the Mariento Chikyu Tanken club.

We learned about Sanriku Geopark in March 2019. There are seven geosites in the Sanriku Geopark northern area. They are shown in Figures 1. After lectures by Sanriku Geopark authorized guide and the field trips, we had many problems such as difficult and unfamiliar technical terms. So we picked difficult terms or mechanism out and drew up a list. And find out them on books, brochures and the website. We rewrote them to an easy-to-understand description for high school students and to the one for elementary school students.

Presenting what we know how a feature of our club. So we propose "GEO-KAMISHIBAI" as one of the solutions to the problem. An example is shown in Figures 2 and 3. Use simple figures and give plain explanations that use as few technical terms as possible. We made it with a keen awareness of living in a changing zone.

It was improved while incorporating expert advice and demonstrated to elementary and junior and senior high school students. We confirmed that we could convey the attractiveness of Geopark in an easy-to-understand and fun way as a result of the questionnaires obtained there. The results of the questionnaire are shown in chart 1.

Through this activity, we were able to realize that we lived on the earth which keeps changing. In addition, the people adapted themselves to various earths' changes many times, and they have made it rather opportunities for the innovation since the Jomon-era. And we want to know wisdom from the geopark. We should not be afraid of earth changing too much and should make it an opportunity of the new innovations. We are trying to improve "GEO-KAMISHIBAI" more and more.

We got the cooperation of Japan Agency for Marine-Earth Science and Technology (JAMSTEC), Hachinohe City, Hachinohe City Board of Education, Korekawa Archaeological Institution, Promotion of Utilization of Research Results by JAMSTEC Hachinohe City Council Meeting Association, the high school to which the members belong and various related organizations. Gratitude is recorded here.

Research of the Fukui Earthquake Fault (Ⅶ)

*Nobuyasu Nagata[1], *Takuma Yoshizawa[1], Shintaro Umeda[1], Reiji Ohigashi[1], Mahiro Tajima[1], Ryuto Kubota[1]

1. Fujishima High School

71 years have passed since the occurrence of “Fukui Earthquake.” Fukui area has overcome a lot of sufferings and has revived from that wretched spectacle. Now, what to do in order not to repeat the tragedy?

The Fukui Earthquake occurred in 1948 with magnitude 7.1, and brought great damage on Fukui prefecture, killing as many as 3769 people there. This is the first large-scale earthquake that occurred directly underneath a modern city and led to set the 7th grade in “Seismic intensity.”

Actually, there exist a lot of active faults including active Fault zone at eastern margin of Fukui plain, which caused the earthquake. Our purpose was to reveal the underground structure through analyzing the seismic wave and we now hope that this research will be some help for disaster prevention in Fukui Prefecture. This research continues for 7 years and we took it over from our senior. We have observed the seismic wave around the active fault zone at eastern margin of Fukui plain with 6 points.

In this research, we studied from 3 respects.

First one is to determine the hypocenters. We determined hypocenters of earthquakes by using “Win-system” in order to accumulate data set, on which our research was based. We determined 47 new hypocenters last year and now have 319 events from the past 7 years.

Another respect is to estimate the underground structure of each observation station from the data of first S wave vibration direction. From the data of seismic wave form, we created hodographs, identify the first vibration directions and pointed out the possibility of existence of cracks and some underground structure from them. This year, we considered what caused the little differences between this year’s data and past ones.

The other respect is to study the structure of active Fault fracture zone at eastern margin of Fukui plain by travel-time analysis for coda waves. In our two observation points (Kanzu, Sakai) inside active Fault zone at eastern margin of Fukui plain, remarkable coda waves are sometimes seen after S waves. According to our senior’s study, they occur because seismic waves which come from extended area of faults zone get to the fault exceeding critical angle and reflect totally. They concluded that the origin of S wave and remarkable coda wave is same by spectrum analysis. On the basis of these, we did travel-time analysis for S waves and remarkable coda waves, and considered the structure of active Fault fracture zone at eastern margin of Fukui plain.

Keywords: Fault zone at eastern margin of Fukui plain, S wave splitting, Coda wave, Travel-time analysis

Estimation of sedimentary environment of volcaniclastic deposit and location of craters in the Nomashi formation, Izu Oshima

*Kouki Aida[1]

1. Musashi High School and Junior High School

Izu-Oshima is an active volcano located in the northern end of Izu archipelago. Its eruptive history has been made clear by observing its outcrops. Most of the real surroundings of each eruption such as weather condition and location of crater remains to be confirmed.
In order to clarify the sedimentary environment of eruptions, we investigated the exposures on Mabushi logging road crossing in an east to west direction on the southern part of the island. On this road, we could observe the Younger Oshima group, which is the upper part of rocks in Oshima. In this study, we narrowed down a survey into the Nomashi formation, which is the middle part of the Younger Oshima group. As a result of correlation, we revealed that some of the same layers have laterally continuous variation of thickness and scoria coarseness. We suggest that continuous thickness variation shows the approximate wind direction of the eruption, and continuous scoria coarseness variation shows the approximate location of the craters.

Keywords: Izu Oshima volcano , Younger Oshima group, tephra thickness, scoria coarseness, wind direction of eruption, location of volcanic crater

Why Is the Baseball Ground in Our School Badly Drained ?

*Ryou Ito[1], *Shuta Aoshima[1], *Tomoya Mizutani[1], *Daichi Ishii[1], Yosuke Saito[1]

1. Tokyo Gakugei University Senior High School

Tokyo Gakugei University High School Baseball Club, are regularly active on the baseball ground, have been bothered by the badness of the drainage. This research aimed to clarify why the drainage of the baseball ground is bad. Previous study in our school had three experiments: 1) observation of baseball ground after raining, 2) experiment comparing the particle size of the soil on the baseball ground and the soccer ground, 3) experiment surveying the property of underground soil with soil boring auger. It indicated that the surface drainage was the main reason of the badness of the baseball ground.
This study had the three experiments below: 1) observations of the puddles, 2) making the surface irregularity map, and 3) surveying the underground soil by soil boring auger. From these experiments, this study suggests that the main reason of the badness of drainage on the baseball ground is the flow path stagnating. For the improvement of the drainage, it is effective to continue the flow path with outside the baseball ground.
On the other hand, it was not possible to estimate the amount of the rainwater that infiltrated the baseball ground. From now on, it is necessary to survey the amount of rainwater infiltrating underground and moving on the surface in order to understand the whole movement of rainwater received by the baseball ground.

Observation of the dust storm over the polar cap of Mars

Yuzaburo Takamura[1], *Rino Hayakawa[1], Soma Ohashi[1], Yuna Kuriki[1]

1. Ichinomiya High School

With Mars Closest Approach occurred on July 31, 2018, we have observed Mars on a continuous basis using a CMOS camera. Along with this event, a massive dust storm was seen on the surface of Mars. Therefore, we analyzed how the dust storm effected our data of Mars, focusing on the polar cap. The results showed that the contrast difference throughout the polar cap got smaller as the dust storm grew big.

Keywords: the polar cap of Mars, CMOS camera, the dust storm

Analyzing the shape of (51)Nemausa

*Taiga Hirozawa[1], Suguru Okada[1], Tomoki Suzuki[1], Tomohiro Shibayama[1]

1. Ichinomiya High School

On, April 1, 2018, we observed a star occultation of asteroid (51) Nemausa. From the collected data and the date from other observation points, we estimated the cross sectional view of Nemausa. We’ ve also conducted a photometric observation to calculate Nemausa’ s rotation period. From the two results, we estimated the possible shape of Nemausa. In addition, we compared the light curve of the actual data with the light curve of a model of the estimated shape.

Get closer to the mustery of Sprites and Elves.

*Ayumu Nishihara[1], *Shogo Kawamura[1], *Hidetoshi Oka[1], Daichi Iriki[1], Shunsuke Nakao[1]

1. Prefectural Kochi Ozu High School

We have been researching Transient Luminous Events such as sprites and elves. Transient Luminous Events are luminescence phenomena that occur with lightning in the mesosphere at an altitude of about 50 to 100 km, and include sprites and elves. Elves is a donut-shaped light emission phenomenon that occurs around an altitude of about 100 km. It is said that the frequency of occurrence is higher than that of sprites, but even in Transient Luminous Events, the duration of light emission is as short as 1 millisecond or less, so the number of data that we can actually observe is smaller than that in sprites. In addition, since the light emission time is short, the number of frames of the camera does not match, and in many cases the peak of brightness does not appear, so many Elves images are unclear. We are collaborating with 32 high schools across the country. This is the world's largest Transient Luminous Events observation team, and holds many data. This time, we analyzed and considered using data taken at our school and data taken at a joint observation school.
This time we did research on sprites and the mystery of Elves. Sprites are a phenomenon of light emission from electrons that have lost their place due to lightning strikes, so it is natural that they occur just above lightning strikes, but there is an unnatural point of about 50 km away from the lightning strike point, and the reason is unknown . Therefore, we identified locations of sprites, elves, lightning strike points for events with very low shooting frequency, where elves and sprites occur simultaneously, and observe simultaneously at multiple schools, and consider their positional relationships.
In addition, it is known that the electromagnetic pulse that causes Elves is generated by the time change of the current intensity, is strongest at a right angle to the current, and emits light by moving the electrons in the sky. However, it is often the case that the lightning strike point and the center of Elves are separated, and the reason is not known. Therefore, it is assumed that the lightning that generates Elves extends horizontally for several kilometers in the cloud and then strikes directly under it, and it is thought that it is impossible to deduce the shape and location of Elves from the intensity distribution of electromagnetic waves emitted from the horizontally extended current. The experiment was performed using a simplified model.

Prediction of the giant-squid movement around Japan using the dataset of ocean current and temperature.

*Yuka Koike[1]

1. Hiroo Gakuen Senior High School

The giant squid is one of the largest invertebrates in the world and is believed to mainly inhabit at depths of 650m to 900m. In Japan, they have been identified mainly in the areas around the Ogasawara Islands and near the Sea of Japan. However, because they are extremely rare in the number of individuals discovered, detailed studies on behavior and distribution have not been conducted. Their migration path/habitat distribution is roughly predicted with the data of the place where the giant squids were discovered, but the quantitative analysis has not been carried out.

The purpose of this study is to identify their movement routes and ecological distribution based on topographical data and to predict them more quantitatively than the research conducted in the past. The final goal is to establish a systematic method that can predict the behavior and distribution of organisms that are not currently studied, regardless of the species.

In this research, I will conduct research from the following two directions.

First, I compare the data of the ocean current and temperature with the location of the discovery and analyze the route and distribution from multiple planes. This time, using the Google Earth Engine (hereinafter referred to as GEE), the ocean current and ocean temperature data obtained from satellites are mapped on the map and compared with the data of the discovery location. As the data of the discovery place of the giant squid, the coordinate data at the time when they were discovered in extraordinary numbers in the Sea of Japan from January 2014 to March 2015 is used[1]. The data of the discovery place is visualized using Google My Map. In the previous researches, I made global predictions using surface data for all currents and temperatures, taking the variation in depth of each data collection location into consideration. The ocean current data was replaced with the HSV color space, and the hue represents the direction of the ocean current and the lightness represents the velocity of the ocean current. As a result, 57 individuals were found in the region where the velocity of the current is almost zero or slow. As for the seawater temperature, 48 out of 57 individuals were found in the region where the seawater temperature is relatively low. The following two were considered from these results. First of all, Squid is present in the region where the ocean current is slow in order to reduce energy consumption in the deep sea where the food is extremely low. Second, it was discovered that it had surfaced to a surface with a relatively large amount of biomass compared to the deep layer. However, because the operation of GEE was insufficient, the quantitative prediction could not be made. So, this time, I will collect data at each point using the method of acquiring the velocity of the ocean current and the temperature of the ocean at each point. The results obtained will be compared with the global forecasts made in previous studies to make new quantitative forecasts.

Secondly, based on the data of the ocean current and the temperatures well as hydrodynamics, I quantitatively forecast the migration path and habitat distribution of the giant squid. At present, the goal is to calculate and visualize the current flow. For this purpose, I’ m investigating how the Boltzmann equation that describes the microscopic behavior of fluid and the Navier-Stokes equation that describes macroscopically, correspond. The Navier-Stokes equation is a basic equation of fluid. Since the solution

©2019. Japan Geoscience Union. All Right Reserved.

of the Navier-Stokes equation does not indicate the existence, the correctness of the numerical solution obtained by performing the numerical simulation cannot be confirmed. I think that it is enough to use the differential equation obtained by discretizing in this scale. Finally, these are used to quantitatively predict how the giant squid will move from the location of the discovery.

By applying this research, it becomes possible to establish models of migration pathways and habitat distribution of not only the giant squid but also other creatures whose habitats are unknown, and it can be expected to be used for fishery and research.

[O-04] New earth and planetary science education created by hybrid community between society and JpGU

convener:Yasushi Fujiwara(Evening Classes; Integrated Course, Kanagawa Prefectual Mukainooka Technical High School), Hiroaki Akimoto(Faculty of Economics,Dokkyo University),
Chairperson:Yasushi Fujiwara(Evening Classes; Integrated Course, Kanagawa Prefectual Mukainooka Technical High School), Hiroaki AKIMOTO(Dokkyo University)

In 2017, the curriculum guidelines for elementary and junior high school were announced by the Ministry of Education, Culture, Sports, Science and Technology. In addition high school curriculum guidelines were announced in 2018.
 These guidelines show "What we learn for (goals and contents of subjects and courses)" and "How to learn (improvement of learning course)" in order to foster student qualities and abilities.
 They also highlight how to develop a curriculum which is open to society and share the common understanding of "fostering of student qualities and abilities".
 Furthermore, High School/University Articulation Reforms will be regarded as important to considering the contents of university education and the admissions so that the results at elementary and secondary education are carried over to university education, and academic ability is reliably fostered.
 Earth and planetary science education also needs to clarify "what we learn for" and respond to what society demands, proposing inquiry activities through observation and experiments in the learning process.
 This session aims to deepen understanding about expectations for new earth and planetary science education and issues to be solved by participants from various viewpoints, including teachers, researchers, students, and citizens.

Discussion

In the next Course of Study, let's send information on world standard "geography / geography" from Japan to the world

*YOJI TAKIKAWA[1]

1. NPO Association of Science Curriculum Initiative NPO Galileo Science Workshop

Previously, at the science education research meeting, a high school geology teacher introduced that "photographs before and after the earthquake" taken in his area, "predicting the dangerous place" is used for his lessons . I learned that we can predict where danger is.
Another geological teacher went to see the principal who invited me to come to my high school and said he refused "I do not want to work for a dangerous school in such a lowland". It might seem like a strange teacher at the present time, but I think that [the crisis management of Japan with many earthquakes] was quite different if these knowledge became common sense of citizens. It is also understood from this that learning of "Earth science education - natural geography, geology, mineralogy, geophysics, oceanography, meteorology etc" is indispensable for earthquake, disaster prevention, environmental understanding. However, teachers of earth science are currently endangered species in Japan. In this situation I hear that it may be forced to withdraw from the forefront of geoscience education.

On the other hand, the New Course of Study guarantees importance on "subjective, interactive and deep learning (active / learning)", not only knowledge but also "student’ s inquire” is claimed to be valued . This direction is also common to "PISA test of OECD, National curriculum of the UK, Standard NGSS of science education of the USA, etc." In short, it is considered important to acquire the "motivation, method, and the living knowledge on which it is based" necessary for the child to continue learning throughout his life. For this reason, the Ministry of Education, Culture, Sports, Science and Technology is also changing the way "college entrance examinations are implemented", especially for high schools and universities to change the direction of learning from "knowledge injection type education".

In the era when "birthrate aging and declining birthrate" and "IT" are rapidly changing the society, we are approaching a milestone that we have to reveal "content and method of education" to foster children appropriate for the next era in a fairly rapid manner. In "Geography / geography education", it is necessary to reconsider the significance of "what to teach" again. And it is time to re-send "geography / geography education" from Japan to the world. I hope everyone will work in a meaningful direction.

Keywords: New Course of Study, Active learning, Inquiry activities, Reform of entrance exam from high school to university, STEM education, The era of "low birthrate and aging" and "IT"

What a mantle scientist hopes geoscience education

*Natsue Abe[1]

1. R&D Center for Ocean Drilling Science Japan Agency for Marine-Earth Science and Technology

When asking what kind of images you have about the Earth's mantle, most people answer "molten magma". People are probably influenced by movies broadcasting on TV, novels such as "Journey to the center of the earth by Jules Verne" and "Japan Sinks by Sakyo Komatsu", or many movies (such as Center of the earth) are strongly influenced. In general, people seem to think as follows. Because there is a hot substance deep under the ground, the "mantle" under the crust is a melted magma, and thinking that the liquid that reached the surface with some meter will erupt as lava It seems to be. I heard a conversation in the Kanto region and was shocked. Since the aftershock of the Great East Japan Earthquake on March 11, 2011, the aftershocks occurred quite a lot, "the Japanese archipelago became loose and decided to sink into the melted" mantle = (magma, but this is wrong!) " There was a person who was threatened by the fear of sinking into the lava. We geoscientists know the Japanese archipelago will never sink into the mantle in that short time-scale and never disappear our life time. Just having this basic knowledge, we are not trapped such fear, and probably know better how to deal with natural disasters such as earthquakes than general people. I think we earth scientists need to act and prepare for natural disasters as a norm for the general public. In this presentation, I would like to talk about some examples cited from my lecture and outreach experience.

As a mantle petrologist who study mantle peridotite, I strongly expect "geoscience classes" in junior high and high school that students learn basic knowledge to be able to properly fear natural disasters and prepare for it. Not only the students who are currently taking "Basic Earth Sciences", but also students entering the Department of Science other than those who wish to enter the Department of Earth Sciences at least as living in Japan, I hope that you will learn the knowledge of Geoscience literacy as a compulsory subject in high school. Contents that are covered within the scope of the current high school "basic earth science" is sufficient, broadly "scientific literacy" is needed for thinking deeply and act properly when something happens.

New high-school compulsory subject “General Geography” and related cooperation of geographers and earth scientists for human resource development

*Takashi Oguchi[1]

1. Center for Spatial Information Science, The University of Tokyo

In Japanese senior high schools, a new subject “General Geography” will be compulsory from the 2022 fiscal year. Although this subject belongs to a section of social sciences under the official education system, it puts emphasis on some physical sides of geosciences such as natural hazards, global environmental problems, and applications of digital data using GIS. Therefore, the new subject will contribute to education and human resource development in not only geography but also broader geosciences. To facilitate this, geographers and geoscientists belonging to the Japan Geoscience Union as well as some committees and subcommittees of Science Council of Japan should cooperate, as is the case with a recently established SCJ subcommittee for high-school education in geosciences and geography.

Visualization of terrain by Red Relief Image Map(RRIM) and geoscience education

*Tatsuro Chiba[1]

1. Asia Air Survey Co., Ltd.

1.Introduction

Three-dimensional understanding of terrain in geoscience education is fundamental and important. For that, the reading of contour lines is a big problem. The contour line shows the planar position of the line of intersection between the topography and the plane as a representation method of the terrain. By altering the altitude at equal intervals, it is visualized as a striped pattern. In principle, horizontal and vertical planes can't be visualized. It is possible to objectively express the topography without individual skill. It is possible to transform mesh data, which is a wonderful invention. This skill is indispensable in order to read topography such as topography map of the GSI.

2. Numerical terrain data and terrain representation

Digitization of terrain had gradually become advanced since the 1980s. The national land numerical information started at 250 m, 50 m, 10 m, 5m. On the other hand, the technology for visualizing this method has remained around the time of low data density, there is no change, and the problem that detailed data can't be fully expressed can also be raised. It was difficult to read all the data in the shadow map, the gradient map, the advanced gradation diagram, and the like. Shaded figures had problems such as irregularities reversed depending on the light source direction, and there was a problem that it was impossible to distinguish between steps and grooves.

3. Principle and advancedness of RRIM

Chiba invented RRIM triggered by the topography survey of the Aokigahara ocean in Mt. Fuji in 2002. This was to visualize detailed data of a 1 m mesh by aerial laser measurement and complex topography of the lava surface where the irregularities are distributed complicatedly and to capture a large topography. The expression that it is redder as steep slope, brighter as a ridge and darker as a valley has the feature that it can be understood immediately even by ordinary people who do not receive special training and education. In addition, this figure could be overlapped with conventional contour diagrams, overlapped with advanced steps, and the understanding of the topography was greatly promoted. In many cases, it is used in media such as BURATAMORI, and recently it has become possible to select it as one of the backgrounds in geological map NAVI and GSI map.

4. JPGU and RRIM

In Asia Air Survey, as a place to transmit the goodness of the red 3D map, I regarded the exhibition of JPGU as a very good opportunity and have held a booth exhibition every year. For the first time here, some high school students also saw the red stereoscopic maps as an opportunity to be interested in topography and geology. It also leads to a series of work with JAMSTEC based on the idea that the exhibition here can be applied to the ocean bottom topography, and its submarine topographical map is bringing the further effect of geoscience education. Also, analog model experiments that flow shampoo lava on the topographical model of red 3D map repeated every year was very effective for understanding the hazard map. I would like to continue exploring what I can do for geoscience education through the activities of JPGU.

The planning of “Integrated Geography” and its aimed competency

*Yasutaka Kogawa[1]

1. Okayama Prefectural Tsuyama High School

The next curriculum guidelines were announced in March 2018, and “Integrated Geography” of required subject is provided as the new subject of geography for “sustainable society”. On International Charter on Geographic Education, five main concepts are “Location and Distribution”, “Place”, ”People-Environment Relationships”, ”Spatial Interaction”, ”Region”. These concepts are one of the guideline on constitution of geographical curriculum, and through International Geography Olympiad, International standard such as thought and skill which is cultivated in geographical education is indicated to high school students in all over the world.
To the implementation of “Integrated Geography”, what we are going to consider when we plan the class. As the point of view, based on the test of International Geography Olympiad and the present condition of the geographical perspective and thinking skill of student in Japan, this presentation introduce The planning of “Integrated Geography” and its aimed competency.

Earth and planetary science education considered by the current student

*Hideto Otsuka[1]

1. Geology Course, Department of Science, Faculty of Science, Shinshu University, National University Corporation

It is necessary that Earth science and geography education for elementary and high school arranges the opportunity to touch the real things. In elementary school, there are many classes to touch the real things, but in high school, we don't have enough time to explain with them. I think that education with using the real thing, understanding of the learning purpose of the student, and knowledge of teacher to answer student's questions.
At first, the earth and planetary science needs to use the knowledge not only sciense but also various information. The students are good at considering and discussion with the real things, but it is difficult to understand conceptually field. So, we should present the real things to the students.
Secondly, it is necessary to understand a learning purpose so that a student is interested. The students like to study outdoor, and understand that studying the earth science contribute to thier lives, such as disaster prevention.
Thirdly, it is important to have the ability that teachers assist for the students to practice deep learning. It is necessary that teachers answer their questions, and lead them to understand.
From these, I think that we should teach earth and planet science practically and more clearly. It is improvement of the individual ability of the teacher to be important above all. Even if it is difficult to become the expert of all fields of earth science, the geography, it is important to deepen the knowledge. It is good for an opportunity attracting the interest of the student to teach the state-of-the-art study and common sense. I hope that practically and developmental earth and planetary science education become popular in the future.

Keywords: earth and planetary science education

Invitation to Geography —Relationship Between Geography and Intellectual Curiosity in Daily Life–

*Takuya Miyao[1]

1. Master Program in Education, University of Tsukuba

I received geography education in school, learned geography at university, and now I’ m studying geography education in graduate school. In such a position, I’ d like to mention the abilities and various perspectives obtained from that looking back on myself that has been studying geography. Specific details are as follows.

Why Am I fascinated to Geography?

I’ ve been faced to the subject of geography, so what is the trigger that I was interested in geography? I’ d like to mention about the opportunity that I was involved in geography through reconsidering myself.

Relations Between Everyday Life and the Viewpoint That Can Get by Learning Geography, Application to Geography

Academic geography is close to our everyday life. It is because geography is a discipline that deal with an actual proof, and especially, the contents we learn from junior high school or high school have many things applying to information and experience we see in our daily life. So, what is the competency that acquired from learning geography? The typical one is “geographic viewpoint and way of thinking.” Then, if we acquire that competency, what are the benefits in daily life? I hope to mention based on my experience and the idea of graduate students who have been on the same situation.
On the other hand, the core point of view of the new geography course in Japanese high school, such as “GIS,” “international Understanding,” “disaster prevention,” there is no doubt that these contents are related to our living area when thinking on the micro scale. For students to learn geography actively, it may be necessary to incorporate contents that make use of students’ knowledge and experiences into the introduction of lessons. I suppose that this is the same in earth science.

About Learning Geography at University and Graduate School

In this part, I would like to mention about two things. One is about university education. It is often said that “geography is memorized subject,” but I strongly feel that was the lecture I took in a university. In teaching subjects, it is desirable to have opportunities for teachers and students to exchange opinions on the contents and methods of classes making full use of the characteristics of geography.
The other is about university and graduate school education. There are few opportunities for learning collaborated in geography, history and civics. It is necessary to exchange opinions among these subjects because these are not independent subjects, and there are many parts that work mutually.

Let's build a bridge between "Rika" and society with new geography and geology education in class

*Naoki Hosaka[1]

1. science writer

Science does not seem to work well when it comes to the consensus formation of modern society, such as global warming. It can be due to the lack of reality of science, although it closely related to the social agenda. New geography and geology education should be a bridge between science and society.

Keywords: science, society, global

[O-05] English improvement tips for Japanese scientists

convener:Chisato Yoshikawa(Japan Agency for Marine-Earth Science and Technology), Wonsuh Song(Waseda University), Rumi Ohgaito(Japan Agency for Marine-Earth Science and Technology), Chairperson:Chisato Yoshikawa(JAMSTEC), Wonsuh Song, RUMI OGAITO(JAMSTEC)

"Presentation in English" is inevitable skill not only for researchers but also for business people or students. In this session, we invite a native English-speaking researcher and a researcher of linguistic education. We learn misleading or unnatural expressions that Japanese tend to do in presentations in English. A mini-workshop is also planned in the session. In this workshop, the lecturers give advises for short presentations given by several Japanese. Why don't you join us to have practical learning to improve your presentation skill?

★Invited Papers

*S. Lan Smith[1] (1.Marine Ecosystem Dynamics Research Group, Research Centre for Global Change, Japan Agency for Marine-Earth Science and Technology)

11:25 AM - 12:15 PM JST | 2:25 AM - 3:15 AM UTC

Discussion

Giving a successful presentation in English: Mission Possible!

*Joel Laurier[1]

1. University of Tsukuba

As with all skills, delivering a successful presentation requires painstaking effort. For people presenting in their second (or third) language, the task is even more daunting because it requires detailed attention to each spoken word. This presentation aims to help presenters of all levels, from the beginner to the seasoned expert, deliver easy to understand and effective public speeches. We will first look at common mistakes made in delivering oral presentations, then look at proposed ways to prepare and deliver quality speeches. A special emphasis will be placed on effective techniques to use in English presentations given by non-native presenters. Attendees will learn how to use body language, effective visuals, and story telling to deliver quality presentations.

How to deliver good presentations in a foreign language

*S. Lan Smith[1]

1. Marine Ecosystem Dynamics Research Group, Research Centre for Global Change, Japan Agency for Marine-Earth Science and Technology

Presenting in a foreign language, for example at international scientific meetings such as JpGU, can be an intimidating challenge. This challenge includes not only communicating one’s own ideas clearly, but also understanding and responding to critical questions, typically within only a few minutes. We researchers can all benefit from continually developing the skills to present in an engaging way that makes a good impression on the audience. To this end, I will share my thoughts based on my experiences as a native English speaker who has worked as a researcher in Japan for 20 years. I have presented results in Japanese at many seminars, conferences, hearings at funding agencies, and job interviews. Of course, no native Japanese would ever mistake me for a native speaker, as will be obvious to all attendees! But still, I have found ways to communicate effectively and have even become nearly as comfortable presenting in Japanese as in my native English. My techniques include: 1) use simple wording, clear statements, and slides that are not too complicated, 2) practice each presentation at least three times, cut out the unnecessary, and get comfortable with the flow, and 3) engage actively with questioners and ask them to clarify their questions if necessary. Accept the challenge, build up your presentation skills, and expand the possibilities for your own career!

[O-06] How to cope with intensifyng storm and flood disasters

convener:Jun Matsumoto(Deaprtment of Geography, Tokyo Metropolitan University), Yukihiro Takahashi(Department of Cosmosciences, Graduate School of Science, Hokkaido University), Akira Wada(Tokyo Institute of Technology)

In the year 2018, we experienced severe rainfalls in July and severe typhoons in September in West Japan, which impressed us that severe storm and flood disasters have been intensifying. Will such severe disasters intensify in future? We will discuss how to cope with intensifying storm and flood disasters. All the oral presentations are invited talks by the specialists in the Japan Geoscience Union (JpGU), and the Japan Academic Network for Disaster Reduction (JANET-DR) which was established in 2016. We will also exhibit poster presentations of various research activities in JpGU and JANET-DR.

[O06-P01] Automatic extraction analysis of widespread sediment disasters from satellite images in the Heavy Rain Event of July 2018, Japan

1. PASCO CORPORATION

[Introduction]The rain front and Typhoon Prapiroon caused the Heavy Rain Event of July 2018, which was a wide area heavy rain disaster in Japan, especially in its western part. Floods and sediment disasters occurred in various places and resulted in a lot of deaths and missing persons. On the occasion of these widely spread simultaneous multiple disasters, there are concerns about delay of starting the initial response. In order to identify the broadly scattered sites of sediment disasters, we applied an automatic extraction analysis using satellite images of wide area coverage.
[Status and issues of existing methods]Aerial photographs are mainly utilized for grasping damage situation in devastating disasters. A number of responsible organizations implemented the aerial photographing at the heavy rain disaster. Geospatial Information Authority of Japan created the land surface failure distribution maps based on the aerial photographs of Southern District of Hiroshima Prefecture, Uwajima Island and Ozu District of Ehime Prefecture, Iwakuni District of Yamaguchi Prefecture, acquired during 9 to 19 July [1)]. PASCO CORPORARION provided the distribution maps of sediment moving scars for the possibly-damaged areas (Kure City and others) developed from the satellite images of SPOT 7 for Hiroshima, Okayama and Ehime Prefectures during 9 to 16 July [2)]. Both results were obtained only for a part of affected areas because of limited image acquisition or analysis. Besides, even well-skilled experts need a lot of time for processing. These issues are mentioned as the problems need to be solved in the field of early response to the widespread disasters.
[Automatic extraction analysis from satellite images]The SPOT Satellites provide images with 60km swath width. In addition, their plural satellite operation endorses the revisit capacity of almost daily basis. These characteristics are superior, although the 1.5m ground resolution is inferior to 20cm of aerial photographs. Our target area of satellite image acquisition is 11,400km^2 including Okayama, Hiroshima and Ehime Prefectures. We applied the automatic extraction analysis to this area in order to identify the affected sites of sediment disasters quickly. The analysis method is based on a supervised maximum likelihood classification method, frequently used in the sphere of remote sensing image analysis. After the classification using the slope failure sites in the images as the supervised data, several sites were extracted as the possibly-affected areas. Then, the forest area data of the National Land Numerical Information was used to eliminate playgrounds or other bare lands in the urban area. The analysis results were compiled into the standard grid square (about 1km by 1km) map with color based on the occupancy area ratio of affected sites in each grid. The analysis time of the process is about one day which is shorter than human-wave tactics. However, some of small surface failure sites (e.g. narow debris flow zone) are not extracted. Past-affected sites and cutover areas are also misidentified. Although these individual issues should be treated more carefully, the density distribution map is helpful to grasp an overview of the damages.
[Conclusion]We showed the availability of the wide area satellite images to grasp an overview of sediment disasters, even in the Heavy Rain Event of July 2018 which devastated widely in Japan, although the usual aerial photograph analysis could achieve only limited areas. Because the optical satellite images of 1.5m resolution provide less clear view than aerial photographs, we will research to define the reasonable conditions to utilize satellite images for understanding of sediment disasters in details. We will also approach the development of automatic interpretation technologies using artificial intelligence in order to

©2019. Japan Geoscience Union. All Right Reserved.

obtain further extraction accuracy, because current our method still remains several misidentified or not-extracted sites.

Examination of the factors influencing the people's evacuation behaviors and cognition of reconstruction in the western Japan heavy rain disaster in July 2018

*Shoji Ohtomo[1], Reo Kimura[2]

1. Konan Women's University, 2. University of Hyogo

The torrential rain from June 28th to July 8th in 2018 caused serious human suffering and damage of property. In such natural disasters, investigation of people's evacuation behaviors at the time and the subsequent recovery process is important to consider support for the affected areas and preparedness for future natural disasters. A previous study indicated that knowledge of disaster had an effect on evacuation behaviors and the subsequent cognition of disasters (e.g. Kimura et al., 2017). This study examined the influences of residents' features in the affected areas of the western Japan heavy rain disaster in July 2018 on the evacuation behavior and the subsequent cognition of risk and of recovery from the disaster.

We implemented a web survey study for 1000 residents in 13 districts in Hiroshima prefecture and 6 districts in Okayama prefecture where that suffered damage caused by the western Japan heavy rain disaster in July 2018. Figure 1a shows the framework of the web survey. The survey asked about the demographic information related to the disaster, damage situations, cognition of disaster risk, recovery and reconstruction calendar and so on. The study analyzed the relationships between residents' prediction for flood damage, evacuation behavior, risk perception, and cognition of recovery. Main results are summarized into four. First, the relationship between prediction for flood damage and evacuation behavior was analyzed by Bayesian inference (Figure 1b). There was a difference in evacuation behavior at the time depending on the level of prediction for flood damage(b=.13, 95%CI=.01˜.25). Residents who thought that damage by flooding would not occur tended not to evacuate. Second, the relationship between knowledge about the hazard-map and evacuation behavior was analyzed by Bayesian inference (Figure 1c). Evaluation behavior at the time differed according to the level of knowledge about the hazard-map (b=.30, 95%CI=.19˜.42). The less knowledge about hazard-map, the fewer residents tended to evacuate. Third, we compared the difference in risk perception (i.e. severity) after the disaster, according to the level of damage by the western Japan heavy rain disaster (Figure 1d). Bayesian inference indicated that there was a difference in perception of the severity of heavy rain between people who had not suffered and people who have suffered from flooding above floor level(b=-.62, 95%CI=-.92˜-.32). People who had suffered above floor level perceived that they were more likely to suffer from future heavy rain than those who had not suffered. Finally, the study compared the difference in cognition of recovery according to the level of the damage by the disaster (Figure 1e). Bayesian inference indicated that there was a difference in cognition of recovery between people who had not suffered and people who had suffered from flooding above floor level (b=2.70, 95%CI=1.53˜4.38). The cognition of recovery was weaker for people who had suffered from flooding above floor level than those who were not suffered.

The study suggested that people's recognition of natural disasters beforehand affected evacuation behavior at the time of the western Japan heavy rain disaster in July 2018. Without adequate knowledge of natural disasters, people are less likely to take evacuation behavior. Furthermore, the study showed that experience suffering from the disaster influenced afterward risk perception and cognition of recovery. The experience is reflected in people's awareness of disaster. Therefore, the study suggested that the dissemination of adequate knowledge of natural disaster such as the hazard-map is important to enhance

[O-06] How to cope with intensifyng storm and flood disasters

convener:Jun Matsumoto(Deaprtment of Geography, Tokyo Metropolitan University), Yukihiro Takahashi(Department of Cosmosciences, Graduate School of Science, Hokkaido University), Akira Wada(Tokyo Institute of Technology)

In the year 2018, we experienced severe rainfalls in July and severe typhoons in September in West Japan, which impressed us that severe storm and flood disasters have been intensifying. Will such severe disasters intensify in future? We will discuss how to cope with intensifying storm and flood disasters. All the oral presentations are invited talks by the specialists in the Japan Geoscience Union (JpGU), and the Japan Academic Network for Disaster Reduction (JANET-DR) which was established in 2016. We will also exhibit poster presentations of various research activities in JpGU and JANET-DR.

Examination of the factors influencing the people's evacuation behaviors and cognition of reconstruction in the western Japan heavy rain disaster in July 2018

*Shoji Ohtomo[1], Reo Kimura[2]

1. Konan Women's University, 2. University of Hyogo

The torrential rain from June 28th to July 8th in 2018 caused serious human suffering and damage of property. In such natural disasters, investigation of people's evacuation behaviors at the time and the subsequent recovery process is important to consider support for the affected areas and preparedness for future natural disasters. A previous study indicated that knowledge of disaster had an effect on evacuation behaviors and the subsequent cognition of disasters (e.g. Kimura et al., 2017). This study examined the influences of residents' features in the affected areas of the western Japan heavy rain disaster in July 2018 on the evacuation behavior and the subsequent cognition of risk and of recovery from the disaster.

We implemented a web survey study for 1000 residents in 13 districts in Hiroshima prefecture and 6 districts in Okayama prefecture where that suffered damage caused by the western Japan heavy rain disaster in July 2018. Figure 1a shows the framework of the web survey. The survey asked about the demographic information related to the disaster, damage situations, cognition of disaster risk, recovery and reconstruction calendar and so on. The study analyzed the relationships between residents' prediction for flood damage, evacuation behavior, risk perception, and cognition of recovery. Main results are summarized into four. First, the relationship between prediction for flood damage and evacuation behavior was analyzed by Bayesian inference (Figure 1b). There was a difference in evacuation behavior at the time depending on the level of prediction for flood damage(b=.13, 95%CI=.01˜.25). Residents who thought that damage by flooding would not occur tended not to evacuate. Second, the relationship between knowledge about the hazard-map and evacuation behavior was analyzed by Bayesian inference (Figure 1c). Evaluation behavior at the time differed according to the level of knowledge about the hazard-map (b=.30, 95%CI=.19˜.42). The less knowledge about hazard-map, the fewer residents tended to evacuate. Third, we compared the difference in risk perception (i.e. severity) after the disaster, according to the level of damage by the western Japan heavy rain disaster (Figure 1d). Bayesian inference indicated that there was a difference in perception of the severity of heavy rain between people who had not suffered and people who have suffered from flooding above floor level(b=-.62, 95%CI=-.92˜-.32). People who had suffered above floor level perceived that they were more likely to suffer from future heavy rain than those who had not suffered. Finally, the study compared the difference in cognition of recovery according to the level of the damage by the disaster (Figure 1e). Bayesian inference indicated that there was a difference in cognition of recovery between people who had not suffered and people who had suffered from flooding above floor level (b=2.70, 95%CI=1.53˜4.38). The cognition of recovery was weaker for people who had suffered from flooding above floor level than those who were not suffered.

The study suggested that people's recognition of natural disasters beforehand affected evacuation behavior at the time of the western Japan heavy rain disaster in July 2018. Without adequate knowledge of natural disasters, people are less likely to take evacuation behavior. Extreme rainfall and heat wave over Japan in 2018 summer: A series of extreme events and underlying global warming

*Hisashi Nakamura[1]

1. Research Center for Advanced Science and Technology, University of Tokyo

In early July extreme rainfall occurred particularly over western Japan and the Tokai region, named “the Heavy Rain Event of July 2018”, which caused widespread havoc. It was followed by heat wave that persisted over most of Japan in setting the highest temperature on record in late July.
The rain event can be attributed to two extremely moist airflows from the Tropics confluent persistently into western Japan in addition to large-scale ascent along the stationary Baiu front. The heat wave is attributable to the enhanced surface North Pacific Subtropical High with a prominent barotropic anticyclonic anomaly just north of western Japan. The consecutive occurrence of these extreme events was related to persistent meandering of the upper-level subtropical jet, indicative of remote influence from the upstream. The heat wave can also be influenced by enhanced convective activity under the above-normal warmness over the tropical North Pacific. The global warming can influence not only the heat wave but also the rain event, as suggested from long-term increasing trends observed over Japan in intensity of extreme precipitation and water vapor amount. Another contribution was possible from anomalous warmth over the midlatitude Northern Hemisphere observed since March 2018.

Influence of meteorological disasters on marine ecosystem

*Yu Umezawa[1,2]

1. Tokyo University of Agriculture and Technology, 2. Study Group on Marine Environmental Problems, the Oceanographic Society of Japan

Since the establishment in 1973, the Study Group on Marine Environmental Problems, the Oceanographic Society of Japan, has been organizing a night sessions and symposiums on marine environmental problems, and summarizing recommendations based on scientific knowledge.

In recent years, with the global warming, an increase in meteorological disasters such as typhoon, localized torrential rain and flood damages has been greatly affecting marine ecosystems, especially in coastal waters. However, our group has not done any efforts to consider weather disasters as one risk of marine environmental problems. In this presentation, I will report on previous studies on the effects of weather disasters on marine ecosystem and hope that this will be utilized in future collaborative research.

Understanding of geomorphic condition indicating the flooding disaster and hazard mapping

*Yohta KUMAKI[1]

1. Senshu University

It is important for the general public to know the place where the natural disaster risk is high. Some geomorphic features are strongly relating to flood or debris flow and useful for understanding the risk. For example, alluvial cone is a highly possible place of debris flow. Geomorphic features have been formed by repetitive phenomena that cause rapid landform changes, i.e. natural disasters. Therefore, it is useful for disaster estimation to know the geomorphic features. The geomorphic survey can be done everywhere at low cost using topographic maps, digital elevation models and air-photos.
The geomorphic condition has been basic information of hazard mapping. Hazard maps, however, show very much simplified information. It is desirable that people can judge the disaster risk by themselves. For it, some kinds of geomorphological maps are available in big plains in Japan.

A role of free satellite remote sensing data as a case study of heavy rain disaster in July 2018

*Yuji Sakuno[1]

1. Graduate School of Engineering, Hiroshima University

A heavy rain disaster occurred mainly in western Japan In July 2018. Immediately after the disaster, various types of aerial photographs and satellite remote sensing (RS) images were taken. In this presentation, I will introduce ground surface analysis using optical and synthetic aperture radar (SAR) in land and inland water around Hiroshima prefecture and their data roles which can be obtained free of charge, especially. It is useful to show the state of landslides and river sediment accumulation clearly by making difference image before and after the disaster using satellite optical sensors data such as LANDSAT-8 and Sentinel-2 with 10 to 30 m resolutions. However since such optical sensors are influenced by the cloud, it is not suitable for rapid damage estimation. Therefore, the difference image analysis similar to the optical sensor using SAR data such as Sentinel-1 was conducted. By this work, in particular, the flooded area was quickly extracted. In the future, we will make these tasks manual, and if any satellite data is downloaded, anyone will make software that can do the same analysis quickly. By regularly conducting data processing courses using such manual and software on local administrative agencies and consultants in construction, we would like to aim at early utilization of RS data in the event of frequent disasters.

State of the Crisis Mapping for heavy rain in west of Japan, 2018.

*Taichi Furuhashi[1]

1. Aoyama Gakuin University

In early July 2018, heavy rain disasters happend in West part of Japan, floods and landslides occurred in many areas, including Mabi-cho in Kurashiki-shi, Okayama Prefecture. We worked with students on crisis mapping activities to implement maps of disaster affected areas as Volunteered Geographic Information (VGI). Specifically, navigation guide maps, evacuation centers / temporary toilets locations etc. were published on the map. In this session, we will report on current issues toward generalization of crisis mapping approach and future.

A Study on Spatial and Temporal Resolution of Evacunation Infomation for Effective Evacuation Behavior

*Michinori Hatayama[1]

1. Disaster Prevention Research Institute, Kyoto University

1. Introduction

In recent years, heavy rains and typhoons that have never been experienced in the past have attacked Japan, such as Northern Kyushu District Heavy Rain in 2017 and Heavy rain in July, 2018, due to the effects of climate change, leaving large damages in various places. In natural phenomena never experienced in the past, actions that protect lives, in other words, appropriate evacuation are required. Evacuation information that triggers evacuation is important, but in some cases, because it will create residents who don’ t take initiative for their evacuation, various discussions have been made on when and how to use and how to utilize evacuation information. In the case of the Izu Oshima Sediment disaster that occurred due to heavy rain accompanying Typhoon Wipha in 2013, the evacuation recommendation was not issued, and in Hiroshima landslide disaster caused by the Heavy Rain in August, 2014, the delay of the evacuation information was pointed out. Following these issues, the "Guidelines on evacuation advisory" was revised in the year of 2017. However, there remains room for discussion as to whether these information are linked to evacuation behaviors. In this paper, we discuss these issues.

2. Evacuation Information and Expected Behavior

In the "Guidelines on evacuation advisory", it is recommended to prepare criteria according to local circumstances about evacuation preparation, evacuation recommendation, and evacuation order from the view points of receivers. Evacuation actions were defined as follows;

(1) evacuation to the "urgent evacuation places" which are designated by administration,

(2) evacuation to the "safe place nearby", and

(3) movement to more secure room inside the building.

3. Temporal Resolution of Evacuation Information

In floods caused by heavy rain and sediment-related disasters, evacuation information will be announced in conjunction with time prediction of rainfall. In recent years, the occurrence of disasters is often expected to be late at night, but even if disaster information is announced at midnight, in many cases it cannot lead to evacuation behavior. Considering this, evacuation is proceeding from the time zone where evacuation behavior can be taken, but evacuation information in the absence of sense of crisis often leads to evacuation behavior.

4. Spatial Resolution of Evacuation Information

Evacuation information is generally presented to certain areas rather than to individual units. This spatial resolution does not have unified standards, but it varies from local governments. When the area is large,

©2019. Japan Geoscience Union. All Right Reserved.

there are many places where high risk and low risk are mixed within the area, and many residents judge that it is not necessary to take evacuation action. However, it is difficult for the municipalities that do not allocate adequate personnel to respond to disasters, it is difficult to narrow down the areas further and it is difficult to judge whether evacuation should be made for each door.

5. Conclusion

Residents cannot be judged of evacuation behavior by evacuation information unless they know its time resolution and spatial resolution. In order to properly receive these information and to take appropriate action, it is necessary for residents to raise their awareness. In order to realize this, it is required not only to prepare administrative policies but also to arrange arrangements in the region and home.

Multi-layered Countermeasures against Widespread Devastating Flood Disasters

*Koike Toshio[1]

1. International Centre for Water Hazard and Risk Management

The largest water vapor convergence since 1958 was recorded across western Japan in early July 2018, breaking the records of 24-to-72-hour rainfall at many stations in the area and causing devastating disasters including floods due to bank breaches and overflows, debris flows, and urban inundations. We also witnessed new types of disasters induced by multiple causes including the backwater phenomenon at confluence zones and floods involving a huge scale of floodwater and sediment transport simultaneously. Furthermore, eight dams in western Japan exhausted their flood control capacities and had to start emergency water-discharge operations to avert reservoir overflows from the heavy rainfall. In addition, we later learned that dam discharge warnings were not used effectively to support residents in safe evacuation. As a consequence, 232 people either died or went missing, and prefectures in western Japan suffered significant economic damage. The number of more than 200 victims was the worst case since 1982. To prevent the recurrence of devastating disasters over a wide area, the Council for Social Infrastructure Development analyzed the characteristics and issues of the July 2018 disasters and submitted a report including the recommended countermeasures based on the key strategies to the Minister of Land, Infrastructure, Transport and Tourism on December 13, 2018. Towards building a community where everyone evacuates proactively, the report recommends that each community develop a cooperative framework to strengthen self-help and mutual support by enriching information of hazards, risks and evacuation and improving communication methods in cooperation with the mass media and the ICT private sector. The report also proposes more resilient infrastructure design, development and operation against complex disasters and hazards which exceed infrastructure capacities and suggests strategies for the implementation of quick disaster responses and recoveries and extra considerations of disaster risks in community development. We need to promote such multi-layered countermeasures as a package to cope with unprecedented disasters.

Keywords: flood, debris flows, backwater, emergency water-discharge operations to avert reservoir overflows

Technologies and wisdom in housings and buildings for protecting our lives from river floods

*Kazuo Tamura[1]

1. Seismic Design Laboratory

There exist many areas which have high risk of flood damages in Japan. River dykes or dams have been constructed to suppress flood damages. However, these countermeasures are not enough, in the condition that severe meteorological phenomena with heavy rainfalls become more frequent. We should make use of technologies and wisdom or ideas in the field of buildings to protect our lives or to maintain our living environment. The river management of the whole river basin, with planning the houses or buildings of the area, is necessary against these severe conditions.

In this presentation, the author explains current situation and applicable technologies of building structures, focusing on maintaining safety of our lives against river floods.
For example, raising the ground level of the building is one selection for the countermeasure against floods. Another idea is to construct high strong foundation walls under the wooden housing to avoid flooding. The piloti structure whose first floor is supported by columns with no walls is effective to decrease flood water pressure to the building. The base isolated building on the piloti structure can decrease both flood load and earthquake load.

Evacuation Planning for School Children and Community Residents

*Takeshi Sato[1], Yoshiaki Yazaki[2]

1. Tohoku University, 2. Institute of Safety Education for School Children

The time line and the evacuation plan will help to reduce the number of effectively cut down human damage from floods or typhoons. On making the plan, It's difficult to consider the local characteristics of nature for school teachers and community residents because of a lack of special knowledge. Academic contribution is expected to support them. A few implementation cases by authors are introduced.

[O-07] Kitchen Earth Science: Let's stimulate your brain by hands-on experiments!

convener:Ichiro Kumagai(School of Science and Engineering, Meisei University), Miwa Kuri(International Research Institute of Disaster Science, Tohoku University), Kei Kurita, Mie Ichihara(Earthquake Research Institute, University of Tokyo), Chairperson:Ichiro Kumagai(Meisei University), Miwa Kuri(東北大学災害科学国際研究所), Mie Ichihara(Earthquake Research Institute, The University of Tokyo), Kei Kurita

"Kitchen Earth Science" aims at understanding a natural phenomenon in Earth and planetary sciences by analogue experiments using goods and tools in our daily life. Analogue experiments have a function to unveil the fundamental physics governing the phenomenon. At the same time, they essentially include uncertainties so that unexpected results are frequently obtained, which have a potential for surprising discoveries. These findings also provide a good opportunity for deeply thinking, and raise new questions to explore. Such experience is precious not only for young researchers in Earth and planetary sciences, but also non-expert people who need a scientific thinking to live wisely. In this session, we focus on "advantages of doing hands-on science experiments" and discuss the significance of analogue experiments with uncertainties, which cause unpredictable results: even if the experiment fails, we learn a lot of things from the failure which may lead to a great success. We are accepting a variety of experimental researches and case studies on scientific education such as introductory educational experiments for Earth and planetary sciences in elementally and junior/high schools, general science education and interdisciplinary researches in post-high schools, and new approaches to citizen science and outreach. We welcome all the participants who are interested in Kitchen Earth Science to stimulate your brain by hands-on science experiments.

Analogue experiments for understanding a crystal morphology variation of igneous rocks using a no-calorie sweetener

*Kuniyuki Furukawa[1], Ririka Watanabe[1], Risa Ito[1], Saori Kotani[1]

1. Faculty of Business Administration, Aichi University

Crystallization of a magma is progressed during cooling. The number and morphology of crystals are chiefly controlled by degree of undercooling of a magma. Since igneous rocks are generally formed under various cooling profiles, crystal occurrences of natural igneous rocks are varied. As it is generally known, difference of crystal textures between plutonic and volcanic rocks are generated from difference of cooling rate. However, only that knowledge is not enough to understand results of field or microscopic observations. Therefore, students, who major in geology or petrology, should be understand general crystallization process. In this presentation, we propose the easy analog experiments to understand crystallization process of silicate melt.

Erythritol ($C_4H_{10}O_4$), which is no-calorie sweetener, is used for the experiments. The melting temperature is 121 ˚C, and erythritol can be easily melted using a hot plate. Since the melted erythritol is relatively low viscosity, crystallization is easily induced even if low degree of undercooling. This characteristic is different from a sugar.

We melted 25 g of erythritol in a petri dish with 90 mm in diameter. The petri dish including melted erythritol was cooled via various cooling rate. In the result, the crystal morphology was varied from euhedral to dendritic, and spherulitic with increasing degree of undercooling. The crystal size tends to be small with increasing degree of undercooling. The occurrences of crystal textures are consistent with those of natural igneous rocks.

The cooling rate can be easily quantified using an infrared thermometer. The boundary of cooling rate between euhedral and dendritic crystal formations was about 12 ˚C/min. The boundary of cooling rate between dendritic and spherulitic crystal formations was about 40 ˚C/min. Furthermore, latent heat could be also analyzed when crystallization progress. Latent heat is important, because it affect to rheology of advancing lavas or a magma chamber. The in-situ crystallization can be observed under a microscope. We consider that these experiments are strongly effective for geology and petrology education.

Making volcanic edifice with edible lava

*Tatsuo Kanamaru[1], Akihiko Fujinawa[2]

1. Department of Earth and Environmental Sciences, College of Humanities & Sciences, Nihon University, 2. Department of Earth Sciences, Faculty of Science, Ibaraki University

Volcano is a window through which inside of the living earth can be seen, and also gives us a lot of grace and pleasure. On the other hand, volcanic disasters always hit human societies sitting on volcanic countries. In order to feel familiar with the volcano and get along well with the volcanoes, it is very important to know how the volcanoes have been formed. For this purpose, it is best to observe directly a volcanic eruption or perform a geological survey. However, it is difficult for non-experts to do the field survey. Therefore, efforts to make volcanoes understandable easily even by non-experts have to be made. In fact, the effort such as flow experiment of lava flow using miniature model, analog experiment of eruption using food, etc. have been conducted actively in recent years (e.g. Hayashi, 2006). In this presentation, we will introduce a lava flow experiment using pseudo-magma material prepared by mixing chocolate, gelatin, milk and heating it in a microwave oven. In addition, making pseudo-scoria formed by foaming of the same substance will be exhibited. In the lava flow experiment, it is possible to produce characteristic forms on the real lava flow surface, such as lava inflation, lava levee, ropy lava, etc. Pseudo-scoria produced by the experiment is optimum for observation of bubbling of lava.

Columnar joint: Geometric pattern analysis and analogue experiment using starch pastes

*Yuri Akiba[1], Aika Takashima[1], Hiroyuki Shima[2]

1. Graduate School of Life and Environmental Sciences, University of Yamanashi, 2. Department of Environmental Sciences, University of Yamanashi

Columnar joints are prismatic cracks that regularly penetrate the rock body. They are formed by contraction of cooled lava followed by sequential crack advances. Worldwide famous examples include: Giant's Causeway in Northern Ireland, Fingal Cave in the UK, and Devil's Tower in the United States.

Despite of much efforts reported thus far, a clear understanding for its formation mechanism has not yet been obtained, mainly because of the difficulty of experimental reproduction. In the last two decades, the situation changed drastically; it was discovered that regular crack structures, which look similar to columnar joints, can be realized very easily using starch paste. The way to make them is shown below. First, starch powder and distill water is mixed thoroughly to make paste. Next, this paste is poured into a container. Then, the surface of the paste is irradiated by an incandescent lamp, and it is left for a long time. As the moisture evaporates from the surface, the paste goes drying and causes cracking. As time elapses further, the cracks at the surface progress inward, and we finally obtain a prismatic structure which regularly penetrates the entire paste. After completely drying, a polygonal network pattern is generated on the surface of the paste.

Obviously, columnar joint and starch paste are different in the chemical composition, length scale, and crack initiation factors. But a similar prismatic crack is formed --- Why? This question motivated us to investigate the statistical properties of the polygonal pattern in both two systems.

Our drone aerial shooting of columnar joints was carried out at the following four domestic sites: (1) Tatami-ishi in Okinawa, (2) Tatami-ga-fuchi in Yamaguchi, (3) Tawara-iso in Shizuoka, and (4) Hi-no-misaki in Shimane. Importantly, the SiO_2content in constituent igneous rocks depends on the sites: the sites 1 and 3 are andesitic, the site 2 is basaltic, and the site 4 is rhyolitic. This difference would have influenced the statistical properties of the polygonal network pattern observed at present. Meanwhile, our starch-paste experiment was aimed at evaluation of the following two effects on the geometry of the polygonal crack pattern: (1) the fluctuation width in the size distribution of constituent starch particles, and (2) the degree of sphericity of the particles. To this end, we used two types of starch, corn starch and potato starch. We also examined the degree of correlation between the film thickness of the paste and the crack pattern obtained.

The first main finding was regarding the characteristic length scale of the polygonal network. For columnar joints, the length scale varies from sites to sites, probably because of the difference in the SiO_2 content. For the desiccated starch paste, the length scale increased with the film thickness only for the potato starch paste. The latter result can be explained from the water diffusion process in the paste and the spatial nonuniformity in the water concentration. Since both the water diffusion and concentration in the paste are directly affected by the size and shape of the constituent particles, our result indicates that the geometry of the dry crack pattern strongly depends on the particles' size and shape.

The second main finding was regarding the number of vertices in polygons. In columnar joint, pentagons

©2019. Japan Geoscience Union. All Right Reserved.

and hexagons occurred in an almost equal frequency. On the other hand, in desiccated starch paste, only pentagons frequently occurred. This result can be interpreted by the difference in cooling/drying speed.

The third finding was regarding the probability distribution of polygon area. Both for the two systems, the distributions are well fitted on the curve of gamma distribution. This suggests the existence of a unified pattern formation mechanism which is common to both the cooling contraction of magma and the drying shrinkage of paste. Details of the results and its interpretation will be given in my talk of the session.

Viscoelastic characterization of a solid projectile impact onto a dense potato starch suspension

Kazuya Egawa[2], *Hiroaki Katsuragi[1]

1. Graduate School of Environmental Studies, Nagoya University, 2. Department of Earth and Planetary Sciences, Nagoya University

Dense suspension of non-Browning particles (e.g. mixture of water and potato starch) shows complex rheological properties such as discontinuous shear thickening (DST) [1]. Usually, DST is defined by the sudden jump of viscosity at a certain shear strain rate. The viscosity jump is observed in steady-state rheometry. However, in a very recent study, elasticity of DST fluid has also been measured by a steady penetration of a rod into a DST fluid [2]. In addition to the steady penetration, various impact experiments onto DST suspensions have also been performed to reveal the fundamental physical process of DST. The solid-like and/or peculiar behaviors have been found in the impacted DST fluid as well (e.g. dynamic jamming [3], dynamic fracturing [4], and negative pressure pulse [5]). Moreover, peculiar surface deformation and/or stable hole structure of the vibrated DST fluid has also been found under the influence of vibration [6]. Nevertheless, the origin of DST has not yet been understood well. Much more detail analyses of the transient rheological properties of DST fluid is necessary. The impact response is a useful way to approach the transient dynamics, Therefore, in this study, we perform a simple solid-projectile impact onto a DST fluid target (dense potato starch suspension), in order to observe the penetration and rebound dynamics. From the experimental results, the rebound timescale and restitution coefficient are measured. To characterize the transient viscoelasticity, we assume a simple linear viscoelastic model. Using the model, the effects of impact inertia, boundary conditions, and mechanical vibration on the rheological properties of the impacted DST fluid are systematically studied. Besides, to investigate the effect of vibration to the rheological properties of DST fluid, mechanical vibration is also used. Namely, the transient viscoelasticity of the vibrated DST fluid is experimentally measured. These results will be presented.

Pattern formation within a sandpile formed by a mixture of grains: The selection of stratification and segregation patterns

*Michiko Shimokawa[1], Hidestugu Sakaguchi[2]

1. Fukuoka Institute of Technology, 2. Kyushu University

By pouring a mixture of two types of grains into a large vertical cell of narrow dimensions, an avalanche occurs toward the bottom of the sandpile, and the mixed grains separate into their respective grain types due to the Brazil nut effect, which is caused by the vibration of the avalanche. The effect causes spontaneous formations of stratification patterns or segregation patterns in a sandpile. The selection of the pattern in the sand pile is determined by a competition of angles of repose and the grain sizes of the two grain types. In the condition of a formation of a segregation pattern, a size of grain A is larger than that of grain B, and a repose angle of grain A is smaller than that of grain B. On the other hand, the grain size and repose angle of grain A are larger than those of grain B for the formation of the stratification pattern. We investigate pattern formation in a sandpile by pouring a ternary mixture of grains into a narrow vertical cell. Size segregation in avalanches causes the formation of patterns. Four kinds of patterns emerge: stratification, segregation, upper stratification–lower segregation, and upper segregation–lower stratification. A phase diagram is constructed in a parameter space of θ_{11}/θ_{33} and θ_{22}/θ_{33}, where θ_{11}, θ_{22}, and θ_{33} are the repose angles of small, intermediate, and large grains, respectively. To qualitatively understand pattern formation, a phenomenological model based on a roll-or-stay rule is proposed. A similar pattern formation is found in a numerical simulation of the phenomenological model. These results suggest that the ratios of the repose angles of the three grain types are important for pattern formation within a sandpile.

Application of kitchen earth science for multidisciplinary and interdisciplinary education

*Miwa Kuri[1]

1. International Research Institute of Disaster Science, Tohoku University

Scince research and education on problem-solving type are required, universities are introducing educational programs aimed at fusion of disciplines and interdisciplinary research and training for human resources. Participatory project-based methods are actively being introduced.
"Kitchen Earth Science" session in the past JpGU, had some developments of teaching materials aimed at raising awareness of specific phenomena and helping understanding, but in this thesis, we will discuss how to apply to team project type education We categorized these cases.
Despite the fact that the time limit is great due to the educational program outside the main major, the importance is put on the practice in the area, and as a result, the expectation from the area is large.
Kitchen Earth Sciences : Simple analog experiments helped understand disaster mechanisms, history shows the frequency and magnitude of disasters. It is possible to deal with specific phenomena such as liquefaction phenomena and river overflowing in multiple ways or to deal with multiple phenomena that can occur in the same area, from multiple fields such as history, mechanism, measures, It was excellent in that it was able to comprehend the characteristics of the way of thinking among fields in the course of making a series of educational curriculums examined.
Living science: Teaching material development using card games and communication terminals was conducted. It is excellent for flexible applications according to age and interest, is excellent in portability, has many opportunities to practice in the region, is excellent as a trigger to listen to the voice of the region, verification of educational effect It was also excellent in terms of easy to do. However, the elements of analog experimental thinking that Kitchen Earth Science had originally been proud of were poor.
Garage Earth Sciences: Material cost is more expensive than kitchen earth science, but while utilizing commercial products, customize according to purpose, learn to divide roles according to specialty in team and create efficient division of labor It was excellent as opportunity.

Considering controlling factors of eruption styles through syrup eruption experiments

*Mie Ichihara[1], Kazuya Yamakawa[1], Kurumi Iwahashi[1], Akira Nishijo[1], Yo Kanno[1]

1. Earthquake Research Institute, University of Tokyo

An eruption experiment by mixing vinegar and baking soda is a simple but indicative analog experiment to study volcanic eruptions. Based on the original work by Takcuchi (2006), we have developed an apparatus that allows us also to simulate geophysical observations like ground inflation and eruption infrasound. Also, to reproduce a typical eruption scenario that is “an eruption is triggered by mixing of two magmas," we have employed a method that is to make an eruption by mixing two syrup solutions one with acid and another with sodium hydrogen carbonate. This experiment has been used in outreach activity and also provided new insights that are useful in volcanology (Kanno and Ichihara, 2018). This paper reports our improvement by which we can reproduce a variety of eruption styles in a more realistic way.

The model volcano consists of a PET bottle and a transparent plastic tube. The tube is fixed to the bottle cap by an original connector. The tube end is initially closed by a rubber plug. When sufficient pressure builds up in the bottle by foaming, it spontaneously opens and an eruption starts.

In the previous method, we poured the syrups into the bottle one after another and closed the cap. We left a sufficient empty volume to prevent overflowing. Then, the tube needed to extend to the bottom of the bottle to lead a syrup eruption instead of a short gas burst. These points have been pointed out to be unrealistic.

We have developed a new connector, which allows to input a second syrup into an arbitral position of the reservoir containing the first syrup and output the mixture upward into the conduit. Then, we can reproduce various eruption styles in better controlled and more realistic ways. We are going to use this apparatus in an experimental volcanology seminar for the graduate students in volcanology. We report the results and effects of the seminar as well.

Cooking karinto, analogical link to magmatic vesiculation and explosion

*Kei Kurita[1], Ichiro Kumagai[3], Mie Ichihara[1], Ayumi Ogawa[2], Michiyo Kumagai[2], yusaku nagata[2], Midori Kasai[2]

1. The University of Tokyo, 2. Ochanomizu University, 3. Meisei University

Karinto is one of the typical traditional sweets, which is classified as a puffed confectionery. When we examine the cross section of karinto we can recognize amazing resemblance to the texture of vesiculated pyroclastic materials. This gives us an idea that the formation mechanism of karinto seems collateral to that of pumice and scoria in volcanic process and it would help deep understanding of magmatic vesiculation process. This is the starting point of our research on karinto.
Here we report experimental investigation on the formation of karinto,cooking process. Particularly we focus on the sound generation during the cooking to characterize vesiculation process. The basic material of the starting dough is flour,baking soda,sugar and water. Baking soda and water determine volatility of the sample. Heating induces vaporization of water and thermal decomposition of baking soda, which result in volume-expansion and create a peculiar vesiculated texture. To see the control of this we tested following 4 sets of the composition;
Sample A:flour 50g,baking soda 2g,sugar 10g,water 25g
Sample B:flour 50g,baking soda 0g,sugar 0g,water 25g
Sample C:flour 50g,baking soda 2g,sugar 0g,water 25g
Sample E:flour 50g,baking soda 0g,sugar 0g,water 30g
Sample A is based on the standard recipe of karinto. Sample C and E seem interesting to see the effect of volatile components.

In the cooking experiment we put the dough of 50mm in length x 10mm in width x 6mm in thickness into hot oil at 180-170C. Soon after start of deep frying familiar cooking sound becomes audible. We recorded this and took movie by high speed camera to inspect size and location of bubbles which emanate from the dough. Common to all the composition the sound changes systematically; in the first several minutes continuous sound with flat spectrum to 25KHz emanates while after this high frequency component gradually decreases and prominent peaks in the spectrum appear in several hundreds Hz, which sound as "chant d'Oiseau". Associated with this transition size of bubbles which appear on the surface of dough changes from broad distribution to homogeneous. Also the vesiculation points become localized. All these observations are consistently interpreted that after 4-5minutes steady paths of the gas emission from the inside have been set up. The talented experienced patissier could discriminate the difference of the sound to inspect maturity.
Only in the case of Sample E destructive explosions were observed at about 2 minutes from the start. During heating two competing processes are working inside the dough:solidification which proceeds from the outside and gas formation. Both are driven by higher temperature. When the solidification advances ahead hard shell is formed to impede escape of gas, which results in accumulation of high vapour pressure inside. This is the cause of the explosion. The standard recipe smartly avoids this route by arranging combination of the ingredients but in our experiments we seek the condition for explosion.
In the presentation we report progressive evolution of the spectrum of cooking sound with textural evolution in relation with magmatic process.

[O-07] Kitchen Earth Science: Let's stimulate your brain by hands-on experiments!

convener:Ichiro Kumagai(School of Science and Engineering, Meisei University), Miwa Kuri(International Research Institute of Disaster Science, Tohoku University), Kei Kurita, Mie Ichihara(Earthquake Research Institute, University of Tokyo)

"Kitchen Earth Science" aims at understanding a natural phenomenon in Earth and planetary sciences by analogue experiments using goods and tools in our daily life. Analogue experiments have a function to unveil the fundamental physics governing the phenomenon. At the same time, they essentially include uncertainties so that unexpected results are frequently obtained, which have a potential for surprising discoveries. These findings also provide a good opportunity for deeply thinking, and raise new questions to explore. Such experience is precious not only for young researchers in Earth and planetary sciences, but also non-expert people who need a scientific thinking to live wisely. In this session, we focus on "advantages of doing hands-on science experiments" and discuss the significance of analogue experiments with uncertainties, which cause unpredictable results: even if the experiment fails, we learn a lot of things from the failure which may lead to a great success. We are accepting a variety of experimental researches and case studies on scientific education such as introductory educational experiments for Earth and planetary sciences in elementally and junior/high schools, general science education and interdisciplinary researches in post-high schools, and new approaches to citizen science and outreach. We welcome all the participants who are interested in Kitchen Earth Science to stimulate your brain by hands-on science experiments.

[O07-P01] Application of kitchen earth science for multidisciplinary and interdisciplinary education

*Miwa Kuri[1] (1.International Research Institute of Disaster Science, Tohoku University)

[O07-P03] Cooking karinto, analogical link to magmatic vesiculation and explosion

*Kei Kurita[1], Ichiro Kumagai[3], Mie Ichihara[1], Ayumi Ogawa[2], Michiyo Kumagai[2], yusaku nagata[2], Midori Kasai[2] (1.The University of Tokyo, 2.Ochanomizu University, 3.Meisei University)

Application of kitchen earth science for multidisciplinary and interdisciplinary education

*Miwa Kuri[1]

1. International Research Institute of Disaster Science, Tohoku University

Scince research and education on problem-solving type are required, universities are introducing educational programs aimed at fusion of disciplines and interdisciplinary research and training for human resources. Participatory project-based methods are actively being introduced.
"Kitchen Earth Science" session in the past JpGU, had some developments of teaching materials aimed at raising awareness of specific phenomena and helping understanding, but in this thesis, we will discuss how to apply to team project type education We categorized these cases.
Despite the fact that the time limit is great due to the educational program outside the main major, the importance is put on the practice in the area, and as a result, the expectation from the area is large.
Kitchen Earth Sciences : Simple analog experiments helped understand disaster mechanisms, history shows the frequency and magnitude of disasters. It is possible to deal with specific phenomena such as liquefaction phenomena and river overflowing in multiple ways or to deal with multiple phenomena that can occur in the same area, from multiple fields such as history, mechanism, measures, It was excellent in that it was able to comprehend the characteristics of the way of thinking among fields in the course of making a series of educational curriculums examined.
Living science: Teaching material development using card games and communication terminals was conducted. It is excellent for flexible applications according to age and interest, is excellent in portability, has many opportunities to practice in the region, is excellent as a trigger to listen to the voice of the region, verification of educational effect It was also excellent in terms of easy to do. However, the elements of analog experimental thinking that Kitchen Earth Science had originally been proud of were poor.
Garage Earth Sciences: Material cost is more expensive than kitchen earth science, but while utilizing commercial products, customize according to purpose, learn to divide roles according to specialty in team and create efficient division of labor It was excellent as opportunity.

Considering controlling factors of eruption styles through syrup eruption experiments

*Mie Ichihara[1], Kazuya Yamakawa[1], Kurumi Iwahashi[1], Akira Nishijo[1], Yo Kanno[1]

1. Earthquake Research Institute, University of Tokyo

An eruption experiment by mixing vinegar and baking soda is a simple but indicative analog experiment to study volcanic eruptions. Based on the original work by Takcuchi (2006), we have developed an apparatus that allows us also to simulate geophysical observations like ground inflation and eruption infrasound. Also, to reproduce a typical eruption scenario that is “an eruption is triggered by mixing of two magmas," we have employed a method that is to make an eruption by mixing two syrup solutions one with acid and another with sodium hydrogen carbonate. This experiment has been used in outreach activity and also provided new insights that are useful in volcanology (Kanno and Ichihara, 2018). This paper reports our improvement by which we can reproduce a variety of eruption styles in a more realistic way.

The model volcano consists of a PET bottle and a transparent plastic tube. The tube is fixed to the bottle cap by an original connector. The tube end is initially closed by a rubber plug. When sufficient pressure builds up in the bottle by foaming, it spontaneously opens and an eruption starts.

In the previous method, we poured the syrups into the bottle one after another and closed the cap. We left a sufficient empty volume to prevent overflowing. Then, the tube needed to extend to the bottom of the bottle to lead a syrup eruption instead of a short gas burst. These points have been pointed out to be unrealistic.

We have developed a new connector, which allows to input a second syrup into an arbitral position of the reservoir containing the first syrup and output the mixture upward into the conduit. Then, we can reproduce various eruption styles in better controlled and more realistic ways. We are going to use this apparatus in an experimental volcanology seminar for the graduate students in volcanology. We report the results and effects of the seminar as well.

Cooking karinto, analogical link to magmatic vesiculation and explosion

*Kei Kurita[1], Ichiro Kumagai[3], Mie Ichihara[1], Ayumi Ogawa[2], Michiyo Kumagai[2], yusaku nagata[2], Midori Kasai[2]

1. The University of Tokyo, 2. Ochanomizu University, 3. Meisei University

Karinto is one of the typical traditional sweets, which is classified as a puffed confectionery. When we examine the cross section of karinto we can recognize amazing resemblance to the texture of vesiculated pyroclastic materials. This gives us an idea that the formation mechanism of karinto seems collateral to that of pumice and scoria in volcanic process and it would help deep understanding of magmatic vesiculation process. This is the starting point of our research on karinto.
Here we report experimental investigation on the formation of karinto,cooking process. Particularly we focus on the sound generation during the cooking to characterize vesiculation process. The basic material of the starting dough is flour,baking soda,sugar and water. Baking soda and water determine volatility of the sample. Heating induces vaporization of water and thermal decomposition of baking soda, which result in volume-expansion and create a peculiar vesiculated texture. To see the control of this we tested following 4 sets of the composition;
Sample A:flour 50g,baking soda 2g,sugar 10g,water 25g
Sample B:flour 50g,baking soda 0g,sugar 0g,water 25g
Sample C:flour 50g,baking soda 2g,sugar 0g,water 25g
Sample E:flour 50g,baking soda 0g,sugar 0g,water 30g
Sample A is based on the standard recipe of karinto. Sample C and E seem interesting to see the effect of volatile components.

In the cooking experiment we put the dough of 50mm in length x 10mm in width x 6mm in thickness into hot oil at 180-170C. Soon after start of deep frying familiar cooking sound becomes audible. We recorded this and took movie by high speed camera to inspect size and location of bubbles which emanate from the dough. Common to all the composition the sound changes systematically; in the first several minutes continuous sound with flat spectrum to 25KHz emanates while after this high frequency component gradually decreases and prominent peaks in the spectrum appear in several hundreds Hz, which sound as "chant d'Oiseau". Associated with this transition size of bubbles which appear on the surface of dough changes from broad distribution to homogeneous. Also the vesiculation points become localized. All these observations are consistently interpreted that after 4-5minutes steady paths of the gas emission from the inside have been set up. The talented experienced patissier could discriminate the difference of the sound to inspect maturity.
Only in the case of Sample E destructive explosions were observed at about 2 minutes from the start. During heating two competing processes are working inside the dough:solidification which proceeds from the outside and gas formation. Both are driven by higher temperature. When the solidification advances ahead hard shell is formed to impede escape of gas, which results in accumulation of high vapour pressure inside. This is the cause of the explosion. The standard recipe smartly avoids this route by arranging combination of the ingredients but in our experiments we seek the condition for explosion.
In the presentation we report progressive evolution of the spectrum of cooking sound with textural evolution in relation with magmatic process.

Significance of the guide to introduce the landscape interestingly

*Daisuke Fukushima[1]

1. Sakurajima Museum

One of the objectives of the geopark is to convey the connection between the earth, people and nature. Many of those who have learned earth science can imagine the formation of the earth from the topography and geology, from which you can imagine the connection with people and nature. However, since many general people do not have knowledge of earth science, it is difficult to understand the story of the connection between the earth, people and nature from the landscape in front of the eyes.

On the other hand, there are many people who have deep knowledge about their hobbies and work, can imagine and enjoy various things. For example, if a person who likes history went to a famous battlefield, it would be possible to imagine and enjoy events of hundreds of years ago. However, it is familiar scenery for many general people. Whether you can enjoy the scenery is proportional to knowledge and imagination. If you have a lot of knowledge, the range you can imagine will expand and you will be able to enjoy various sceneries.

The role of the guides is to introduce the scenery interestingly even if the customer does not have knowledge. The guides provide the necessary knowledge to bring out imagination, take you to a place suitable for imagining, use imagery, photographs, illustrations etc so that guides and customers can imagine similar images. Then, the scenery in front of you seems to change, and you can know the story. It is the best way to tell the connection between earth and people and nature. Therefore, the role of the guide in geoparks is very important.

Understanding of "geology" without difficult explanation. - Let's conduct experiment to tell about geology more easily. -

*Hikaru Yokoyama[1]

1. Hokusho University

In the geopark, it is necessary to positively transmit the geoscientific appeal of the area. However, in Japan, many people are not sufficiently educated about geology. Therefore, it is very important task to communicate about the geological phenomena to the citizen easily.

Model experiments are one effective means to tell phenomena difficult to express in words easily. Several activities have been conducted to deepen understanding of geology through model experiments. "The kitchen volcano experiments" is an example of a typical model experiment. Experiments that can easily model geological phenomena and convey it are essential communication tools for the dissemination of geoparks and educational activities.

In this presentation, I will give some examples of experiments to model and convey complex geological phenomena. I will propose the effect of dissemination activities through experiments and how to utilize the experiment in geopark.

The appealing points and challenges of Japanese geoparks, as seen from a foreigner’ s point of view.

*Jagoda Woloszyn[1]

1. Oki Islands UNESCO Global Geopark Promotion Committee

It has been almost three years since I started my work as a Coordinator of International Relations at the Oki Islands UNESCO Global Geopark Promotion Committee. Before coming here, I did not even know that organizations like geoparks existed. Therefore, at the beginning, Japanese geoparks became my model for geoparks. During my presentation I will talk about the appealing points of geoparks in Japan from an amateur’ s point of view.

Geopark Promotion Committees in Japan have the necessary resources to gather information about not only the local geology, but also the local nature, history and culture. Therefore, they can function as a hub for human resource development projects and high-quality tourism product creation.
I wish to look at the challenges that geopark promotion committees face in Japan, as well as talk about the differences between Japanese and European geoparks. Focusing on the differences resulting from the different starting points of the networks, differences in geopark office organization style and culture differences in working style, I will touch upon what I believe the networks can learn from each other.

The Important Things in Communicating Earth's Activity to Local Residents: the Awareness during Four Years after Changing a Job from a Geoscience Postdoc to a Curator

*Kyoko Kanayama[1]

1. San'in Kaigan Geopark Museum of the Earth and Sea, Tottori Prefectural Government

Four years ago, I changed a job from a postdoctoral researcher at a university to a curator at the Tottori Prefectural Government. After my career change, a target for my communication changed from scientists and graduate students having a passion for earth sciences to local people and administrative staff who had never learned earth sciences deeply. How can I let them know the interest for earth sciences?
I believe the interest about earth sciences is to come to realize or imagine that "the earth is active". However, I feel many people are less interested in earth sciences because there is little opportunity to feel its interest. One of my missions as a curator is simply passing on "the earth is active" to as many people as possible.
What I gradually learned from my experience as a curator for four years is that telling memories of landscape and life which listeners had seen could link to their interest for earth sciences when I tell about earth activity. Including these stories, I would like to talk about some perceptions that I gained through the curatorial work in my presentation.

*Makoto Hasuoka[1], Yusuke Suzuki[2], Hiroko Imai[3]

1. Bandai-san Geopark Council, 2. Izu Peninsula Geopark Promotion Council, 3. COM SUPPORT OFFICE

It is not easy for ordinary people and local residents who do not have expertise to image the earth's activities in the geopark - know the importance of geodiversity. In each geopark, local people such as experts and geo guides unravel the phenomena related to the activities of the earth and the relationship between people and the earth, communicate their enjoyment and importance to the general public through guided tours and activities There.
NHK Blatamori introduces to the tea room that it is close to activities that this geopark region is practicing.This program is a program of the concept that Mr. Tamori of the guru walking master approaches the history of the unknown city and the lives of people while walking around the glove.

An analysis of the implementation of Mikasa Geopark`s experienced-based GeoTour and its impacts on recruitment and changes in the participant population.

*kei SHIMOMURA[1,2], souta KAMIGUCHI[1,2]

1. Mikasa Geopark Promotion council, 2. Regional Development and Geopark Promotion Division, Mikasa City Office

Mikasa Geopark, located in the center of Hokkaido, joined the Japanese Geopark Network (JGN) in 2013.

Since joining JGN, Mikasa Geopark has focused its efforts on carrying out various experience-based GeoTours.

In recent years, the number of kindergarten and pre-k participants has risen sharply. Mikasa Geopark is successfully achieving its goal of merging geology, and people in a way that appeals to all ages.

The information about GeoTours that appears in this announcement was attained via surveys filled out by participants. The information and the survey results gathered during GeoTour show annual changes across a variety of areas such as participant ages and the number of repeat visitors. Based on these results, we will be conducting further analyses to determine how to improve GeoTours in a way that utilizes of regional history, topography, and the needs of the Geopark as a whole. Going forward, we will be investigating regional opportunities for self-promotion and new activities at the Geopark.

Strategy for revaluation and promotion of Toya-Usu UNESCO Global Geopark through SDGs

*Nire Kagaya[1]

1. Toya-Usu UNESCO Global Geopark Council

Toya-Usu UNESCO Global Geopark is located in the southwestern part of Hokkaido. The whole area of Date City, Toyoura Town, Sobetsu Town and Toyako Town is included in the geopark area. In the area, we have the following program which corresponds to SDGs (Sustainable Development Goals). In "Goal 4: Quality education", promotion of ESD (education for sustainable development) is promoted, and "Goal 11: Sustainable cities and communities" includes reductions of victims in natural disasters, regional comprehensive Disaster risk reduction is included.
The disaster prevention leader "Volcano Meister" qualified in the area has lectures of not only the guided tour of the field study to observe the craters and the disaster remains but also the eruption disaster and the life in the shelter. They also offer courses to learn volcanic activities and disasters using outdoor learning textbooks, hazard maps (volcanic disaster prevention maps), equipment that understands volcanic eruptions. In addition to this, we are implementing initiatives related to the achievement of several SDGs. Regarding these efforts, we will further enhance the contents so that more people can use it.
Geopark is a place where you can enjoy various attractions related to the activities of the earth. At the same time, it is a place where you can think about a sustainable society through concrete examples such as natural disasters. Toya-Usu UNESCO Global Geopark is an area where the practice of reducing disaster education has been continued aiming at co-existence with active volcano which continues eruptions. As a UNESCO World Geopark, we will continue to enhance regional education and to promote information dissemination for domestic and overseas as well as improve tourist and trainee acceptance. In this presentation, we will introduce specific measures for that.

Geosite Cleanup Activities Leading to Solutions for Global Environmental Problems

*Satoshi Ishikawa[1], Takuya Koike[1]

1. Shimokita geopark promotion council

The Shimokita area is surrounded by three seas: the Tsugaru Strait, the Pacific Ocean, and Mutsu Bay. The differing characteristics of these seas bring both grace and harm to the area. Various fish are caught in these seas due to differences in the geological features of their sea floors as well as their ocean currents: the Tsushima Current, which flows northward in the Sea of Japan, and the Oyashio Current, which flows southward in the Pacific Ocean. These currents also cause a variety of items to be washed ashore. Once, strange items found washed up along the beach lead to the creation of indigenous religions. Now however, the large amount of sea garbage that collects here is part of a global problem to be solved. People in Shimokita work on global environmental problems through local activities. Local citizens clean the beaches regularly, and some hosted an exhibition of art made from garbage to raise awareness about the problem of marine debris. The Shimokita Geopark Promotion Council also holds advertising campaigns and collaborative events to increase local interest and participation. These activities have increased awareness of both global environmental problems as well as one of the Sustainable Development Goals (SDG), ” Life Below Water.” The promotion of Shimokita Geopark's theme, “Living with Oceans on the Axe-shaped Land,” by the activities of local citizens has inspired other Geoparks to address marine environmental problems and work toward solving them.

Inspiring geosites and not-inspiring geosites: Case study of the Oga Peninsula-Ogata Geopark

*Norihito Kawamura[1]

1. Faculty of Education and Human Studies, Akita University

The speaker analyzed protocols spoken by the trainee for the Geopark guide in Oga Peninsula –Ogata Geopark. In the question and answer sessions during the training program, response types shown by the trainees are classified into two types; getting knowledge type and no response type. At the geosites showing only something, e.g. fossils, the trainees would ask about something. Hence, the learners show almost nothing at the geosites requiring some cognition to understand. Finally, the speaker insists that geopark guides should choice better instructional method, depending on the visitors' readiness regarding geoscience concepts.

Keywords: geocognition, geopark guide

Are habitats such as fumaroles or areas with heavy snowfall suitable for organisms living in Yuzawa Geopark? Considering the efficacy of the Geopark Guides with a focus on Yamatanukiran and snow camellia.

*Haruki Takayanagi[1]

1. Yuzawa Geopark Promotion Council

Outline
The biodiversity of Yuzawa Geopark is derived from its unique geodiversity, which includes abundant geothermal activity and heavy snowfall. For example, almost no organisms can persist in the vicinity of the Kawaragejigoku-fumarole, which is a geoformation formed by geothermal activity, snow, and rain water, due to the effect of hydrogen sulfide gas. One exception is the dominant and rare species Yamatanukiran (*Carex angustisquama*). The heavy snowfall in the geopark affects the distribution of snow camellia (*Camellia rusticana*), which has supple branches than can withstand heavy snows. In general, Yamatanukiran and snow camellia are found in acidic soils, such as those located near fumaroles (Tsujimura 1982), or along the land of the Japan Sea side (Sakai 1977). The distributions of these two species reflect key characteristics of this unique region.
Typically, two primary reasons are cited for the observed distributions of these two species: 1) that these species merely prefer these environments and/or 2) that their growth is adapted only to this environment. However, we suspect that such explanations are flawed and/or lack a solid foundation. At first glance, the growth of the two species appears to be adequate at their current locations. Neither species requires the existence of fumaroles or heavy snow, given that Yamatanukiran thrives in agricultural soils (Yuzawa Municipal Sukawa Junior High School, 2011) and that snow camellia is bred at botanical gardens on the Pacific side of Japan (e.g., Koishikawa Botanical Garden, 2019). Yuzawa Municipal Sukawa Junior High School (2011) suggested that the growth rate of Yamatanukiran improves as pH approaches neutrality, and as the distance between individual plants and fumaroles increases. In other words, the influence of soil acidification near fumaroles does not promote the growth of Yamatanukiran but instead inhibits it. Therefore, the fumarole has an overall negative effect on the success of Yamatanukiran. Regarding snow camellia, this species almost certainly experiences damage from avalanches or heavy snow. Based on the above information, we concluded that the restricted distributions of these two species represent their response to strong negative effects rather than being a consequence of fumarole and heavy snowfall environments.
Clearly, in the geopark, as-yet-unknown factors have relegated the two species to inadequate environments.
We refer to plausible reproductive interference [interspecific interactions between closely related species (Takakura and Nishida 2018), e.g., *C. angustisquama* with the widely distributed species, *Carex podogyna* (Fujiwara1997); and *C. rusticana* with a species found along the land of Pacific side of Japan, *Camellia japonica* (Sakai1977)] as the primary factor limiting the biodistribution of the two species, as well as to problems with the academic credibility of the Geopark Guides.

The evaluation of geosites in Sanriku Geopark

*Sho Nagata[1], Hideo Takagi[2]

1. Waseda University, 2. Department of Earth Science, Faculty of Education and Integrated Arts and Sciences, Waseda University

The Sanriku Geopark is the largest national geopark in Japan and involves geodiversity and also remains of repeated Tsunami disasters. It was established in 2013 after the big Tsunami disaster in March 2011. Its geopark status was extended after the review in 2017, however, the result was "yellow card" (next requalification within 2 years), therefore the next review will be scheduled in 2019. The purpose of this study is to evaluate geosites selected from the perspective of various values, highlight their advantages and issues to be considered, and finally contribute to the management of the Sanriku Geopark through presenting this study. In order to attain this purpose, research has been conducted for 65 geosites from 48 areas (previous geosites). They are assessed from the perspective of six main values; educational value, scientific value, tourism value, safety and accessibility, conservation and site sustainability, and value of tourism information (Suzuki and Takagi, 2017). After showing advantage and issues to be considered for each geosites, this study lists up various problems to be considered and presents ways to make the Sanriku Geopark more attractive for many tourists.

The nature experience program created by Geopark and National Youth Outdoor Learning Center

*Takuya Harada[1], Mizuki Kobayashi[1], Ken-ichi Yamada[2], Akiyoshi Adachi[2]

1. Mt. Kurikoma Area Geopark Promotion Committee, 2. National Hanayama Youth Outdoor Learning Center

The program called “*Children’s Environment Exploration Corps*” gets to experience nature and aims to promote environmental education. Currently, under the cooperation Mt. Kurikoma Area Geopark and Sanriku Geopark, we are developing content that aims at various ways of enjoying nature and their understanding. In this report, we will introduce the contents and outcomes of 4 activities held since 2017.

In the Sanriku edition, we learned the features and difference of nature and culture of the sea and the land through on-site inspection and experience activities.

In the Mt. Kurikoma Area edition, we learned about various nature and culture spreading on the Mt. Kurikoma Area Geopark through various experience activities.

With the involvement of geoparks, we were able to incorporate new perspectives such as knowledge of nature science and connection with nature and life in activity. Also, children who participated in this program learned new perspectives on nature and how to enjoy them, leading to deepening their interest in nature.

A review of geosites in the Bandaisan Geopark

*Yojiro Taketani[1], Hiroshi Sato[2], Makoto Hasuoka[1]

1. Bandaisan Geopark Council, 2. Mt. Bandai Museum

It has been 7 years since the Bandaisan Geopark was designated as Japan Geopark. We are currently reviewing whether existing geosites in the area are appropriate for the geopark and trying to discover new geosites with geo-guides. Based on the results, we plan to add and remove the public geosites, to progress sustainable conservation of important geosites and to develop geo-tours with new themes.
The geosites of the Bandaisan Geopark have been selected based on the main theme of the geopark, "To deepen understanding of the birth and transition of the Bandai Volcano, in particular, the large-scale changes in the landform and natural environment due to collapses of the mountain body and debris avalanches and to learn about the influence of Mt. Bandai on people's lives and history and formation of the unique culture".
The Oshio area of Kitashiobara-mura in the northwestern part of the Bandaisan Geopark is mainly composed of the Miocene Green Tuff in the Neogene Period and has important outcrops for understanding the geological history of the period. But, because the geology is not directly related to the formation or eruptive activity of the Bandai Volcano, the area has been excluded from geosites and geo-tours in the geopark.
However, studying the geological history of the Neogene Formation, which forms the basis of the Quaternary volcanoes, provides an important opportunity to understand the plate movements, from the birth of Japan Sea through the uplift of the earth to the formation of Quaternary volcanoes. In addition, there is the Oshio hot spring in the Oshio area, which is visited by many tourists. Salt purified from the hot spring water was an important local resource supplied to the Aizu clan in the Edo period and is even now sold as "mountain salt". The "mountain salt" originates in the seawater of the Green Tuff era, and the role which the heritage of the earth achieved in the history and industry of the region can be shown through a geo-tour. For these reasons, the establishment of new geosites in the Oshio area can be attractive and significant for the geopark.
We will attempt a tour around the newly selected geosites in the Oshio area as the "Geology Day Tour" in 2019 and examine the effects and significance of the tour. Based on the results, we hope to provide a geo-tour with the story for visitors.

Receiving a Yellow Card: Efforts and Future Actions of Sado Island Geopark

*Yayoi ICHIHASHI[1]

1. Sado Islanad Geopark Promotion Office

In Autumn 2017, Sado Island Geopark was re-examined by JGC and received a yellow card, requiring necessary action to be taken within a two-year period to qualify as a geopark.
I will state the changes in efforts currently underway and initiatives which Sado Island Geopark envisages to take in the near future.

Keywords: geopark, yellow card, sado island

Method for resetting geosites and their use in Sado Island Geopark

*Takeyoshi SADAKANE[1], Yayoi ICHIHASHI[1], Mituhisa AIDA[1]

1. Sado Island Geopark Promotion Office

In recent years, in geoparks in Japan, a definite policy for the classification and definition of sites has been announced by the Japan Geopark Committee.In Sado Island Geopark, all the places of interest have so far been identified with the term ‘geo point’. On this point, in the evaluation report of Sado Island Geopark of 2017, it was pointed out that it is necessary to reclassify all 237 geo points into the geological sites, natural (ecological) sites and cultural sites, as advocated by the UNESCO Global Geoparks.
Based on this recommendation, we created a ‘comprehensive geosite setting plan’ which contains all criteria and procedures such as how to reclassify the geo points into geosites. We are now working on resetting the 237 geo points as geosites.

Two criteria were established in this above-mentioned plan in order to reset geo points as geosites.
The first criterion is for selecting geosites with geoscientific value from geo points, which include sites which also have natural (ecological) and cultural value besides geological value.
The second criterion is whether selected geosites are suitable for actual utilization. Regarding this actual utilization, we established three categories which are ‘for research’, ‘for learning’ and ‘for general purposes (tourism)’ to classify geosites.
Among the selected geosites, those that fit into all three categories will be introduced on our website and in the brochure, and will also be used for sightseeing.

In this presentation, we will describe the geosite resetting method in Sado Island Geopark, introduce the geosites finally chosen, and discuss the utilization of geosites and the challenges that arise from resetting them.

Keywords: Sado Island, geopark, geotourism, geosite, geological heritage

Look back on the 10 years at the statistical data of the Itoigawa UNESCO Global Geopark

*Takahiko Ogawara[1], Ko Takenouchi[1], Yousuke Ibaraki[1], Takeo Kobayashi[2]

1. Fossa Magna Museum, 2. Itoigawa Geopark Promotion Office

Itoigawa was designated a Global Geopark in August 2009 and continues activities as the Itoigawa UNESCO Global Geopark today. This paper is a retrospective of the past 10 years of the Itoigawa Geopark, through analysis of statistical data related to tourist sites and geopark activities.

Itoigawa City first implemented the “Fossa Magna and Regional Development Plan” in 1987 to make use of the region’s geological and topographical heritage for tourist promotion. Itoigawa City’s tourism averaged about 3 million visitors per year between 1997 and 2001, but began a downward trend starting in 2002, decreasing further following the Chuetsu Earthquake (2004) and Chuetsu Oki Earthquake (2007) to only 1.85 million visitors in 2007 (Fig 1). Itoigawa was then recognized as a Japanese Geopark in 2008 and a Global Geopark in 2009, which saw a stop in tourism decline. Coinciding with the opening of the Hokuriku Shinkansen, Itoigawa saw 2.49 million visitors in 2015.

The Fossa Magna Museum is Itoigawa Geopark’s central facility. On its opening year in 1994, the museum saw 95,705 visitors, but this had over halved to 40,683 visitors in 2007 (Fig 2). This can be seen to be a result of not only disasters, but also because the museum’s exhibits had never been updated. Following Geopark certification, the museum saw an increase to nearly 60,000 annual visitors and, following the opening of the Hokuriku Shinkansen and a complete renovation of the museum’s exhibits, the museum saw a record-breaking 101,725 visitors in 2015.

Takanami-no-ike Pond is part of the tourism course which visits the Kotakigawa Jade Gorge, one of Itoigawa’s jade producing gorges and Itoigawa’s representative geosite. After Global Geopark certification in 2009, an increase in bus tours saw a peak of 28,940 visitors in 2012. However, bus tours continue to decrease, with only 17,720 visitors in 2014. There is no regular public transportation to Takanami-no-Ike Pond, so the opening of the Hokuriku Shinkansen had no effect on these numbers, and 2017 saw a continued downward trend with only 14,610 visitors.

Itoigawa Geopark formed the Geopark Tourist Guide Society in 2010. During this first year, the guides led 97 tours of 1770 people. The Hokuriku Shinkansen has increased demand for tours and following the Itoigawa City Station North Fire of 2016, tours of the affected areas are also in demand. In 2017, there were 147 tours of 3,645 people recorded.

The Itoigawa Geopark Certification Exam started in 2009 as a ‘gotochi kentei’ regional certification exam. Such exams are popular in Japan to promote study of local culture and history. The first year, which coincided with Global Geopark Certification, saw 464 testees (Fig 3). Itoigawa Geopark and Hong Kong Geopark share a sister geopark relationship and since 2011 have conducted student exchange programs. Itoigawa Geopark requires that participants pass the first level of Itoigawa Geopark Certifications. For this reason, the number of primary school students taking the test increased from 20 in the first year to 86 in 2011.

Recently, foreign tourism to Japan has been increasing dramatically, and Itoigawa is no exception. 2013

©2019. Japan Geoscience Union. All Right Reserved.

saw only 154 foreign visitors staying in Itoigawa hotels (Fig 4), but since Geoparks became an official UNESCO Program (2015) and the through promotional efforts including the Itoigawa Seafood Shuttle Bus (2015), these have increased to 2,662 visitors in 2017, an increase even more dramatic than that of nearby cities such as Hakuba.
The Geopark Activities have seen an increase in visitors to the Fossa Magna Museum and foreign visitors, but regions of the Geopark that lack public transportation infrastructure like Takanami-no-Ike Pond continue to see a noteworthy decrease in yearly visitors. Furthermore, projects such as the Hokuriku Shinkansen and Geopark Certification Exam have significant effects, but these effects diminish over time. Further polishing of the region’ s attractiveness and development of new programs and activities are essential.

Application of terrain representation in Geosite - Case study in North Ibaraki Geopark Project -

*Go Ishikawa[1], Keiko SUZUKI[1], Mamoru Koarai[2], Rika Imaizumi[3], Naoki Takeda[4]

1. Tokyo Map Research Inc., 2. College of Science, Ibaraki University, 3. Aero Asahi Corp., 4. Association for Promotion of North Ibaraki Geopark Project

Geosites feature the sights of the geopark, which designate sites of spectacular geological feature. It is important to make it have corrected geological information and easily to understand. Most geopark use flyers, but only a few have topographic map.
In the Japanese Geoparks re-certification activity, North Ibaraki Geopark Project has the Geosite pamphlet with map illustration. It's customized and approachable but hard to match with the on-site. To design the new pamphlet, we used **New Relief Map created with Multiple Light Source (DecoBocoChizu Premium)** based on the 5m DEM (Digital Elevation Model). The new Geosite maps show more reality and much easier to recognize the geological feature such as marine terrace, river terrace and fault. Furthermore, overlapping the shadow graph and geologic graph can get the geographic structures.

*: This research is supported by Ibaraki University Geological Information Utilizing Project and KAKENHI (16K01213).

Evaluation and utilization of 34 geosites in Geopark Chichibu

*Hideo Takagi[1], Satomi Hirose[2]

1. Department of Earth Science, Faculty of Education and Integrated Arts and Sciences, Waseda University, 2. School of Education, Waseda University

The Geopark Chichibu was established in 2011 as a national geopark of Japan, and its geopark status was extended after the review in 2015. Next review is scheduled to be conducted in 2019. Geopark Chichibu is claimed to be the birthplace of modern Japanese geology due to its geodiversity since the Meiji era. The purpose of this study is to evaluate 34 new geosites (Inoue and Tomita, 2018) of the Geopark Chichibu from the perspective of various values, highlight their advantages and issues to be considered, and finally contribute to the management of the Geopark Chichibu through presenting this study. In order to attain the above purpose, research has been conducted for 34 (this number is important because of the 34 pilgrimage sites (temples) in Chichibu) new geosites proposed in July, 2018, and additional 5 possible geosites. Total 39 geosite candidates are assessed from the perspective of six main values; educational value, scientific value, tourism value, safety and accessibility, conservation and site sustainability, and value of tourism information (Suzuki and Takagi, 2017). After showing advantage and issues to be considered for each geosites, this study proposes a partial change of new geosite from the perspective of geotourism as well as ways to make the Geopark Chichibu more attractive for many tourists.

Aiming for Further Development in Hakone Geopark

Ichiro Murayama[1], Shinobu Katano[1], *Yusuke Okutsu[1]

1. Hakone Geopark Promotion Council

Hakone Geopark consists of 2 cities and 3 towns, Hakone Town, Odawara City, Manazuru Town, Yugawara Town and Minamiashigara City, were at first, consisted by 1 city and 3 towns and were authorized by Japanese Geoparks in 2012. After the authorization, there was an increasing momentum to join us in Minamiashigara City, and in 2015, MInamiashigara City, Minamiashigara-Geoguide Association and other related company joined the council. With this new material, we passed the new authorized examination in 2016.

Due to this addition, 8 new geosites were added. For example, at Mt. Yaguratake, a very new rock formation in the world, you can experience the dynamic earth movements of the Ashigara group, which joined the mainland by the collision between the plates. Also Ashigara road which has a history that is older than Tokaido has been added.
Theme of the Hakone Geopark can be understood by studying the geosites. it produced further depth and expanse in Hakone Geopark’ s theme and story.

Citizen Science Forecast and Evaluate Ship and Airplane Operation Success to a Remote Oceanic Island: a case study for Izu-oshima

Kazuhiro Nakamura[2], Juri Hashimoto[1], *Rika Usui[1], Yuichiro Teramoto[1], Kana Nishitani[3]

1. Izu Oshima Geopark Promotion Committee, 2. Former Tokyo Metropolitan Oshima High School Teacher, 3. Corp. Global Sport Club

Weather outlook and forecast of ship and airplane operation are invaluable information for daily life in remote islands, but also for tourism and business on those islands. In order to help a local island community, a web site was opened in 2004 to provide an outlook for week-term ship and airplane operation between Tokyo and Izu-oshima and annual report evaluating outlook success ratio for better understandings of nature and climate of Izu-oshima. In collaboration with Izu-shima Geopark, we analyze and discuss a long-term outlook success from 2004 to 2018 for promoting and implementing geo- and eco- tour operation in good, convenient and comfortable seasons of the year.

Minami-Alps Geopark Development of programs for education and spread activities

*Eri Ozawa[1], Takahiro Kitahara[1], Airi Karasawa[1]

1. Minami-Alps MTL area Geopark Council

In order to know and enjoy the Geopark more deeply, it is effective to listen to the story of the guide by actually looking at the site. However, I think that people who do not know Geopark suddenly participate in geotour etc. are high hurdles.
So, at the Minami-Alps Geopark, we developed a program that allows you to feel free to participate as a catalyst for getting to know the Geopark. And we have been using it in workshop at community center and events. We are also discussing prior learning of educational tour intended for elementary school students' and utilization as rainy day program.
In this presentation, we introduce the mainly about newly developed program and the situation of the use.

Present situation and issues of the Tateyama Kurobe Geopark after Yellow card

*Yuta Yamaoka[1], Akira Takeuchi[1], Hajime Iida[2], Kiyoshi Imai[1], Kazuo Kaneko[1], Yukimitsu Shimura[1], Osamu Inamura[3], Tohru Ikurumi[4], Kiichi Imahori[1], Satoshi Kotani[1]

1. Tateyama Kurobe Geopark Society, 2. Tateyama Caldera Sabo Museum, 3. Uozu Aquarium, 4. Lifelong Learning Division, The Board of Education, Kurobe City

Tateyama Kurobe Geopark is a Japanese Geopark composed of 9 municipalities in eastern Toyama prefecture and a part of Toyama bay. The features of our Geopark are 4000 meters difference in elevation from the top of Tateyama mountain range with 3000 meters above sea level to the Toyama Bay with depth 1000 meters. Our Geopark was proposed by mainly researchers. The management organization was established by local businesspersons and supported by local governments. Therefore, it is a unique Geopark in Japan that is operated by NGO. Tateyama Kurobe Geopark is operated in cooperation with municipalities, universities and museums. In recent years, more local people, companies and private groups are active about Geopark. The role of Geopark in the region is gradually increasing. However, the result of the Japanese Geoparks revalidation process in 2018 was Yellow card (conditions attached). The main indications are four points as follows (1) difference in recognition about Geopark among participant in Geopark activities, (2) conservation plan and conservation activities are unclear, (3) lack of visibility in major tourist routes and few Geopark signs, (4) difficult explanation. We make and fulfill an improvement plan getting advices from the Japanese Geopark Committee. In this paper, we report activities and issues of the Tateyama Kurobe Geopark considering the results of the revalidation process.

Keywords: Tateyama Kurobe Geopark, Geopark, Conservation, Tourism, Education

1 year survey conducted by Hakusan Tedorigawa Geopark regarding number of pamphlets taken from Roadside station Shirayamasan

*Nakano Kaori[1], Tsuyoshi Hibino[1], Ryoichi Onishi[1]

1. Hakusan Tedorigawa Geopark Promotion Council

Tourism is one of the very important initiatives being focused on by the geopark. Tourism at its core can be thought of as many people visiting a certain area. Also pamphlets exist as a tool able to increase the number of visitors. In recent years the principal means of sharing information has become electronic devices, however conveying information through printed mediums is still effective.
At the Hakusan Tedorigawa Geopark Promotion Council, in order to understand which size and design of pamphlet will catch the customer’ s eye, in January 2018 we started monitoring the number of national geopark regional pamphlets being taken from the roadside station Shirayamasan. When we make future pamphlets this information should allow us to create a pamphlet which both entices customers to take the pamphlet home as well convey the charms of the region.
The roadside station Shirayamasan is located alongside Japan National Route 157, connecting the flatland with the Mt. Hakusan foothills. This roadside station is the entrance gate to the route leading from Ishikawa Prefecture, through the foothills of Mt. Hakusan and onto Fukui and Gifu Prefectures. There is no public transportation such as trains or buses assigned to this route and the roadside station does not currently offer popular services such as restaurants and souvenir shops. Due to this the vast majority of users come by car or bicycle with their main purpose being a brief rest. However, we do not have any information regarding the age, gender, occupation, social status or reason for taking the pamphlets home.
As a result of the monitoring, there was no particular connection found between the number of pamphlets taken last month and the design of the pamphlets or their positioning within the roadside station. However what we did notice was that the season strongly influences the number of people who take pamphlets home. The period over GW (Golden Week –series of national holidays in May), the summer holiday period as well as the popular autumn leaves period saw an increase in the number of pamphlets being taken home. This concludes my report after one year of monitoring the number of pamphlets being taken from the roadside station Shirayamasan.

Keywords: pamphlet, tourism, Hakusan Tedorigawa Geopark, roadside station, public awareness

Promotion of the earth science utilizing the Geopark “Making the stone specimen in Hakusan Tedorigawa Japanese Geopark”

*Yuya Kitoh[1], Satoshi Hirai[1], Kiyofumi Tamamura[1], Tsuyoshi Hibino[2], Kaori Nakano[2], Tomoaki Morishita[3], Yoshihiro Hiramatsu[3], Maki Hamada[3]

1. Ishikawa Geological Survey Association, 2. Hakusan Tedorigawa Geopark Promotion Council, 3. Kanazawa University

In recent years, due to the declining birthrate, aging of society, and fewer interests of science, new leaders in the field of the natural science has been decreasing. On the other hand, extreme weather with severe damages has increased in recent years. Therefore, it is necessary to develop human resources not only of researchers and engineers with interests of natural science but also of citizens with understanding and knowledge of natural environment.
The Ishikawa Geological Survey Association, the Hakusan Tedorigawa Geopark Promotion Council, and Kanazawa University have organized the event entitled “Making the stone specimen in Hakusan Tedorigawa Japanese Geopark" for elementary school students and their parents since 2017. This event utilizes a field of the Geopark, aiming to make children, as the next generation, have interests in nature and natural science through activities in the field.
On Saturday 20 October 2018, the 35 pairs of children over fourth grade in elementary school and their parents selected by lottery participated joined the event. After learning stones, formation processes of those and how to distinguish them, they collected stones and made the stone specimens with Japanese and foreign students and others using hammers, loupes, and medicinal liquids. From the results of the questionnaire answered by the children after the event, we recognize that the children showed the high curiosity of the stone and the nature, experienced the difficulty and the pleasure of learning the nature. Based on the questionnaire, we verify the learning level of the contents and the explanation of the activity and reflect it in future activities. We are planning to continue this event, as well as trying new attempts to tackle the curiosity of children.

School Trip from Hong Kong to Dinosaur Valley Fukui Katsuyama Geopark : Challenges and Prospects

*Sumiaki Machi[1]

1. Dinosaur Valley Fukui Katsuyama Geopark Promotion Council

Dinosaur Valley Fukui Katsuyama Geopark is located at mountainous region, Fukui Prefecture, Japan. As you can understand from the name of geopark, the region is famous for dinosaur fossils excavation. 5 named dinosaurs have been discovered from Tetori group (early Cretaceous) so far (Azuma & Currie, 2000; Kobayashi & Azuma, 2003; Azuma & Shibata, 2010; Shibata & Azuma, 2015; Azuma et al., 2016). And there are various beautiful landscapes, formed by old volcanic activities and river flows (Kuzuryu rive and its branches).
Fukui Prefectural Dinosaur Museum is very famous in Japan and probably there are many visitors for school trip every year. However, most of them visit there and leave Katsuyama. This has been an old problem of Katsuyama city since the museum was established. We accepted school trip from Hong Kong Chinese Women's Club Fung Yiu King Middle School. We report challenges and prospects about accepting the students trip and guiding them.

Keywords: Dinosauar Valley Fukui Katsuyama Geopark, school trip, Hong Kong UNESCO Global Geopark

Outline of the activities of the Kumano Kodo Ohechi Rangers

*Keishi Jimbo[1]

1. Nanki Kumano Geopark Guide Club

Outline of the activities of the Kumano Kodo Ohechi Rangers

In this poster we will report about the activities of the Kumano Kodo Ohechi Rangers and the relationship between the Nanki Kumano geopark.

The Kumano Kodo Ohechi Rangers was formed in 2004.

The Ohechi route of Kumano Kodo has few flatlands around the coast.

As a result, due to modern traffic improvement many roads of the Ohechi route were duplicated, traces of which were lost.

Volunteers to conduct the exploratory activities of the Ohechi route have gathered, and the Kumano Kodo OhechiRangers is formed.

Search activity is to listen from old people and learn from old maps, investigate the route, rediscover the way.

The exploring activity of the Kumano Kodo Ohechi Rangers revealed about 120 km of the large side route from Tanabe City to Nachikatsura Town, and in 2017 the addition of some part of Ohechito the World Cultural Heritage "Sacred Sites and Pilgrimage Routes in the Kii Mountain Range" was confirmed.

In the vicinity of the Ohechi Route, many of the members of the Kumano Kodo Ohechi Rangers where the major geosites of the Nanki Kumano Geopark are dotted have completed the geopark guide training course and are conducting guide activities.

Also, it is also an area of Yoshino Kumano National Park, and some have registered as a natural park instructor.

Members are actively engaged in the creation of illustration maps, the setting of signposts, the implementation of walking in cooperation with tourism associations and travel agencies, and the conservation activities at local school classes.

I will examine what kind of activities are needed in the future.

Keywords: Geopark, Kumanokodo, maintenance

Diversity of Nature Activities Related Geodiversity

maeda atsushi[2], Ministry of the Environment Kinki Regional Environment Office, *Suzuka Koriyama[1], Noritaka Matsubara[3]

1. Sanin Kaigan Geopark Promotion Council, 2. SGAR, 3. Graduate School of Regional Resource Management, University of Hyogo

San’in Kaigan UNESCO Global Geopark is the area stretching from Kyotango City in Kyoto Prefecture; Toyooka City, Kami Town and Shin’onsen Town in Hyogo Prefecture; and Iwami Town and northern part of Tottori City in Tottori Prefecture.

Geopark theme is ‘Geological features, natural environment, people’s lives and the formation of the Sea of Japan.’

There are many organizations which conduct outdoor activities in San’in Kaigan Geopark area. More than 20 bodies in 3 prefectures offer variety of activity programs, making good use of the geological characteristics of the area including the seas (sea kayaking, snorkeling, diving), mountains (mountainous area cycling, treeing), snows (skiing, showshoe), sand dunes (sand board) and rocks (lava trekking).

Each activities need suitable geological features. Diverse activities mean that there are diverse geological features in San’in Kaigan Geopark. In this presentation, I’ll talk about the relationships between variety of activities and the geological features in San’in Kaigan Geopark.

Understanding of regional scientific importance by local Residents –In case of San’ in Kaigan UNESCO Global Geopark

*Noritaka Matsubara[1]

1. Graduate School of Regional Resource Management, University of Hyogo

Regional self-support is very important things in local community. And one of the important roles of geopark activities is resident understanding of the regional scientific importance and features. UNESCO Global Geoparks give international recognition for sites that promote the importance and significance of protecting the Earth's geodiversity through actively engaging with the local communities. For this purpose, it is important that local residents participate in geopark activities positively. However, it is difficult for local residents to understand regional scientific importance and local geological phenomena.
So, we started “geo-communication” with local people. For example, we created “Geopark foot pass” and “geopark walking map” in cooperation with local people, to promote better understanding and communication with local people, government and academia involved in geopark activities. Local residents could understand geological features through this activity. In this poster, I would like to introduce our “geo-communication” activities.

Keywords: geopark, geo-communication, earth's phenomenon

Stones forming tombs of feudal lords during Edo period in some geoparks located along the coast of the Sea of Japan

*Tohru Sakiyama[1]

1. Graduate School of Regional Resource Management, University of Hyogo

San’in Kaigan Geopark, Shimane Peninsula and Shinjiko Nakaumi estuary Geopark, and Hagi Geopark are located along the coastal area of Sea of Japan and each has feudal load tombs of the generations. I show the characteristics and speculate the production area of the stones, in the basis of petrography and magnetic susceptibility. Grave site of Ikeda family who are feudal loads of Tottori Domain situate in the San’in Kaigan UNESCO Global Geopark. Most of the tombs in the grave site are made by Mochigase Granite with low magnetic susceptibility located in the south of Tottori City. Stones of tombs in the grave site of Matsudaira family who are feudal loads of Matsu Domain in the Shimane Penninsula and Shinjiko Nakaumi estuary Geopark are clearly divided to older and younger tombs. Former is made of coarse-grained biotite granite with low magnetic susceptibility and latter is made of medium-grained hornblende biotite granodiorite with high magnetic susceptibility. Former ones may be quarried from Seto Inland Sea area and latter ones may be the granite from local area in San’in Zone. Granitic tombs in the Hagi Geopark have also similar tendency.

Keywords: granite, geopark, stone material, magnetic susceptibility

Science Design to make the earth attractive

*Miho Sasaoka[1], Mine-Akiyoshidai Geopark[2]

1. Kochi University / SASAMI-GEO-SCIENCE, Inc., 2. Mine-Akiyoshidai Karst Plateau Geopark

Geoparks goes beyond just the science framework. I think that how geoparks are expected to show relationship earth and people's livelihood of the future and the past in each area.

In order to attract the public, it will be necessary to establish diverse entrances to diverse people.

In this presentation, from the viewpoint of science design, I would like to have the opportunity to think about the future activities of Geopark together, and introducing the completely new efforts I have been doing to the public in general.

Keywords: science design, diverse perspectives

‘Be one with the earth; help each other’: the Geopark activities of Mine-Akiyoshidai Karst Plateau Geopark

*Hokuto Obara[1], Tomoko Muratani[1], Tristan Gray[1], Kazuhiro Yuhora[2], Koji Wakita[3]

1. Mine-Akiyoshidai Karst Plateau Geopark Promotion Council, 2. Tottori University of Environmental Studies, 3. Yamaguchi University

In Mine-Akiyoshidai Karst Plateau Geopark, our every activity is conducted under the concept of ‘be one with the earth; help each other’. Through the conservation and utilisation of the earth’s geological heritage, these activities work towards the realisation of the Sustainable Development Goals, which exist for the purpose of achieving UNESCO’s core principle of building peace in the hearts of men and women. This presentation will explain what this concept means in reality, and will introduce the activities already put into practice and plans to be executed in the future in Mine-Akiyoshidai Karst Plateau Geopark, as we look towards achieving UNESCO Global Geopark status.

Keywords: Mine-Akiyoshidai Karst Plateau Geopark, Japanese Geoparks, geopark activity, Sustainable Development Goals

Highlights of Suzaki Coast, Shikoku Seiyo Geopark - Kurosegawa Tectonic Zone, geologic strata of 400 million years ago -

*Chisato Nakamura[1], Tomohiro Tsuji[2], Shikoku Seiyo Geopark Promotion Council -[3]

1. NAIBA Co. Ltd., 2. Shikoku Research Institute INC., 3. Seiyo City

Kurosegawa tectonic zone is composed mainly of rocks of the continental crust and strata deposited in shallow seas around the continent. It has been assumed that the fragments which has been divided from the supercontinent Pangea near the equator collided with another continent. Suzaki coast is one of the main geological sites of Shikoku Seiyo Geopark in Ehime Prefecture. It is the only location in Japan where the strata of acidic tuff belong to the Kurosegawa tectonic zone crops out continuously for 300 m. The acidic tuff was inclined vertically, creating fantastic landscape. In addition, there are outcrops of tuff breccia and intrusive rocks which are closely related with the acidic tuff. We introduce the highlights of Suzaki coast and explain how these strata were formed.

Acidic tuff: The acidic tuff layer constituted of alternation of muddy and sandy beds. Various sedimentary structures, such as grading, load structure and convolution, those are characteristic in turbidites were formed in the acidic tuff. As showed by Makisaka and Kato (1983), upper direction of the strata faces to the northeast. The acidic tuff includes coarse tephric particles of feldspar, suggesting that it deposited the sea close to continental or volcanic arc. The acidic tuff deposit of 300 m-thick suggests that there was stably volcanic activity over a prolonged period. It is implied that the sedimentary environment of the strata was the sea close to the volcano of the continent. The acidic tuff yields well-preserved radiolarian fossils. Further identification of the radiolarian fossils could contribute to estimate the ages of the sedimentation and the volcanic activity.

Tuff breccia: Tuff breccia including coral fossils overlies unconformably on the acidic tuff with the obvious boundary. The tuff breccia is poorly sorted, and reverse-grading is observed at the bottom of the tuff breccia. Those findings indicate that it is a debris flow deposit formed by the sector collapse or the submarine sliding, and it is presumed that they flowed into the deeper ocean floor.

Intrusive rock: We can see the intrusive rocks at several localities. They cut lamination of the tuff layer and are fine-grained and has massive and homogeneous texture. Since the existence of intrusive rock implies that volcanic activity took place at the site where the acidic tuff deposited, more detailed work is necessary.

On the Suzaki Coast, we can see how the acidic tuff accumulated in the sea close to the continental or the volcanic arc. The Suzaki coast is an academically important place to elucidate the geological history of the Japanese islands and it is also an attractive geological site for the ordinary visitors. Finally, we also introduce how to tour around geological spots in Suzaki coast on the presentation.

Keywords: Shikoku Seiyo Geopark, Kurosegawa tectonic zone, acidic tuff, intrusive rock, debris flow deposit, radiolarian fossil

The Efforts of the Shikoku Seiyo Geopark after the revalidation from JGN council and the 2018 Japan Floods.

*Takumi Sakakiyama[1], Fumito Doi[1], Koshiro Utsunomiya[1], Tsukasa Takahashi[1]

1. Shikoku Seiyo Geopark Promotion Council

On December 22, 2017, Japanese Geopark Network Council granted the renewal certified status to our Shikoku Seiyo Geopark for another four years. Although we were actively involved in geopark activities after getting the approval of renewal certificate, we had experience of several severe damages due to heavy rain, landslides, and floods in Seiyo City in 2018, and which caused the loss of six people’ s lives. In the Shikoku Seiyo Geopark, the five geosites were damaged among twenty-three sites. The two geosites are still in the state of restricting to the visitors to access for the entry up until now.

In order to respond to the situation, we conducted the educational programs named “Seiyo Nature and Culture College” to the people living around the areas for the awareness of their surroundings. In the programs, we conducted lectures and field trip programs with experts who are familiar with local knowledge and geography, train new courses, and teach the participants how to use the geopark. The participants in the field trips had joyful experience of watching the scenery of the areas familiar from usual as they listened to the commentaries from the experts. In cooperation with school education, we offered the school tours to affected geosites as the annual education program of learning about the geopark.

To improve the indicated matter of revalidation, we are seeking a geopark story that makes visitors interested in the last year. Not only each working committee and geoguides have shared the keywords, but also the participants in the educational programs have taken the discussions. In addition to that, our council have supported the collaborations with local industry and commerce for the preparation for the Shikoku Seiyo Geopark guidebook, establishment of promotion shops, and branding new special products. On the other hand, we also have some challenges of dealing with both disaster response and geopark promotion. For the future, we are going to share the issue in JGN and make the opportunity to learn our lands how it was formed by using new educational material of disaster prevention.

Method of enjoying relationships with the earth and culture in "the central Shikoku island".

*Azusa Tonotani[1,2], Kana Nakao[1,2], Kazuyoshi Ishii[2], Takuma Asa[3], Soichiro Sagawa[3], Kenshi Nishinari[3], Iori Yamamoto[3], Hisashi Hirao[3], Keiji Nakagawa[3]

1. Miyoshi city office, 2. Geoguides of Miyoshi city, 3. Tokushima prefectural Ikeda high school

Miyoshi city in Tokushima prefecture is called "the central Shikoku island", which consists of "Sora" and "Machi" area. In the Sora area, villages are scattered on the gentle slopes that are formed by landslides in Shikoku mountains and Sanuki mountain range, and there we can find various creative solutions for living on such landforms in agriculture, architecture and customs. On the other hand, in the Machi area people live on river terraces made by the Yoshino river or on the ground formed by activities of the Median Tectonic Line, where the shredded tabaco industry and water transportation business were prosperous utilizing the Yoshino river.
As stated above, we, Miyoshi city, who has deep relationships with the earth and culture, are promoting activities aiming for the Japanese Geopark certification. We are doing the "Geotours" as one of efforts that have tourists and local people enjoy relationships with the earth and culture.
In this presentation, we introduce four types of the Geotours; by 1) Geologist, 2) Staff in Geopark plan, 3) Geoguide, 4) High school student.

Keywords: Geotour, Median Techtonic Line

Bridge of scientific research to school education in a geopark, using a research fund of Muroto UNESCO Geopark

*Takeyuki Ueki[1]

1. Faculty of Risk and Crisis Management, Chiba Institute of Science

Activities in a geopark is composed of conservation, education and tourism, in ascending order. Scientific research is mainly related to conservation, with little contribution to school education. Drilling survey was performed on the school ground, using a research fund of Muroto UNESCO Geopark. In the field, students observed a drilling work and enjoyed small excursion around. In the laboratory, students cut a sediment core, observed facies and imagined paleoenvironment. This presentation reports a bridge of scientific research to school education in a geopark.

Keywords: bridge, scientific research, school education, research fund, drilling survey

New basic philosophy of Unzen Volcanic Area UNESCO Global Geopark made in union with local residents and government officers.

*Taku MORIMOTO[1], Marekazu OHNO[1]

1. Unzen Volcanic Area Geopark Promotion Office

1. Revision of a basic philosophy's of The Council of Unzen Volcanic Area Geopark.

The basic philosophy of Geopark is to share the vision of our area with local residents, government officers and academics.Geopark activities are to protect and prevent local resources through local sustainable development.The basic philosophy should be easy to understand and to agree for local residents.

Its philosophy was made by The Council of Unzen Volcanic Area Geopark in 2010 led by local Geopark stakeholders.But, Geopark Programme became the official programme of UNESCO in 2015 andits programme was necessary to contribute and pursue the UNESCO philosophy.

The Council of Unzen Volcanic Area Geopark formulated the new basic philosophy of Unzen Volcanic Area UNESCO Global Geopark in November in 2018 with local residents and government officers to contribute to achieve the philosophy of UNESCO Global Geopark.This is the process how our geopark made the philosophy and showed it to public.

2. The way to consider a new basic philosophy and the flow of workshop with government officers.

I started the project team, which was consisted of Unzen Vlocaninc Area UNESCO Global Geopark members and government officers such as the Ministry of the Environmentry, Nagasaki Prefecture, 3 cities of Shimabara Peninsula (Shimabara, Unzen and Minamishimabara).The project meeting was held 4 times titled "how we build Shimabara Peninsula in the future", and we share each idea by Affinity diagram with the team and group similar ideas which were shared.

As a result, the new basic philosophy was made: "Sustain our beautiful home town and local geo-heritages more and forever".

3. The new basic philosophy sent to local residents

Approximately 230 wide range of local residents including high school students joined the " Japan Geopark authorization 10th anniversary commemoration symposium of Shimabara Peninsula " and have a dialogue to review last 10 year geopark activities and about our future of Shimabara Peninsula.The opinion from participants of the symposium and from project team had in common.The new basic philosophy,as a result, became the one which reflected from local residents' opinions.The new basic philosophy was announced to local residents as declaration of the symposium at the venue.

©2019. Japan Geoscience Union. All Right Reserved.

4. Our outlook to achieve the new basic philosophy.

It is a task how we pursue the philosophy.for that, we would like to enlarge the number of our fellows towork with us to protect and prevent local resources through local sustainable development.

Keywords: UNESCO, New basic idea, Sustainable development, Affinity diagram, Project team, Local resident

Evaluation of explanation panels settling at geopark's sites –case study of the explanation panel at a memorial park of houses destroyed by debris flows in Unzen Volcanic Area UNESCO Global Geopark, Japan

Sean OTA[1], Shion MORIKITA[1], Kuumu ONIDUKA[1], Tatsuya MORITA[1], Kenshin OSHIMA[1], Yui KURITA[1], Miyu KAWAZOE[1], Toshiki HIGASHIUCHI[2], Hiroaki OSAKO[2], *Marekazu OHNO[3]

1. Glocal Course, Nagasaki Prefecture Koka High School, 2. Nagasaki Prefecture Koka High School, 3. Unzen Volcanic Area Geopark Promotion Office

Introduction

Explanation panels placed at Geopark sites are advertising tools to inform local residents and tourists about the value of these sites. These panels enable people to understand how important the sites. However, if the panels only have information that isn't well known to many people, such as geology or geography, they might not be able to understand them smoothly. In order to have people with little knowledge on geology or geography know the values of those sites and have them enjoy the Geopark, it is necessary that the explanation panels are easy to read and understand. In this study, we investigated visitors' impressions on one of the panel at the Geopark's sites. Then, considering the results, we redesigned the contents of the panel and compared the visitor's impressions on it with the original one.

Methods

On August 10th and September 16th in 2018, we placed video camera at *a memorial park of houses destroyed by debris flows*, which is one of the main sites of Unzen Volcanic Area UNESCO Global Geopark, to see how much time visitors look at the explanation panel. We also looked into the visitors' gender, age, hometown, and impressions on the panel. The impressions are evaluated from 1 to 6 points on five different perspectives: total impression, pictures, contents the number of letters, and font size. As for pictures and contents, 6 points is the highest score while 1 point is the lowest. As for the number of letters and font size, 3.5 points is standard and as it gets closer to 1, it means too small or too few pictures, while as it gets closer to 6, it means too big or too many pictures. Then, based on the results, we redesigned the panel and had the same investigation on October 14th and compared the results from both studies.

Results

The number of visitors who saw the original panel was 52 out of a total of 250 visitors (about 21%). The average time they looked at the panel was 22.4 seconds. On the other hand, the number of visitors who saw the redesigned panel was 34 out of 204 visitors (about 17%). The points on impressions were as follows:

1) The original panel: total impression 4.7 / contents 4.6 / pictures 4.6 / the number of letters 4.1 / font size 3.7

2) The redesigned panel: total impression 4.6 / contents 4.8 / pictures 4.7 / the number of letters 4.0 / font size 4.0

The average time the visitors looked at the original panel was about 22 seconds and the longest one was about 63 seconds, while the average and longest times of redesigned panel were 17 seconds and 62 seconds, respectively.

©2019. Japan Geoscience Union. All Right Reserved.

Discussion

As for the font size, visitors had impressions such as “these are too many letters” or “it is difficult to decide where to start reading” on the original panel. Therefore, we decreased the number of letters and made the font larger on the redesigned one. As a result, the number of people who think the panel became easier to understand has increased. Though the evaluation of the contents improved, the reading time of the redesigned panel became shorter than that of the original one. This implies that visitors were able to finish reading it in a shorter amount of time. On the other hand, some visitors had negative impressions on the redesigned panel such as “there’s not enough information” or “it doesn’t tell information that it should.” This may be because we decreased the number of letters too much and couldn’t show the importance or the values of the sites enough.

Future prospects

Considering the results, we are going to investigate the visitors’ needs for the panel again and redesign it with necessary information to tell the values of the site. We will be able to show you the redesigned one and the visitors’ impressions on it at the conference.

ESD-SDGs Promotion Model Development utilizing Geoparks including the basic research on the contents of educational programs in Geoparks in Japan

Katsuhiko Asahi[1], Yayoi Ichihasi[1], Takahiko Ogawara[1], Shinobu Katano[1], Ken'ichi Kurihara[1], *Suzuka Koriyama[1], Takeo Kobayashi[1], kei Shimomura[1], Yusuke Suzuki[1], Ko Takenouchi[1], Tsuyoshi Hibino[1], Jun Fujishima[1], Kana Furusawa[1], Yu Horiuchi[1], Emiko Mizuno[1], Ko Miyama[1], Yuta Yamaoka[1], Tamami Yamaguchi[1], Yukiko Yamasaki[1], Ryuta Yamamoto[1], Hikaru Yokoyama[1]

1. Japanese Geoparks Network

The Japanese Geoparks Network(JGN) started a project aiming at developing a sustainable society through the debelopment and dissemination of Geopark ESD-SDGs practical model.
This project is funded by FP2018 the UNESCO activities grant of the Japanede National Commission for UNESCO. We conducted a survey of educational contents of all the Geoparks in Japan and made the foundation for utilizing these contents widely. We also conducted a survey for educational trip needs to promote edubational trips to Geoparks.
Furthermore,we started to debelop the following five Geopark ESD practical models.

1) UNESCO school Geopark ESD model
2) Elementary and middle school Geopark ESD model
3) High school Geopark ESD model
4) Museum Geopark ESD model
5) International Geopark ESD model

[O-08] How to make the image of the earth's phenomenon to the general people in the Geopark

convener:Noritaka Matsubara(Graduate School of Regional Resource Management, University of Hyogo), Yayoi ICHIHASHI(Sado Island Geopark Promotion Office), Hokuto Obara(Mine-Akiyoshidai Karst Plateau Geopark Promotion Council), Marekazu OHNO(Unzen Volcanic Area Geopark Promotion Office)

unesco global geoparks give international recognition for sites that promote the importance and significance of protecting the Earth's geodiversity through actively engaging with the local communities. in order for the general people to understand the earth's activity, it is necessary to imagine the phenomenon of the earth. in this session, we discuss about how to make the image of the earth's phenomenon to the general people in the Geopark.

1. Mikasa Geopark Promotion council, 2. Regional Development and Geopark Promotion Division, Mikasa City Office

Mikasa Geopark, located in the center of Hokkaido, joined the Japanese Geopark Network (JGN) in 2013.

Since joining JGN, Mikasa Geopark has focused its efforts on carrying out various experience-based GeoTours.

In recent years, the number of kindergarten and pre-k participants has risen sharply. Mikasa Geopark is successfully achieving its goal of merging geology, and people in a way that appeals to all ages.

The information about GeoTours that appears in this announcement was attained via surveys filled out by participants. The information and the survey results gathered during GeoTour show annual changes across a variety of areas such as participant ages and the number of repeat visitors. Based on these results, we will be conducting further analyses to determine how to improve GeoTours in a way that utilizes of regional history, topography, and the needs of the Geopark as a whole. Going forward, we will be investigating regional opportunities for self-promotion and new activities at the Geopark.

Strategy for revaluation and promotion of Toya-Usu UNESCO Global Geopark through SDGs

*Nire Kagaya[1]

1. Toya-Usu UNESCO Global Geopark Council

Toya-Usu UNESCO Global Geopark is located in the southwestern part of Hokkaido. The whole area of Date City, Toyoura Town, Sobetsu Town and Toyako Town is included in the geopark area. In the area, we have the following program which corresponds to SDGs (Sustainable Development Goals). In "Goal 4: Quality education", promotion of ESD (education for sustainable development) is promoted, and "Goal 11: Sustainable cities and communities" includes reductions of victims in natural disasters, regional comprehensive Disaster risk reduction is included.
The disaster prevention leader "Volcano Meister" qualified in the area has lectures of not only the guided tour of the field study to observe the craters and the disaster remains but also the eruption disaster and the life in the shelter. They also offer courses to learn volcanic activities and disasters using outdoor learning textbooks, hazard maps (volcanic disaster prevention maps), equipment that understands volcanic eruptions. In addition to this, we are implementing initiatives related to the achievement of several SDGs. Regarding these efforts, we will further enhance the contents so that more people can use it.
Geopark is a place where you can enjoy various attractions related to the activities of the earth. At the same time, it is a place where you can think about a sustainable society through concrete examples such as natural disasters. Toya-Usu UNESCO Global Geopark is an area where the practice of reducing disaster education has been continued aiming at co-existence with active volcano which continues eruptions. As a UNESCO World Geopark, we will continue to enhance regional education and to promote information dissemination for domestic and overseas as well as improve tourist and trainee acceptance. In this presentation, we will introduce specific measures for that.

Geosite Cleanup Activities Leading to Solutions for Global Environmental Problems

*Satoshi Ishikawa[1], Takuya Koike[1]

1. Shimokita geopark promotion council

The Shimokita area is surrounded by three seas: the Tsugaru Strait, the Pacific Ocean, and Mutsu Bay. The differing characteristics of these seas bring both grace and harm to the area. Various fish are caught in these seas due to differences in the geological features of their sea floors as well as their ocean currents: the Tsushima Current, which flows northward in the Sea of Japan, and the Oyashio Current, which flows southward in the Pacific Ocean. These currents also cause a variety of items to be washed ashore. Once, strange items found washed up along the beach lead to the creation of indigenous religions. Now however, the large amount of sea garbage that collects here is part of a global problem to be solved. People in Shimokita work on global environmental problems through local activities. Local citizens clean the beaches regularly, and some hosted an exhibition of art made from garbage to raise awareness about the problem of marine debris. The Shimokita Geopark Promotion Council also holds advertising campaigns and collaborative events to increase local interest and participation. These activities have increased awareness of both global environmental problems as well as one of the Sustainable Development Goals (SDG), ” Life Below Water.” The promotion of Shimokita Geopark's theme, “Living with Oceans on the Axe-shaped Land,” by the activities of local citizens has inspired other Geoparks to address marine environmental problems and work toward solving them.

Inspiring geosites and not-inspiring geosites: Case study of the Oga Peninsula-Ogata Geopark

*Norihito Kawamura[1]

1. Faculty of Education and Human Studies, Akita University

The speaker analyzed protocols spoken by the trainee for the Geopark guide in Oga Peninsula –Ogata Geopark. In the question and answer sessions during the training program, response types shown by the trainees are classified into two types; getting knowledge type and no response type. At the geosites showing only something, e.g. fossils, the trainees would ask about something. Hence, the learners show almost nothing at the geosites requiring some cognition to understand. Finally, the speaker insists that geopark guides should choice better instructional method, depending on the visitors' readiness regarding geoscience concepts.

Keywords: geocognition, geopark guide

Are habitats such as fumaroles or areas with heavy snowfall suitable for organisms living in Yuzawa Geopark? Considering the efficacy of the Geopark Guides with a focus on Yamatanukiran and snow camellia.

*Haruki Takayanagi[1]

1. Yuzawa Geopark Promotion Council

Outline
The biodiversity of Yuzawa Geopark is derived from its unique geodiversity, which includes abundant geothermal activity and heavy snowfall. For example, almost no organisms can persist in the vicinity of the Kawaragejigoku-fumarole, which is a geoformation formed by geothermal activity, snow, and rain water, due to the effect of hydrogen sulfide gas. One exception is the dominant and rare species Yamatanukiran (*Carex angustisquama*). The heavy snowfall in the geopark affects the distribution of snow camellia (*Camellia rusticana*), which has supple branches than can withstand heavy snows. In general, Yamatanukiran and snow camellia are found in acidic soils, such as those located near fumaroles (Tsujimura 1982), or along the land of the Japan Sea side (Sakai 1977). The distributions of these two species reflect key characteristics of this unique region.
Typically, two primary reasons are cited for the observed distributions of these two species: 1) that these species merely prefer these environments and/or 2) that their growth is adapted only to this environment. However, we suspect that such explanations are flawed and/or lack a solid foundation. At first glance, the growth of the two species appears to be adequate at their current locations. Neither species requires the existence of fumaroles or heavy snow, given that Yamatanukiran thrives in agricultural soils (Yuzawa Municipal Sukawa Junior High School, 2011) and that snow camellia is bred at botanical gardens on the Pacific side of Japan (e.g., Koishikawa Botanical Garden, 2019). Yuzawa Municipal Sukawa Junior High School (2011) suggested that the growth rate of Yamatanukiran improves as pH approaches neutrality, and as the distance between individual plants and fumaroles increases. In other words, the influence of soil acidification near fumaroles does not promote the growth of Yamatanukiran but instead inhibits it. Therefore, the fumarole has an overall negative effect on the success of Yamatanukiran. Regarding snow camellia, this species almost certainly experiences damage from avalanches or heavy snow. Based on the above information, we concluded that the restricted distributions of these two species represent their response to strong negative effects rather than being a consequence of fumarole and heavy snowfall environments.
Clearly, in the geopark, as-yet-unknown factors have relegated the two species to inadequate environments.
We refer to plausible reproductive interference [interspecific interactions between closely related species (Takakura and Nishida 2018), e.g., *C. angustisquama* with the widely distributed species, *Carex podogyna* (Fujiwara1997); and *C. rusticana* with a species found along the land of Pacific side of Japan, *Camellia japonica* (Sakai1977)] as the primary factor limiting the biodistribution of the two species, as well as to problems with the academic credibility of the Geopark Guides.

The evaluation of geosites in Sanriku Geopark

*Sho Nagata[1], Hideo Takagi[2]

1. Waseda University, 2. Department of Earth Science, Faculty of Education and Integrated Arts and Sciences, Waseda University

The Sanriku Geopark is the largest national geopark in Japan and involves geodiversity and also remains of repeated Tsunami disasters. It was established in 2013 after the big Tsunami disaster in March 2011. Its geopark status was extended after the review in 2017, however, the result was "yellow card" (next requalification within 2 years), therefore the next review will be scheduled in 2019. The purpose of this study is to evaluate geosites selected from the perspective of various values, highlight their advantages and issues to be considered, and finally contribute to the management of the Sanriku Geopark through presenting this study. In order to attain this purpose, research has been conducted for 65 geosites from 48 areas (previous geosites). They are assessed from the perspective of six main values; educational value, scientific value, tourism value, safety and accessibility, conservation and site sustainability, and value of tourism information (Suzuki and Takagi, 2017). After showing advantage and issues to be considered for each geosites, this study lists up various problems to be considered and presents ways to make the Sanriku Geopark more attractive for many tourists.

The nature experience program created by Geopark and National Youth Outdoor Learning Center

*Takuya Harada[1], Mizuki Kobayashi[1], Ken-ichi Yamada[2], Akiyoshi Adachi[2]

1. Mt. Kurikoma Area Geopark Promotion Committee, 2. National Hanayama Youth Outdoor Learning Center

The program called “*Children’s Environment Exploration Corps*” gets to experience nature and aims to promote environmental education. Currently, under the cooperation Mt. Kurikoma Area Geopark and Sanriku Geopark, we are developing content that aims at various ways of enjoying nature and their understanding. In this report, we will introduce the contents and outcomes of 4 activities held since 2017.

In the Sanriku edition, we learned the features and difference of nature and culture of the sea and the land through on-site inspection and experience activities.

In the Mt. Kurikoma Area edition, we learned about various nature and culture spreading on the Mt. Kurikoma Area Geopark through various experience activities.

With the involvement of geoparks, we were able to incorporate new perspectives such as knowledge of nature science and connection with nature and life in activity. Also, children who participated in this program learned new perspectives on nature and how to enjoy them, leading to deepening their interest in nature.

A review of geosites in the Bandaisan Geopark

*Yojiro Taketani[1], Hiroshi Sato[2], Makoto Hasuoka[1]

1. Bandaisan Geopark Council, 2. Mt. Bandai Museum

It has been 7 years since the Bandaisan Geopark was designated as Japan Geopark. We are currently reviewing whether existing geosites in the area are appropriate for the geopark and trying to discover new geosites with geo-guides. Based on the results, we plan to add and remove the public geosites, to progress sustainable conservation of important geosites and to develop geo-tours with new themes.
The geosites of the Bandaisan Geopark have been selected based on the main theme of the geopark, "To deepen understanding of the birth and transition of the Bandai Volcano, in particular, the large-scale changes in the landform and natural environment due to collapses of the mountain body and debris avalanches and to learn about the influence of Mt. Bandai on people's lives and history and formation of the unique culture".
The Oshio area of Kitashiobara-mura in the northwestern part of the Bandaisan Geopark is mainly composed of the Miocene Green Tuff in the Neogene Period and has important outcrops for understanding the geological history of the period. But, because the geology is not directly related to the formation or eruptive activity of the Bandai Volcano, the area has been excluded from geosites and geo-tours in the geopark.
However, studying the geological history of the Neogene Formation, which forms the basis of the Quaternary volcanoes, provides an important opportunity to understand the plate movements, from the birth of Japan Sea through the uplift of the earth to the formation of Quaternary volcanoes. In addition, there is the Oshio hot spring in the Oshio area, which is visited by many tourists. Salt purified from the hot spring water was an important local resource supplied to the Aizu clan in the Edo period and is even now sold as "mountain salt". The "mountain salt" originates in the seawater of the Green Tuff era, and the role which the heritage of the earth achieved in the history and industry of the region can be shown through a geo-tour. For these reasons, the establishment of new geosites in the Oshio area can be attractive and significant for the geopark.
We will attempt a tour around the newly selected geosites in the Oshio area as the "Geology Day Tour" in 2019 and examine the effects and significance of the tour. Based on the results, we hope to provide a geo-tour with the story for visitors.

Receiving a Yellow Card: Efforts and Future Actions of Sado Island Geopark

*Yayoi ICHIHASHI[1]

1. Sado Islanad Geopark Promotion Office

In Autumn 2017, Sado Island Geopark was re-examined by JGC and received a yellow card, requiring necessary action to be taken within a two-year period to qualify as a geopark.
I will state the changes in efforts currently underway and initiatives which Sado Island Geopark envisages to take in the near future.

Method for resetting geosites and their use in Sado Island Geopark

*Takeyoshi SADAKANE[1], Yayoi ICHIHASHI[1], Mituhisa AIDA[1]

1. Sado Island Geopark Promotion Office

In recent years, in geoparks in Japan, a definite policy for the classification and definition of sites has been announced by the Japan Geopark Committee.In Sado Island Geopark, all the places of interest have so far been identified with the term ‘geo point’. On this point, in the evaluation report of Sado Island Geopark of 2017, it was pointed out that it is necessary to reclassify all 237 geo points into the geological sites, natural (ecological) sites and cultural sites, as advocated by the UNESCO Global Geoparks.
Based on this recommendation, we created a ‘comprehensive geosite setting plan’ which contains all criteria and procedures such as how to reclassify the geo points into geosites. We are now working on resetting the 237 geo points as geosites.

Two criteria were established in this above-mentioned plan in order to reset geo points as geosites.
The first criterion is for selecting geosites with geoscientific value from geo points, which include sites which also have natural (ecological) and cultural value besides geological value.
The second criterion is whether selected geosites are suitable for actual utilization. Regarding this actual utilization, we established three categories which are ‘for research’, ‘for learning’ and ‘for general purposes (tourism)’ to classify geosites.
Among the selected geosites, those that fit into all three categories will be introduced on our website and in the brochure, and will also be used for sightseeing.

In this presentation, we will describe the geosite resetting method in Sado Island Geopark, introduce the geosites finally chosen, and discuss the utilization of geosites and the challenges that arise from resetting them.

Look back on the 10 years at the statistical data of the Itoigawa UNESCO Global Geopark

*Takahiko Ogawara[1], Ko Takenouchi[1], Yousuke Ibaraki[1], Takeo Kobayashi[2]

1. Fossa Magna Museum, 2. Itoigawa Geopark Promotion Office

Itoigawa was designated a Global Geopark in August 2009 and continues activities as the Itoigawa UNESCO Global Geopark today. This paper is a retrospective of the past 10 years of the Itoigawa Geopark, through analysis of statistical data related to tourist sites and geopark activities.

Itoigawa City first implemented the “Fossa Magna and Regional Development Plan” in 1987 to make use of the region’s geological and topographical heritage for tourist promotion. Itoigawa City’s tourism averaged about 3 million visitors per year between 1997 and 2001, but began a downward trend starting in 2002, decreasing further following the Chuetsu Earthquake (2004) and Chuetsu Oki Earthquake (2007) to only 1.85 million visitors in 2007 (Fig 1). Itoigawa was then recognized as a Japanese Geopark in 2008 and a Global Geopark in 2009, which saw a stop in tourism decline. Coinciding with the opening of the Hokuriku Shinkansen, Itoigawa saw 2.49 million visitors in 2015.

The Fossa Magna Museum is Itoigawa Geopark’s central facility. On its opening year in 1994, the museum saw 95,705 visitors, but this had over halved to 40,683 visitors in 2007 (Fig 2). This can be seen to be a result of not only disasters, but also because the museum’s exhibits had never been updated. Following Geopark certification, the museum saw an increase to nearly 60,000 annual visitors and, following the opening of the Hokuriku Shinkansen and a complete renovation of the museum’s exhibits, the museum saw a record-breaking 101,725 visitors in 2015.

Takanami-no-ike Pond is part of the tourism course which visits the Kotakigawa Jade Gorge, one of Itoigawa’s jade producing gorges and Itoigawa’s representative geosite. After Global Geopark certification in 2009, an increase in bus tours saw a peak of 28,940 visitors in 2012. However, bus tours continue to decrease, with only 17,720 visitors in 2014. There is no regular public transportation to Takanami-no-Ike Pond, so the opening of the Hokuriku Shinkansen had no effect on these numbers, and 2017 saw a continued downward trend with only 14,610 visitors.

Itoigawa Geopark formed the Geopark Tourist Guide Society in 2010. During this first year, the guides led 97 tours of 1770 people. The Hokuriku Shinkansen has increased demand for tours and following the Itoigawa City Station North Fire of 2016, tours of the affected areas are also in demand. In 2017, there were 147 tours of 3,645 people recorded.

The Itoigawa Geopark Certification Exam started in 2009 as a ‘gotochi kentei’ regional certification exam. Such exams are popular in Japan to promote study of local culture and history. The first year, which coincided with Global Geopark Certification, saw 464 testees (Fig 3). Itoigawa Geopark and Hong Kong Geopark share a sister geopark relationship and since 2011 have conducted student exchange programs. Itoigawa Geopark requires that participants pass the first level of Itoigawa Geopark Certifications. For this reason, the number of primary school students taking the test increased from 20 in the first year to 86 in 2011.

Recently, foreign tourism to Japan has been increasing dramatically, and Itoigawa is no exception. 2013

©2019. Japan Geoscience Union. All Right Reserved.

saw only 154 foreign visitors staying in Itoigawa hotels (Fig 4), but since Geoparks became an official UNESCO Program (2015) and the through promotional efforts including the Itoigawa Seafood Shuttle Bus (2015), these have increased to 2,662 visitors in 2017, an increase even more dramatic than that of nearby cities such as Hakuba.
The Geopark Activities have seen an increase in visitors to the Fossa Magna Museum and foreign visitors, but regions of the Geopark that lack public transportation infrastructure like Takanami-no-Ike Pond continue to see a noteworthy decrease in yearly visitors. Furthermore, projects such as the Hokuriku Shinkansen and Geopark Certification Exam have significant effects, but these effects diminish over time. Further polishing of the region’ s attractiveness and development of new programs and activities are essential.

Application of terrain representation in Geosite - Case study in North Ibaraki Geopark Project -

*Go Ishikawa[1], Keiko SUZUKI[1], Mamoru Koarai[2], Rika Imaizumi[3], Naoki Takeda[4]

1. Tokyo Map Research Inc., 2. College of Science, Ibaraki University, 3. Aero Asahi Corp., 4. Association for Promotion of North Ibaraki Geopark Project

Geosites feature the sights of the geopark, which designate sites of spectacular geological feature. It is important to make it have corrected geological information and easily to understand. Most geopark use flyers, but only a few have topographic map.
In the Japanese Geoparks re-certification activity, North Ibaraki Geopark Project has the Geosite pamphlet with map illustration. It's customized and approachable but hard to match with the on-site. To design the new pamphlet, we used **New Relief Map created with Multiple Light Source (DecoBocoChizu Premium)** based on the 5m DEM (Digital Elevation Model). The new Geosite maps show more reality and much easier to recognize the geological feature such as marine terrace, river terrace and fault. Furthermore, overlapping the shadow graph and geologic graph can get the geographic structures.

*: This research is supported by Ibaraki University Geological Information Utilizing Project and KAKENHI (16K01213).

Evaluation and utilization of 34 geosites in Geopark Chichibu

*Hideo Takagi[1], Satomi Hirose[2]

1. Department of Earth Science, Faculty of Education and Integrated Arts and Sciences, Waseda University, 2. School of Education, Waseda University

The Geopark Chichibu was established in 2011 as a national geopark of Japan, and its geopark status was extended after the review in 2015. Next review is scheduled to be conducted in 2019. Geopark Chichibu is claimed to be the birthplace of modern Japanese geology due to its geodiversity since the Meiji era. The purpose of this study is to evaluate 34 new geosites (Inoue and Tomita, 2018) of the Geopark Chichibu from the perspective of various values, highlight their advantages and issues to be considered, and finally contribute to the management of the Geopark Chichibu through presenting this study. In order to attain the above purpose, research has been conducted for 34 (this number is important because of the 34 pilgrimage sites (temples) in Chichibu) new geosites proposed in July, 2018, and additional 5 possible geosites. Total 39 geosite candidates are assessed from the perspective of six main values; educational value, scientific value, tourism value, safety and accessibility, conservation and site sustainability, and value of tourism information (Suzuki and Takagi, 2017). After showing advantage and issues to be considered for each geosites, this study proposes a partial change of new geosite from the perspective of geotourism as well as ways to make the Geopark Chichibu more attractive for many tourists.

Aiming for Further Development in Hakone Geopark

Ichiro Murayama[1], Shinobu Katano[1], *Yusuke Okutsu[1]

1. Hakone Geopark Promotion Council

Hakone Geopark consists of 2 cities and 3 towns, Hakone Town, Odawara City, Manazuru Town, Yugawara Town and Minamiashigara City, were at first, consisted by 1 city and 3 towns and were authorized by Japanese Geoparks in 2012. After the authorization, there was an increasing momentum to join us in Minamiashigara City, and in 2015, MInamiashigara City, Minamiashigara-Geoguide Association and other related company joined the council. With this new material, we passed the new authorized examination in 2016.

Due to this addition, 8 new geosites were added. For example, at Mt. Yaguratake, a very new rock formation in the world, you can experience the dynamic earth movements of the Ashigara group, which joined the mainland by the collision between the plates. Also Ashigara road which has a history that is older than Tokaido has been added.
Theme of the Hakone Geopark can be understood by studying the geosites. it produced further depth and expanse in Hakone Geopark’ s theme and story.

Citizen Science Forecast and Evaluate Ship and Airplane Operation Success to a Remote Oceanic Island: a case study for Izu-oshima

Kazuhiro Nakamura[2], Juri Hashimoto[1], *Rika Usui[1], Yuichiro Teramoto[1], Kana Nishitani[3]

1. Izu Oshima Geopark Promotion Committee, 2. Former Tokyo Metropolitan Oshima High School Teacher, 3. Corp. Global Sport Club

Weather outlook and forecast of ship and airplane operation are invaluable information for daily life in remote islands, but also for tourism and business on those islands. In order to help a local island community, a web site was opened in 2004 to provide an outlook for week-term ship and airplane operation between Tokyo and Izu-oshima and annual report evaluating outlook success ratio for better understandings of nature and climate of Izu-oshima. In collaboration with Izu-shima Geopark, we analyze and discuss a long-term outlook success from 2004 to 2018 for promoting and implementing geo- and eco- tour operation in good, convenient and comfortable seasons of the year.

Minami-Alps Geopark Development of programs for education and spread activities

*Eri Ozawa[1], Takahiro Kitahara[1], Airi Karasawa[1]

1. Minami-Alps MTL area Geopark Council

In order to know and enjoy the Geopark more deeply, it is effective to listen to the story of the guide by actually looking at the site. However, I think that people who do not know Geopark suddenly participate in geotour etc. are high hurdles.
So, at the Minami-Alps Geopark, we developed a program that allows you to feel free to participate as a catalyst for getting to know the Geopark. And we have been using it in workshop at community center and events. We are also discussing prior learning of educational tour intended for elementary school students' and utilization as rainy day program.
In this presentation, we introduce the mainly about newly developed program and the situation of the use.

Present situation and issues of the Tateyama Kurobe Geopark after Yellow card

*Yuta Yamaoka[1], Akira Takeuchi[1], Hajime Iida[2], Kiyoshi Imai[1], Kazuo Kaneko[1], Yukimitsu Shimura[1], Osamu Inamura[3], Tohru Ikurumi[4], Kiichi Imahori[1], Satoshi Kotani[1]

1. Tateyama Kurobe Geopark Society, 2. Tateyama Caldera Sabo Museum, 3. Uozu Aquarium, 4. Lifelong Learning Division, The Board of Education, Kurobe City

Tateyama Kurobe Geopark is a Japanese Geopark composed of 9 municipalities in eastern Toyama prefecture and a part of Toyama bay. The features of our Geopark are 4000 meters difference in elevation from the top of Tateyama mountain range with 3000 meters above sea level to the Toyama Bay with depth 1000 meters. Our Geopark was proposed by mainly researchers. The management organization was established by local businesspersons and supported by local governments. Therefore, it is a unique Geopark in Japan that is operated by NGO. Tateyama Kurobe Geopark is operated in cooperation with municipalities, universities and museums. In recent years, more local people, companies and private groups are active about Geopark. The role of Geopark in the region is gradually increasing. However, the result of the Japanese Geoparks revalidation process in 2018 was Yellow card (conditions attached). The main indications are four points as follows (1) difference in recognition about Geopark among participant in Geopark activities, (2) conservation plan and conservation activities are unclear, (3) lack of visibility in major tourist routes and few Geopark signs, (4) difficult explanation. We make and fulfill an improvement plan getting advices from the Japanese Geopark Committee. In this paper, we report activities and issues of the Tateyama Kurobe Geopark considering the results of the revalidation process.

Keywords: Tateyama Kurobe Geopark, Geopark, Conservation, Tourism, Education

1 year survey conducted by Hakusan Tedorigawa Geopark regarding number of pamphlets taken from Roadside station Shirayamasan

*Nakano Kaori[1], Tsuyoshi Hibino[1], Ryoichi Onishi[1]

1. Hakusan Tedorigawa Geopark Promotion Council

Tourism is one of the very important initiatives being focused on by the geopark. Tourism at its core can be thought of as many people visiting a certain area. Also pamphlets exist as a tool able to increase the number of visitors. In recent years the principal means of sharing information has become electronic devices, however conveying information through printed mediums is still effective.
At the Hakusan Tedorigawa Geopark Promotion Council, in order to understand which size and design of pamphlet will catch the customer’ s eye, in January 2018 we started monitoring the number of national geopark regional pamphlets being taken from the roadside station Shirayamasan. When we make future pamphlets this information should allow us to create a pamphlet which both entices customers to take the pamphlet home as well convey the charms of the region.
The roadside station Shirayamasan is located alongside Japan National Route 157, connecting the flatland with the Mt. Hakusan foothills. This roadside station is the entrance gate to the route leading from Ishikawa Prefecture, through the foothills of Mt. Hakusan and onto Fukui and Gifu Prefectures. There is no public transportation such as trains or buses assigned to this route and the roadside station does not currently offer popular services such as restaurants and souvenir shops. Due to this the vast majority of users come by car or bicycle with their main purpose being a brief rest. However, we do not have any information regarding the age, gender, occupation, social status or reason for taking the pamphlets home.
As a result of the monitoring, there was no particular connection found between the number of pamphlets taken last month and the design of the pamphlets or their positioning within the roadside station. However what we did notice was that the season strongly influences the number of people who take pamphlets home. The period over GW (Golden Week –series of national holidays in May), the summer holiday period as well as the popular autumn leaves period saw an increase in the number of pamphlets being taken home. This concludes my report after one year of monitoring the number of pamphlets being taken from the roadside station Shirayamasan.

Promotion of the earth science utilizing the Geopark “Making the stone specimen in Hakusan Tedorigawa Japanese Geopark”

*Yuya Kitoh[1], Satoshi Hirai[1], Kiyofumi Tamamura[1], Tsuyoshi Hibino[2], Kaori Nakano[2], Tomoaki Morishita[3], Yoshihiro Hiramatsu[3], Maki Hamada[3]

1. Ishikawa Geological Survey Association, 2. Hakusan Tedorigawa Geopark Promotion Council, 3. Kanazawa University

In recent years, due to the declining birthrate, aging of society, and fewer interests of science, new leaders in the field of the natural science has been decreasing. On the other hand, extreme weather with severe damages has increased in recent years. Therefore, it is necessary to develop human resources not only of researchers and engineers with interests of natural science but also of citizens with understanding and knowledge of natural environment.
The Ishikawa Geological Survey Association, the Hakusan Tedorigawa Geopark Promotion Council, and Kanazawa University have organized the event entitled “Making the stone specimen in Hakusan Tedorigawa Japanese Geopark" for elementary school students and their parents since 2017. This event utilizes a field of the Geopark, aiming to make children, as the next generation, have interests in nature and natural science through activities in the field.
On Saturday 20 October 2018, the 35 pairs of children over fourth grade in elementary school and their parents selected by lottery participated joined the event. After learning stones, formation processes of those and how to distinguish them, they collected stones and made the stone specimens with Japanese and foreign students and others using hammers, loupes, and medicinal liquids. From the results of the questionnaire answered by the children after the event, we recognize that the children showed the high curiosity of the stone and the nature, experienced the difficulty and the pleasure of learning the nature. Based on the questionnaire, we verify the learning level of the contents and the explanation of the activity and reflect it in future activities. We are planning to continue this event, as well as trying new attempts to tackle the curiosity of children.

School Trip from Hong Kong to Dinosaur Valley Fukui Katsuyama Geopark : Challenges and Prospects

*Sumiaki Machi[1]

1. Dinosaur Valley Fukui Katsuyama Geopark Promotion Council

Dinosaur Valley Fukui Katsuyama Geopark is located at mountainous region, Fukui Prefecture, Japan. As you can understand from the name of geopark, the region is famous for dinosaur fossils excavation. 5 named dinosaurs have been discovered from Tetori group (early Cretaceous) so far (Azuma & Currie, 2000; Kobayashi & Azuma, 2003; Azuma & Shibata, 2010; Shibata & Azuma, 2015; Azuma et al., 2016). And there are various beautiful landscapes, formed by old volcanic activities and river flows (Kuzuryu rive and its branches).
Fukui Prefectural Dinosaur Museum is very famous in Japan and probably there are many visitors for school trip every year. However, most of them visit there and leave Katsuyama. This has been an old problem of Katsuyama city since the museum was established. We accepted school trip from Hong Kong Chinese Women's Club Fung Yiu King Middle School. We report challenges and prospects about accepting the students trip and guiding them.

Outline of the activities of the Kumano Kodo Ohechi Rangers

*Keishi Jimbo[1]

1. Nanki Kumano Geopark Guide Club

Outline of the activities of the Kumano Kodo Ohechi Rangers

In this poster we will report about the activities of the Kumano Kodo Ohechi Rangers and the relationship between the Nanki Kumano geopark.

The Kumano Kodo Ohechi Rangers was formed in 2004.

The Ohechi route of Kumano Kodo has few flatlands around the coast.

As a result, due to modern traffic improvement many roads of the Ohechi route were duplicated, traces of which were lost.

Volunteers to conduct the exploratory activities of the Ohechi route have gathered, and the Kumano Kodo OhechiRangers is formed.

Search activity is to listen from old people and learn from old maps, investigate the route, rediscover the way.

The exploring activity of the Kumano Kodo Ohechi Rangers revealed about 120 km of the large side route from Tanabe City to Nachikatsura Town, and in 2017 the addition of some part of Ohechito the World Cultural Heritage "Sacred Sites and Pilgrimage Routes in the Kii Mountain Range" was confirmed.

In the vicinity of the Ohechi Route, many of the members of the Kumano Kodo Ohechi Rangers where the major geosites of the Nanki Kumano Geopark are dotted have completed the geopark guide training course and are conducting guide activities.

Also, it is also an area of Yoshino Kumano National Park, and some have registered as a natural park instructor.

Members are actively engaged in the creation of illustration maps, the setting of signposts, the implementation of walking in cooperation with tourism associations and travel agencies, and the conservation activities at local school classes.

I will examine what kind of activities are needed in the future.

Diversity of Nature Activities Related Geodiversity

maeda atsushi[2], Ministry of the Environment Kinki Regional Environment Office, *Suzuka Koriyama[1], Noritaka Matsubara[3]

1. Sanin Kaigan Geopark Promotion Council, 2. SGAR, 3. Graduate School of Regional Resource Management, University of Hyogo

San’in Kaigan UNESCO Global Geopark is the area stretching from Kyotango City in Kyoto Prefecture; Toyooka City, Kami Town and Shin’onsen Town in Hyogo Prefecture; and Iwami Town and northern part of Tottori City in Tottori Prefecture.

Geopark theme is ‘Geological features, natural environment, people’s lives and the formation of the Sea of Japan.’

There are many organizations which conduct outdoor activities in San’in Kaigan Geopark area. More than 20 bodies in 3 prefectures offer variety of activity programs, making good use of the geological characteristics of the area including the seas (sea kayaking, snorkeling, diving), mountains (mountainous area cycling, treeing), snows (skiing, showshoe), sand dunes (sand board) and rocks (lava trekking).

Each activities need suitable geological features. Diverse activities mean that there are diverse geological features in San’in Kaigan Geopark. In this presentation, I’ll talk about the relationships between variety of activities and the geological features in San’in Kaigan Geopark.

Understanding of regional scientific importance by local Residents –In case of San’ in Kaigan UNESCO Global Geopark

*Noritaka Matsubara[1]

1. Graduate School of Regional Resource Management, University of Hyogo

Regional self-support is very important things in local community. And one of the important roles of geopark activities is resident understanding of the regional scientific importance and features. UNESCO Global Geoparks give international recognition for sites that promote the importance and significance of protecting the Earth's geodiversity through actively engaging with the local communities. For this purpose, it is important that local residents participate in geopark activities positively. However, it is difficult for local residents to understand regional scientific importance and local geological phenomena.
So, we started “geo-communication” with local people. For example, we created “Geopark foot pass” and “geopark walking map” in cooperation with local people, to promote better understanding and communication with local people, government and academia involved in geopark activities. Local residents could understand geological features through this activity. In this poster, I would like to introduce our “geo-communication” activities.

Keywords: geopark, geo-communication, earth's phenomenon

Stones forming tombs of feudal lords during Edo period in some geoparks located along the coast of the Sea of Japan

*Tohru Sakiyama[1]

1. Graduate School of Regional Resource Management, University of Hyogo

San’in Kaigan Geopark, Shimane Peninsula and Shinjiko Nakaumi estuary Geopark, and Hagi Geopark are located along the coastal area of Sea of Japan and each has feudal load tombs of the generations. I show the characteristics and speculate the production area of the stones, in the basis of petrography and magnetic susceptibility. Grave site of Ikeda family who are feudal loads of Tottori Domain situate in the San’in Kaigan UNESCO Global Geopark. Most of the tombs in the grave site are made by Mochigase Granite with low magnetic susceptibility located in the south of Tottori City. Stones of tombs in the grave site of Matsudaira family who are feudal loads of Matsu Domain in the Shimane Penninsula and Shinjiko Nakaumi estuary Geopark are clearly divided to older and younger tombs. Former is made of coarse-grained biotite granite with low magnetic susceptibility and latter is made of medium-grained hornblende biotite granodiorite with high magnetic susceptibility. Former ones may be quarried from Seto Inland Sea area and latter ones may be the granite from local area in San’in Zone. Granitic tombs in the Hagi Geopark have also similar tendency.

Keywords: granite, geopark, stone material, magnetic susceptibility

Science Design to make the earth attractive

*Miho Sasaoka[1], Mine-Akiyoshidai Geopark[2]

1. Kochi University / SASAMI-GEO-SCIENCE, Inc., 2. Mine-Akiyoshidai Karst Plateau Geopark

Geoparks goes beyond just the science framework. I think that how geoparks are expected to show relationship earth and people's livelihood of the future and the past in each area.

In order to attract the public, it will be necessary to establish diverse entrances to diverse people.

In this presentation, from the viewpoint of science design, I would like to have the opportunity to think about the future activities of Geopark together, and introducing the completely new efforts I have been doing to the public in general.

Keywords: science design, diverse perspectives

‘Be one with the earth; help each other’: the Geopark activities of Mine-Akiyoshidai Karst Plateau Geopark

*Hokuto Obara[1], Tomoko Muratani[1], Tristan Gray[1], Kazuhiro Yuhora[2], Koji Wakita[3]

1. Mine-Akiyoshidai Karst Plateau Geopark Promotion Council, 2. Tottori University of Environmental Studies, 3. Yamaguchi University

In Mine-Akiyoshidai Karst Plateau Geopark, our every activity is conducted under the concept of ‘be one with the earth; help each other’. Through the conservation and utilisation of the earth’s geological heritage, these activities work towards the realisation of the Sustainable Development Goals, which exist for the purpose of achieving UNESCO’s core principle of building peace in the hearts of men and women. This presentation will explain what this concept means in reality, and will introduce the activities already put into practice and plans to be executed in the future in Mine-Akiyoshidai Karst Plateau Geopark, as we look towards achieving UNESCO Global Geopark status.

Highlights of Suzaki Coast, Shikoku Seiyo Geopark - Kurosegawa Tectonic Zone, geologic strata of 400 million years ago -

*Chisato Nakamura[1], Tomohiro Tsuji[2], Shikoku Seiyo Geopark Promotion Council -[3]

1. NAIBA Co. Ltd., 2. Shikoku Research Institute INC., 3. Seiyo City

Kurosegawa tectonic zone is composed mainly of rocks of the continental crust and strata deposited in shallow seas around the continent. It has been assumed that the fragments which has been divided from the supercontinent Pangea near the equator collided with another continent. Suzaki coast is one of the main geological sites of Shikoku Seiyo Geopark in Ehime Prefecture. It is the only location in Japan where the strata of acidic tuff belong to the Kurosegawa tectonic zone crops out continuously for 300 m. The acidic tuff was inclined vertically, creating fantastic landscape. In addition, there are outcrops of tuff breccia and intrusive rocks which are closely related with the acidic tuff. We introduce the highlights of Suzaki coast and explain how these strata were formed.

Acidic tuff: The acidic tuff layer constituted of alternation of muddy and sandy beds. Various sedimentary structures, such as grading, load structure and convolution, those are characteristic in turbidites were formed in the acidic tuff. As showed by Makisaka and Kato (1983), upper direction of the strata faces to the northeast. The acidic tuff includes coarse tephric particles of feldspar, suggesting that it deposited the sea close to continental or volcanic arc. The acidic tuff deposit of 300 m-thick suggests that there was stably volcanic activity over a prolonged period. It is implied that the sedimentary environment of the strata was the sea close to the volcano of the continent. The acidic tuff yields well-preserved radiolarian fossils. Further identification of the radiolarian fossils could contribute to estimate the ages of the sedimentation and the volcanic activity.

Tuff breccia: Tuff breccia including coral fossils overlies unconformably on the acidic tuff with the obvious boundary. The tuff breccia is poorly sorted, and reverse-grading is observed at the bottom of the tuff breccia. Those findings indicate that it is a debris flow deposit formed by the sector collapse or the submarine sliding, and it is presumed that they flowed into the deeper ocean floor.

Intrusive rock: We can see the intrusive rocks at several localities. They cut lamination of the tuff layer and are fine-grained and has massive and homogeneous texture. Since the existence of intrusive rock implies that volcanic activity took place at the site where the acidic tuff deposited, more detailed work is necessary.

On the Suzaki Coast, we can see how the acidic tuff accumulated in the sea close to the continental or the volcanic arc. The Suzaki coast is an academically important place to elucidate the geological history of the Japanese islands and it is also an attractive geological site for the ordinary visitors. Finally, we also introduce how to tour around geological spots in Suzaki coast on the presentation.

Keywords: Shikoku Seiyo Geopark, Kurosegawa tectonic zone, acidic tuff, intrusive rock, debris flow deposit, radiolarian fossil

The Efforts of the Shikoku Seiyo Geopark after the revalidation from JGN council and the 2018 Japan Floods.

*Takumi Sakakiyama[1], Fumito Doi[1], Koshiro Utsunomiya[1], Tsukasa Takahashi[1]

1. Shikoku Seiyo Geopark Promotion Council

On December 22, 2017, Japanese Geopark Network Council granted the renewal certified status to our Shikoku Seiyo Geopark for another four years. Although we were actively involved in geopark activities after getting the approval of renewal certificate, we had experience of several severe damages due to heavy rain, landslides, and floods in Seiyo City in 2018, and which caused the loss of six people’ s lives. In the Shikoku Seiyo Geopark, the five geosites were damaged among twenty-three sites. The two geosites are still in the state of restricting to the visitors to access for the entry up until now.

In order to respond to the situation, we conducted the educational programs named “Seiyo Nature and Culture College” to the people living around the areas for the awareness of their surroundings. In the programs, we conducted lectures and field trip programs with experts who are familiar with local knowledge and geography, train new courses, and teach the participants how to use the geopark. The participants in the field trips had joyful experience of watching the scenery of the areas familiar from usual as they listened to the commentaries from the experts. In cooperation with school education, we offered the school tours to affected geosites as the annual education program of learning about the geopark.

To improve the indicated matter of revalidation, we are seeking a geopark story that makes visitors interested in the last year. Not only each working committee and geoguides have shared the keywords, but also the participants in the educational programs have taken the discussions. In addition to that, our council have supported the collaborations with local industry and commerce for the preparation for the Shikoku Seiyo Geopark guidebook, establishment of promotion shops, and branding new special products. On the other hand, we also have some challenges of dealing with both disaster response and geopark promotion. For the future, we are going to share the issue in JGN and make the opportunity to learn our lands how it was formed by using new educational material of disaster prevention.

Method of enjoying relationships with the earth and culture in "the central Shikoku island".

*Azusa Tonotani[1,2], Kana Nakao[1,2], Kazuyoshi Ishii[2], Takuma Asa[3], Soichiro Sagawa[3], Kenshi Nishinari[3], Iori Yamamoto[3], Hisashi Hirao[3], Keiji Nakagawa[3]

1. Miyoshi city office, 2. Geoguides of Miyoshi city, 3. Tokushima prefectural Ikeda high school

Miyoshi city in Tokushima prefecture is called "the central Shikoku island", which consists of "Sora" and "Machi" area. In the Sora area, villages are scattered on the gentle slopes that are formed by landslides in Shikoku mountains and Sanuki mountain range, and there we can find various creative solutions for living on such landforms in agriculture, architecture and customs. On the other hand, in the Machi area people live on river terraces made by the Yoshino river or on the ground formed by activities of the Median Tectonic Line, where the shredded tabaco industry and water transportation business were prosperous utilizing the Yoshino river.
As stated above, we, Miyoshi city, who has deep relationships with the earth and culture, are promoting activities aiming for the Japanese Geopark certification. We are doing the "Geotours" as one of efforts that have tourists and local people enjoy relationships with the earth and culture.
In this presentation, we introduce four types of the Geotours; by 1) Geologist, 2) Staff in Geopark plan, 3) Geoguide, 4) High school student.

Keywords: Geotour, Median Techtonic Line

Bridge of scientific research to school education in a geopark, using a research fund of Muroto UNESCO Geopark

*Takeyuki Ueki[1]

1. Faculty of Risk and Crisis Management, Chiba Institute of Science

Activities in a geopark is composed of conservation, education and tourism, in ascending order. Scientific research is mainly related to conservation, with little contribution to school education. Drilling survey was performed on the school ground, using a research fund of Muroto UNESCO Geopark. In the field, students observed a drilling work and enjoyed small excursion around. In the laboratory, students cut a sediment core, observed facies and imagined paleoenvironment. This presentation reports a bridge of scientific research to school education in a geopark.

Keywords: bridge, scientific research, school education, research fund, drilling survey

New basic philosophy of Unzen Volcanic Area UNESCO Global Geopark made in union with local residents and government officers.

*Taku MORIMOTO[1], Marekazu OHNO[1]

1. Unzen Volcanic Area Geopark Promotion Office

1. Revision of a basic philosophy's of The Council of Unzen Volcanic Area Geopark.

The basic philosophy of Geopark is to share the vision of our area with local residents, government officers and academics.Geopark activities are to protect and prevent local resources through local sustainable development.The basic philosophy should be easy to understand and to agree for local residents.

Its philosophy was made by The Council of Unzen Volcanic Area Geopark in 2010 led by local Geopark stakeholders.But, Geopark Programme became the official programme of UNESCO in 2015 andits programme was necessary to contribute and pursue the UNESCO philosophy.

The Council of Unzen Volcanic Area Geopark formulated the new basic philosophy of Unzen Volcanic Area UNESCO Global Geopark in November in 2018 with local residents and government officers to contribute to achieve the philosophy of UNESCO Global Geopark.This is the process how our geopark made the philosophy and showed it to public.

2. The way to consider a new basic philosophy and the flow of workshop with government officers.

I started the project team, which was consisted of Unzen Vlocaninc Area UNESCO Global Geopark members and government officers such as the Ministry of the Environmentry, Nagasaki Prefecture, 3 cities of Shimabara Peninsula (Shimabara, Unzen and Minamishimabara).The project meeting was held 4 times titled "how we build Shimabara Peninsula in the future", and we share each idea by Affinity diagram with the team and group similar ideas which were shared.

As a result, the new basic philosophy was made: "Sustain our beautiful home town and local geo-heritages more and forever".

3. The new basic philosophy sent to local residents

Approximately 230 wide range of local residents including high school students joined the " Japan Geopark authorization 10th anniversary commemoration symposium of Shimabara Peninsula " and have a dialogue to review last 10 year geopark activities and about our future of Shimabara Peninsula.The opinion from participants of the symposium and from project team had in common.The new basic philosophy,as a result, became the one which reflected from local residents' opinions.The new basic philosophy was announced to local residents as declaration of the symposium at the venue.

©2019. Japan Geoscience Union. All Right Reserved.

4. Our outlook to achieve the new basic philosophy.

It is a task how we pursue the philosophy.for that, we would like to enlarge the number of our fellows towork with us to protect and prevent local resources through local sustainable development.

Evaluation of explanation panels settling at geopark's sites –case study of the explanation panel at a memorial park of houses destroyed by debris flows in Unzen Volcanic Area UNESCO Global Geopark, Japan

Sean OTA[1], Shion MORIKITA[1], Kuumu ONIDUKA[1], Tatsuya MORITA[1], Kenshin OSHIMA[1], Yui KURITA[1], Miyu KAWAZOE[1], Toshiki HIGASHIUCHI[2], Hiroaki OSAKO[2], *Marekazu OHNO[3]

1. Glocal Course, Nagasaki Prefecture Koka High School, 2. Nagasaki Prefecture Koka High School, 3. Unzen Volcanic Area Geopark Promotion Office

Introduction

Explanation panels placed at Geopark sites are advertising tools to inform local residents and tourists about the value of these sites. These panels enable people to understand how important the sites. However, if the panels only have information that isn't well known to many people, such as geology or geography, they might not be able to understand them smoothly. In order to have people with little knowledge on geology or geography know the values of those sites and have them enjoy the Geopark, it is necessary that the explanation panels are easy to read and understand. In this study, we investigated visitors' impressions on one of the panel at the Geopark's sites. Then, considering the results, we redesigned the contents of the panel and compared the visitor's impressions on it with the original one.

Methods

On August 10th and September 16th in 2018, we placed video camera at *a memorial park of houses destroyed by debris flows*, which is one of the main sites of Unzen Volcanic Area UNESCO Global Geopark, to see how much time visitors look at the explanation panel. We also looked into the visitors' gender, age, hometown, and impressions on the panel. The impressions are evaluated from 1 to 6 points on five different perspectives: total impression, pictures, contents the number of letters, and font size. As for pictures and contents, 6 points is the highest score while 1 point is the lowest. As for the number of letters and font size, 3.5 points is standard and as it gets closer to 1, it means too small or too few pictures, while as it gets closer to 6, it means too big or too many pictures. Then, based on the results, we redesigned the panel and had the same investigation on October 14th and compared the results from both studies.

Results

The number of visitors who saw the original panel was 52 out of a total of 250 visitors (about 21%). The average time they looked at the panel was 22.4 seconds. On the other hand, the number of visitors who saw the redesigned panel was 34 out of 204 visitors (about 17%). The points on impressions were as follows:

1) The original panel: total impression 4.7 / contents 4.6 / pictures 4.6 / the number of letters 4.1 / font size 3.7

2) The redesigned panel: total impression 4.6 / contents 4.8 / pictures 4.7 / the number of letters 4.0 / font size 4.0

The average time the visitors looked at the original panel was about 22 seconds and the longest one was about 63 seconds, while the average and longest times of redesigned panel were 17 seconds and 62 seconds, respectively.

©2019. Japan Geoscience Union. All Right Reserved.

Discussion

As for the font size, visitors had impressions such as “these are too many letters” or “it is difficult to decide where to start reading” on the original panel. Therefore, we decreased the number of letters and made the font larger on the redesigned one. As a result, the number of people who think the panel became easier to understand has increased. Though the evaluation of the contents improved, the reading time of the redesigned panel became shorter than that of the original one. This implies that visitors were able to finish reading it in a shorter amount of time. On the other hand, some visitors had negative impressions on the redesigned panel such as “there’s not enough information” or “it doesn’t tell information that it should.” This may be because we decreased the number of letters too much and couldn’t show the importance or the values of the sites enough.

Future prospects

Considering the results, we are going to investigate the visitors’ needs for the panel again and redesign it with necessary information to tell the values of the site. We will be able to show you the redesigned one and the visitors’ impressions on it at the conference.

ESD-SDGs Promotion Model Development utilizing Geoparks including the basic research on the contents of educational programs in Geoparks in Japan

Katsuhiko Asahi[1], Yayoi Ichihasi[1], Takahiko Ogawara[1], Shinobu Katano[1], Ken'ichi Kurihara[1], *Suzuka Koriyama[1], Takeo Kobayashi[1], kei Shimomura[1], Yusuke Suzuki[1], Ko Takenouchi[1], Tsuyoshi Hibino[1], Jun Fujishima[1], Kana Furusawa[1], Yu Horiuchi[1], Emiko Mizuno[1], Ko Miyama[1], Yuta Yamaoka[1], Tamami Yamaguchi[1], Yukiko Yamasaki[1], Ryuta Yamamoto[1], Hikaru Yokoyama[1]

1. Japanese Geoparks Network

The Japanese Geoparks Network(JGN) started a project aiming at developing a sustainable society through the debelopment and dissemination of Geopark ESD-SDGs practical model.
This project is funded by FP2018 the UNESCO activities grant of the Japanede National Commission for UNESCO. We conducted a survey of educational contents of all the Geoparks in Japan and made the foundation for utilizing these contents widely. We also conducted a survey for educational trip needs to promote edubational trips to Geoparks.
Furthermore,we started to debelop the following five Geopark ESD practical models.

1) UNESCO school Geopark ESD model
2) Elementary and middle school Geopark ESD model
3) High school Geopark ESD model
4) Museum Geopark ESD model
5) International Geopark ESD model

[P-PS04] Mars and Mars system: results from a broad spectrum of Mars studies and aspects for future missions

convener:Hideaki Miyamoto(University of Tokyo), Tomohiro Usui(Earth-Life Science Institute, Tokyo Institute of Technology), Ayako Matsuoka(Research Division for Space Plasma, Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Sushil K Atreya(University of Michigan Ann Arbor), Chairperson:Sushil Atreya

In view of unprecedented advances in our understanding of Mars, primarily due to new and ongoing observations of the planet with a number of spacecraft missions of the US, Europe and Asia, we propose a session on Mars. Mars is an object of intense scrutiny. Currently, eight spacecraft are operating at Mars, with six in orbit (Odyssey, MRO, MAVEN, Mars Express, Mangalyaan and TGO) and two on the surface (MSL-Curiosity and MER-Opportunity), the largest number ever at any given time. In addition, InSight is on track to land on Mars in November 2018, and several spacecraft are in various stages of implementation with launches scheduled for 2020 (Mars 2020, ExoMars 2020, Emirates Mars Mission Hope, Chinese Mars Mission and the Japanese Mars Terahertz Microsatellite), 2022 (ISRO's Mangalyaan 2), and 2024 (JAXA's MMX mission to explore Phobos, Deimos, and Mars). All this is a clear demonstration of public's strong fascination with and commitment to Mars exploration and the resulting scientific bonanza. Synergistic investigations with ongoing and already completed missions along with modeling studies and earth-based observations are gradually revealing the nature of Earth's most closely resembling planet that took on a different evolutionary track than our home planet. Morphology and variable phenomena seen on the surface (RSLs, e.g.) and in the atmosphere (methane) indicate that Mars is possibly currently active. Available data are providing a better understanding of Mars' present geologic and atmospheric state, climate evolution, and habitability. Thus, the scope of this session will be the recent results from a broad spectrum of Mars studies encompassing the interior, surface, atmosphere, plasma environment, and the Mars system including its two satellites. Abstracts on modelling, instrumentation and future mission plans are also encouraged.

The Mars Atmosphere and Volatile EvolutioN (MAVEN) mission has been making science observations from Mars orbit since November, 2014, with the science goal of assessing the role that loss of atmospheric gas to space has played in changing the Martian climate through time. To achieve this objective, MAVEN measures the energetic inputs to the Martian upper atmosphere from the Sun (“drivers”), the properties of the regions of the upper atmosphere from which escaping particles are drawn (“reservoirs”), and the different escape processes as they occur today (“escape”). These data, and the models used to help understand them, allow us to constrain the influence of escape on the evolution of the Martian atmosphere over time. In this presentation we will summarize the main findings of MAVEN over more than 4 years of science observations, with an emphasis on recent results released over the past year. We will then present the status and future science plans for the mission as the spacecraft’s orbit is changed to prepare for increased relay activities in the coming months and years.

From Clouds to Aurora to Atmospheric Escape: Highlights from MAVEN's Imaging UltraViolet Spectrograph

*Nicholas McCord Schneider[1], MAVEN/IUVS Science Team

1. LASP, University of Colorado Boulder

The Mars Atmosphere and Volatile EvolutioN (MAVEN) mission's Imaging Ultraviolet Spectrograph (IUVS) observes Mars in the far and mid ultraviolet (110-340 nm), investigating lower and upper atmospheric structure and indirectly probing neutral atmospheric escape. The instrument is among the most powerful spectrographs sent to another planet, with several key capabilities: separate Far-UV & Mid-UV channels for stray light control; a high-resolution echelle mode to resolve deuterium and hydrogen emission; internal instrument pointing and scanning capabilities to allow complete mapping and nearly continuous operation; and optimization for airglow studies. After four Earth years in orbit (two Mars years), IUVS has assembled a large quantity of data and provided insights on present-day processes at Mars including dayglow, nightglow, aurora, meteor showers, clouds, and solar-planetary interactions. In this presentation, we will highlight key results obtained by IUVS, including: (1) dust storm and cloud activity from a synoptic perspective; (2) a surprisingly high level of auroral activity of three types; (3) long-term tracking of seasonally-modulated escape of hydrogen. We will present an overview of these results and a discussion of their implications for understanding Mars atmospheric dynamics and evolution.

Variation in Martian Crustal Magnetic Field Cusp Topology

*Tristan David Weber[1], David Brain[1], Shaosui Xu[2], David Mitchell[2], Jasper Halekas[3]

1. University of Colorado, Boulder, 2. Space Sciences Laboratory, UC Berkeley, 3. University of Iowa, Iowa City

The Martian magnetic field environment is complex. Crustal magnetic fields interact with the incoming interplanetary magnetic field (IMF) to produce a dynamic topological system that in turn constrains the motion of charged particles. The inflow of energetic electrons and the outflow of ionospheric particles are both channeled through regions of vertically oriented field referred to as magnetic "cusps". These cusp regions are consequently host to a range of energetic processes including field-aligned currents and aurora, and may be the source of substantial quantities of ion escape at Mars.
Here we present an analysis of variability in crustal cusps, using electron pitch-angle distributions and energy distributions measured by MAVEN to study how cusp topology varies with upstream solar wind conditions. We find that increased solar wind pressure causes an increase in the spread of open cusp regions on both the dayside and nightside of the planet, and that changes in IMF direction control which cusps preferentially open to the solar wind. Finally, we then pair these results with direct measurements of particle flux to begin an analysis of energy deposition and ion outflow in cusp regions.

Institute of Geophysics and Planetary Physics, University of California, Los Angeles, Los Angeles, CA, USA, 6. Department of Physics and Astronomy, University of Iowa, Iowa City, IA, USA

Magnetic fields inconsistent with draped IMFs and crustal fields have been observed on Mars. Considering the discovery of a global looping magnetic field around the Venusian magnetotail and the similarities in the solar wind interactions between Mars and Venus, we use MAVEN observations to investigate the global looping field on Mars and its formation mechanism. It is found that a global looping field also exists on Mars; therefore, this type of global looping field is a common feature of unmagnetized planetary bodies with ionospheres and it should also exist on Titan and near-Sun comets. The comparison of the looping fields on Mars and Venus shows that the looping field is stronger on Mars. Solar wind azimuthal flows around the magnetotail towards the -E magnetotail polar region (X_MSE<0,Y_MSE=0,Z_MSE}<-1R_M) are observed. We illustrate that the looping field can be formed by bending the draped field lines with these azimuthal flows, and that these azimuthal flows are associated with heavy ion plumes along the +E direction that are expected to be stronger on Mars than Venus. The current system associated with the looping field and its possible connection with the nightside ionosphere formations and ion escapes on Mars and Venus are discussed.

First Observation of Magnetic Pulsations on Martian Surface

*Peter J Chi[1], Christopher T Russell[1], Steve Joy[1], Don Banfield[2], Catherine L Johnson[3,4], Yingjuan Ma[1], Anna Mittelholz[3], Yanan Yu[1]

1. University of California Los Angeles, 2. Cornell University, 3. University of British Columbia, 4. Planetary Science Institute

Landed in the western Elysium Planitia on Mars on November 26, 2018, InSight is the first Mars surface mission that carries a magnetometer. One of the research topics that can be investigated by using the InSight FluxGate (IFG) magnetometer observations is ultra-low-frequency (ULF) magnetic pulsations. Past and ongoing Mars orbiter missions have observed several types of magnetic pulsations near the planet, but whether any of them can reach the Martian surface is an open question. We study the initial IFG data to examine whether and what types of magnetic pulsations are present on the Martian surface. We have found continuous pulsations (Pc) with frequencies at ~10 mHz occurring mostly near midnight. Pc at lower frequencies (of the order of 1 mHz) has also been found in the local morning. The data from the Temperature and Wind for InSight Subsystem (TWINS) confirm that these ULF oscillations in the IFG data are not caused by the wind-driven motion of the lander. Data from the Mars-orbiting MAVEN spacecraft show that the ~10-mHz magnetic pulsations observed by InSight are different from the upstream waves in the foreshock region but may be induced by the oscillations in the tail plasma sheet. The observed continuous pulsations on the Martian surface near midnight are distinct from what are typically observed on the Earth's surface at the same local hours. The different field and plasma environment at Mars raises interesting questions regarding how the magnetic pulsations in the induced magnetosphere propagate to the surface.

Retrieval of vertical aerosol and gas profiles considering multiple scattering from Martian limb observations by MRO/CRISM

*Yasumasa Kasaba[1], Masashi Toyooka[2], Shohei Aoki[3], Arnaud Mahieux[3,4], Hiromu Nakagawa[2], Hironobu Iwabuchi[2]

1. Planetary Plasma and Atmospheric Research Center (PPARC), Tohoku University, 2. Dep. Geophysics, Tohoku University, 3. Planetary Aeronomy, Belgian Institute for Space Aeronomy, Belgium , 4. University of Texas at Austin, USA

Mars must somehow have lost most of its atmosphere and water. The evolution of the Mars environment is thought to have proceeded by atmospheric escape to space. In the last decades, there have been a renewed interest from lower to upper atmosphere to understanding the Martian climate. Vertical profiles of atmospheric gases and aerosols are thus the primary information for key processes in energy and mass transport into the upper atmosphere from below. Thanks to the aggressive explorations by MRO and MEx missions, there have been a lot of dataset of limb-viewing observations that can add new restrict the history of the Martian environment. However, these limb datasets haven’t started on the retrieval due to their computational costs in the process of radiative transfer calculations.

JACOSPAR is a fast RT code that considers multiple scattering that simulates the radiance and Jacobians in the fully spherical geometry, which has been developed for the terrestrial atmosphere. We have newly developed the retrieval code by applying JACOSPAR for Martian limb observation. For the first step to apply JACOSPAR to Martian limb observation, we modified two points for RT simulations to be optimized. First, we implemented a uniform distribution of line of sight within the field of view (FOV) in order to reduce the resultant variance of the calculated radiance along line of sight in the FOV. Second, we also optimized the threshold of Russian roulette method for the efficient calculation in the Monte Carlo simulation.

The evaluation results of Jacobians calculated by JACOSPAR showed the agreements accurate within 2% and 10% for absorption and scattering, respectively, in almost cases. In order to evaluate our retrieval code and its proper implementations, we have applied our retrieval code for the MRO/CRISM limb observations. We conducted spectral fitting to retrieve vertical profiles of number density of CO#CO,H#O,dust,andwatericefor the observed spectra by CRISM in the altitude range from 0 to 20 km. Here we newly attempted to retrieve the mean radius, and its variance of aerosols for the two cases of difference a priori conditions for the variance of aerosols’ radius of 0.5 and 1.2. We, however, still found the discrepancy of spectral slope and intensity between retrieved spectra and measured spectra. It is also noted that the repetitive variations of fitting profiles do not converge during the iterations. The possible explanation for the discrepancy of the spectral slope and intensity might be due to the treatments of aerosol properties. One of the solutions is to apply modified-gamma distribution for size distribution function, instead of log-normal distribution function applied for this study.

More precise and accurate treatment of size distribution function is required as a next step. The repetitive variations of fitting profiles might be caused by the sensitivity of the retrieval. The detailed evaluation of the retrieval sensitivity should also be required for the future work.

[P-PS04] Mars and Mars system: results from a broad spectrum of Mars studies and aspects for future missions

convener:Hideaki Miyamoto(University of Tokyo), Tomohiro Usui(Earth-Life Science Institute, Tokyo Institute of Technology), Ayako Matsuoka(Research Division for Space Plasma, Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Sushil K Atreya(University of Michigan Ann Arbor), Chairperson:Hideaki Miyamoto, Tomohiro Usui

In view of unprecedented advances in our understanding of Mars, primarily due to new and ongoing observations of the planet with a number of spacecraft missions of the US, Europe and Asia, we propose a session on Mars. Mars is an object of intense scrutiny. Currently, eight spacecraft are operating at Mars, with six in orbit (Odyssey, MRO, MAVEN, Mars Express, Mangalyaan and TGO) and two on the surface (MSL-Curiosity and MER-Opportunity), the largest number ever at any given time. In addition, InSight is on track to land on Mars in November 2018, and several spacecraft are in various stages of implementation with launches scheduled for 2020 (Mars 2020, ExoMars 2020, Emirates Mars Mission Hope, Chinese Mars Mission and the Japanese Mars Terahertz Microsatellite), 2022 (ISRO's Mangalyaan 2), and 2024 (JAXA's MMX mission to explore Phobos, Deimos, and Mars). All this is a clear demonstration of public's strong fascination with and commitment to Mars exploration and the resulting scientific bonanza. Synergistic investigations with ongoing and already completed missions along with modeling studies and earth-based observations are gradually revealing the nature of Earth's most closely resembling planet that took on a different evolutionary track than our home planet. Morphology and variable phenomena seen on the surface (RSLs, e.g.) and in the atmosphere (methane) indicate that Mars is possibly currently active. Available data are providing a better understanding of Mars' present geologic and atmospheric state, climate evolution, and habitability. Thus, the scope of this session will be the recent results from a broad spectrum of Mars studies encompassing the interior, surface, atmosphere, plasma environment, and the Mars system including its two satellites. Abstracts on modelling, instrumentation and future mission plans are also encouraged.

MODELING MORE COMPLEX EARLY MARTIAN ATMOSPHERES AND DETERMINING THE RESULTING PRECIPITATION AND EROSION RATES

*Ramses M Ramirez[1,2]

1. Earth-life Science Institute, 2. Tokyo Institute of Technology

The early Mars climate problem remains one of the most interesting ones in planetary science. In particular, the high degree of fluvial surface erosion, as exemplified by modified craters and large winding ancient valley networks, suggests that early Mars may have exhibited a more Earth-like climate in the past. However, climate models have always struggled to simulate the warmer and wetter conditions that were apparently required to explain these observations, given that early Mars (~3.8 Ga) received less than 1/3 the solar insolation that reaches our planet today. One possibility is that warm climate conditions on early Mars were maintained by a multi-bar CO_2-rich atmosphere (with H_2O vapor), mirroring conditions that may have been true during the early days of Earth and Venus. However, climate models have repeatedly shown that a dense CO_2 atmosphere alone is insufficient to generate warm conditions.

This inability of climate models to warm planets using the conventional greenhouse gases (i.e. CO_2 and H_2O) had prompted us and other groups to consider additional warming from secondary absorbers, such as H_2 and CH_4. Both CO_2-H_2 and CO_2-CH_4 atmospheres have been shown to generate above-freezing mean surface temperatures, which are high enough to explain the existence of geological features that were most likely carved by running water.

However, these previous calculations were performed by single-column radiative convective climate models that can only compute mean-averaged planetwide properties and are unable to spatially resolve atmospheric and surface parameters. Such models are also unable to evaluate the effects of oceans on climate, or compute precipitation and the resulting erosion rates to compare with those inferred from observations. On the other end, 3-D models, although quite complex, are very expensive computationally and are unable to explore parameter space as fully and completely as can simpler models. For best results, 3-D models also require a level of knowledge about the planet that, although available for present Earth, is simply unavailable for early Mars, which necessarily results in making many assumptions that cannot be tested or verified as with any other model.

Here, I present my advanced 2-D non-grey energy balance model, which provides a nice compromise between complexity and speed for this problem. It contains 36 latitude bands, clouds, topography, the ice-albedo feedback, and accurate radiative transfer directly computed from detailed single-column climate modeling calculations. Ocean sizes can be varied and planetary parameters, including eccentricity and obliquity can be computed. A typical simulation takes less than a minute. I present some preliminary results (Figure 1).

We will present simulation results for CO_2-H_2 and CO_2-CH_4 atmospheres of various H_2 (0 -20%) and CH_4 (0- 10%) concentrations, pressures (0 –3 bar), while varying ocean size given various literature estimates. From these simulations, we will compute atmospheric and surface temperatures as a function of latitude, yielding precipitation rates, and the resultant erosion rates as a function of latitude. These latitudinal erosion rates will be compared against those inferred for observations. Should such erosion rates be too

©2019. Japan Geoscience Union. All Right Reserved.

high, we can conclude that the resultant climates are too wet/warm. Likewise, should they be too low, the climates are not wet enough. Thus, for the first time we will be able to constrain realistic atmospheric compositions using a relatively complex model that may satisfy the available atmospheric and geologic constraints, providing a glimpse into what the ancient atmosphere could have actually been like. We will also discuss the implications of our results and give hypotheses that can be tested by upcoming and future missions searching for ancient geology and even life.

Keywords: early Mars, life, climate, atmospheres, erosion

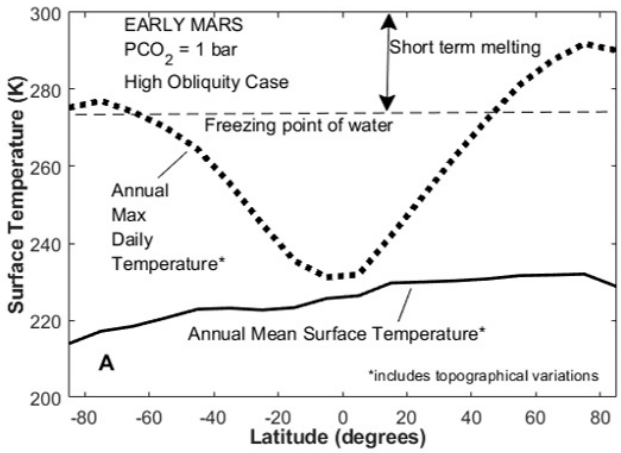

Figure 1: Computed surface temperatures per latitude band, which agrees well with the similar 1-bar case from the 3-D model of Wordsworth et al. 2015 Fig.1.

GCM simulations of the present and past water environment on Mars

*Takeshi Kuroda[1,2], Arihiro Kamada[1], Katsushige Toriumi[1], Yasumasa Kasaba[1], Naoki Terada[1], Hiromu Nakagawa[1]

Though the current Mars is a dry planet, the ancient Mars is thought to have been a water-rich planet like the present Earth. There are many topographic evidences of past liquid water flow, which should be hints for the past climate on Mars. Most of the liquid water is thought to have escaped into space, but even on the present Mars, some water environments have been found as the permanent north polar cap, underground ice, and possibly salty liquid water.

On the present Mars, water vapor exists in the atmosphere with the mixing ratio of up to hundreds of ppmv from surface up to ~100 km altitude, and water ice clouds also exist in low-latitudes around aphelion (northern summer) with the infrared opacity of up to ~0.2 and winter polar regions. The north polar ice sheet is thought to be the main source of atmospheric water, as well as possibly the underground water. Also the detection and mapping of HDO/H2O ratio in the atmospheric water could be hints for the history and movement of water. Our Mars global climate model (MGCM), DRAMATIC, has simulated such water environment consistently with the available observations, and the detailed investigations are ongoing with high-resolution (horizontal resolution of ~67 km) simulations.

Moreover, we have simulated the paleoclimate on Mars using a MGCM for paleoclimate (PMGCM), with a dense CO2 atmosphere with the surface pressure of up to a few bars. Radiative effects of water vapor may contribute the warming, and the existence of liquid ocean and lakes contributes the supply of water in the atmosphere. Our PMGCM simulation with ocean/lakes estimated the distributions of fluvial and sediment discharges from the precipitation and snow accumulations, and showed the agreements with the observed valley networks with several exceptions.

Cold-based glaciation at Pavonis Mons, Mars: Evidence for moraine deposition during glacial advance

*Reid Parsons[1,2], Tomohiro Kanzaki[3], Ryodo Hemmi[1], Hideaki Miyamoto[3]

1. University Museum, University of Tokyo, 2. Earth and Geographic Science Dept., Fitchburg State University, 3. Dept. of Systems Innovation, University of Tokyo

The three large volcanoes in the Tharsis region of Mars: Arsia, Pavonis, and Ascraeus Montes all have fan-shaped deposits (FSDs) on their northern or western flanks consisting of a combination of parallel ridges, knobby/hummocky terrain, and a smooth, viscous flow-like unit. The FSDs are hypothesized to have formed in the Amazonian during a period of high spin-axis obliquity which redistributed polar ice to the equatorial Tharsis region resulting in thick (>2 km), flowing ice deposits.

The ridged units in the FSDs are hypothesized to be deposited during glacial recession based on their similarity to terrestrial analogs in the Dry Valleys of Antarctica [1] and Iceland [2,3]. Crater age dates [4] suggest glacial recession took place slowly over hundreds of millions of years, but that recession episodically halted for a period of about a million years [4] in order to deposit an individual ridge. However, the 120 kyr periodicity in obliquity [5-7] is the most likely climate signal to influence the redistribution of ice and glacial dynamics. Therefore, there is an inconsistency between the million-year timescale attributed to ridge formation and the climate variation timescale. To investigate the process of ridge formation, we conducted numerical simulations of ice accumulation and flow using temperature and mass balance assumptions associated with Amazonian global circulation models [8] and laboratory experiments of ice sublimation under martian conditions [9].

We find that ice flow ceases during glacial retreat due to the reduction in ice thickness associated with the slow sublimation (0.5 mm/yr) of buried ice. Laboratory experiments of sublimation of buried ice supports this model assumption [9] as does the presence of remnant ice deposits within the Pavonis FSD. Because ice flow has ceased during glacial retreat, there is no mechanism to advect surface debris to form a ridge.

The model results, when combined with topography observations of a long sequence of ridges located interior of the Pavonis FSD, show that the ridged units were more likely deposited during one or more periods of glacial advance (instead of retreat) when surface temperature variations caused by 120 kyr periodicity obliquity oscillations propagated through the ice deposit resulting in a fluctuating ice flow rate. A model-derived ice flow rate of 3 cm/yr during glacial advance can deposit an average interior ridge in less than 100 kyrs if the supraglacial debris layer is two or more meters thick.

The pattern in ridge spacing observed at Pavonis Mons is more consistent with ridge deposition occurring during glacial advance. These ridges were overrun by the advancing ice, but remained preserved due to the cold temperatures at the glacier bed. Evidence supporting the preservation of ridges underneath an ice sheet comes from intersecting ridge sequences at Arsia and Pavonis [10], as well as the superposition of remnant ice (the smooth unit) on top of ridges.

Our hypothesis links the dominant, 120 kyr periodicity in obliquity to the time interval between adjacent ridges. By measuring the spacing between these ridges and dividing by the obliquity periodicity, we constrain the velocity of glacial margin to be between 0.2 and 4 cm/Earth yr - in close agreement with the

©2019. Japan Geoscience Union. All Right Reserved.

numerical simulation. Furthermore, a comparison with a simulation conducted under terrestrial gravity confirms the prediction of steeper ice margins on Mars during glacial advance which may contribute to ridge deposition via mass wasting, although invoking mass wasting is not required by our hypothesis so long as the supraglacial debris layer is >2 m thick. This re-interpretation of the FSD ridged unit suggests that the timescale of FSD formation (and perhaps the duration of the Amazonian high obliquity period) was shorter than previously reported.

Possible Earth-like tectonic scenario on Mars; a mineralogical and geochemical perspective

*Trishit Ruj[1], Gene W Schimdt[2], Goro Komatsu[2], Kenji Kawai[1]

1. Department of Earth and Planetary Science, School of Science, UTokyo, Japan, 2. International Research School of Planetary Sciences, Università d'Annunzio, Italy

The southern highlands of Mars preserve a series of Noachian aged (Eoarchean equivalent to Earth) grabens with multiple orientations and morphologies (Ruj et al., 2018). We have found traces of a 3000 km long succession of grabens (with individual grabens ranging from 30 to 1200 km) in the Noachis Terra and Terra Sabaea region around the western boundary of the massive Hellas basin. However, the origin of these grabens is neither confirmed to be a result of Earth-like plate tectonics or related to giant impacts such as Hellas, Argyre and Isidis. Here, after preparing the geological map, we present our preliminary observation (using remotely sensed datasets) on the mineralogy of the rocks and the geochemistry of the crust associated with the grabens. The hyperspectral analysis of several CRISM (Compact Reconnaissance Imaging Spectrometer, onboard the Mars Reconnaissance Orbiter) observations indicates the presence of olivine, pyroxene (clino), plagioclase, phyllosilicates and hydrated sulfates. GRS (Gamma Ray Spectrometer onboard on Mars Odyssey) observation of the area shows a higher abundance of Potassium (K) and Thorium (Th) than their average global distribution. Plagioclase, olivine and pyroxene are the main constituents of basalts and the GRS derived geochemistry confirms the existence of this alkali basalt type with a higher abundance of Potassium (K). Meanwhile, Thorium (Th) content is higher than the surroundings, indicating the presence of granitic composition rocks which are typically found within continental rift zones on Earth associated with bimodal volcanism.

Hydration state of the Martian lithosphere constrained from gravity and topography

*James Daniel Paul Moore[1], Jon Wade[2], Anthony B Watts[2], Richard M Palin[3], Lars M Hansen[2], Brendan Dyck[4], Jun Muto[6], Andrew J Smye[5], Adam D Switzer[1]

Widespread aqueous alteration of the Martian crust suggests that metamorphic hydration reactions may have played a critical role in the sequestration of water early during the planet’s history. The presence of hydrous phases in the Martian crust reduce its bending strength, and we show that observations of the Martian gravity anomaly may be used to constrain the fate of Martian surface water.

Using the gravity anomalies associated with notable topographic features, such Olympus Mons, as well as the global gravity and topography, we construct yield strength envelopes for hydrous and anhydrous end-member crustal sections, and derive the predicted elastic thicknesses, Te, a proxy for the long-term lithospheric strength of Mars. We also use spherical harmonic coefficients that describe the Martian gravity anomaly and topography fields to quantify the role of isostasy in contributing to crustal and upper mantle structure. Power spectra of these fields reveal that the gravity effect of topography and its flexural compensation contributes significantly to the observed free-air gravity anomaly spectra for spherical harmonic degree $8 < n < 50$, corresponding to wavelength $300 < \lambda < 3000$ km. The best-fit global average is for an elastic plate (flexure) model with T_e of ~126 km. All isostatic models under-predict the spectra at $2 < n < 5$, and we interpret the low-order Martian gravity field, at least in part, to be the result of processes that formed the Northern Basin. By comparing the observed Martian T_e to that predicted for our metamorphic mineral assemblages, we iterate on the water content until convergence. In short, we show the bending strength of Mars places constraints on the amount of hydration of the Martian crust, which in turn we use to calculate the planetary water budget. Notably, the stiffer flexural response of Olympus Mons is consistent with its younger age and eruption predominantly into a dry environment.

SUBGLACIAL ANTARCTIC LAKE VOSTOK VS. SUBGLACIAL SOUTH POLE MARTIAN LAKE AND HYPERSALINE CANADIAN ARCTIC LAKES –PROSPECTS FOR LIFE

*Sergey Bulat[1]

1. NRC KI - Petersburg Nuclear Physics Institute, Saint-Petersburg-Gatchina, Russia

The objective was to search for microbial life in the subglacial freshwater Antarctic Lake Vostok by analyzing the uppermost water layer entered the borehole following successful lake unsealing at the depth 3769m from the surface. The samples included the drillbit frozen and re-cored borehole-frozen water ice. The study aimed to explore the Earth’ s subglacial Antarctic lake and use the results to prospect the life potential in recently discovered subglacial very likely hypersaline South Pole ice cap Martian lake (liquid water reservoir) [1] as well as similar subglacial hypersaline lakes (reservoirs) in Canadian Arctic [2].

The Lake Vostok is a giant (270 x 70 km, 15800 km2 area), deep (up to 1.3km) freshwater liquid body buried in a graben beneath 4-km thick East Antarctic Ice Sheet with the temperature near ice melting point (around -2.5°C) under 400 bar pressure. It is extremely oligotrophic and poor in major chemical ions contents (comparable with surface snow), under the high dissolved oxygen tension (in the range of 320 –1300 mg/L), with no light and sealed from the surface biota about 15 Ma ago [3].

The water frozen samples studied showed very dilute cell concentrations - from 167 to 38 cells per ml. The 16S rRNA gene sequencing came up with total of 53 bacterial phylotypes. Of them, only three phylotypes passed all contamination criteria. Two phylotypes were reported before [4] - hitherto-unknown and phylogenetically unclassified phylotype w123-10 likely belonging to *Parcubacteria* Candidatus *Adlerbacteria* and 3429v3-4 showing below-genus level (93.5%) similarity with *Herminiimonas glaciei* of *Oxalobacteraceae* (*Beta-Proteobacteria*) –water-inhabited ultramicrobacterium isolated from a deep Greenland ice core. The new third finding (the phylotype 3698v46-27) proved to be conspecific with several species of *Marinilactobacillus* of *Carnobacteriaceae* (*Firmicutes*). All three bacterial phylotypes may represent ingenious microbial communities in the subglacial Lake Vostok.

Two newly discovered (RES) subglacial hypersaline lakes (5 and 8.3km2 areas) in the Canadian Arctic are settled in bedrock throughs beneath 560 and 740m ice cap with modeled temperature below -10.5°C [2] and isolated by a glacier for at least 120 Ky ago. The biology is not yet studied (lakes are not unsealed), but the life potential is rather high (while dissimilar to the Lake Vostok). Their estimated salinity (140-160 psu) is in a range of that observed for brine-rich water body beneath Taylor Glacier (–7.8˚C, 125 psu) and the ice-covered Lake Vida (–13˚C, 200 psu) in Antarctica, both inhabited by active unique microbial communities.

The just discovered (RES) 20km-wide subglacial lake beneath the South Pole ice cap on Mars [1] should be ultra-hypersaline because it is buried beneath a 1.5km water ice cap with modeled temperature -68° C. It is well below known low-temperature limits supporting terrestrial microbial cell propagation and metabolism as well (-18°C and -33°C, respectively [5]). Such conditions may indicate zero-level life potential for this lake from the Earth-bound point of view, but its exploration may give us surprises.

©2019. Japan Geoscience Union. All Right Reserved.

In general, all three subglacial lakes (complexes) –two Earth-bound and one Martian, may host unique life forms never met before but their exploration (unsealing) is challenging as it happened with the Lake Vostok.

The reported study was partly funded by RFBR according to the research project №18-55-16004.

[E] Poster | P (Space and Planetary Sciences)：P-PS Planetary Sciences

Sun. May 26, 2019 3:30 PM - 5:00 PM JST | Sun. May 26, 2019 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_3

[P-PS04] Mars and Mars system: results from a broad spectrum of Mars studies and aspects for future missions

convener:Hideaki Miyamoto(University of Tokyo), Tomohiro Usui(Earth-Life Science Institute, Tokyo Institute of Technology), Ayako Matsuoka(Research Division for Space Plasma, Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Sushil K Atreya(University of Michigan Ann Arbor)

In view of unprecedented advances in our understanding of Mars, primarily due to new and ongoing observations of the planet with a number of spacecraft missions of the US, Europe and Asia, we propose a session on Mars. Mars is an object of intense scrutiny. Currently, eight spacecraft are operating at Mars, with six in orbit (Odyssey, MRO, MAVEN, Mars Express, Mangalyaan and TGO) and two on the surface (MSL-Curiosity and MER-Opportunity), the largest number ever at any given time. In addition, InSight is on track to land on Mars in November 2018, and several spacecraft are in various stages of implementation with launches scheduled for 2020 (Mars 2020, ExoMars 2020, Emirates Mars Mission Hope, Chinese Mars Mission and the Japanese Mars Terahertz Microsatellite), 2022 (ISRO's Mangalyaan 2), and 2024 (JAXA's MMX mission to explore Phobos, Deimos, and Mars). All this is a clear demonstration of public's strong fascination with and commitment to Mars exploration and the resulting scientific bonanza. Synergistic investigations with ongoing and already completed missions along with modeling studies and earth-based observations are gradually revealing the nature of Earth's most closely resembling planet that took on a different evolutionary track than our home planet. Morphology and variable phenomena seen on the surface (RSLs, e.g.) and in the atmosphere (methane) indicate that Mars is possibly currently active. Available data are providing a better understanding of Mars' present geologic and atmospheric state, climate evolution, and habitability. Thus, the scope of this session will be the recent results from a broad spectrum of Mars studies encompassing the interior, surface, atmosphere, plasma environment, and the Mars system including its two satellites. Abstracts on modelling, instrumentation and future mission plans are also encouraged.

Observation of the O_2^+ first negative band (1,0) emissions in the Mars ionosphere with a visible spectrograph on Haleakala T60

*Toshihisa Suzuki[1], Masato Kagitani[1], Takeshi Sakanoi[1]

1. PPARC, Graduate School of Science, Tohoku University

We carried out ground-based telescope observations of Martian ionospheric O_2^+ emission to obtain global distribution of Martian O_2^+ ionosphere and its variation for understanding Martian atmospheric escape process. After verifying the analysis method, the result suggests that the O_2^+ first negative bands (1NG) (1, 0) emissions are successfully detected, and calculated O_2^+ emission intensity and column density.
Mars has tenuous atmosphere compared with the Earth. One possible model for Martian tenuous atmosphere is caused by atmospheric escape to space for a long time. In addition, present Mars has only weak crustal magnetic fields for limited area, and therefore, it is likely that solar wind strongly affects Martian atmosphere escape. In recent years, ion composition and densities in the Martian ionosphere are revealed by Mars probes (e.g. Mars Express, MAVEN). In the Martian ionosphere, main ion is O_2^+ [M. Benna et al., 2015]. Moreover O_2^+ recombines with an electron, and as a result of a neutral molecule dissociation, neutral atomic oxygens are generated. Since the neutral atomic oxygen energy is higher than escape velocity of Mars, it can be escaped from Martian gravity. This process is important in Martian atmosphere escape. However, it is difficult to detect atomic oxygen by Mars probe in-situ observation, and escape quantity is indirectly estimated by plasma temperature and density from in-situ observations. On the other hand, remote-sensing of Martian ionosphere is useful to obtain global distribution and its time and spatial variations. It is essential to combine in-situ plasma data with global remote sensing for understanding Martian atmospheric escape, such as solar wind impact and/or crustal magnetic field effect on the escape process.
We carried out Martian ionosphere O_2^+ emission observation using Tohoku University T60 telescope (located at the summit of Mt. Haleakala in Maui) with Vispec (Visual imager and Spectrograph with Coronagraphy) from September 10 to 19, 2018. This is the first attempt to detect Martian O_2^+ emission with a ground-based telescope. We focused O_2^+ 1NG (1, 0) bands emission with a peak wavelength of about 561 nm. Visible Echelle spectrograph Vispec (wavelength resolution was 10,000) covered wavelength range from 550 nm to 570 nm. Vispec slit (width 2” ×length 90”) was located near Martian dayside limb parallel to the Martian rotation axis, and exposure time of one frame was 2 minutes. Total exposure time in observation period was 450 minutes. To refer sunlight spectrum reflecting by Martian surface, we acquired spectrum of disk center by Martian surface. First analysis process (subtraction dark, revision by flat-field, wavelength and space) was conducted on each frame, and each frame was added to gain S/N. Finally, sunlight spectrum was subtracted using disk center to obtain O_2^+ 1NG (1, 0) bands emission spectrum. Next, we compared observed O_2^+ spectrum with O_2^+ 1NG (1, 0) model spectrum given by Henriksen and Veseth [1987]. Focusing on only short period wavelength variations, we performed high-pass filter analysis on the both of observed and model spectrum. After that, we calculated the correlation coefficient between observed spectrum and model spectrum, and found that the coefficient maximum is 0.40 with no wavelength lag between two spectra. Data points, i.e., wavelength range, using correlation coefficient analysis were selected so that model O_2^+ emission is relatively intense and the contamination of solar fraunhofer absorption line is negligible. We estimated O_2^+ 1NG (1, 0) emission intensity with a least-square method to be 691 +/- 171 $\times 10^3$ Rayleighs, and the column density to be 4.4 +/- 1.1 $\times 10^{13}$ /cm^2. The estimated column density was greater than that of simulation. In this presentation, we compare O_2^+ emission observation spectrum with model spectrum, and give the estimation of O_2^+ emission intensity and column density in detail. We also give discussion about the

Search of shallow subsurface reflectors around RSLs in Martian Chryse and Acidalia planitiae by the MRO/SHARAD public data

*Aina Oura[1], Yasumasa Kasaba[1], Atsushi Kumamoto[1], Rina Noguchi[2], Tomohiro Usui[2], Ken Ishiyama[2], Chihiro Uemura[3]

1. Tohoku University, 2. Institute of Space and Astronautical Science, 3. SOKENDAI

One of recent discoveries on Mars is the recurring slope lineae (RSL), which are certain features on the surface invoking current icy processes. RSLs are distributed on Mars and these narrow features incrementally lengthen down steep slopes, fade in colder seasons, and recur annually. Candidate and confirmed RSL sites are distributed in four regions, (1) southern mid-latitudes (SML), (2) Valles Marineris (VM), (3) equatorial highlands, and (4) northern Chryse Planitia and southwestern Acidalia Planitia (CAP). The RSLs in (2) VM and (4) CAP are more densely located than other two areas.
This study tries to identify the subsurface structures of the northern mid-latitude RSL in (4) Chryse and Acidalia Planitiae by the public data of Mars shallow radar sounder (SHARAD) onboad the Mars Reconnaissance Orbiter opened on the PDS Geosciences Node. That is because CAP RSLs are densely distributed compared to other regions. CAP RSLs are found on the steep slopes of craters. Their source zones are at or below the elevation of the surrounding plains. We used the Java Mission-planning and Analysis for Remote Sensing (JMARS, https://jmars.asu.edu/) in order to investigate the geological information of the RSL sites and the MRO locations at the SHARAD observed data. We then picked up the location correspond to the RSL sites and generated radargrams from SHARAD data. The observation frequency of SHARAD is 15-25 MHz with the bandwidth of 10 MHz, and the subsurface close to the surface can potentially be resolved with the depth resolution of 15 m in vacuum. Using MOLA data, we generated the virtual radargrams with the surface clutter emulated by the Kirchhoff approximation. Then, we compared both observed radargrams with emulated ones to identify whether there are subsurface reflectors or not.
We surveyed about 12 orbits close to the confirmed RSLs. We could find the hypothetical detection of the subsurface reflector in ‘orbit.00688101’ (Jan 14 2008, N10.0-44.7˚, E313.6-318.3˚) and ‘orbit.00673602’ (Jan 03 2008, N10.1-44.7˚, E312.7-317.4˚). In this abstract, we concentrated the characteristics of the former candidate. In this sample, the closest RSL located at N34.1˚, E317.0˚ and nadir line from the orbit was 13.8 km. Another RSL close to this orbit located N34.8˚, E318.6˚ and nadir line from the orbit was 85.2 km. Apparent elevation of closest RSL was about -3,763 ±10 m. The deepest elevation of the crater was about -4,744 ±10 m and the highest elevation of it was about -3,640 ±10 m. The radargram of this orbit showed that the elevation of surface echo was in the range from -3720 to -3780 m and that of subsurface echo ranged from -3750 to -3800 m. This means that the closest RSL height was almost the same as the depth of subsurface reflector. The subsurface echo located 25 m below the surface, and it had a little bit weak echo strength compared to surface one. If this subsurface echo shows the underground reflection, the subsurface layer will be 180 km wide along the orbit. Although this depth is marginal for the depth resolution of SHARAD, we could not identify such an echo in the emulated radargram.
In the presentation, we will summarize the results of this region including other orbits.

Detecting surface changes on Mars using principle component analysis of repeat imagery

*Reid Parsons[1], Hideaki Miyamoto[1]

1. University of Tokyo

Change detection is an analytical tool of Remote Sensing in which repeat observations of a particular location can be overlain, subtracted, or ratioed to detect differences between images. High-resolution, repeat imagery on Mars has led to several discoveries of ongoing geologic processes operating at the sub-kilometer scale such as recurring slope lineae (RSL) [1-3], new, small impacts [4], aeolian dune migration [5], sublimation of polar ice [6], and gully formation [7]. Generally, the detection of these changes is done manually by overlaying, and “flipping” between the two images. As planetary remote sensing data sets continue to grow, so does the need for a more efficient means of change detection.

Principle component analysis (PCA) offers an advantageous means for detecting change because it considers the values of all pixels in all the repeat images to extract the most statistically significant variations. These variations are then isolated from one another as a hierarchical set of “principle components” of the image dataset. The user can quickly identify patterns or features of interest which are present in one or more of these components. To illustrate this method, nine HiRISE images [8] collected from Palikir crater on Mars between November 2007 and June 2011 documenting RSL formation will be used.

PCA changes the values of the pixels in each image by plotting the pixel data on a set of axes which capture the maximum variance in the dataset. In our example image set, each pixel in the image stack can be treated as a 9-dimensional vector since there is a value for that pixel in each of the nine images. However, each pixel can be plotted on a new set of axes that capture the most important, or PCs of the image stack.

The figure shows the result of the PC transform (performed using ENVI® software) on the stacked time-series. Because most of the variation in the images is captured in the first PC (PCA1), it uses a grayscale color bar spanning 0-255 pixel values. Generally, variations covering a large spatial extent or variations causing a big shift in pixel values will be captured in the lower PCA components. Higher components, on the other hand, will depict smaller amplitude variations occurring in fewer images (or over smaller spatial extents). Thus, components 2 and 3 (panels b and c, respectively) are dominated by variations caused by differences in lighting (sun direction and elevation angle) and possibly dust or frost deposition/erosion. RSL features are identifiable in PCA4 (panel d) as elongated blue “fingers” and become more dominant and appear red in PCA5 (panel e). Subsequent components capture smaller variations caused either by changes in lighting, RSL shape (in PCA 8 and 9), or camera noise.

After identifying the PCs which contain the feature of interest, the feature can be traced back to the original images via an inverting from PC coordinates to image coordinates. Although this step is not completely reliable, it is successful in determining which images contain the most prominent RSL. Eventual combination of this method with machine-learning algorithms may permit a more automated means of detecting interesting surface changes on Mars and other planetary bodies. Note this work was previously published in [9].

Evaluation of the detectability of hydrated salts on recurring slope lineae on Mars.

*Shoko Imamura[1,2], Yasuhito Sekine[2], Hiroyuki Kurokawa[2]

1. University of Tokyo, 2. Earth-Life Science Institute, Tokyo Institute of Technology

On present-day Mars, pure liquid water is thermodynamically unstable; whereas, high-salinity brine can exist on the surface, at least temporally, due to freezing point depression [1]. Deliquescence and melting of subsurface ice are proposed as being the major processes of formation of liquid brine on Mars [2, 3]. Although liquid brine is suggested to form upon Mars' daily and seasonal changes [2, 3], generation of brine flow has not been confirmed on current Mars. Our previous study suggests that cycles of formation and evaporation of liquid brine can generate characteristic morphological features of downward-elongated flows on steep slopes [4]. This happens because precipitated salts within soil dramatically decrease the porosity and permeability, leading generation of surface flows [4]. Our study also suggests that precipitation of salts reaches up to ~30% in volume within the soil, implying that any detection of such salt may be evidence for the occurrence of brine flow on current Mars [4]. Proposed morphological features formed by current brine activity include recurring slope lineae (RSL) [5, 6]. Although hydrated salts are suggested to exist on RSL at a few locations [6], identification of salt compositions is still challenging. Additionally, there are no reports on detection of hydrated salts at most of the RSL sites across Mars.

In the present study, we investigate the conditions of identification of hydrated salt compositions on RSL using Compact Reconnaissance Imaging Spectrometer for Mars (CRISM) onboarded on Mars Reconnaissance Orbiter (MRO). We calculate synthesized spectra of mixtures of basaltic soil and various hydrated salts (such as $MgCl_2 \cdot 2H_2O$) with the different mixing ratios using a linear combination method and an addition of random noise with a Gaussian distribution. We evaluate the threshold mixing ratios of salt for the identification of the salt compositions based on the analyses of the synthesized spectra. Our results show that if the mixing ratio of hydrated salt exceeds 20% in volume, O-H bands attributed from hydrated salts can be detected with CRISM. We discuss the observational conditions, such as the observational altitude from the surface, for the identification of salt compositions on RSL in future missions.

Frequency of ice sheet growth recorded on Mons Pavonis, Mars

*Tomohiro Kanzaki[1], Reid Parsons[1,2], Ryodo Hemmi[1], Hideaki Miyamoto[1]

1. University of Tokyo, 2. Fitchburg State University

On present-day Mars, large scale ice bodies are only found at each pole. However, in mid latitudinal areas, LDA (lobate debris apron), LVF (lineated valley fill), CCF (concentric crater fill) are reported and interpreted to have a glacial origin (Levy et al., 2014). Also, inequatorial areas, fan-shaped deposits at northwestern rim of three shield volcanos in Tharsis region though to have a glacial origin (e.g. Fastook et al., 2008).
Fan-shaped deposits sit beside three Tharsis montes and have characteristic geomorphologies extending for roughly 100-500 km from the foot of mountain, typically consisting of three facies: Smooth facies at the top, Knobby facies at the middle, and Ridged facies at the rim. Smooth facies are smooth-surfaced mounds which superpose on other facies, Knobby facies are collective hillocks a few hundred meters in radius, and Ridged facies are linear ridges (moraine-like features) parallel to the rim of the fan. At Arsia (Kadish et al., 2014) and Pavonis (Shean et al., 2005) Mons, ridged facies are especialy well-developed - containing tens to few hundreds of ridges interpreted to be moraines that indicates the varying extent of a former ice sheet. Such geomorphologies potentially record the advance and retreat of ice sheet for tens of kilometers during the Amazonian adjacent to Arsia and Pavonis Mons.
The association of these geomorphologic features to glacial processes is supported by global climate simulations of Mars during high-obliquity (Forget, 2006). The obliquity of the rotation axis of Mars is considered not stable as on the Earth, reaching 45˚ in the past 20 Myrs (Laskar et al., 2004). Such high obliquity can cause sublimation of the polar cap, enhancing the water vapor content in the atmosphere compared to present-day Mars. By diffusion and condensation model, Mellon & Jakosky (1995) found that in the surface environment of present-day Martian obliquity (25.2˚) water ice is stable only at 40˚ latitude or higher, however, when obliquity gets higher than 32.3˚, with enough amount of atmospheric water vapor, water ice becomes stable globally. This result suggests Martian surface environment has experienced such climate condition that water ice condenses and deposits in mid and low latitudinal areas. Therefore, the existence of Martian “ice age” during Amazonian high-obliquity periods is being proposed (Head et al., 2003).
If ice sheet growth and disappearance on the flanks of Tharsis Montes are an indication of the climate change caused by orbital parameters, each of moraine-like features should correspond to a paleoclimate cycle. However, fluctuation of its spacing, scale and correlation to orbital parameter have not yet been discussed. Hence, as basic study to associate distribution of moraine-like features to extent of the ice sheet, we made DEM data from CTX imagery at the rim of fan-shaped deposits at the foot of Mons Pavonis, and using the DEM data, we measured spacing and cross-sectional area of each moraine, and conducted frequency analysis on the cross section of DEM data.
As a result, spacing of moraine-like feature appeared to fluctuate from few hundred meters to 4.5 km, showing drastic change of the density. Also, cross sectional area of moraine-like feature fluctuates up to 1.4×10^4 m^2. These fluctuations potentially record the change of frequency of events that caused accumulation and ablation of ice sheet or change of velocity of ice sheet flow. In Tharsis region, these two periodic events are assumed to affect ice sheet: global climate change caused by orbital parameter, and local volcanic activity. To prove the spacing and moraine-size are driven by global climate forcings, there should be similarities between the ridges found at Pavonis, Arsia, and a correlation to orbital parameters. Therefore, frequency analysis of cross- sectional view of the terrain is being conducted. The result will be shown in the presentation.

Development of Life Detection Microscope (LDM) for *in situ* imaging of living cells on Mars surface

*Yoshitaka Yoshimura[1], Akihiko Yamagishi[2], Takehiko Satoh[3], Atsuo Miyakawa[2], Eiichi Imai[4], Satoshi Sasaki[5], Kensei Kobayashi[6], Yoko Kebukawa[6], Tomoka Okada[6], Keigo Enya[3], Hikaru Yabuta[7], Takeshi Naganuma[7], Hajime Mita[8], Kazuhisa Fujita[3], Tomohiro Usui[3]

1. College of Agriculture, Tamagawa University, 2. Tokyo University of Pharmacy and Life Science, 3. Japan Aerospace Exploration Agency, 4. Nagaoka University of Technology, 5. Tokyo University of Technology, 6. Yokohama National University, 7. Hiroshima University, 8. Fukuoka Institute of Technology

Past trial of direct detection of life on Mars by 1970's Viking mission ended up with a negative conclusion [1]. Whereas, numbers of new finding provided by Mars exploration missions in the last decade indicate that there are good reasons to perform another life detection program. The sensitivity of the gas chromatograph mass spectrometer onboard the Viking mission was not very high, and was not able to detect the microbes 10^6 cells in 1 gram clay [2,3]. Resent observations on Mars have found the evidences of past water activities. MSL Curiosity has found the temporal increase of methane concentration in Martian atmosphere [4]. The presence of reduced sulfur compound such as pyrite in Martian soil was also detected by MSL [5]. Methane and reduced sulfur compound can be the energy source to support the growth of chemoautotrophic microbes [6]. Possible presence of liquid water at Recurring Slope Lineae has been supported by the detection of hydrated salts [7]. The presence of organic compounds of Martian origin has been reported [8]. These evidences tend to support the possible presence of living microbes near the surface of Mars.

Physical and chemical limits for terrestrial life have been major foci in astrobiology [9], and are summarized in ref. [6]. Combining the environmental factors, anywhere in the Martian environment where we can find the three components, water molecules, reducing compounds and oxidative compounds could be an environment where life can be sustained for long periods of time, if other factors such as temperature, pressure, UV and other radiations permit [6]. Among these factors, most of the factors including ionic radiation, can be endured by terrestrial extremophiles. Only UV can kill the most UV-resistant microbes within minutes. However, UV can be shielded by a few centimeters soil layer. These evaluations lead to the conclusion that the Martian soil under a few cm can be the place to support the growth of microbes, if the water activity is higher than 0.6.

For exploring extant life on Mars, we have proposed to search cells from a depth of about 5 - 10 cm below the surface by the Life Detection Microscope (LDM) [6, 10]. LDM has the potential to detect single cells in the resolution of 1 micrometer and could detect less than 10^4 cells in 1 gram clay, which is much higher sensitivity than the instrument onboard Viking. We have developed the solution and combination of fluorescence pigments to detect organic compounds, and to differentiate organic compounds surrounded by membrane, which we think to be the most fundamental features that a cell should possess to constitute life. Our investigation goals are the followings. 1) Identify cell-like structure in which organic compounds are enveloped by membrane, which may represent Martian life. 2) Search for any type of organic compounds in Mars surface samples. The compounds include cells, other biological materials, and abiotic polycyclic aromatic hydrocarbon (PAH). 3) High-resolution characterization of regolith and dust particles. The current status of development of LDM will be presented.

Development of a Mars Web-GIS for viewing multiple kinds of spectral data from orbiters

*Yuya Matsubara[1], Hironori Fukuchi[1], Yoshiko Ogawa[1], Yohei Hayashi[2]

1. The University of Aizu, 2. National Astronomical Observatory of Japan

The VIS-NIR reflectance spectra observed during latest Mars orbiter missions are of high quality and cover the whole globe. Such data sets are very informative for understanding the materials and their distribution on the surface. Each mineral has unique absorption bands in the spectra. We can identify which minerals are present by comparing the absorption bands of the observed spectra with the known absorption bands in the spectra measured in laboratories. In the case of Mars, we can estimate the type and distribution of hydrous minerals which leads to important clues to understand the water environment.

However, the VIS-NIR spectral data observed on Mars are not well utilized among the community. There are huge volume of accumulated data due to an increasing number of missions and various kinds of instruments with higher accuracy. It is not easy to process huge data and understand the relevance of them visually and intuitively.

We develop a new Mars web-GIS application, "Red Ace", to view and download the Mars observation data, especially the VIS-NIR spectra (image cube data format), easily and intuitively. The Red Ace handles multiple kinds of observation data: the Compact Reconnaissance Imaging Spectrometers for Mars (CRISM) data, the Thermal Emission Imaging System (THEMIS) data and DEM (Digital Elevation Model) data at the same time. Additionally, we use the DEM data from the Mars Orbiter Laser Altimeter (MOLA) to display 3D map of Mars with the Red Ace.

The Red Ace is developed based on CesiumJS that is an open source JavaScript library for 2D/3D maps. The user can choose the dimension of the map. In the Red Ace, the spectral observation points are displayed on the surface image layers. When the user clicks any point on the footprint of the layer, the color of the selected footprint changes and the thumbnail image appears. When the user selects any pixel on the thumbnail image, the Red Ace provides reflectance spectral data and ancillary data as graphs and tables. In response to user operation, multiple kinds of spectral data are displayed on the same window. The Red Ace also provides band- ratio images of THEMIS. The user can download band-ratio images, spectral data and ancillary data as files of PNG, CSV, JSON, XLSX and PVL formats. The user can move the windows displaying thumbnail image and graph freely. In addition, the Red Ace provides the function to control the Mars base map changing the exaggeration of height of the Mars globe. The user can change the order of layers and transparency of layers arbitrarily. The user can also jump to the region of interest directly by setting the coordinates and the zoom level. The user can handle these functions smoothly.

In the case of THEMIS, published data from the mission data archive are not reflectance data but radiance data. Therefore, the Red Ace derives reflectance data from radiance data and ancillary data, in order to compare them with CRISM spectra observed in the same spot.
In this study, considering the portability and extension of the application, the Docker was used for the development environment. Docker is an open source software platform that allow the user to develop applications quickly using containers. JSON format is adopted for data handling to make it easier to add new observation data from new observation equipments in the future. In the JSON format, it is unnecessary to associate item order and item meaning. Hence, it has high reusability and freedom. In the

©2019. Japan Geoscience Union. All Right Reserved.

Red Ace, by standardizing the structure of JSON format data in advance, it is possible to store and handle diverse data by using the same data structure.

Visualization and Analysis of the Surface of Mars with NASA's Mars Trek Portal

*Brian Hamilton Day[1], Emily Law[2]

1. NASA Solar System Exploration Research Virtual Institute, NASA Ames Research Center, 2. NASA Jet Propulsion Laboratory, California Institute of Technology

Originally released in June, 2015 as a public outreach tool, Mars Trek is currently being enhanced to support site selection and analysis for upcoming human and robotic missions to Mars. Many new data products are being added, with emphasis on providing detailed information for proposed exploration zones. Data products can be loaded and even combined from many different instruments aboard many different Mars-orbiting spacecraft including Viking, Mars Global Surveyor, Mars Odyssey, Mars Reconnaissance Orbiter, and Mars Express. Users can download data products from Mars Trek and access metadata for each product. Web services and APIs allow other clients to access data from Mars Trek's servers. A standardized interface across the Trek portals provides for advanced 3D visualization and navigation. Standard keyboard gaming controls allow the user to maneuver a first-person visualization of "flying" across the surface of the Mars. User-specified bounding boxes can be used to generate STL and/or OBJ files to create physical models of surface features with 3D printers. A new VR capability allows users to generate their own virtual reality flyovers for any user-defined paths along the Mars' surface.

Mars Trek's power as a tool for education and outreach is exemplified by its being designated as key supporting infrastructure for NASA Science Mission Directorate's STEM Activation Initiative, and its serving of data to a growing community of digital planetariums.

As private industry and space agencies of a growing number of nations plan new missions to Mars, detailed maps and models of Mars' surface and climate will be essential for mission planning. Mars Trek's generalized suite of tools are being designed to meet the needs of this new generation of missions. The portal will also provide an outstanding means of dissemination of data from these missions. Layering and blending many different data products and putting individual products in the context of many others will facilitate mining of information going far beyond what individual products can provide separately. In addition to mission planning and planetary science, Mars Trek will continue supporting the essential task of engaging the public in this great adventure. Mars Trek is developed at NASA's Jet Propulsion Laboratory (JPL) and managed as a project of NASA's Solar System Exploration Research Virtual Institute (SSERVI) at NASA Ames Research Center.

At the request of the Planetary Science Division of NASA's Science Mission Directorate, we are extending the technologies of our existing Trek platforms to create a new portal for Mars' largest moon, Phobos. In this effort, we are working with the International Phobos/Deimos Landing Site Working Group and with JAXA, with JAXA's MMX mission as a primary driver.
Mars Trek is one of the portals in the NASA Solar System Treks Project (SSTP), available at https://trek.nasa.gov. NASA's Solar System Trek online portals provide web-based suites of interactive data visualization and analysis tools to enable mission planners, planetary scientists, students, and the general public to access mapped data products from past and current missions for a growing number of planetary bodies including the Moon, Mars, Vesta, etc. These portals are being used for site selection and analysis by NASA and a number of its international partners, supporting upcoming missions. In addition to demonstrating the capabilities of Mars Trek in this presentation and providing a preview of Phobos Trek,

we will solicit input from the community for ideas for future enhancements to the portals.

Increase in Dissolved Iron Concentration from Fayalite by UltravioletA・C Irradiation

*Nobuo Komori[1]

1. The United Graduate School of Education Tokyo Gakugei University

To investigate the mystery of “Why the Mars' surface with poor oxgen has so much iron oxide" I have led student experiments at junior high schools. I will show my recent experiments and their results.
A.S.Yen (1999) showed that reactive oxygen species can also be formed on mineral grains under Martian conditions by irradiating ultraviolet C to quartz samples. Furthermore he irradiated ultraviolet C to thin iron films in the air and showed that exposure to ultraviolet radiation increases the rate of oxide formation. My experiments was irradiating ultraviolet A and C to fayalites and iron in acid water. This results indicated the possibility that iron oxides might be formed because of ultraviolet rays other than the cause of reactive oxygen species in the past.
Experiment no.1:
I had students irradiate ultraviolet rays A and C to Fayalite in hydrochloric acid.I had students irradiate ultraviolet rays A and C to Fayalite in hydrochloric acid. In this experiment, I used Fayalite from Kawamata-machi, Fukushima.
Fayalite, which is about 1g and not formatted was put in the test tube in the test tube filled with hydrochloric acid pH2.After the experiment, I had students check the concentration of iron ions in the water solution by using a digital pack test. This experiment with ultraviolet rays A was carried out 7 times and the experiment with ulttaviolet rays was carried out 3times.According to the results of the experiment with ultraviolet rays A, the quantity of iron elution increased more in the case of ultraviolet rays irradiating 6 times out of 7 than with the result of no irradiation.The results of the experiment with ultraviolet rays C were idential (3 times out of 3). The peak of wavelength ultraviolet rays A is generated by black lite is 365 nm. The peak of wavelength ultraviolet rays C is generated by germicidal lamp is 245 nm.
Experiments no.2:
I had the students irradiate ultraviolet rays A to a battery that has the iron cathode copper anode in hydrochloric acid. The Students then measured the occured voltage of the battery. I compared the voltage between ultla violet rays irradiation and non irradiation.The irradiated battery’s voltage stayed over 0.2V and the voltage did not decrease after 150hours.Another non-irradiated battery’s voltage decreased lower little by little and the voltage was close to 0V after 150 hours.This experiment was carried out 4times. In all cases the voltage of the battery that was irradiated by ultraviolet rays was higher than the non-irradiated battery.
It seems that electrons dissociate from iron atoms by ultlaviolet energy and form iron ions.
Consideration
From my experiments results, I would infer that ultraviolet rays advance the dissolution of iron ion from fayalite and iron. I think ultraviolet rays are one of the causes of iron oxide and hidroxide existing on Mars’ surface besides reactive oxygen species.It seems that there was water on Mars’ surface. There was a possibility that advancing of iron dissolution from rocks on Mars by ultraviolet rays irradiation.

Small-scale ridges newly identified on the equatorial region of the Phobos nearside

*Ryodo Hemmi[1], Hiroshi Kikuchi[1], Hideaki Miyamoto[1]

1. The University of Tokyo

Although the craters and grooves on Phobos are indicative of widespread and abundant surface modification during Phobos' geologic history [Basilevsky et al., 2014], little definitive evidence exists for geologically recent regolith migration other than down-slope mass-wasting [Shi et al., 2016]. Here we report newly found small-scale sinuous ridges identified in Mars Reconnaissance Orbiter's High Resolution Imaging Science Experiment (HiRISE [McEwen et al., 2007]) images of the nearside of Phobos. These ridges are spatially focused within the equatorial region (-5° to 20° N). Some of them superpose on craters and grooves, which is consistent with a geologically recent activity. They are ~200 m to ~1 km in length, several 10's m in width, and most of them are roughly parallel to each other and are generally oriented in NE-SW direction. To extract detailed topographic profiles, we constructed a high-resolution (~5-6 m/pixel; almost same as the original image) digital elevation model (DEM) by using shape-from-shading [Alexandrov and Beyer, 2018] in the selected regions of a HiRISE image and a stereo-derived HiRISE DEM (20 m/pixel) [Hemmi and Miyamoto, 2019]. Our preliminary analysis shows these ridges are less than several meters high. Their morphology and topography are unlikely to be formed by impact cratering, extensional stress fields, or mass wasting processes. In this presentation, we provide initial results of geological mapping of the small-scale ridges and discuss their possible origins.

Development of a compact Muography instrument for future Mars exploration missions

*Hiroaki Kamiyoshihara[1], Tetsuro Ninomiya[1], Yuri Yoshihara[1], Kenji Shimazoe[1], Hiroyuki Takahashi[1], Hiroyuki Tanaka[1], Hideaki Miyamoto[1]

1. University of Tokyo

Muography is a technique that uses cosmic ray muons for visualizing the interior of large-scale structures in much the same way as standard X-ray radiography is used to image the interior of smaller objects. Muography has been successfully applied to explore the internal structure of geological targets on earth. Because exploring the inner structure of the shallow subsurface of celestial bodies is important to understand their origin and evolution, we are planning to operate muography instrument in the extraterrestrial environment, especially on the surface of Mars. Applying muography to planetary explorations has some advantages over conventional internal exploration methods: (1) it is able to observe the absolute linear density of objects; (2) the passive nature of the measurements provides low power consumption; (3) the instrument size is arbitral [1]. However, in order to mount muography instrument on a spacecraft, it is essential to downsize the instrument and investigate the radiation environment on the surface of the celestial body. In this study, we designed and developed a compact muography instrument based on the knowledge of compact gamma ray detectors for nuclear medicine imaging. At the same time, we theoretically estimated the muon production on Mars and evaluated the validity of using muography instrument on Mars.

The detection device of developing muography instrument consists of 64-channel silicon photomultipliers (SiPM), plastic scintillators, dynamic Time-Over-Threshold (dTOT) boards [2], data-acquisition (DAQ) board, and high-voltage power supply units. Incident muons react with the scintillator to emit weak light, and the light is amplified by SiPM attached to the both ends of the scintillator and read out with dTOT boards. The depth of interaction (DOI) in the scintillator is analyzed by measuring the pulse-height ratio of dual-sided readout. The size of the detector is 26.2 mm×26.2 mm×31.4 mm.

We first evaluated DOI resolution of this detector using a point beta-decay source of ^{90}Sr. The result indicates that the DOI resolution (FWHM) is 7.2 mm for the emitted beta rays with a spread of 2.2 mm. Then, we performed a Geant4 [3] simulation to examine the muon angular distribution that would be detected on the ground by this instrument. The result suggests that the structure of the detector makes the observation bias (Fig. 1). There are two solutions that can be considered to solve this problem: (1) developing one more detector and analyzing the coincident signals from dual-sided readout; (2) improving DOI resolution by performing accurate calibration.

We also performed a theoretical estimation to evaluate the muon production on Mars. Although the chemical composition and the density of Martian atmosphere are different from Earth's, the known muon flux in the upper earth atmosphere can be used for estimating the muon rates on Mars [4]. The result shows that the horizontal muon flux is greater than that on Earth (Fig. 2), which means that muography is more suitable for exploration of geological targets on Mars than on Earth.

In this presentation, we report the development status of the detection device and the concrete result of numerical calculation of radiation environment on Mars.

[P-PS04] Mars and Mars system: results from a broad spectrum of Mars studies and aspects for future missions

convener:Hideaki Miyamoto(University of Tokyo), Tomohiro Usui(Earth-Life Science Institute, Tokyo Institute of Technology), Ayako Matsuoka(Research Division for Space Plasma, Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Sushil K Atreya(University of Michigan Ann Arbor)

In view of unprecedented advances in our understanding of Mars, primarily due to new and ongoing observations of the planet with a number of spacecraft missions of the US, Europe and Asia, we propose a session on Mars. Mars is an object of intense scrutiny. Currently, eight spacecraft are operating at Mars, with six in orbit (Odyssey, MRO, MAVEN, Mars Express, Mangalyaan and TGO) and two on the surface (MSL-Curiosity and MER-Opportunity), the largest number ever at any given time. In addition, InSight is on track to land on Mars in November 2018, and several spacecraft are in various stages of implementation with launches scheduled for 2020 (Mars 2020, ExoMars 2020, Emirates Mars Mission Hope, Chinese Mars Mission and the Japanese Mars Terahertz Microsatellite), 2022 (ISRO's Mangalyaan 2), and 2024 (JAXA's MMX mission to explore Phobos, Deimos, and Mars). All this is a clear demonstration of public's strong fascination with and commitment to Mars exploration and the resulting scientific bonanza. Synergistic investigations with ongoing and already completed missions along with modeling studies and earth-based observations are gradually revealing the nature of Earth's most closely resembling planet that took on a different evolutionary track than our home planet. Morphology and variable phenomena seen on the surface (RSLs, e.g.) and in the atmosphere (methane) indicate that Mars is possibly currently active. Available data are providing a better understanding of Mars' present geologic and atmospheric state, climate evolution, and habitability. Thus, the scope of this session will be the recent results from a broad spectrum of Mars studies encompassing the interior, surface, atmosphere, plasma environment, and the Mars system including its two satellites. Abstracts on modelling, instrumentation and future mission plans are also encouraged.

Observation of the O_2^+ first negative band (1,0) emissions in the Mars ionosphere with a visible spectrograph on Haleakala T60

*Toshihisa Suzuki[1], Masato Kagitani[1], Takeshi Sakanoi[1]

1. PPARC, Graduate School of Science, Tohoku University

We carried out ground-based telescope observations of Martian ionospheric O_2^+ emission to obtain global distribution of Martian O_2^+ ionosphere and its variation for understanding Martian atmospheric escape process. After verifying the analysis method, the result suggests that the O_2^+ first negative bands (1NG) (1, 0) emissions are successfully detected, and calculated O_2^+ emission intensity and column density.
Mars has tenuous atmosphere compared with the Earth. One possible model for Martian tenuous atmosphere is caused by atmospheric escape to space for a long time. In addition, present Mars has only weak crustal magnetic fields for limited area, and therefore, it is likely that solar wind strongly affects Martian atmosphere escape. In recent years, ion composition and densities in the Martian ionosphere are revealed by Mars probes (e.g. Mars Express, MAVEN). In the Martian ionosphere, main ion is O_2^+ [M. Benna et al., 2015]. Moreover O_2^+ recombines with an electron, and as a result of a neutral molecule dissociation, neutral atomic oxygens are generated. Since the neutral atomic oxygen energy is higher than escape velocity of Mars, it can be escaped from Martian gravity. This process is important in Martian atmosphere escape. However, it is difficult to detect atomic oxygen by Mars probe in-situ observation, and escape quantity is indirectly estimated by plasma temperature and density from in-situ observations. On the other hand, remote-sensing of Martian ionosphere is useful to obtain global distribution and its time and spatial variations. It is essential to combine in-situ plasma data with global remote sensing for understanding Martian atmospheric escape, such as solar wind impact and/or crustal magnetic field effect on the escape process.
We carried out Martian ionosphere O_2^+ emission observation using Tohoku University T60 telescope (located at the summit of Mt. Haleakala in Maui) with Vispec (Visual imager and Spectrograph with Coronagraphy) from September 10 to 19, 2018. This is the first attempt to detect Martian O_2^+ emission with a ground-based telescope. We focused O_2^+ 1NG (1, 0) bands emission with a peak wavelength of about 561 nm. Visible Echelle spectrograph Vispec (wavelength resolution was 10,000) covered wavelength range from 550 nm to 570 nm. Vispec slit (width 2” ×length 90”) was located near Martian dayside limb parallel to the Martian rotation axis, and exposure time of one frame was 2 minutes. Total exposure time in observation period was 450 minutes. To refer sunlight spectrum reflecting by Martian surface, we acquired spectrum of disk center by Martian surface. First analysis process (subtraction dark, revision by flat-field, wavelength and space) was conducted on each frame, and each frame was added to gain S/N. Finally, sunlight spectrum was subtracted using disk center to obtain O_2^+ 1NG (1, 0) bands emission spectrum. Next, we compared observed O_2^+ spectrum with O_2^+ 1NG (1, 0) model spectrum given by Henriksen and Veseth [1987]. Focusing on only short period wavelength variations, we performed high-pass filter analysis on the both of observed and model spectrum. After that, we calculated the correlation coefficient between observed spectrum and model spectrum, and found that the coefficient maximum is 0.40 with no wavelength lag between two spectra. Data points, i.e., wavelength range, using correlation coefficient analysis were selected so that model O_2^+ emission is relatively intense and the contamination of solar fraunhofer absorption line is negligible. We estimated O_2^+ 1NG (1, 0) emission intensity with a least-square method to be 691 +/- 171 $\times 10^3$ Rayleighs, and the column density to be 4.4 +/- 1.1 $\times 10^{13}$ /cm^2. The estimated column density was greater than that of simulation. In this presentation, we compare O_2^+ emission observation spectrum with model spectrum, and give the estimation of O_2^+ emission intensity and column density in detail. We also give discussion about the

Search of shallow subsurface reflectors around RSLs in Martian Chryse and Acidalia planitiae by the MRO/SHARAD public data

*Aina Oura[1], Yasumasa Kasaba[1], Atsushi Kumamoto[1], Rina Noguchi[2], Tomohiro Usui[2], Ken Ishiyama[2], Chihiro Uemura[3]

1. Tohoku University, 2. Institute of Space and Astronautical Science, 3. SOKENDAI

One of recent discoveries on Mars is the recurring slope lineae (RSL), which are certain features on the surface invoking current icy processes. RSLs are distributed on Mars and these narrow features incrementally lengthen down steep slopes, fade in colder seasons, and recur annually. Candidate and confirmed RSL sites are distributed in four regions, (1) southern mid-latitudes (SML), (2) Valles Marineris (VM), (3) equatorial highlands, and (4) northern Chryse Planitia and southwestern Acidalia Planitia (CAP). The RSLs in (2) VM and (4) CAP are more densely located than other two areas.
This study tries to identify the subsurface structures of the northern mid-latitude RSL in (4) Chryse and Acidalia Planitiae by the public data of Mars shallow radar sounder (SHARAD) onboad the Mars Reconnaissance Orbiter opened on the PDS Geosciences Node. That is because CAP RSLs are densely distributed compared to other regions. CAP RSLs are found on the steep slopes of craters. Their source zones are at or below the elevation of the surrounding plains. We used the Java Mission-planning and Analysis for Remote Sensing (JMARS, https://jmars.asu.edu/) in order to investigate the geological information of the RSL sites and the MRO locations at the SHARAD observed data. We then picked up the location correspond to the RSL sites and generated radargrams from SHARAD data. The observation frequency of SHARAD is 15-25 MHz with the bandwidth of 10 MHz, and the subsurface close to the surface can potentially be resolved with the depth resolution of 15 m in vacuum. Using MOLA data, we generated the virtual radargrams with the surface clutter emulated by the Kirchhoff approximation. Then, we compared both observed radargrams with emulated ones to identify whether there are subsurface reflectors or not.
We surveyed about 12 orbits close to the confirmed RSLs. We could find the hypothetical detection of the subsurface reflector in ‘orbit.00688101’ (Jan 14 2008, N10.0-44.7˚, E313.6-318.3˚) and ‘orbit.00673602’ (Jan 03 2008, N10.1-44.7˚, E312.7-317.4˚). In this abstract, we concentrated the characteristics of the former candidate. In this sample, the closest RSL located at N34.1˚, E317.0˚ and nadir line from the orbit was 13.8 km. Another RSL close to this orbit located N34.8˚, E318.6˚ and nadir line from the orbit was 85.2 km. Apparent elevation of closest RSL was about -3,763 ±10 m. The deepest elevation of the crater was about -4,744 ±10 m and the highest elevation of it was about -3,640 ±10 m. The radargram of this orbit showed that the elevation of surface echo was in the range from -3720 to -3780 m and that of subsurface echo ranged from -3750 to -3800 m. This means that the closest RSL height was almost the same as the depth of subsurface reflector. The subsurface echo located 25 m below the surface, and it had a little bit weak echo strength compared to surface one. If this subsurface echo shows the underground reflection, the subsurface layer will be 180 km wide along the orbit. Although this depth is marginal for the depth resolution of SHARAD, we could not identify such an echo in the emulated radargram.
In the presentation, we will summarize the results of this region including other orbits.

Detecting surface changes on Mars using principle component analysis of repeat imagery

*Reid Parsons[1], Hideaki Miyamoto[1]

1. University of Tokyo

Change detection is an analytical tool of Remote Sensing in which repeat observations of a particular location can be overlain, subtracted, or ratioed to detect differences between images. High-resolution, repeat imagery on Mars has led to several discoveries of ongoing geologic processes operating at the sub-kilometer scale such as recurring slope lineae (RSL) [1-3], new, small impacts [4], aeolian dune migration [5], sublimation of polar ice [6], and gully formation [7]. Generally, the detection of these changes is done manually by overlaying, and “flipping” between the two images. As planetary remote sensing data sets continue to grow, so does the need for a more efficient means of change detection.

Principle component analysis (PCA) offers an advantageous means for detecting change because it considers the values of all pixels in all the repeat images to extract the most statistically significant variations. These variations are then isolated from one another as a hierarchical set of “principle components” of the image dataset. The user can quickly identify patterns or features of interest which are present in one or more of these components. To illustrate this method, nine HiRISE images [8] collected from Palikir crater on Mars between November 2007 and June 2011 documenting RSL formation will be used.

PCA changes the values of the pixels in each image by plotting the pixel data on a set of axes which capture the maximum variance in the dataset. In our example image set, each pixel in the image stack can be treated as a 9-dimensional vector since there is a value for that pixel in each of the nine images. However, each pixel can be plotted on a new set of axes that capture the most important, or PCs of the image stack.

The figure shows the result of the PC transform (performed using ENVI® software) on the stacked time-series. Because most of the variation in the images is captured in the first PC (PCA1), it uses a grayscale color bar spanning 0-255 pixel values. Generally, variations covering a large spatial extent or variations causing a big shift in pixel values will be captured in the lower PCA components. Higher components, on the other hand, will depict smaller amplitude variations occurring in fewer images (or over smaller spatial extents). Thus, components 2 and 3 (panels b and c, respectively) are dominated by variations caused by differences in lighting (sun direction and elevation angle) and possibly dust or frost deposition/erosion. RSL features are identifiable in PCA4 (panel d) as elongated blue “fingers” and become more dominant and appear red in PCA5 (panel e). Subsequent components capture smaller variations caused either by changes in lighting, RSL shape (in PCA 8 and 9), or camera noise.

After identifying the PCs which contain the feature of interest, the feature can be traced back to the original images via an inverting from PC coordinates to image coordinates. Although this step is not completely reliable, it is successful in determining which images contain the most prominent RSL. Eventual combination of this method with machine-learning algorithms may permit a more automated means of detecting interesting surface changes on Mars and other planetary bodies. Note this work was previously published in [9].

Evaluation of the detectability of hydrated salts on recurring slope lineae on Mars.

*Shoko Imamura[1,2], Yasuhito Sekine[2], Hiroyuki Kurokawa[2]

1. University of Tokyo, 2. Earth-Life Science Institute, Tokyo Institute of Technology

On present-day Mars, pure liquid water is thermodynamically unstable; whereas, high-salinity brine can exist on the surface, at least temporally, due to freezing point depression [1]. Deliquescence and melting of subsurface ice are proposed as being the major processes of formation of liquid brine on Mars [2, 3]. Although liquid brine is suggested to form upon Mars' daily and seasonal changes [2, 3], generation of brine flow has not been confirmed on current Mars. Our previous study suggests that cycles of formation and evaporation of liquid brine can generate characteristic morphological features of downward-elongated flows on steep slopes [4]. This happens because precipitated salts within soil dramatically decrease the porosity and permeability, leading generation of surface flows [4]. Our study also suggests that precipitation of salts reaches up to ~30% in volume within the soil, implying that any detection of such salt may be evidence for the occurrence of brine flow on current Mars [4]. Proposed morphological features formed by current brine activity include recurring slope lineae (RSL) [5, 6]. Although hydrated salts are suggested to exist on RSL at a few locations [6], identification of salt compositions is still challenging. Additionally, there are no reports on detection of hydrated salts at most of the RSL sites across Mars.

In the present study, we investigate the conditions of identification of hydrated salt compositions on RSL using Compact Reconnaissance Imaging Spectrometer for Mars (CRISM) onboarded on Mars Reconnaissance Orbiter (MRO). We calculate synthesized spectra of mixtures of basaltic soil and various hydrated salts (such as $MgCl_2 \cdot 2H_2O$) with the different mixing ratios using a linear combination method and an addition of random noise with a Gaussian distribution. We evaluate the threshold mixing ratios of salt for the identification of the salt compositions based on the analyses of the synthesized spectra. Our results show that if the mixing ratio of hydrated salt exceeds 20% in volume, O-H bands attributed from hydrated salts can be detected with CRISM. We discuss the observational conditions, such as the observational altitude from the surface, for the identification of salt compositions on RSL in future missions.

Frequency of ice sheet growth recorded on Mons Pavonis, Mars

*Tomohiro Kanzaki[1], Reid Parsons[1,2], Ryodo Hemmi[1], Hideaki Miyamoto[1]

1. University of Tokyo, 2. Fitchburg State University

On present-day Mars, large scale ice bodies are only found at each pole. However, in mid latitudinal areas, LDA (lobate debris apron), LVF (lineated valley fill), CCF (concentric crater fill) are reported and interpreted to have a glacial origin (Levy et al., 2014). Also, inequatorial areas, fan-shaped deposits at northwestern rim of three shield volcanos in Tharsis region though to have a glacial origin (e.g. Fastook et al., 2008).
Fan-shaped deposits sit beside three Tharsis montes and have characteristic geomorphologies extending for roughly 100-500 km from the foot of mountain, typically consisting of three facies: Smooth facies at the top, Knobby facies at the middle, and Ridged facies at the rim. Smooth facies are smooth-surfaced mounds which superpose on other facies, Knobby facies are collective hillocks a few hundred meters in radius, and Ridged facies are linear ridges (moraine-like features) parallel to the rim of the fan. At Arsia (Kadish et al., 2014) and Pavonis (Shean et al., 2005) Mons, ridged facies are especialy well-developed - containing tens to few hundreds of ridges interpreted to be moraines that indicates the varying extent of a former ice sheet. Such geomorphologies potentially record the advance and retreat of ice sheet for tens of kilometers during the Amazonian adjacent to Arsia and Pavonis Mons.
The association of these geomorphologic features to glacial processes is supported by global climate simulations of Mars during high-obliquity (Forget, 2006). The obliquity of the rotation axis of Mars is considered not stable as on the Earth, reaching 45˚ in the past 20 Myrs (Laskar et al., 2004). Such high obliquity can cause sublimation of the polar cap, enhancing the water vapor content in the atmosphere compared to present-day Mars. By diffusion and condensation model, Mellon & Jakosky (1995) found that in the surface environment of present-day Martian obliquity (25.2˚) water ice is stable only at 40˚ latitude or higher, however, when obliquity gets higher than 32.3˚, with enough amount of atmospheric water vapor, water ice becomes stable globally. This result suggests Martian surface environment has experienced such climate condition that water ice condenses and deposits in mid and low latitudinal areas. Therefore, the existence of Martian “ice age” during Amazonian high-obliquity periods is being proposed (Head et al., 2003).
If ice sheet growth and disappearance on the flanks of Tharsis Montes are an indication of the climate change caused by orbital parameters, each of moraine-like features should correspond to a paleoclimate cycle. However, fluctuation of its spacing, scale and correlation to orbital parameter have not yet been discussed. Hence, as basic study to associate distribution of moraine-like features to extent of the ice sheet, we made DEM data from CTX imagery at the rim of fan-shaped deposits at the foot of Mons Pavonis, and using the DEM data, we measured spacing and cross-sectional area of each moraine, and conducted frequency analysis on the cross section of DEM data.
As a result, spacing of moraine-like feature appeared to fluctuate from few hundred meters to 4.5 km, showing drastic change of the density. Also, cross sectional area of moraine-like feature fluctuates up to 1.4×10^4 m^2. These fluctuations potentially record the change of frequency of events that caused accumulation and ablation of ice sheet or change of velocity of ice sheet flow. In Tharsis region, these two periodic events are assumed to affect ice sheet: global climate change caused by orbital parameter, and local volcanic activity. To prove the spacing and moraine-size are driven by global climate forcings, there should be similarities between the ridges found at Pavonis, Arsia, and a correlation to orbital parameters. Therefore, frequency analysis of cross- sectional view of the terrain is being conducted. The result will be shown in the presentation.

Development of Life Detection Microscope (LDM) for *in situ* imaging of living cells on Mars surface

*Yoshitaka Yoshimura[1], Akihiko Yamagishi[2], Takehiko Satoh[3], Atsuo Miyakawa[2], Eiichi Imai[4], Satoshi Sasaki[5], Kensei Kobayashi[6], Yoko Kebukawa[6], Tomoka Okada[6], Keigo Enya[3], Hikaru Yabuta[7], Takeshi Naganuma[7], Hajime Mita[8], Kazuhisa Fujita[3], Tomohiro Usui[3]

Tokyo University of Technology, 6. Yokohama National University, 7. Hiroshima University, 8. Fukuoka Institute of Technology

Past trial of direct detection of life on Mars by 1970's Viking mission ended up with a negative conclusion [1]. Whereas, numbers of new finding provided by Mars exploration missions in the last decade indicate that there are good reasons to perform another life detection program. The sensitivity of the gas chromatograph mass spectrometer onboard the Viking mission was not very high, and was not able to detect the microbes 10^6 cells in 1 gram clay [2,3]. Resent observations on Mars have found the evidences of past water activities. MSL Curiosity has found the temporal increase of methane concentration in Martian atmosphere [4]. The presence of reduced sulfur compound such as pyrite in Martian soil was also detected by MSL [5]. Methane and reduced sulfur compound can be the energy source to support the growth of chemoautotrophic microbes [6]. Possible presence of liquid water at Recurring Slope Lineae has been supported by the detection of hydrated salts [7]. The presence of organic compounds of Martian origin has been reported [8]. These evidences tend to support the possible presence of living microbes near the surface of Mars.

Physical and chemical limits for terrestrial life have been major foci in astrobiology [9], and are summarized in ref. [6]. Combining the environmental factors, anywhere in the Martian environment where we can find the three components, water molecules, reducing compounds and oxidative compounds could be an environment where life can be sustained for long periods of time, if other factors such as temperature, pressure, UV and other radiations permit [6]. Among these factors, most of the factors including ionic radiation, can be endured by terrestrial extremophiles. Only UV can kill the most UV-resistant microbes within minutes. However, UV can be shielded by a few centimeters soil layer. These evaluations lead to the conclusion that the Martian soil under a few cm can be the place to support the growth of microbes, if the water activity is higher than 0.6.

For exploring extant life on Mars, we have proposed to search cells from a depth of about 5 - 10 cm below the surface by the Life Detection Microscope (LDM) [6, 10]. LDM has the potential to detect single cells in the resolution of 1 micrometer and could detect less than 10^4 cells in 1 gram clay, which is much higher sensitivity than the instrument onboard Viking. We have developed the solution and combination of fluorescence pigments to detect organic compounds, and to differentiate organic compounds surrounded by membrane, which we think to be the most fundamental features that a cell should possess to constitute life. Our investigation goals are the followings. 1) Identify cell-like structure in which organic compounds are enveloped by membrane, which may represent Martian life. 2) Search for any type of organic compounds in Mars surface samples. The compounds include cells, other biological materials, and abiotic polycyclic aromatic hydrocarbon (PAH). 3) High-resolution characterization of regolith and dust particles. The current status of development of LDM will be presented.

Development of a Mars Web-GIS for viewing multiple kinds of spectral data from orbiters

*Yuya Matsubara[1], Hironori Fukuchi[1], Yoshiko Ogawa[1], Yohei Hayashi[2]

1. The University of Aizu, 2. National Astronomical Observatory of Japan

The VIS-NIR reflectance spectra observed during latest Mars orbiter missions are of high quality and cover the whole globe. Such data sets are very informative for understanding the materials and their distribution on the surface. Each mineral has unique absorption bands in the spectra. We can identify which minerals are present by comparing the absorption bands of the observed spectra with the known absorption bands in the spectra measured in laboratories. In the case of Mars, we can estimate the type and distribution of hydrous minerals which leads to important clues to understand the water environment.

However, the VIS-NIR spectral data observed on Mars are not well utilized among the community. There are huge volume of accumulated data due to an increasing number of missions and various kinds of instruments with higher accuracy. It is not easy to process huge data and understand the relevance of them visually and intuitively.

We develop a new Mars web-GIS application, "Red Ace", to view and download the Mars observation data, especially the VIS-NIR spectra (image cube data format), easily and intuitively. The Red Ace handles multiple kinds of observation data: the Compact Reconnaissance Imaging Spectrometers for Mars (CRISM) data, the Thermal Emission Imaging System (THEMIS) data and DEM (Digital Elevation Model) data at the same time. Additionally, we use the DEM data from the Mars Orbiter Laser Altimeter (MOLA) to display 3D map of Mars with the Red Ace.

The Red Ace is developed based on CesiumJS that is an open source JavaScript library for 2D/3D maps. The user can choose the dimension of the map. In the Red Ace, the spectral observation points are displayed on the surface image layers. When the user clicks any point on the footprint of the layer, the color of the selected footprint changes and the thumbnail image appears. When the user selects any pixel on the thumbnail image, the Red Ace provides reflectance spectral data and ancillary data as graphs and tables. In response to user operation, multiple kinds of spectral data are displayed on the same window. The Red Ace also provides band- ratio images of THEMIS. The user can download band-ratio images, spectral data and ancillary data as files of PNG, CSV, JSON, XLSX and PVL formats. The user can move the windows displaying thumbnail image and graph freely. In addition, the Red Ace provides the function to control the Mars base map changing the exaggeration of height of the Mars globe. The user can change the order of layers and transparency of layers arbitrarily. The user can also jump to the region of interest directly by setting the coordinates and the zoom level. The user can handle these functions smoothly.

In the case of THEMIS, published data from the mission data archive are not reflectance data but radiance data. Therefore, the Red Ace derives reflectance data from radiance data and ancillary data, in order to compare them with CRISM spectra observed in the same spot.
In this study, considering the portability and extension of the application, the Docker was used for the development environment. Docker is an open source software platform that allow the user to develop applications quickly using containers. JSON format is adopted for data handling to make it easier to add new observation data from new observation equipments in the future. In the JSON format, it is unnecessary to associate item order and item meaning. Hence, it has high reusability and freedom. In the

©2019. Japan Geoscience Union. All Right Reserved.

Red Ace, by standardizing the structure of JSON format data in advance, it is possible to store and handle diverse data by using the same data structure.

Visualization and Analysis of the Surface of Mars with NASA's Mars Trek Portal

*Brian Hamilton Day[1], Emily Law[2]

1. NASA Solar System Exploration Research Virtual Institute, NASA Ames Research Center, 2. NASA Jet Propulsion Laboratory, California Institute of Technology

Originally released in June, 2015 as a public outreach tool, Mars Trek is currently being enhanced to support site selection and analysis for upcoming human and robotic missions to Mars. Many new data products are being added, with emphasis on providing detailed information for proposed exploration zones. Data products can be loaded and even combined from many different instruments aboard many different Mars-orbiting spacecraft including Viking, Mars Global Surveyor, Mars Odyssey, Mars Reconnaissance Orbiter, and Mars Express. Users can download data products from Mars Trek and access metadata for each product. Web services and APIs allow other clients to access data from Mars Trek's servers. A standardized interface across the Trek portals provides for advanced 3D visualization and navigation. Standard keyboard gaming controls allow the user to maneuver a first-person visualization of "flying" across the surface of the Mars. User-specified bounding boxes can be used to generate STL and/or OBJ files to create physical models of surface features with 3D printers. A new VR capability allows users to generate their own virtual reality flyovers for any user-defined paths along the Mars' surface.

Mars Trek's power as a tool for education and outreach is exemplified by its being designated as key supporting infrastructure for NASA Science Mission Directorate's STEM Activation Initiative, and its serving of data to a growing community of digital planetariums.

As private industry and space agencies of a growing number of nations plan new missions to Mars, detailed maps and models of Mars' surface and climate will be essential for mission planning. Mars Trek's generalized suite of tools are being designed to meet the needs of this new generation of missions. The portal will also provide an outstanding means of dissemination of data from these missions. Layering and blending many different data products and putting individual products in the context of many others will facilitate mining of information going far beyond what individual products can provide separately. In addition to mission planning and planetary science, Mars Trek will continue supporting the essential task of engaging the public in this great adventure. Mars Trek is developed at NASA's Jet Propulsion Laboratory (JPL) and managed as a project of NASA's Solar System Exploration Research Virtual Institute (SSERVI) at NASA Ames Research Center.

At the request of the Planetary Science Division of NASA's Science Mission Directorate, we are extending the technologies of our existing Trek platforms to create a new portal for Mars' largest moon, Phobos. In this effort, we are working with the International Phobos/Deimos Landing Site Working Group and with JAXA, with JAXA's MMX mission as a primary driver.
Mars Trek is one of the portals in the NASA Solar System Treks Project (SSTP), available at https://trek.nasa.gov. NASA's Solar System Trek online portals provide web-based suites of interactive data visualization and analysis tools to enable mission planners, planetary scientists, students, and the general public to access mapped data products from past and current missions for a growing number of planetary bodies including the Moon, Mars, Vesta, etc. These portals are being used for site selection and analysis by NASA and a number of its international partners, supporting upcoming missions. In addition to demonstrating the capabilities of Mars Trek in this presentation and providing a preview of Phobos Trek,

©2019. Japan Geoscience Union. All Right Reserved.

we will solicit input from the community for ideas for future enhancements to the portals.

Increase in Dissolved Iron Concentration from Fayalite by UltravioletA・C Irradiation

*Nobuo Komori[1]

1. The United Graduate School of Education Tokyo Gakugei University

To investigate the mystery of “Why the Mars' surface with poor oxgen has so much iron oxide" I have led student experiments at junior high schools. I will show my recent experiments and their results.
A.S.Yen (1999) showed that reactive oxygen species can also be formed on mineral grains under Martian conditions by irradiating ultraviolet C to quartz samples. Furthermore he irradiated ultraviolet C to thin iron films in the air and showed that exposure to ultraviolet radiation increases the rate of oxide formation. My experiments was irradiating ultraviolet A and C to fayalites and iron in acid water. This results indicated the possibility that iron oxides might be formed because of ultraviolet rays other than the cause of reactive oxygen species in the past.
Experiment no.1:
I had students irradiate ultraviolet rays A and C to Fayalite in hydrochloric acid.I had students irradiate ultraviolet rays A and C to Fayalite in hydrochloric acid. In this experiment, I used Fayalite from Kawamata-machi, Fukushima.
Fayalite, which is about 1g and not formatted was put in the test tube in the test tube filled with hydrochloric acid pH2.After the experiment, I had students check the concentration of iron ions in the water solution by using a digital pack test. This experiment with ultraviolet rays A was carried out 7 times and the experiment with ulttaviolet rays was carried out 3times.According to the results of the experiment with ultraviolet rays A, the quantity of iron elution increased more in the case of ultraviolet rays irradiating 6 times out of 7 than with the result of no irradiation.The results of the experiment with ultraviolet rays C were idential (3 times out of 3). The peak of wavelength ultraviolet rays A is generated by black lite is 365 nm. The peak of wavelength ultraviolet rays C is generated by germicidal lamp is 245 nm.
Experiments no.2:
I had the students irradiate ultraviolet rays A to a battery that has the iron cathode copper anode in hydrochloric acid. The Students then measured the occured voltage of the battery. I compared the voltage between ultla violet rays irradiation and non irradiation.The irradiated battery’s voltage stayed over 0.2V and the voltage did not decrease after 150hours.Another non-irradiated battery’s voltage decreased lower little by little and the voltage was close to 0V after 150 hours.This experiment was carried out 4times. In all cases the voltage of the battery that was irradiated by ultraviolet rays was higher than the non-irradiated battery.
It seems that electrons dissociate from iron atoms by ultlaviolet energy and form iron ions.
Consideration
From my experiments results, I would infer that ultraviolet rays advance the dissolution of iron ion from fayalite and iron. I think ultraviolet rays are one of the causes of iron oxide and hidroxide existing on Mars’ surface besides reactive oxygen species.It seems that there was water on Mars’ surface. There was a possibility that advancing of iron dissolution from rocks on Mars by ultraviolet rays irradiation.

Small-scale ridges newly identified on the equatorial region of the Phobos nearside

*Ryodo Hemmi[1], Hiroshi Kikuchi[1], Hideaki Miyamoto[1]

1. The University of Tokyo

Although the craters and grooves on Phobos are indicative of widespread and abundant surface modification during Phobos' geologic history [Basilevsky et al., 2014], little definitive evidence exists for geologically recent regolith migration other than down-slope mass-wasting [Shi et al., 2016]. Here we report newly found small-scale sinuous ridges identified in Mars Reconnaissance Orbiter's High Resolution Imaging Science Experiment (HiRISE [McEwen et al., 2007]) images of the nearside of Phobos. These ridges are spatially focused within the equatorial region (-5° to 20° N). Some of them superpose on craters and grooves, which is consistent with a geologically recent activity. They are ~200 m to ~1 km in length, several 10's m in width, and most of them are roughly parallel to each other and are generally oriented in NE-SW direction. To extract detailed topographic profiles, we constructed a high-resolution (~5-6 m/pixel; almost same as the original image) digital elevation model (DEM) by using shape-from-shading [Alexandrov and Beyer, 2018] in the selected regions of a HiRISE image and a stereo-derived HiRISE DEM (20 m/pixel) [Hemmi and Miyamoto, 2019]. Our preliminary analysis shows these ridges are less than several meters high. Their morphology and topography are unlikely to be formed by impact cratering, extensional stress fields, or mass wasting processes. In this presentation, we provide initial results of geological mapping of the small-scale ridges and discuss their possible origins.

Development of a compact Muography instrument for future Mars exploration missions

*Hiroaki Kamiyoshihara[1], Tetsuro Ninomiya[1], Yuri Yoshihara[1], Kenji Shimazoe[1], Hiroyuki Takahashi[1], Hiroyuki Tanaka[1], Hideaki Miyamoto[1]

1. University of Tokyo

Muography is a technique that uses cosmic ray muons for visualizing the interior of large-scale structures in much the same way as standard X-ray radiography is used to image the interior of smaller objects. Muography has been successfully applied to explore the internal structure of geological targets on earth. Because exploring the inner structure of the shallow subsurface of celestial bodies is important to understand their origin and evolution, we are planning to operate muography instrument in the extraterrestrial environment, especially on the surface of Mars. Applying muography to planetary explorations has some advantages over conventional internal exploration methods: (1) it is able to observe the absolute linear density of objects; (2) the passive nature of the measurements provides low power consumption; (3) the instrument size is arbitral [1]. However, in order to mount muography instrument on a spacecraft, it is essential to downsize the instrument and investigate the radiation environment on the surface of the celestial body. In this study, we designed and developed a compact muography instrument based on the knowledge of compact gamma ray detectors for nuclear medicine imaging. At the same time, we theoretically estimated the muon production on Mars and evaluated the validity of using muography instrument on Mars.

The detection device of developing muography instrument consists of 64-channel silicon photomultipliers (SiPM), plastic scintillators, dynamic Time-Over-Threshold (dTOT) boards [2], data-acquisition (DAQ) board, and high-voltage power supply units. Incident muons react with the scintillator to emit weak light, and the light is amplified by SiPM attached to the both ends of the scintillator and read out with dTOT boards. The depth of interaction (DOI) in the scintillator is analyzed by measuring the pulse-height ratio of dual-sided readout. The size of the detector is 26.2 mm×26.2 mm×31.4 mm.

We first evaluated DOI resolution of this detector using a point beta-decay source of ^{90}Sr. The result indicates that the DOI resolution (FWHM) is 7.2 mm for the emitted beta rays with a spread of 2.2 mm. Then, we performed a Geant4 [3] simulation to examine the muon angular distribution that would be detected on the ground by this instrument. The result suggests that the structure of the detector makes the observation bias (Fig. 1). There are two solutions that can be considered to solve this problem: (1) developing one more detector and analyzing the coincident signals from dual-sided readout; (2) improving DOI resolution by performing accurate calibration.

We also performed a theoretical estimation to evaluate the muon production on Mars. Although the chemical composition and the density of Martian atmosphere are different from Earth's, the known muon flux in the upper earth atmosphere can be used for estimating the muon rates on Mars [4]. The result shows that the horizontal muon flux is greater than that on Earth (Fig. 2), which means that muography is more suitable for exploration of geological targets on Mars than on Earth.

In this presentation, we report the development status of the detection device and the concrete result of numerical calculation of radiation environment on Mars.

[P-PS07] Formation and evolution of planetary materials in the Solar System

convener:Yoko Kebukawa(Faculty of Engineering, Yokohama National University), Wataru Fujiya(Ibaraki University, College of Science), Shin Ozawa(Department of Earth Science, Graduate School of Science, Tohoku University), Megumi Matsumoto(Graduate School of Science, Tohoku University), Chairperson:Megumi Matsumoto, Wataru Fujiya

This session will focus on the evolution in the Solar System with interaction and co-evolution in minerals, water, organic matter, and noble gas in meteorites and interplanetary dust particles. New innovative analytical and theoretical techniques in various fields will be discussed. The developing methods are welcome to submit for the future mainstream of meteorite study. In order to explore the planetary materials and their evolution, both meteorite studies and experimental approaches are necessary. In this session, we will discuss these topics from extraterrestrial sample analyses and experimental works. Research works on undifferentiated and differentiated meteorites and parent body processes such as aqueous alteration, thermal metamorphism, shock metamorphism, volcanic activity, and core-mantle-crust differentiation are especially included in this session.

Sugars are essential components of DNA and RNA and also are essential substrates of glycolysis. Ribose is especially an important sugar as the sole component in RNA that supports both genotype and phenotype of primordial life. Investigations of sugars in meteorites have been conducted since more than 50 years ago. However, no extraterrestrial sugar that composes life has been found from any astronomical samples including meteorites, although several sugar-related compounds have been detected from meteorites. This would be preliminary because of the low concentration, difficulty in extraction, and the absence of suitable derivatization for gas chromatographic separation. Therefore, we developed a protocol to extract and analyze sugars in meteorites. We have also investigated the compound-specific carbon isotope ratios ($\delta^{13}C$ values) of sugars. All meteorites have some possibilities of biological contamination, since they have been collected on the terrestrial environment filled with biota. Thus, the evaluation of the source of sugars in meteorites (i.e., biological or extraterrestrial) is significantly important. Biological sugars are all have negative $\delta^{13}C$ values (against VPDB). Conversely, soluble organic compounds in meteorites like amino acids, nucleobases, amines, and sugar-related compounds all have positive carbon $\delta^{13}C$ values. Thus, the isotope ratios are an essential indicator for the evaluation of the origin of sugars in meteorites. In this presentation, we show the results of identification and carbon isotope ratio analysis of sugars for two CR2 chondrites. We also report the mineral composition, and chemical state of C in insoluble organic matter in these meteorites.

Establishment of ice sublimation method for detection of soluble organic matter contained in Antarctic micrometeorites in Antarctic glacier ice

*Yui Ishikawa[1], Yamamoto Kota[1], Hiroshi Naraoka[2], Toru Yada[3], Tatsuaki Okada[1,3]

1. Graduate School of Science, The University of Tokyo, 2. Graduate School of Science, Kyushu University, 3. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency

Earth is habitable even in the inner planetary region where volatiles are depleted, so that there should be sources and mechanism to supply them to earth. It has been revealed by the recent exploration of outer planets and comets that volatile components such as water and organics exist abundantly in the outer planetary region, where it is colder than in the inner planetary region. According to the researches, the existence of organic matter cannot be ignored for understanding the nature of small bodies in the outer planetary region (e.g., bodies in Edgeworth Kuiper Belt bodies or Oort Cloud). As means to get samples of that region not in the space but on the Earth, there are Antarctic MicroMeteorites (AMMs) [1]. There are interplanetary dust particles (IDPs) drifting in the interplanetary space, ejected from small solar system bodies such as asteroids and comets. Those dusts are called micrometeorites when they fall to the earth, and they are called AMMs especially when they fall to the Antarctic ice sheets. The size of MMs is defined as less than 2 mm. The accretion rate of MMs reaching the Earth’ s surface has been estimated tens of thousand tons in the previous study, which is about ten times as much as the annual influx of meteorites to the Earth [2]. Since soluble organic matter (SOM) and insoluble organic matter (IOM) are present in the MMs, it is considered that MMs rather than meteorites dominantly contributed to the supply of volatile components to the inner planetary region where they were deficient [3].

In order to understand chemical characteristics of organics in IDPs, we are aiming for the detection of SOM in AMMs. While it is difficult to determine the structure of IOM because they are Kerogen-like macromolecules, the structure of SOM can be determined. Therefore, it can be the key of elucidating the evolution of materials (chemical reaction) in the low temperature environment of the outer solar system specifically. In the previous study, samples were collected by filtering the melted water, so that no molecular species were evidently identified to have originated from primitive MMs [4, 5]. In this study, ice blocks that were collected from an ice sheet in Antarctica were sublimated as it was in order to prevent the leakage of SOM during sample collection. The apparatus for sublimation of ice blocks consists of a vacuum chamber with a sample holding jig and a dish for collecting sublimation residue set in the climate chamber. In order to prevent the ice blocks from melting before it is enough evacuated, the temperature in the climate chamber was set at -10.0 degrees Celsius. The whole apparatus was set and cooled in advance in the climate chamber. After ice blocks were set on the jig in the vacuum chamber, evacuation was started. In order to increase the efficiency of sublimation, the temperature in the climate chamber was set at 40.0 degrees Celsius after the pressure in the chamber reaching about 80 Pa.

About 330 g of Antarctica ice blocks were sublimated experimentally using the above apparatus. The residue was observed with a stereoscopic microscope. Most of the residue was occupied with white aggregated particles. According to the part of the observation by SEM-EDS, it was found that they are composed of Na, Cl, Ca, C, O and other elements. Their chemical compositions indicate that they should be marine or continental aerosols [6]. Particles composed of silicate minerals containing Mg and Fe were also found in the residue. The composition of them is consistent with that of AMMs [7]. However, it needs

©2019. Japan Geoscience Union. All Right Reserved.

to be confirmed whether it is AMM by analytical methods such as μ-FTIR, μ-Raman, DESI-Orbitrap MAS and so on. We are planning to analyze samples in various ways, mainly on the degree of polymerization of insoluble organic matter and identification of soluble organic matter.

Magnesium-containing organic compounds in the Tagish Lake and Murchison meteorites.

*Minako Hashiguchi[1], Hiroshi Naraoka[2,1]

1. Research Center for Planetary Trace Organic Compounds, Kyushu University, 2. Department of Earth and Planetary Sciences, Kyushu University

Introduction: Recent compound analyses using high-resolution mass spectrometry (HRMS) from the solvent extracts of the Murchison meteorite (CM2) reported various CHO, CHNO, CHOS and CHNOS compounds [Schmitt-Kopplin *et al.*, 2010] and ~600 alkylated homologues of CHN compounds [Naraoka *et al.*, 2017]. CHOMg compounds were also identified from methanol extracts of various meteorites by using HRMS [Ruf *et al.*, 2017]. To understand chemical evolution of the meteoritic organic matter, investigation of their relationship with surrounding minerals by *in-situ* analysis is necessary. Our previous studies revealed spatial distribution of alkylated homologues of CHN compounds in the Murray and Murchison meteorites using desorption electrospray ionization (DESI) with HRMS [Naraoka and Hashiguchi, 2018; Hashiguchi and Naraoka, 2019], but clear relationship with specific minerals was not found. In this study, we carried out DESI-HRMS imaging on the Tagish Lake meteorite to reveal the relationship between SOM and minerals.

Experimental: Fragments of the Tagish Lake (Ung-C2) meteorite and the Murchison meteorite with a flat surface of each meteorite were embedded in indium or alloy with low melting point (60 ºC). The DESI-HRMS imaging was performed using a 2D DESI ion source equipped with Orbitrap MS. A spray solvent was methanol 100% with the flow rate of 2–3 μL/min, and electrospray voltage was set at 3 kV. The positive ions (m/z 60–500) were collected with mass resolution of 140,000 ($m/\Delta m$ at m/z 200) on the surface of Tagish Lake (2.5×2.5 mm^2) and Murchison (4.5×4.5 mm^2). Antigorite grains was also analyzed to understand adsorption effects of organic compounds on clay minerals during storage in a clean room (Class 1000). After the imaging, FE-SEM-EDS analysis was carried out on the samples without coating and polishing.

Results and Discussion: Any CHN compounds were not detected from the Tagish Lake by DESI-HRMS imaging, whereas several alkylated homologues of CHN compounds were identified from Murchison similar to the previous study [Hashiguchi and Naraoka et al., 2019]. The distinctly different organic characteristics between the two meteorites was contrast to previous bulk analysis showing its quite low abundance of CHN compounds in Tagish Lake relative to Murchison [e.g. Pizzarello *et al.*, 2006]. Instead of the CHN compounds, abundant Mg-containing organic compounds were identified from Tagish Lake with mass precision of <1.5 ppm. Isotopomers of $^{24\text{-}26}$Mg for compounds were identified using the exact mass and Mg isotope simulation. Several families of $C_nH_mO_xMg^+$ (n=0-10) different from the compounds identified by Ruf *et al.* (2017), and $C_nH_mN_yO_xMg^+$ (n=1-7) were assigned using Kendrick mass defect plots. The Mg-organic compounds were also detected from Murchison, however, the abundance was more than an order of magnitude lower than that in Tagish Lake. By DESI-HRMS analysis on antigorite grains, some Mg-organic compounds (e.g. $C_nH_{2n+2}NO_2Mg^+$ families) showed high ion intensity after storage for 1 month, indicating their adsorption effects on the clay minerals. In contrast, other Mg-organic compounds were not found by the adsorption effect, suggesting that these compounds were indigenous in the meteorites.

The CHOMg and CHNOMg compounds showed a similar spatial distribution with various intensity among the different families in both meteorites. In the Tagish Lake meteorite, they were likely to be concentrated in the matrix with less framboidal magnetite and relatively saponite/serpentine-rich region. This indicates that the Mg-organic compounds might have been formed by ion exchange between organic species and

©2019. Japan Geoscience Union. All Right Reserved.

the clay minerals during aqueous alteration. Moreover, the Mg-organic compounds and CHN compounds were also distributed in matrix of Murchison, however, their spatial distributions were different, suggesting different origins between these compounds.

Interactions between minerals and organic materials on thermal processes in meteorite parent bodies

*Naoki Hirakawa[1], Yoko Kebukawa[1], Kensei Kobayashi[1]

1. Yokohama National University

Introduction:
Carbonaceous chondrites and several other chondrites contain a few wt.% of organic matters. Pearson et al. (2002) reported co-existence of organic matters with phyllosilicates in the matrix or chondrule rim and discussed the roles of phyllosilicates on alteration of organic matters during aqueous processing in a meteorite parent body. However, interaction between minerals and organics has not been well-known compared to interactions between minerals and water or organics and water. In this study, molecular cloud organic material analogue (Kouchi et al, 2002; hereafter called MC) was heated with powdered minerals using an autoclave to understand, 1) the effect of minerals on thermal metamorphism of organic matter, 2) whether minerals were affected by organic matter or not.

Methods:
MC was prepared by mixing chemical compounds based on Kouchi et al. (2002). Samples used in this study were MC (5 g), MC (0.25 g) with olivine (0.25 g), and MC (0.25 g) + montmorillonite (0.25 g). Each sample was put in a pyrex glass tube without sealing and the tube was placed in the autoclave. The autoclave was purged with N2+H2 gas mixture (99 : 1, v/v). The samples were heated at 200 ˚C, 300 ˚C, and 400 ˚C in the autoclave for 5 hours under 1 atm. After cooling to room temperature, recovered samples were analyzed using FT-IR, GC/MS, XRD and SEM-EDS.

Results and Discussion:
MC heated products: Changes of the peak position and the intensity of carbonyl C=O in IR spectra with temperatures were consistent with the products at each temperature detected by GC/MS. The long-chain carboxylic acids in the initial MC were converted into long-chain ester compounds at 200 ˚C. Long-chain ester, amide and nitrile compounds were produced at 300 ˚C, and long-chain alkane and nitrile compounds were produced at 400 ˚C. Dehydration condensation of carboxylic acids with alcohols and amines in the initial MC formed esters and amides, respectively, at 200 ˚C and 300 ˚C. Alkanes and nitriles were formed at 400 ˚C through thermal cracking of long chain aliphatic compounds and dehydration of amides, respectively.

Monoaromatic hydrocarbons also increased at 400 ˚C. Monoaromatic hydrocarbons were probably formed through thermal cracking of bridged aromatic hydrocarbons (e.g.,
4,4’ -methylenebis-(2,6-dimethylphenol)) in the initial MC at 400 ˚C.

Effects of minerals: Changes in the peak position of carbonyl C=O was more significant with montmorillonite than with olivine. Carbonyl C=O significantly decreased at 300 ˚C and 400 ˚C with montmorillonite. This result could be explained by the differences of acidity and contact surface area of olivine and montmorillonite.

Alexander et al. (2007) reported that both O/C ratios and H/C ratios of insoluble organic matter (IOM) in heated CM chondrites and ordinary chondrites decreased by heating. However, O/C ratios of IOM in heated CM chondrites were much lower than these in ordinary chondrites when compared at the same

©2019. Japan Geoscience Union. All Right Reserved.

H/C ranges. It may indicate that pyrolysis of IOM in heated CM chondrites was promoted by co-existed phyllosilicates even at lower degree of thermal processes compared to IOM in ordinary chondrites which contain large amount of olivine but less phyllosilicates.

Alteration of minerals: Possibility of partial hydrous alteration in olivine to serpentine was found in products at 200 ˚C and 300 ˚C by SEM observations, while the alteration was not detected at 400 ˚C. It could be due to the dehydration of MC that hydrates olivine at 200 ˚C and 300 ˚C. This result might indicate that hydrated minerals could have formed without water but with organics in some meteorite parent bodies accreted inside the snow line. Further analysis using TEM is now being conducted to confirm the formation of phyllosilicates on the surface of olivine particles reacted with MC.

Japan Agency for Marine-Earth Science and Technology, 6. Lawrence Berkeley National Laboratory, 7. Institute for Molecular Science, 8. University of Khartoum, 9. The University of Tokyo

The Almahata Sitta (AhS) meteorite is a brecciated, polymict ureilite that has originated from the near-earth asteroid 2008 TC3 which is classified as an F-type asteroid (a group in C complex) in spectroscopic taxonomy [1]. Carbonaceous chondritic lithologies AhS 671 and 91/91A have been characterized and contain phyllosilicates, bruennerite, dolomite, magnetite, fayalite, ilmenite, phosphates, pyrrhotite, and pentlandite [2]. These lithologies are breccias and enclose fragments of ureilitic olivine and pyroxene [2]. We investigated organic matter (OM) in AhS 671 and 91A with various methods including C and N elemental and isotopic analysis and FTIR for bulk samples (~100 μg), and microscopic analysis of their FIB sections using STXM/C-XANES and NanoSIMS.

AhS 671

The IR absorption spectrum of AhS 671 show phyllosilicates and carbonates consistent with mineralogical observations [2], and similar to the IR spectra of CI chondrites [3]. AhS 671 contains 3.9 ±0.22 wt.% of C and 0.19 ±0.02 wt.% of N with δ^{13}C = -3.8 ±0.7 ‰and δ^{15}N = 50.5 ±2.6 ‰. Its δ^{15}N and N/C ratio (0.042 ±0.002, atomic) is close to the values of insoluble organic matter (IOM) in the Tagish Lake meteorite [4]. Note that the N/C ratio of OM in AhS 671 would be higher than the value of the bulk sample since the bulk value includes carbonates.

C-XANES spectra of the organic-rich regions in the AhS 671 FIB section show large peaks at 285 eV assigned to aromatic carbon with no other specific features. Although, organic matter in AS 671 is highly aromatic, there is no 1s-σ^* exciton peak at 291.7 eV of graphene structures that is characteristic of thermally-metamorphosed meteorites [5]. Such characteristics are similar to the C-rich aggregate in the Zag clast [6]. The difference of their organic matter is related to morphology; Zag organics form large (over 10 μm) aggregates while those in AhS 671 are smaller and mixed with the matrix at the submicron scale. δ^{13}C and δ^{15}N obtained with NanoSIMS in C-rich areas are homogeneous with averages of 3 ±3 ‰ and 234 ±32 ‰, respectively. The δ^{15}N is higher than the bulk value and is close to the value of IOM of CR chondrites [7]. The δD value in C-rich areas is 988 ±59 ‰. It is similar to the value of IOM of CI and CM chondrites [7], but less than the value of CRs [7]. The N isotopes of organic matter in AhS 671 shows an isotopically heavier than ureilitic fragments of AhS (-53 to -94 ‰[8]) and rather close to the values of primitive carbonaceous chondrites. However, OM is dominated in aromatic structure without any sign of graphitization.

AhS 91A

Not like AhS 671, the IR absorption spectrum of AhS 91A show no sighs if phyllosilicates and carbonates. The C and N contents vary up to 4.8 wt.% and 0.056 wt.%, respectively, with the average δ^{13}C of -17 ±8

©2019. Japan Geoscience Union. All Right Reserved.

‰. It is consistent with the heterogeneous nature of AhS 91A. We could not obtain C-XANES due to low C contents in the FIB section of AhS 91A. We are going to analyze an additional FIB section since AhS 91A is highly heterogeneous.

Considering the molecular structure and the nitrogen isotope composition, the organic matter in AhS 671 is similar origin to the C-rich aggregate in the Zag clast [6], and thus perhaps related to D/P asteroids.

Thermal Evolution of Hydrous Minerals on Small Bodies: To Understand Thermal Histories of Ryugu and Bennu

*Kana Ishimaru[1], Shogo Tachibana[2]

1. University of Tokyo, 2. UTokyo Organization for Planetary and Space Science, University of Tokyo

Asteroid sample return missions JAXA's Hayabusa2 and NASA's OSIRIS-REx are currently exploring asteroids Ryugu and Bennu, respectively. Infrared spectroscopic observation done by the near-infrared spectrometer on board Hayabusa2 (NIRS3) suggests that Ryugu has a weak absorption feature of hydrous minerals, while the visible and infrared spectrometer on board OSIRIS-REx (OVIRS) have detected a clear absorption feature of hydrous minerals on the surface of Bennu. These findings indicate that two asteroids experienced different thermal histories, and dehydration of hydrous phases could have occurred more effectively on Ryugu. It is thus important to understand thermal transformation processes of hydrous minerals, but there has been limited kinetic data that can be extrapolated to the processes occurring in the geologic timescale. Therefore, with the aim of understanding thermal metamorphism on Ryugu/Bennu, we conducted heating experiments of serpentine in vacuum.

The starting material of serpentine was ground into powder using an agate mortar and pestle to a particle size of ~1 μm. Samples were heated at 500 - 800˚C, for durations of 2 –88 hours in vacuum (10^{-4} –10^{-5} Pa). The analyses were done with XRD (X-ray powder diffraction) at the University of Tokyo and FTIR (Fourier transform infrared spectroscopy) at Hokkaido University. The weight changes of the samples were obtained by weighing them before and after the experiments using an electric balance.

The serpentine samples heated at 500˚C were dehydrated with heating, but crystalline serpentine was still dominant in the run products. The samples heated at 600˚C decomposed to become amorphous. The XRD spectra of the samples heated at 650℃ show the presence of small and broad peaks of olivine that recrystallized from the amorphous and also a slight halo representing remaining amorphous. The samples heated at 700˚C also have small and broad XRD peaks of olivine without the halo feature of amorphous silicate. The XRD spectra of the samples heated at 800˚C show the strongest peak of enstatite in addition to the peaks of olivine. FTIR spectra also confirm the above observations.

The FTIR spectra of the samples heated at 650˚C and 700˚C were analyzed further to obtain the kinetics of crystallization of olivine from dehydrated serpentine. The absorbance ratio of the peaks at 10.4 and 11.4 mm, both of which are characteristic of olivine, was converted into the degree of olivine crystallization based on the results by [1]. The time evolution of crystallization degree at 650 and 700˚C were fitted by the Johnson-Mehl-Avrami-Kolmogorov equation with the Avrami exponent of 1.5 [1], and the crystallization rate constant k [$h^{-1.5}$] of 0.032 and 0.34 were obtained at 650 and 700˚C, respectively. The estimated activation energy for the crystallization is 356 kJ mol^{-1}.

©2019. Japan Geoscience Union. All Right Reserved.

The TTT (time-temperature-transformation) diagrams for dehydration and recrystallization of serpentine were obtained. The dehydration timescale was adopted from [2]. Considering that the decay of ^{26}Al with a half-life of 0.72 My is a possible heat source within parent bodies of Ryugu and Bennu in the early Solar System, the heating time scale should be shorter than 10 Myr. The diagram indicates that Bennu, with a clear infrared feature of hydrous minerals should not have experienced heating at >350 K on its parent body. Ryugu, with a subtle feature of hydrous minerals may have been heated at >450 K on its parent body. Fujiya et al. (2012) [3] estimated that within a 60-km sized asteroid accreted 3.5 Myr after the Solar System formation, the highest temperature is about 400 –450 K that lasts for 2 –3 Myr at 3 km distance from the center. If this is the case, most part of the asteroid was kept below 350 K, which could be similar to Bennu. In order to dehydrate Ryugu, its parent body may have been larger than 60 km in diameter or may have accreted earlier than 3.5 Myr after the Solar System formation with a more available heat source (^{26}Al).

[P-EM14] Recent Advances in Ionosphere Observation and Modeling for Monitoring and Forecast

convener:Yang-Yi Sun(China University of Geosciences), CHIYEN LIN(Center for Astronautical Physics and Engineering, National Central University, TAIWAN), MINYANG CHOU(National Cheng Kung University)

Over the past few decades, rapid developments in space technology have advanced the research of ionospheric space weather by increasing a great number of ground- and space-based observations. In the ground segment, the dense ground-based GNSS networks, radars, and airglow instruments have greatly extended the observational coverages. In the space segment, the extraordinary satellite missions with payloads onboard the satellites providing radio occultation soundings of vertical electron density structure and in-situ observations of airglow, temperature, neutral winds, and electron density contribute to the understanding of middle and upper atmospheric dynamics. With the large amount and diversity of datasets, theoretical and empirical models can be validated and implemented for inclusion of new thermosphere and ionosphere phenomena. Furthermore, remarkable breakthrough of data assimilation techniques advances the ionosphere monitoring and forecast. The recent innovations in observations and models reinterpret the studies of ionospheric space weather. The purpose of this session is to solicit studies providing observations, theoretical and empirical modeling and data assimilation on the multiple scales of ionospheric phenomena, from global morphology to small-scale irregularities and traveling ionospheric disturbances. Studies on magnetically quiescent and disturbed conditions will be both addressed.

This paper investigates the plasmapause positions in the ionosphere by measurement of the whistler count probed by DEMETER (Detection of Electro-Magnetic Emissions Transmitted from Earthquake Regions) satellite in the daytime at 1030 LT (local time) and the nighttime at 2230 LT during 2005-2010. The whistler finds the plasmapause position which can be clearly allocated in both daytime and nighttime. We examine the nighttime/daytime plasmapause in various longitudes, solar activities, seasons, and geomagnetic actives. Results show that the daytime plasmapause appears in the equatorward side of the nighttime one. Both the daytime and nighttime plasmapause are sensitive to solar activity, which move equatorward form the low to high solar activity in the study period. The seasonal variation of the plasmapause are rather random and insignificant. During magnetic disturbed condition, the plasmapause tend to move equatorward.

Global Plasma Density Irregularity Distributions Observed by Advanced Ionospheric Probe Onboard FORMOSAT-5 Satellite

*Chi-Kuang Chao[1], Yi-Wun Chen[1]

1. Graduate Institute of Space Science, National Central University

A FORMOSAT-5 satellite has been launched on25 August 2017 CST into a 98.28° inclination sun-synchronous circular orbit at 720 km altitude along the 1030/2230 local time sectors. The orbital coverage provides a great opportunity to survey terrestrial ionosphere from equatorial to polar region every two days. Advanced Ionospheric Probe (AIP) is a piggyback science payload developed by National Central University for the FORMOSAT-5 satellite to measure ionospheric plasma concentrations, velocities, and temperatures. It is also capable of measuring ionospheric plasma density irregularities at a sample rate up to 8,192 Hz over a wide range of spatial scales. In this presentation/poster, distributions and structures of pre-midnight low-latitude ionospheric plasma density irregularities will be shown from AIP science data collected since winter 2017. Especially, seasonal variations of the distributions will be compared with ROCSAT-1/Ionospheric Plasma and Electrodynamics Instrument dataset (1999-2004) to understand their trends. Meanwhile, high resolution data measured at a BURST rate (8,192 Hz) in some longitudinal sectors with high plasma density irregularity occurrence rates will also be investigated by spectral analysis to understand their characteristics.

The First Result on Ionospheric Space Weather of FORMOSAT-5/AIP Ion Density

*FU-YUAN CHANG[1], JANN-YENQ Liu[1], Chi-Kuang Chao[1]

1. National Central University

The science payload of Advantage Ionosphere Probe (AIP) onboard FORMOSAT-5 (F5) launched on 24 August 2017 has being operated in a Sun synchronous orbit at 720km altitude with an inclination angle of 98.28 degrees and the revisit period every 2-day. The global distribution of F5/AIP ion density (Ni) in nighttime of 2200LT during November 2017-October 2018 is examined and reported. F5/AIP ion densities show that equatorial plasma depletions frequently appear over South America, Africa, and Asia sectors; four-peaked EIA (non-migrating tide) structures prominently occur in September-March; and plasma depletion bays (PDBs) at low-latitudes in April-August. It is found that prominent locations of the plasma depletions slightly differ from those of equatorial irregularities, while non-migrating tide and PDBs result from different physical mechanisms.

The global total electron content reconstruction in the local time frame

*Tsung-Che Tsai[1,2], Hau-Kun Jhuang[3], Lou-Chuang Lee[3,4,5], Yi-Ying Ho[4]

1. National Center for High-Performance Computing, National Applied Research Laboratories, Hsinchu, Taiwan, 2. Department of Civil Engineering, National Chiao Tung University, Hsinchu, Taiwan., 3. Department of Geoscience, National Taiwan University, Taipei, Taiwan., 4. Institute of Earth Science, Academia Sinica, Nankang, Taipei, Taiwan., 5. Institute of Space Science, National Central University, Jhongli, Taiwan.

The total electron content (TEC) data from Global Ionosphere Maps provide a global TEC map in the region between latitude 87.5˚S to 87.5˚N, and longitude 180˚W to 180˚E. The TEC data in geographic coordinates are first transformed into geomagnetic coordinates through Altitude-Adjusted Corrected Geomagnetic Model (AACGM). We then use 2-dimensional (longitude, 180˚W~180˚E and time, 10 days) Fourier transform (FT) of TEC variations along different geomagnetic latitude to obtain all wave modes for the period from November 18, to October 15, 2014. By the summation of all non-migrating tides, migrating tides, and zonal mean, the TEC global map in the local time frame is reconstructed. Again, the AACGM is applied to transform from geomagnetic coordinates back to geographic coordinates. The local time evolution in geographic coordinates of TEC is then produced. The features of TEC peaks in the local time frame are presented.

Research on impacts of power line harmonic radiation on ionospheric parameters

*Qiang Guo[1], Jing Wu[1], Ling Yang[1]

1. Beihang University

Introduction: Power line harmonic radiation (PLHR) refers to a kind of electromagnetic wave phenomena at harmonic frequencies of 50 or 60 Hz, which are the working frequencies of terrestrial power systems. Since the 1970s, PLHR events have been detected with several magnetically conjugate pairs of receivers and different satellites [1, 2, 3]. With the increase of global power consumption, PLHR has become more serious. Already, many scientific satellites have observed such anthropogenic electromagnetic waves in the ionosphere, and some possible typical impacts of those waves on the ionosphere have been reported [4]. However, reaching a final conclusion as to the impacts has been proven to be a difficult task. To further understand PLHR and its impacts, we utilize the data of three scientific payloads of DEMETER satellite collected with the Langmuir probe (ISL), thermal plasma analyzer (IAP), and energetic particle detector (IDP) to study the variation of ionospheric parameters due to the occurrence of PLHR.

Analytical Methods: DEMETER is a French seismo-electromagnetic microsatellite that was in operation from June 29, 2004 to December 9, 2010. The ISL onboard measured the electron density (N_e), electron temperature (T_e), and ion density (N_i). The IAP measured the density of H^+ (N_{H+}), He^+ (N_{He+}), O^+ (N_{O+}), and ion temperature (T_i). The IDP measured the electron fluxes in the range from 70 keV to 2.5 MeV. The variations of ionospheric parameters are affected by many factors, including latitude, longitude, altitude, daytime or nighttime, season, and solar activity. To minimize these impacts, we proposed an approach that compares the data from the PLHR-orbit and quiet-period orbit ($AE \leqq 50$ nT, AE is an index to evaluate the level of geomagnetic activity).

Among the 133 PLHR events detected by Wu et al. [5] when DEMETER flew over China, one quiet-period orbit, covering most of China's latitudes, was found for each year (2004-2010) according to AE index. In each PLHR-orbit, three-segment dataset were obtained: 30s before, at, and 30s after the occurrence region of PLHR event. By subtracting data of quiet-period orbit with corresponding latitudes from each-segment data of PLHR-orbit, we statistically analyzed the variation trend of ionospheric parameter in each PLHR-orbit due to PLHR.

Results & Discussion: With ISL and IAP data, it was found that both N_e and T_e were at a low level, N_{H+} was at a high level, and N_{O+} was at a low level when PLHR occurred. These results were generally helpful for understanding the formation behaviors of PLHR and were consistent with the theoretical results. From the analysis of IDP data, obvious variations of pitch angles before and after PLHR were occasionally observed to occur, and the variation did not exceed 10°. Its corresponding equatorial pitch-angle may not have fallen into a loss-cone, so the variation tendency of the electron flux did not have a definite connection with the pitch angle. The statistical results indicate that when PLHR occurs, the electron flux in the high-band (>1 MeV) tends to decrease and the decremental magnitude is very large, while the electron flux in the middle-band tends to increase and the incremental magnitude is relatively large.

Analysis of cosmic rays dynamics and ionospheric parameters during increased solar activity and magnetic storms

*Oksana Mandrikova[1], Yurii Polozov[1], Bogdana Mandrikova[1,2]

1. Institute of Cosmophysical Research and Radio Wave Propagation, Far Eastern Branch of the Russian Academy of Sciences, 2. Saint Petersburg Electrotechnical University "LETI"

Based on the ground station data, the paper makes complex analysis of cosmic ray dynamics and of ionospheric parameters during strong and moderate magnetic storms in 2015-2018. During the investigation, new methods of modeling and data analysis were applied. A neural network model for neutron monitor data classification was presented. This model makes it possible to evaluate galactic cosmic ray flux state and to detect periods of sporadic effect occurrences in automatic mode. By the use of this model, sporadic effects preceding and accompanying strong and moderate magnetic storms were detected. The model showed its efficiency when applied for data on-line analysis and for detection of sporadic effects including those of small amplitude. Ionospheric data were analyzed on the bases of multi-component modeling method and ionospheric parameter analysis [1, 2]. It allowed us to detect ionospheric disturbances of different intensity and to estimate their characteristics. The results of the work confirmed the possibility of ionospheric electron concentration increase effect preceding magnetic storm commencements [3]. Comparison with cosmic ray data showed the correlation of the effects in the ionospehre with anomalous changes in cosmic ray dynamics that was first mentioned in the paper [3].

King Tidal Effects on the ionosphere during the period of 2000 to 2017

*TsungYu Wu[1], JANN-YENQ Liu[1]

1. Institute of Space Science, NCU, Taiwan

This study examines the spring tide signature of the 14.7-day period in concurrent/co-located measurements of the ionosphere total electron content (TEC) and sea level in an 18-year period of 2000-2017. A discrete Fourier transform is applied to find amplitude and phase of the spring tide in the TEC and sea level. Results show that the spring tide amplitude in the sea level is clear and steady, while that in the ionospheric TEC is rather fluctuated and proportional to the ambient TEC value. The relative amplitude of TEC in the 18-year is a function of the solar local time and become prominent in the daytime of 08:00-19:00. and however that in the nighttime 00:00-06:00 LT becomes prominent in 2002, 2005, 2009, and 2015, when the perihelion and perigee simultaneously occur. On the other hand, the phase of the spring tide signature in the sea level and TEC yield a 3-year period, which is close to the time interval of the above prominent spring tide signature in the nighttime. More detailed discussions and results will be presented.

SuperDARN near range echoes and higher resolution measurement - recent improvement and future

*Akira Sessai Yukimatu[1,2]

1. National Institute of Polar Research, 2. SOKENDAI

SuperDARN (Super Dual Auroral Radar Network) is an international high-frequency radar network originally intended to cover a wide range of polar ionosphere in both hemispheres by its fields-of-view and to monitor global ionospheric plasma convection in high temporal resolution of about 1-2 minitues in quasi real time mainly for space weather research. It can observe not only basic and important ionospheric plasma Doppler velocity and electric field, a variety of geomagnetic waves, ionospheric disturbances and irregularities, but also properties of neutral atmosphere, e.g., traveling ionospheric disturbances (TIDs), mesoepheric echoes like PMSEs and neutral wind around mesopause region. As it is originally designed to measure global large-scale ionospheric plasma parameters, the spatial resolution has been rather coarse, and it was originally difficult to obtain height information of echoes, high temporal resolution less than 1 second, and high spatial resolution of less than 15km in radial direction. Echo height information is very important especially to distinguish those among D, E and F regions as the properties of plasma among them are considerably different and also to obtain precise altitude of meteor echoes around mesopause due to existence of thin layers of neutral wind shear. Recent development in calibrating radar interferometry in SuperDARN community is an important step to improve much the reliability of height information especially in near range echoes and also of region identification for further echoes as well. Combining raw I/Q time series analysis method (Yukimatu and Tsutsumi, GRL, 2002) to be applied to extract underdense meteor echoes precisely, frequency domain interferometry (FDI) and/or over-sampling technique (Tsutsumi et al., 2009) with the appropriate interferometer calibration will improve the reliability and height resolution of the neutral wind measurement possibly leading to global neutral wind observing network around mesopause region with SuperDARN which will contribute to many studies on mesosphere-lower-thermosphere (MLT) or mesoephere-thermosphere-ionosphere (MTI) region dynamics and vertical coupling between ionosphere and neutral upper atmosphere. Another issue possibly critical for some specific studies, e.g., on short period electro-magnetic waves is possibility to achieve higher temporal resolution within a second as well as higher spatial resolution in range direction. (Higher spatial resolution in azimuth direction has been already tried and achieved by some radars using general imaging or spatial domain interferometry (SDI) technique.) There have been some trial against these possibilities with some success depending on the cases of the applied phenomena and the conditions of echoes, but have still been thought to be difficult to be overcome. This presentation will describe the evolution of SuperDARN near range echo measurement after last JpGU meeting, and will also discuss about the reliability of high temporal resolution measurement and the possible method to obtain reliable high temporal resolution data to extend the ability of SuperDARN.

The ionospheric wave peak structures in the low latitude region and their seasonal, and solar activity dependence based on Global Ionosphere Maps

*Hau-Kun Jhuang[1], Tsung-Che Tsai[2,3], Lou-Chuang Lee[1,4,5], Yi-Ying Ho[4]

1. Department of Geosciences, National Taiwan University, Taipei, Taiwan, 2. National Center for High-performance Computing, National Applied Research Laboratories, Hsinchu, Taiwan, 3. Department of Civil Engineering, National Chiao Tung University, Hsinchu, Taiwan, 4. Institute of Earth Science, Academia Sinica, Nankang, Taipei, Taiwan, 5. Institute of Space Science, National Central University, Jhongli, Taiwan

The total electron content (TEC) data from Global Ionosphere Maps (GIM) are used to obtain the wave modes in both UT (universal time) and LT (local time) frames through the Fourier transform. The summation of contributing wave modes at a given local time provides the longitudinal variation of the wave peak structure. The phases of wave modes lead to a constructive or destructive interference of contributing wave modes, which gives different wave peak structure at different local time. The dependence of the wave peak structures on latitudinal, seasonal, and solar activity is studied.

[P-EM14] Recent Advances in Ionosphere Observation and Modeling for Monitoring and Forecast

convener:Yang-Yi Sun(China University of Geosciences), CHIYEN LIN(Center for Astronautical Physics and Engineering, National Central University, TAIWAN), MINYANG CHOU(National Cheng Kung University)

Over the past few decades, rapid developments in space technology have advanced the research of ionospheric space weather by increasing a great number of ground- and space-based observations. In the ground segment, the dense ground-based GNSS networks, radars, and airglow instruments have greatly extended the observational coverages. In the space segment, the extraordinary satellite missions with payloads onboard the satellites providing radio occultation soundings of vertical electron density structure and in-situ observations of airglow, temperature, neutral winds, and electron density contribute to the understanding of middle and upper atmospheric dynamics. With the large amount and diversity of datasets, theoretical and empirical models can be validated and implemented for inclusion of new thermosphere and ionosphere phenomena. Furthermore, remarkable breakthrough of data assimilation techniques advances the ionosphere monitoring and forecast. The recent innovations in observations and models reinterpret the studies of ionospheric space weather. The purpose of this session is to solicit studies providing observations, theoretical and empirical modeling and data assimilation on the multiple scales of ionospheric phenomena, from global morphology to small-scale irregularities and traveling ionospheric disturbances. Studies on magnetically quiescent and disturbed conditions will be both addressed.

This paper investigates the plasmapause positions in the ionosphere by measurement of the whistler count probed by DEMETER (Detection of Electro-Magnetic Emissions Transmitted from Earthquake Regions) satellite in the daytime at 1030 LT (local time) and the nighttime at 2230 LT during 2005-2010. The whistler finds the plasmapause position which can be clearly allocated in both daytime and nighttime. We examine the nighttime/daytime plasmapause in various longitudes, solar activities, seasons, and geomagnetic actives. Results show that the daytime plasmapause appears in the equatorward side of the nighttime one. Both the daytime and nighttime plasmapause are sensitive to solar activity, which move equatorward form the low to high solar activity in the study period. The seasonal variation of the plasmapause are rather random and insignificant. During magnetic disturbed condition, the plasmapause tend to move equatorward.

Research on impacts of power line harmonic radiation on ionospheric parameters

*Qiang Guo[1], Jing Wu[1], Ling Yang[1]

1. Beihang University

Introduction: Power line harmonic radiation (PLHR) refers to a kind of electromagnetic wave phenomena at harmonic frequencies of 50 or 60 Hz, which are the working frequencies of terrestrial power systems. Since the 1970s, PLHR events have been detected with several magnetically conjugate pairs of receivers and different satellites [1, 2, 3]. With the increase of global power consumption, PLHR has become more serious. Already, many scientific satellites have observed such anthropogenic electromagnetic waves in the ionosphere, and some possible typical impacts of those waves on the ionosphere have been reported [4]. However, reaching a final conclusion as to the impacts has been proven to be a difficult task. To further understand PLHR and its impacts, we utilize the data of three scientific payloads of DEMETER satellite collected with the Langmuir probe (ISL), thermal plasma analyzer (IAP), and energetic particle detector (IDP) to study the variation of ionospheric parameters due to the occurrence of PLHR.

Analytical Methods: DEMETER is a French seismo-electromagnetic microsatellite that was in operation from June 29, 2004 to December 9, 2010. The ISL onboard measured the electron density (N_e), electron temperature (T_e), and ion density (N_i). The IAP measured the density of H^+ (N_{H+}), He^+ (N_{He+}), O^+ (N_{O+}), and ion temperature (T_i). The IDP measured the electron fluxes in the range from 70 keV to 2.5 MeV. The variations of ionospheric parameters are affected by many factors, including latitude, longitude, altitude, daytime or nighttime, season, and solar activity. To minimize these impacts, we proposed an approach that compares the data from the PLHR-orbit and quiet-period orbit ($AE \leqq 50$ nT, AE is an index to evaluate the level of geomagnetic activity).

Among the 133 PLHR events detected by Wu et al. [5] when DEMETER flew over China, one quiet-period orbit, covering most of China's latitudes, was found for each year (2004-2010) according to AE index. In each PLHR-orbit, three-segment dataset were obtained: 30s before, at, and 30s after the occurrence region of PLHR event. By subtracting data of quiet-period orbit with corresponding latitudes from each-segment data of PLHR-orbit, we statistically analyzed the variation trend of ionospheric parameter in each PLHR-orbit due to PLHR.

Results & Discussion: With ISL and IAP data, it was found that both N_e and T_e were at a low level, N_{H+} was at a high level, and N_{O+} was at a low level when PLHR occurred. These results were generally helpful for understanding the formation behaviors of PLHR and were consistent with the theoretical results. From the analysis of IDP data, obvious variations of pitch angles before and after PLHR were occasionally observed to occur, and the variation did not exceed 10°. Its corresponding equatorial pitch-angle may not have fallen into a loss-cone, so the variation tendency of the electron flux did not have a definite connection with the pitch angle. The statistical results indicate that when PLHR occurs, the electron flux in the high-band (>1 MeV) tends to decrease and the decremental magnitude is very large, while the electron flux in the middle-band tends to increase and the incremental magnitude is relatively large.

Based on the ground station data, the paper makes complex analysis of cosmic ray dynamics and of ionospheric parameters during strong and moderate magnetic storms in 2015-2018. During the investigation, new methods of modeling and data analysis were applied. A neural network model for neutron monitor data classification was presented. This model makes it possible to evaluate galactic cosmic ray flux state and to detect periods of sporadic effect occurrences in automatic mode. By the use of this model, sporadic effects preceding and accompanying strong and moderate magnetic storms were detected. The model showed its efficiency when applied for data on-line analysis and for detection of sporadic effects including those of small amplitude. Ionospheric data were analyzed on the bases of multi-component modeling method and ionospheric parameter analysis [1, 2]. It allowed us to detect ionospheric disturbances of different intensity and to estimate their characteristics. The results of the work confirmed the possibility of ionospheric electron concentration increase effect preceding magnetic storm commencements [3]. Comparison with cosmic ray data showed the correlation of the effects in the ionospehre with anomalous changes in cosmic ray dynamics that was first mentioned in the paper [3].

King Tidal Effects on the ionosphere during the period of 2000 to 2017

*TsungYu Wu[1], JANN-YENQ Liu[1]

1. Institute of Space Science, NCU, Taiwan

This study examines the spring tide signature of the 14.7-day period in concurrent/co-located measurements of the ionosphere total electron content (TEC) and sea level in an 18-year period of 2000-2017. A discrete Fourier transform is applied to find amplitude and phase of the spring tide in the TEC and sea level. Results show that the spring tide amplitude in the sea level is clear and steady, while that in the ionospheric TEC is rather fluctuated and proportional to the ambient TEC value. The relative amplitude of TEC in the 18-year is a function of the solar local time and become prominent in the daytime of 08:00-19:00. and however that in the nighttime 00:00-06:00 LT becomes prominent in 2002, 2005, 2009, and 2015, when the perihelion and perigee simultaneously occur. On the other hand, the phase of the spring tide signature in the sea level and TEC yield a 3-year period, which is close to the time interval of the above prominent spring tide signature in the nighttime. More detailed discussions and results will be presented.

SuperDARN near range echoes and higher resolution measurement - recent improvement and future

*Akira Sessai Yukimatu[1,2]

1. National Institute of Polar Research, 2. SOKENDAI

SuperDARN (Super Dual Auroral Radar Network) is an international high-frequency radar network originally intended to cover a wide range of polar ionosphere in both hemispheres by its fields-of-view and to monitor global ionospheric plasma convection in high temporal resolution of about 1-2 minitues in quasi real time mainly for space weather research. It can observe not only basic and important ionospheric plasma Doppler velocity and electric field, a variety of geomagnetic waves, ionospheric disturbances and irregularities, but also properties of neutral atmosphere, e.g., traveling ionospheric disturbances (TIDs), mesoepheric echoes like PMSEs and neutral wind around mesopause region. As it is originally designed to measure global large-scale ionospheric plasma parameters, the spatial resolution has been rather coarse, and it was originally difficult to obtain height information of echoes, high temporal resolution less than 1 second, and high spatial resolution of less than 15km in radial direction. Echo height information is very important especially to distinguish those among D, E and F regions as the properties of plasma among them are considerably different and also to obtain precise altitude of meteor echoes around mesopause due to existence of thin layers of neutral wind shear. Recent development in calibrating radar interferometry in SuperDARN community is an important step to improve much the reliability of height information especially in near range echoes and also of region identification for further echoes as well. Combining raw I/Q time series analysis method (Yukimatu and Tsutsumi, GRL, 2002) to be applied to extract underdense meteor echoes precisely, frequency domain interferometry (FDI) and/or over-sampling technique (Tsutsumi et al., 2009) with the appropriate interferometer calibration will improve the reliability and height resolution of the neutral wind measurement possibly leading to global neutral wind observing network around mesopause region with SuperDARN which will contribute to many studies on mesosphere-lower-thermosphere (MLT) or mesoephere-thermosphere-ionosphere (MTI) region dynamics and vertical coupling between ionosphere and neutral upper atmosphere. Another issue possibly critical for some specific studies, e.g., on short period electro-magnetic waves is possibility to achieve higher temporal resolution within a second as well as higher spatial resolution in range direction. (Higher spatial resolution in azimuth direction has been already tried and achieved by some radars using general imaging or spatial domain interferometry (SDI) technique.) There have been some trial against these possibilities with some success depending on the cases of the applied phenomena and the conditions of echoes, but have still been thought to be difficult to be overcome. This presentation will describe the evolution of SuperDARN near range echo measurement after last JpGU meeting, and will also discuss about the reliability of high temporal resolution measurement and the possible method to obtain reliable high temporal resolution data to extend the ability of SuperDARN.

The ionospheric wave peak structures in the low latitude region and their seasonal, and solar activity dependence based on Global Ionosphere Maps

*Hau-Kun Jhuang[1], Tsung-Che Tsai[2,3], Lou-Chuang Lee[1,4,5], Yi-Ying Ho[4]

1. Department of Geosciences, National Taiwan University, Taipei, Taiwan, 2. National Center for High-performance Computing, National Applied Research Laboratories, Hsinchu, Taiwan, 3. Department of Civil Engineering, National Chiao Tung University, Hsinchu, Taiwan, 4. Institute of Earth Science, Academia Sinica, Nankang, Taipei, Taiwan, 5. Institute of Space Science, National Central University, Jhongli, Taiwan

The total electron content (TEC) data from Global Ionosphere Maps (GIM) are used to obtain the wave modes in both UT (universal time) and LT (local time) frames through the Fourier transform. The summation of contributing wave modes at a given local time provides the longitudinal variation of the wave peak structure. The phases of wave modes lead to a constructive or destructive interference of contributing wave modes, which gives different wave peak structure at different local time. The dependence of the wave peak structures on latitudinal, seasonal, and solar activity is studied.

[P-EM14] Recent Advances in Ionosphere Observation and Modeling for Monitoring and Forecast

convener:Yang-Yi Sun(China University of Geosciences), CHIYEN LIN(Center for Astronautical Physics and Engineering, National Central University, TAIWAN), MINYANG CHOU(National Cheng Kung University), Chairperson:Yang-Yi Sun

Over the past few decades, rapid developments in space technology have advanced the research of ionospheric space weather by increasing a great number of ground- and space-based observations. In the ground segment, the dense ground-based GNSS networks, radars, and airglow instruments have greatly extended the observational coverages. In the space segment, the extraordinary satellite missions with payloads onboard the satellites providing radio occultation soundings of vertical electron density structure and in-situ observations of airglow, temperature, neutral winds, and electron density contribute to the understanding of middle and upper atmospheric dynamics. With the large amount and diversity of datasets, theoretical and empirical models can be validated and implemented for inclusion of new thermosphere and ionosphere phenomena. Furthermore, remarkable breakthrough of data assimilation techniques advances the ionosphere monitoring and forecast. The recent innovations in observations and models reinterpret the studies of ionospheric space weather. The purpose of this session is to solicit studies providing observations, theoretical and empirical modeling and data assimilation on the multiple scales of ionospheric phenomena, from global morphology to small-scale irregularities and traveling ionospheric disturbances. Studies on magnetically quiescent and disturbed conditions will be both addressed.

New In-situ Ion Composition and Velocity Observations in the Topside Ionosphere from the Swarm-E Ion Mass Spectrometer

*Andrew W Yau[1]

1. University of Calgary

The imaging and rapid-scanning ion mass spectrometer (IRM) onboard the polar-orbiting Swarm-E (e-POP) satellite is a new type of ion mass spectrometer that combines the techniques of hemispherical electrostatic deflection and ion time-of-flight analysis, with the unique capability of measuring simultaneously both the ion composition distribution and the detailed ion velocity distributions of individual ion species. We present several new observation results of the low, mid, and high-latitude topside ionosphere (300-1500 km altitude), from both detailed and statistical analyses of IRM data acquired in the first five years of the Swarm-E mission (since the launch in September 2013). These include the enhancement of minor ion composition at high latitudes, including N+ and molecular ions; localized regions of heavy ion up-flows and down-flows in the F-region auroral ionosphere; and bi-directional light ion flows at mid-latitudes; among others. We discuss the implications of these observation results in the context of both magnetosphere-ionosphere and ionosphere-thermosphere coupling.

Spatial-time features and dynamics of ionospheric disturbances during magnetic storms in 2015-2018

*Oksana Mandrikova[1], Nadezhda Fetisova[1], Yurii Polozov[1,2]

1. Institute of Cosmophysical Research and Radio Wave Propagation, Far Eastern Branch of the Russian Academy of Sciences, 2. Kamchatka State Technical University

Ionospheric disturbances are formed as a result of ionosphere reaction to the increase in solar and geomagnetic activity (solar flares, coronal emissions, geomagnetic storms and substorms).They can have different intensity and duration and lead to the occurrences of positive and negative ionospheric storms. The ionospheric storm dynamics has complex spatial-time characteristics, depending on geographic location (polar and auroral zones, mid-latitude and equatorial regions), geomagnetic storm force, local time, and other factors. Ionospheric storms have negative impact on modern technical systems; therefore, their timely detection and prediction are an important task. In spite of the intensive development of technical tools and data analysis methods, the question of effective solution of this problem remains open [ex. 1].
In the paper, we modeled and analyzed the ionospheric parameter time course according to the ground station network (the resource http://wdc.nict.go.jp was used). Spatial-time features and dynamics of ionospheric disturbances were studied during magnetic storms which occured in 2015-2018. In the paper, a method proposed by the authors was used to model and to analyze ionospheric data. The method is based on wavelet transform [1]. The method allowed us to study the ionospheric parameter dynamics in detail, to detect ionospheric disturbances and to estimate their characteristics (Fig.1). The method was implemented numerically and adapted for real-time (as data are recorded). Comparison with the traditional approaches [2, 3] (median methods, IRI model) showed high efficiency of the proposed method and the possibility to apply it for on-line analysis of ionospheric data and to detect of ionospheric disturbances.

Estimating 2D neutral wind patterns using line-of-sight data from multiple Scanning Doppler Imagers

*Heikki Vanhamaki[1], Shin-ichiro Oyama[1,2], Mark Conde[3], Anita Aikio[1], Lei Cai[4], Ilkka Virtanen[1]

1. University of Oulu, Finland, 2. Institute for Space-Earth Environmental Research, Nagoya University, Japan, 3. Geophysical Institute, University of Alaska Fairbanks, US, 4. KTH Royal Institute of Technology, Sweden

We present a new analysis technique for estimating 2D neutral wind pattern using data from a single Scanning Doppler Imager (SDI) or a combination of SDIs, incoherent scatter radars (ISR) and Fabry-Perot interferometers (FPI) within overlapping field-of-views. Neutral wind plays an important role in ionospheric electrodynamics and Ionosphere-Thermosphere coupling, by for example affecting the Joule heating rates and plasma transport. However, reliable and extensive measurements of the neutral wind are rather difficult to obtain.

Pointwise measurements can be obtained with ISRs or FPIs, but these measurements can not provide 2D latitude-longitude maps of the neutral wind pattern needed in mesospheric studies. A Scanning Doppler Imager can measure the line-of-sight (LOS) component of the neutral wind in dozens of directions simultaneously. However, further modeling is needed to convert the LOS velocities into 2D velocity maps. Unfortunately these maps are far from unique, as perpendicular velocities (e.g. rotation around the measurement site) are not visible in the LOS data. This can be mitigated by combining data from several nearby SDIs, or a combination of SDIs, FPIs and ISRs.

Our analysis technique is based on fitting the LOS data with special vector basis functions called Spherical Elementary Current Systems (SECS). In this approach the wind is naturally divided into curl-free and divergence-free components, and there is no need to provide any explicit boundary conditions on the wind pattern.

We present several synthetic test scenarios as well as first results using data from SDIs located in Alaska. Using the synthetic test scenarious we further estimate optimal locations for 2 or 3 SDIs that could be located around the future EISCAT_3D radar system in northern Scandinavia.

Comparison of empirical models for the location of the ionospheric middle-latitude trough in the nighttime

*Sarah Park[1], Khan-Hyuk Kim[1]

1. School of Space Research, Kyung Hee University

The middle-latitude ionization trough is a region of depleted plasma density in the ionosphere located at the equatorward edge of the auroral oval in the nighttime. Numerous studies have shown that trough locations shift equatorward under disturbed geomagnetic conditions. Many empirical models were developed to predict the trough location as a function of magnetic latitude (MLAT) and geomagnetic activity. Using the DMSP F15 data obtained in the nighttime sector of MLT = 1700-0130 hrs from February 2000 to January 2005, we identified 7735 middle-latitude troughs and statistically examined the trough location under different geomagnetic conditions. Unlike previous studies, we found that the middle-latitude trough minimum in the plasma density are distributed in a broad range of magnetic latitudes from ~40˚N to ~72˚N around 1700-2200 MLT in the Northern Hemisphere and from ~28˚S to ~76˚S around 2000-0130 MLT in the Southern Hemisphere depending on geomagnetic conditions. Trough locations at low latitudes and high latitudes, which appear under extremely disturbed (Kp > 6) and quiet (Kp < 1) geomagnetic conditions, respectively, are not well expected from previous empirical models. In this study, we develop an empirical model, in which trough locations can be expected under extreme geomagnetic conditions, and compare it with previous models.

Research on nonlinear cross-modulation of power line emission and other very low frequency radiations in the ionosphere

*Ling Yang[1], Jing Wu[1], Qiang Guo[1]

1. Beihang University

By analyzing the observation data on electric field intensity from DEMETER satellite, we found that there exists a special type of line radiation events in the ionosphere above China. Their time-frequency power spectrums have several parallel lines with the center frequency 19.8 kHz, interval 50 Hz/100 Hz, and bandwidth 10 Hz. This phenomenon mostly occurs above central and eastern regions of China, which are the magnetic conjugate point of NWC transmitter in Australia (21.81˚S, 114.16˚E) [1]. The 19.8 kHz-spectral line is considered from the transmitter, which generates signal with center frequency 19.8 kHz and frequency band 200 Hz.

We applied bicoherence spectral analysis [2] to the spectrum of these events and found that they are likely to be generated by the wave radiated from NWC transmitter nonlinearly cross-modulated by 50 Hz-power line emission (PLE) from Chinese power grid. We further used the theory of interaction of plane radio waves for the theoretical analysis on such nonlinear cross-modulation. This phenomenon indicates that radiation from ground power grid can not only directly propagate into the ionosphere, but also interact with other waves in the ionosphere and further change their original state.

Ionospheric variation induced by 21 August 2017 total solar eclipse detected by Global Ionospheric Specification

*CHIYEN LIN[1,2], JANN-YENQ Liu[1,2,3], Charles Lin[4]

1. Center for Astronautical Physics and Engineering, National Central University, Taiwan, 2. Graduate Institute of Space Science, National Central University, Taiwan, 3. Center for Space and Remote Sensing Research, National Central University, Taiwan, 4. Department of Earth Science, National Cheng Kung University, Taiwan

On 21 August 2017, a total solar eclipse passed through the continental United States (CONUS) from the west to the east coast. Total Electron Content (TEC) measurements from thousands ground-based GNSS (Global Navigation Satellite System) receiving stations over CONUS observe the ionospheric horizontal variation induced by the moon shadow. Meanwhile, Global Ionospheric Specification (GIS) is an ionospheric data assimilation product based on Gauss-Markov Kalman filter, to assimilate slant TEC observed from ground-based GPS receivers and space-based RO instrumentations into background model International Reference Ionosphere (IRI-2016) to provide the continuity ionospheric three-dimensional (3D) electron density distribution. In this study, GIS assimilates about 1000 ground-based GNSS receiving stations data over the CONUS to reconstruct 3D electron density distribution during the obscuration period. Comparison of integrated TEC, N_mF_2, and h_mF_2 for the eclipse day and the day before the eclipse day, the assimilation analysis results demonstrate that not only electron density is depleted and also the peak height is uplifted during the solar eclipse. These results also indicate that the GIS electron density can study ionospheric 3D structural variation.

Spatial gradients in the ionospheric delays (TECs) and scintillations associated with plasma bubbles

*Susumu Saito[1], Takayuki Yoshihara[1]

1. Electronic Navigation Research Institute, National Institute of Maritime, Port, and Aviation Technology

Spatial gradients in the ionospheric delays (equivalently ionospheric total electron contents: TECs) are the threat to the differential GNSS systems such as the ground-based GNSS augmentation system (GBAS), because they decorrelates the ionosphere induced errors between the reference and user stations. Another important issues is the scintillations associated with small-scale (a few hundred meters for GPS L1 signals at 1.57542 GHz) plasma irregularities. While the spatial gradient in the ionospheric delay may result in differential correction errors, the scintillation may result in increased noise of pseudo-range measurements, and in the worst case, cycle-slips and signal lock-off. Although both are associated plasma bubbles, they may not always occur simultaneously, partly because they are associated withplasma irregularities with different scale sizes.

In this study, correlation between the ionospheric spatial variation measured by a set of GNSS stations locate at the New Ishigaki Airport (24.3N, 124.2E) and the amplitude scintillation index (S4) observed near the airport are analyzed. The GNSS stations at the airport are separated by 0.1 - 2.3 km. The ionospheric delay differences are estimated based on the carrier-phase double differences with sophisticated methods originally developed for integrity monitors for GBAS. S4 index is estimated by a dedicated GNSS scintillation receiver. It was shown that the ionospheric delay gradients are not always enhanced when scintillation index is enhanced, though they are positively correlated. Further analysis of their correlations with different scale sizes by different combinations of GNSS receivers for ionospheric delay gradient estimation will be conducted, and the results will also be reported at the meeting.

Ionospheric structure caused by precipitation of energetic particles can adversely affect the GPS signals resulting in phase scintillation and cycle slips (loss of lock). GPS phase scintillation has been found correlated with auroral emission intensity, particularly with rapid changes in auroral forms and their brightness [1,2,3]. Total electron content (TEC) enhancements that were observed during substorm expansion phase within the night side downward (R1) current appear to be associated with enhanced precipitating particle fluxes [4]. Such TEC enhancements cause phase scintillation, which is most intense just after substorm onsets and auroral breakups. Phase scintillation index is computed for sampling rate of 50 Hz by specialized GPS scintillation receivers from the Canadian High Arctic Ionospheric Network (CHAIN). A proxy scintillation index is obtained from dual frequency measurements of geodetic-quality GPS receivers sampling at 1 Hz, which include globally distributed receivers of RT-IGS network that are monitored by the Canadian Geodetic Survey in near-real-time. Temporal and spatial changes of TEC and phase scintillation are investigated in the context of equivalent ionospheric currents derived from ground magnetometer network using the spherical elementary current method [5,6]. The relation of phase scintillation with auroral emission observed by THEMIS all-sky imagers and the far-ultraviolet scanning imager SSUSI onboard the DMSP satellites is also examined. In general, GPS phase scintillation is mapped to regions of strong westward electrojet (upward R2 currents or the interface with downward R1 currents) and to the poleward edge of the eastward electrojet (upward R1 currents). Following substorm onsets and auroral breakups, strong phase scintillation associated with TEC enhancements are mapped mainly to the upward R2 current or the equatorward edge of the downward R1 current at or near the Harang discontinuity region [7].

IGS ROTI Maps extension toward Southern Hemisphere and low latitudes

*Iurii Cherniak[1,2], Irina Zakharenkova[2], Andrzej Krankowski[2]

1. COSMIC Program Office, University Corporation for Atmospheric Research, 2. University of Warmia and Mazury in Olsztyn

The International GNSS Service (IGS) has accepted for official release a new ionospheric product to characterize ionospheric irregularity and intensity as derived from multi-site ground-based GPS observations. This product routinely generated by multi-step processing of carrier phase delays in dual-frequency GPS signals and transferred to the IGS CDDIS database. These ROTI maps allow regular monitoring of ionospheric irregularities over the Northern Hemisphere where there is the highest concentration of the GNSS users. This product represents changes of the GPS-based index ROTI (Rate of TEC Index) and has a polar projection within a range of 50˚-90˚N in geomagnetic latitude and 00-24 magnetic local time and based on measurements with 30 s sampling rate from about 700 GPS representative stations located at high and middle latitudes of the Northern Hemisphere.As the highest concentration of the GNSS users is within the American, European and Asian sectors, initially it focused on the Northern Hemisphere auroral, and midlatitude regions. But plasma irregularities that occurred at high, middle, and low latitudes have different physical mechanisms of their origin and development. For investigation of the ionospheric irregularities climatology, study of the ionospheric responses for Space Weather events, processes derived from below, this actual ROTI Map product is required to be extended to low latitudes and the Southern hemisphere polar and midlatitudes.

Recently, a number of the ground-based receivers within the global and regional networks grew significantly. It offers an excellent opportunity to extend the current IGS ROTI maps product toward global coverage. We present initial results of improved ROTI maps product performance to characterize ionospheric irregularities exited by different types of geophysical processes and space weather events. The new ROTI maps product can be a valuable tool for retrospective analysis of plasma irregularities impact on the GNSS positioning in the “worst case” examination domain.

The research is supported by the National Science Centre, Poland, through grants 2017/25/B/ST10/00479 and 2017/27/B/ST10/02190.

Durations of ionospheric gradients and plasma bubbles as ionospheric threats to GBAS

*MAHO NAKAMURA[1], Susumu Saito[1], Takayuki Yoshihara[1]

1. Electronic Navigation Research Institute

Ground-Based Augmentation System (GBAS) of global navigation satellite systems (GNSS) is now being widely deployed in the world. Ionospheric disturbances are one of the threats to GBAS operation because it is based on the differential GNSS (DGNSS) technique with L1 single frequency signals.In 2017, The International Civil Aviation Organization (ICAO) Asia-Pacific (APAC) region has defined the ionospheric threat model that can be used in the low magnetic latitude part of the region [1]. The threat model is being optimized for the transition region from low to mid-latitude regions over Japan by collecting more data using Japanese dense GNSS network (the GNSS Earth Observation NETwork: GEONET) [2,3,4].

Steep ionospheric delay gradients of which widths are several tens kilometers or less are one of the ionospheric threats in GBAS, because steep ionospheric gradients with small spatial scales may not be detected neither by GBAS ground stations nor by an airborne receiver when the gradient stands between the GBAS ground station and airplanes. From the viewpoint of GBAS operations, it is important to know how long such gradient events would last to predict the duration of GBAS operation outage. Therefore, clarifying durations of steep but small ionospheric gradients is important for GBAS operations. Though the duration of the ionospheric delay depletions associated with plasma bubbles have been studied extensively, the duration of the steep gradients have not been studied well.

In this paper, we extracted the steep ionospheric gradients caused by plasma bubbles from the ionospheric delay differences between some pairs of stations using the single-frequency-carrier-phase based and code-aided (SF-CBCA) technique [5] and GEONET data. Once the plasma bubbles candidates and the satellites which is affected by the ionospheric disturbances are selected, ionospheric delay variations of each receiver derived by dual-frequency measurements for estimation of the durations for each ionospheric gradient. The analyses of durations of steep ionospheric gradients which could be the threat for GBAS operations will be reported.

Ionospheric Space Weather Data Product of FORMOSAT-7/COSMIC-2

*Charles Lin[1], P. K. Rajesh[1], CHIYEN LIN[2,3], Chia-Hung Chen[1], Jia-Ting Lin[1]

1. Department of Earth Sciences, National Cheng Kung University, 2. Center for Astronautical Physics and Engineering, National Central University, Taoyuan 32001, Taiwan, 3. Graduate Institute of Space Science, National Central University, Taoyuan 32001, Taiwan

FORMOSAT-7/COSMIC-2 (F7/C2) will provide unprecedented number of ionosphere observations in the mid- and low-latitude regions where the ionosphere is highly variable due to its interactions with planetary waves, solar oscillations, and lunar tides overlapping on top of the original ionospheric climatological electron density morphologies. To study the strong day-to-day variability of the ionosphere there, we have developed a global ionospheric data assimilation model using radio occultation observations together with auxiliary observations from ground-based GNSS stations. The assimilation system is capable of producing day-to-day and hour-to-hour ionospheric electron density maps three dimensionally for the study. With the advance given by the newly developed data assimilation model, we re-examine the wave-4 variations on daily basis, as well as the migrating tidal variations during the stratospheric sudden warming events. Additionally, electron density profiles from the aided Abel inversion of radio occultation observations will also be provided which is expected to give more reliable electron density profile around 200-300 km altitude compared with traditional Abel inversion. The abovementioned ionosphere products from the F7/C2 observations will be available six months after launch.

Vertical structure of ionosphere perturbed by large earthquake and tsunami

*Yang-Yi Sun[1], XiangXiang Yan[1], Tao Yu[1], JANN-YENQ Liu[2]

1. China University of Geosciences (Wuhan), 2. National Central University

The FORMOSAT-3/COSMIC (F3/C) radio occultation (RO) technique vertically scans the atmosphere from 0 to 800 km altitude. Here we first show the ionospheric electron density structures which were perturbed by the wavefront of the M_W7.8 Nepal earthquake that occurred on 25 April 2015. Next, we show the acoustic resonance due to the 2008 Mw8.0 Wenchuan earthquake and 2011 Mw9.0 Tohoku earthquake and tsunami. The mean wavelet spectra derived from dozens of atmospheric and ionospheric RO sounding profiles within six hours after the earthquake illustrate that the atmospheric oscillations with the vertical wavelength ranging from 0.5 to 60 km appear at the altitudes from the lower atmosphere to the ionosphere. The vertical wavelength estimated from the atmospheric gravity wave dispersion relation is compared with the observed vertical wavelength. The small-scale gravity waves may not be easy to reach the upper ionosphere. These RO-observed long-lasting atmospheric and ionospheric oscillations may consist of the earthquake/tsunami wavefront and its residual oscillatory tail or acoustic resonance. The results suggest that the RO technique is a powerful tool which is suitable for probing earthquake/tsunami-induced oscillations in the atmosphere, and allow a more comprehensive understanding of the excitation, propagation, and dissipation of earthquake/tsunami-induced gravity waves in the entire atmosphere.

[P-EM19] Frontiers in the solar physics

convener:Shinsuke Imada(Institute for Space-Earth Environmental Research, Nagoya University), Takaaki Yokoyama(School of Science, University of Tokyo), Toshifumi Shimizu(Institute of Space and Astronautical Science, JAXA), Yukio Katsukawa(National Astronomical Observatory of Japan, National Institute of Natural Sciences)

To date, we have three Japanese satellite missions to observe solar atmosphere, i.e., "Hinotori", "Yohkoh", and "Hinode", and revealed very dynamic nature of the solar atmosphere.These satellite observations allow us to see magnetic activities in the corona in X-ray, which cannot be obtained by ground-based telescopes. Also, thanks to seeing free condition, "Hinode" continuously observes the magnetic field in the photosphere. From these experiences, we have learned following three important requirements for the future missions to solve "coronal heating" and "solar flare" problems;1) seamless and simultaneous observation covering all temperature regimes from the photosphere to the corona, 2) high spatial and temporal resolution to resolve elemental structures and to track their evolution, 3) plasma diagnostic capability to quantify the dynamics of elementary processes. Recently, solar physics community in Japan proposed Solar-C_EUVST mission which is intended to be launched in middle of 2020s. Further, next-generation instruments, such as Parker Solar Probe (PSP), the Daniel K. Inouye Solar Telescope (DKIST), and SUNRISE will appear even before Solar-C_EUVST. Several proposals, e.g., PhoENiX, are also appearing. We will discuss in this session what we should study for further understanding of solar physics from current observations and numerical simulations and what we must prepare before 2020s. We welcome participations and presentations especially from Solar Terrestrial Physics (STP) community.

Solar active region (AR) NOAA 12673, which appeared on the solar surface in September 2017, showed us amazing grows of magnetic field and produced numbers of flares including four X-class flares. We focused on the X2.2 and X9.3 flares that occurred while rapid growth of the AR on September 6, because latter the X9.3 flare caused increase of disturbances in ionosphere and magnetosphere. We aimed to understand the onset mechanism(s) of the X-class flares. Hence we analyzed the data obtained by Hinode and Solar Dynamics Observatory (SDO), and compared the analysis results to nonlinear force-free field (NLFFF), which is extrapolated from observed vector magnetic field.

We revealed that the key feature to trigger the X-class flares is the negative polarity region that emerged in the east in the AR and rapidly intrude into the positive polarity region. Highly sheared fields were located along the intruding negative field, and those were elongated and were pressed along with the intruding motion. Then the sheared fields were reconnected, and that could be a trigger of X-class flares. Hinode and SDO observed proxies of the magnetic reconnection, such as fast (over 100 km/s) down flow and brightening in the solar corona, over the intruding negative field approximately 2 hours before the X2.2 flare onset. The NLFFF has several small flux ropes that lying along the magnetic polarity inversion line. We found that a part of those flux ropes erupt in our magnetohydrodynamics (MHD) simulation. Therefore, a possibility that the intruding motion of the negative field would drive the flux rope to unstable state. This would cause the X2.2 small eruption. Following the X2.2 eruption, we further found that a new flux rope, which is larger and highly twisted, is formed by the reconnection between another small flux ropes, that shows dramatic eruption. We suggest that this eruption causes the X9.3 flare. In fact, the continuous intruding motion of negative field is observed after the X2.2 flare, therefore it would play an important role in producing the X9.3 flare.

From these results, we propose the scenario that the sequential X2.2 and X9.3 flares were triggered by push-mode-like magnetic reconnection corresponding to the intruding motion of the negative polarity field. We also discuss possibility of another triggering scenario such as emerging flux that has specific features of so-called the reversed shear type.

Infrequent Occurrence of Significant Linear Polarization in H-alpha Solar Flares

*Tomoko Kawate[1], Yoichiro Hanaoka[2]

1. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2. National Astronomical Observatory of Japan

We performed statistical and event studies of linear polarization in the H-alpha line during solar flares. The statistical study revealed that, among 71 H-alpha flares analyzed, including 64 GOES flares, only one event shows significant linear polarization signals. Such an infrequent occurrence of significant linear polarization in solar flares is consistent with the result by Bianda et al. (2005), who studied 30 flares and found no polarization signals. In the event showing the significant polarization, the maximum degree of linear polarization was 1.16±0.06%, and the average direction of the polarization deviated by -142.5±6.0 degrees from the solar north. The observed polarization degrees and the directions are consistent with the preceding reports. These strong linear polarization signals did not appear at major flare ribbons, nor did they correlate with either hard or soft X-ray emissions temporally or spatially. Instead they appeared at a minor flare kernel, which corresponds to one of the footpoints of a coronal loop. The active region caused coronal dimming after the soft X-ray peak. The observed flare show no direct evidence that the linear polarization is produced by high energy particles, which are often considered to generate the polarization. On the other hand, our study suggests the possibility that coronal mass ejections, which have been often observed in flares showing linear polarization signals, play an important role for exciting linear polarization at H-alpha flare kernels.

Statistical study of solar flares simultaneously observed with RHESSI and Nobeyama Radioheliograph

*Satoshi Masuda[1], Sam Krucker[2,3], Stephen White[4]

1. Institute for Space-Earth Environmental Research, Nagoya University, 2. University of Applied Sciences Northwestern Switzerland, 3. University of California, Berkeley, 4. Air Force Research Laboratory

Solar flares give us a unique opportunity to make spatially resolved observations to study magnetic energy release and particle acceleration in space plasmas. The most direct diagnostics of electron acceleration are provided through radio and hard X-ray observations where we observe synchrotron emissions in the GHz range and non-thermal bremsstrahlung emissions above typically 10 keV. The two leading solar dedicated observatories in these two wavelength ranges are the Nobeyama Radioheliograph (NoRH) and the Reuven Ramaty High Energy Solar Spectroscopic Imager (RHESSI).
We present a statistical study of 35 jointly observed big (>GOES M7) flares. Initial results reveal a linear correlation between the hard X-ray flux above 50 keV and the microwave fluxes at 17 and 34 GHz. This result indicates that the population of accelerated electrons emit both of hard X-rays and microwaves. The correlation is too good even if this is true. Because the mechanism of these two emissions (hard X-rays and microwaves) are much different. Hard X-rays are emitted by Bremsstrahlung and its intensity simply depends on the flux of the accelerated electrons precipitating into the chromosphere in the case that the thick-target model is valid. However, microwaves emitted by gyro-synchrotron are a little complex. The microwave source is observed at different location for flare by flare, i.e. near the looptop, at the footpoint region, and in between them. Footpoint region has much stronger magnetic field than the looptop region. Gyro-synchrotron emission is very sensitive to magnetic field strength. Though the microwave intensity may strongly depend on the source location, however, microwave intensity without any selection by source location shows a very good correlation with hard X-rays. Another puzzle is the energy spectrum of accelerated electrons. Roughly speaking, 50 keV hard X-rays are manly emitted by below 100 keV electrons. On the other hand, 17GHz and 34GHz microwaves are typically emitted by ~1 MeV electrons (it depends on the magnetic field strength of the emitting region). Typically accelerated electrons show a power-law spectrum with the power-law index 3 –6. The power-law index is different in flare by flare. When the number of 100 keV electrons is fixed, the number of 1 MeV electrons changes in 3 order of magnitudes with the change of the power-law index from 3 to 6. The microwave intensity is proportional to the number of ~1 MeV electrons. So roughly thinking, the ratio between hard X-rays and microwave intensity easily change with the change of the power-law index. Without considering the spectral information, we choose the events. However, still there is a very good correlation. This is also a hard puzzle.
In order to understand this too good correlation between hard X-ray and microwave intensity, we need further analyses such as source location of hard X-ray and microwaves, hard X-ray spectrum, photospheric magnetic field at the footpoint region, location of the flare on the solar disc, and so on.

Microwave turn-over frequencies and emission temperatures for white-light solar flares

*Kosuke Tsuruda[1], Kyoko Watanabe[1], Satoshi Masuda[2], Säm Krucker[3]

1. National Defense Academy , 2. Institute for Space-Earth Environmental Research, Nagoya University, 3. University of Applied Sciences Northwestern Switzerland, UC Berkeley

It is believed that the origin of white-light enhancement, which is usually associated with large solar flare, is accelerated non-thermal electrons. The relationship between emission measure and temperature of white-light flares (WLFs) supported the existence of strong magnetic field around the acceleration site (Watanabe et al., 2017). Although the field strength at the acceleration site cannot measure directly, it can be estimated by using the turn-over frequency of gyro-synchrotron emission in microwaves (Dulk 1985). Kitagawa (2015, master thesis) suggested the existence of strong magnetic field on WLFs because the turn-over frequencies of WLFs were higher than those of no white-light flares (NWLFs), by the microwave spectra observed with the Nobeyama Radio polarimeters (NoRP).

We performed a statistical analysis of microwave turn-over frequencies for >M3 class flares during the period from January 2011 to December 2017. We found 51 events which were simultaneously observed with white-light (*Hinode*/SOT and/or *SDO*/HMI) and microwave (NoRP), however, we couldn't find any difference in turn-over frequencies for WLF and NWLF. We thought this result might be due to the difference of the location (loop-top or foot-point) of the microwave source in each flare. Then we checked the location of microwave emission by comparing with images of *SDO*/AIA (193Å), Nobeyama Radio heliograph (NoRH, 17GHz), and/or RHESSI (30-80 keV). Finally we found 29 flares (WLF: 17 events, NWLF: 12 events) have a dominant microwave source around the loop-top. When we checked turn-over frequencies for these events, only 7 events (WLF: 4 events, NWLF: 3 events) have higher turn-over frequencies than 17 GHz, and no clear difference was found between WLF and NWLF. Because the turn-over frequency is determined by not only the field strength but also the electron density (Dulk 1985), we have to think about the variation of electron density for this study.
On the other hand, durations of flare were clearly differing in WLF and NWLF, and WLFs are well associated with impulsive flares (Watanabe et al., 2017). However, there are some impulsive flares that do not have any white-light enhancements. In order to check the effect of flare duration (impulsivity) for white-light emission, a statistical analysis of emission temperature for WLFs is one of the effective approaches. So we derive emission temperature from three-color continuum data of *Hinode*/SOT (red, green, and blue) for ~40 events (e.g. Watanabe et al., 2013; Kerr & Fletcher, 2014), and discuss the relationship with flare impulsivity.

Stellar flare of a close binary system monitored by the Hisaki satellite during the NICER-Hisaki Observing Campaign 2018-2019

*Tomoki Kimura[1], Wataru Iwakiri[2], Atsushi Yamazaki[3], Go Murakami[3], Fuminori Tsuchiya[4], Kazuo Yoshioka[5], Shin Toriumi[6], Hajime Kita[3], Masaki Kuwabara[3]

1. Frontier Research Institute for Interdisciplinary Sciences, Tohoku University, 2. Faculty of Science and Engineering, Chuo University, 3. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 4. Planetary Plasma and Atmospheric Research Center, Tohoku University, 5. Department of Complexity Science and Engineering, University of Tokyo, 6. National Astronomical Observatory of Japan

Dynamics of stellar flare is still not well understood compared to that of the sun because of lack of continuous monitoring of distant stars in multiple wavelengths. Here we present a flare event at a close binary system, UX Arietis, monitored with the planetary extreme ultraviolet (EUV) space telescope Hisaki during the coordinated observing campaign with the NICER X-ray Telescope from late 2018 to early 2019. Time variability in the EUV spectrum of the binary was successfully monitored from the begging to the end of flare. Emission power at the EUV wavelengths peaked at ~6x10^24 W, which is comparable with that measured in the previous X-ray observations by e.g., the Advanced Satellite for Cosmology and Astrophysics (ASCA) (Gudel et al., 1999). The EUV spectrum showed emission lines of carbon, nitrogen, oxygen, and silicon ions. Electron temperature and density, emission measure, and ion balance were reduced from the emission lines by EUV spectral diagnostics. Dynamics of the stellar flare will be discussed based on comparison of the reduced plasma parameters with the X-ray spectrum measured with NICER.

Solar neutron observations are very important on understanding of particle acceleration mechanism in the Sun. However, previous ground-based observations with large area telescope (~10 m2)at high latitude are not sensitive to solar neutrons due to attenuation in the earth atomsphere and roughly 10 detection since its discovery in 1980 (Chupp et al. 1982). From space, the SEDA-AP instrument with much smaller area (100 cm^2) onboard the International Space Station (ISS) monitored solar neutrons including charged particles, and successfully detected more than 30 detection since its launch in 2009 (Muraki et al. 2014). Unfortunately the SEDA-AP operation was stopped on March 2018. To overcome situation for no mission dedicated for solar neutrons, we have designed and developed a solar neutron and gamma-ray detector for a 3U cubesat with a size of 30x10x10 cm. Actually we launched the 50-kg class ChubuSat-2 satellite for solar neutron observations on February 2016 (Yamaoka et al. 2016), and have now been modifying it to a 3U cubesat application. for the launch in 2021. The solar neutron and gamma-ray detector consists of multi-layered plastic scintillator bars, and GAGG(Ce) scintillator array, and both of them are read out with silicon photo-multipliers (Si PMs). More than 600 signals from Si PMs are processed by IDEAS ASICs. In this paper, we will describe scientific motivation, details of the detector and performance of its breadboard model (BBM).

Magnetic Flux Cancelation as the Buildup and Trigger Mechanism for CME-Producing Eruptions in two Small Active Regions

*Alphonse Sterling[1], Ronald L Moore[1,2], Navdeep K Panesar[1]

1. NASA/MSFC, 2. CSPAR, University of Alabama Huntsville

We follow two small, magnetically isolated CME-producing solar active regions (ARs) from the time of their emergence until several days later, when their core regions erupt to produce the CMEs. In both cases, magnetograms show: (a) following an initial period where the poles of the emerging regions separate from each other, the poles then reverse direction and start to retract inward; (b) during the retraction period, flux cancelation occurs along the main neutral line of the regions, (c) this cancelation builds the sheared core field/flux rope that eventually erupts to make the CME. In the two cases, respectively 30% and 50% of the maximum flux of the region cancels prior to the eruption. Recent studies indicate that solar coronal jets frequently result from small-scale filaments eruptions (Sterling et al. 2015), with those “minifilament” eruptions also being built up and triggered by cancelation of magnetic flux (Panesar et al. 2016). Together, the small-AR eruptions here and the coronal jet results suggest that isolated bipolar regions tend to erupt when some threshold fraction, perhaps in the range of 50%, of the region’s maximum flux has canceled. Our observed erupting filaments/flux ropes form at sites of flux cancelation, in agreement with previous observations. Thus, the recent finding that minifilaments that erupt to form jets also form via flux cancelation is further evidence that minifilaments are small-scale versions of the long-studied full-sized filaments. (Details are in Sterling et al. 2018, ApJ, 864, 68.) This work was supported by the NASA HGI Program, and the NASA/MSFC NPP program.

Estimation of turbulent pumping in the solar near-surface convection zone

*Haruhisa Iijima[1], Hideyuki Hotta[2], Shinsuke Imada[1]

1. Institute for Space-Earth Environmental Research, Nagoya University, 2. Graduate School of Science, Chiba University

We estimate the turbulent transport coefficients of the mean field model of solar dynamo process using the three-dimensional radiation magnetohydrodynamic simulations. The number of studies has been devoted to investigate the mean field description of the solar dynamo process. Large uncertainty of this model comes from the turbulent transport coefficients like the turbulent diffusion, alpha effect, or turbulent pumping. Although various numerical and observational studies has been estimated the turbulent transport coefficients, very few studies focused on the near-surface values of the vertical transport coefficients. These vertical transport coefficients in the near-surface convection zone is important for characterizing the upper boundary of the solar dynamo models. In this study, we estimate the vertical transport coefficients such as the turbulent diffusion and pumping using the large-eddy numerical simulation. The realistic near-surface convection is modeled by the three-dimensional radiation magnetohydrodynamic simulations. In the presentation, we report the wavenumber dependence of the transport coefficients and suggest a suitable upper boundary condition of the solar dynamo models.

Evaluation of the influence of the next solar cycle by sunspots using surface flux transport model

*Yusaku Watanabe[1], Shinsuke Imada[1], Haruhisa Iijima[1], Yoshizumi Miyoshi[1]

1. Institute for Space–Earth Environmental Research, Nagoya University

Predicting the next solar cycle and finding its schemes are a key for the long-term space weather research. Recent studies suggest that there is the correlation between polar magnetic field at the solar minimum and the next solar activity. Iijima et al. (2017) calculated the polar transport of the sunspots by using the surface flux transport model (SFT) and predicted the polar magnetic field at the solar minimum concluded that next solar cycle is weaker than the present. To evaluate their result, we have calculated the time evolution of the solar magnetic field for specific active region by SFT, and discussed the discrepancy between the model result and observations obtained by Helioseismic and Magnetic Imager (HMI). The peculiar example of the observation data is the active region AR12673 which occurred X9.3 solar flare on September 6, 2017 and played a role of weakening the negative magnetic field in the southern polar region. Meanwhile, AR12674 which appeared at the same time strengthened the positive magnetic field in the northern polar region, so we found the prediction result is different before and after the appearance of these active regions. Regarding the active regions after these, it is thought the influence is small because the transport to the polar region cannot be completed in time to the solar minimum. We confirmed reproducibility of polar transport in the model continuously using the actual magnetic field distribution from 2010 to the end of 2018 and the reproducibility 80 %, and found the activity of the next solar cycle is to be about 5 to 10 % stronger than present.

The image analysis of sunspot sketches in Dalton minimum(the early 1800s)

*SHOMA UNEME[1], Shinsuke Imada[1], Hisashi Hayakawa[2], Yoshizumi Miyoshi[1]

1. Nagoya University Institute for Space Earth for Enviornmental research, 2. Osaka University School of Letters

Solar activity changes periodically in 11 years. Because the solar activity is one of the main origins of the variability of the solar-terrestrial environment, it is important to predict the solar activity especially in the category of space weather study. It is known that the polar magnetic field at the solar minimum is closely correlated with the solar activity at the next solar activity. This correlation was confirmed by observing the current sun precisely. On the other hand, it is not clear whether there was a similar correlation in the past sun. Therefore, the aim of this study is to analyze the past sun spot sketch images to verify whether the polar field value at the solar minimum is also good correlation with the next solar activity. Especially, we focused on the Dalton minimum when sun spots were little in the early 1800s. We extracted latitude and longitude of sun spot from sketches in the early 1800 's. We will discuss the differences between the result obtained in this analysis and the characteristics of current sun. As a future plan, we calculate the surface magnetic flux transport model based on these obtained sun spot information and estimate the value of the polar magnetic field at the solar minimum of the Dalton minimum.

Observations of Photospheric Magnetic Structure below a Solar Dark Filament

*Takaaki Yokoyama[1], Yukio Katsukawa[2], Masumi Shimojo[2]

1. School of Science, The University of Tokyo, 2. National Astronomical Observatory of Japan

The structure of the photospheric vector magnetic field below a dark filament on the Sun is studied using the observations of the Spectro-Polarimeter attached to the Solar Optical Telescope onboard Hinode. Special attention is paid to discriminate the two suggested models, a flux rope or a bent arcade. "Inverse-polarity" orientation is possible below the filament in a flux rope, whereas "normal-polarity" can appear in both models. We study a filament in active region NOAA 10930, which appeared on the solar disk during 2006 December. To know whether it is in the normal orientation or in the inverse one under 180-degree ambiguity of the transverse field, the center-to-limb variation is used for the solution under an assumption that the filament does not drastically change its magnetic structure during the passage. When the filament is near the east limb, we found that the line-of-site magnetic component below is positive, while it is negative near the west limb. This change of sign indicates that the horizontal photospheric field perpendicular to the polarity inversion line beneath the filament has an "inverse-polarity", that is indicating a flux-rope structure of the filament supporting field.

Science Target of Solar-C_EUVST Mission

*Shinsuke Imada[1]

1. Institute for Space-Earth Environmental Research, Nagoya University

Solar-C EUVST (EUV High-Throughput Spectroscopic Telescope) is designed to comprehen- sively understand the energy and mass transfer from the solar surface to the solar corona and interplanetary space, and to investigate the elementary processes that take place universally in cosmic plasmas. The proposed mission is a fundamental step for answering how the plasma universe is created and evolves, and how the Sun influences the Earth and other planets in our solar system. The two primary science objectives for Solar-C EUVST are : I) Understand how fundamental processes lead to the formation of the solar atmosphere and the solar wind, II) Understand how the solar atmosphere becomes unstable, releasing the energy that drives solar flares and eruptions. Solar-C EUVST will, A) seamlessly observe all the temperature regimes of the solar atmosphere from the chromosphere to the corona at the same time, B) resolve elemental structures of the solar atmosphere with high spatial resolution and cadence to track their evolution, and C) obtain spectroscopic information on the dynamics of elementary pro- cesses taking place in the solar atmosphere. In this talk, we will discuss the science target of the Solar-C EUVST.

[P-EM19] Frontiers in the solar physics

convener:Shinsuke Imada(Institute for Space-Earth Environmental Research, Nagoya University), Takaaki Yokoyama(School of Science, University of Tokyo), Toshifumi Shimizu(Institute of Space and Astronautical Science, JAXA), Yukio Katsukawa(National Astronomical Observatory of Japan, National Institute of Natural Sciences)

To date, we have three Japanese satellite missions to observe solar atmosphere, i.e., "Hinotori", "Yohkoh", and "Hinode", and revealed very dynamic nature of the solar atmosphere.These satellite observations allow us to see magnetic activities in the corona in X-ray, which cannot be obtained by ground-based telescopes. Also, thanks to seeing free condition, "Hinode" continuously observes the magnetic field in the photosphere. From these experiences, we have learned following three important requirements for the future missions to solve "coronal heating" and "solar flare" problems;1) seamless and simultaneous observation covering all temperature regimes from the photosphere to the corona, 2) high spatial and temporal resolution to resolve elemental structures and to track their evolution, 3) plasma diagnostic capability to quantify the dynamics of elementary processes. Recently, solar physics community in Japan proposed Solar-C_EUVST mission which is intended to be launched in middle of 2020s. Further, next-generation instruments, such as Parker Solar Probe (PSP), the Daniel K. Inouye Solar Telescope (DKIST), and SUNRISE will appear even before Solar-C_EUVST. Several proposals, e.g., PhoENiX, are also appearing. We will discuss in this session what we should study for further understanding of solar physics from current observations and numerical simulations and what we must prepare before 2020s. We welcome participations and presentations especially from Solar Terrestrial Physics (STP) community.

1. Institute for Space-Earth Environmental Research/Nagoya University, 2. Institute if Space and Astronautical Science/Japan Aerospace Exploration Agency

Solar active region (AR) NOAA 12673, which appeared on the solar surface in September 2017, showed us amazing grows of magnetic field and produced numbers of flares including four X-class flares. We focused on the X2.2 and X9.3 flares that occurred while rapid growth of the AR on September 6, because latter the X9.3 flare caused increase of disturbances in ionosphere and magnetosphere. We aimed to understand the onset mechanism(s) of the X-class flares. Hence we analyzed the data obtained by Hinode and Solar Dynamics Observatory (SDO), and compared the analysis results to nonlinear force-free field (NLFFF), which is extrapolated from observed vector magnetic field.

We revealed that the key feature to trigger the X-class flares is the negative polarity region that emerged in the east in the AR and rapidly intrude into the positive polarity region. Highly sheared fields were located along the intruding negative field, and those were elongated and were pressed along with the intruding motion. Then the sheared fields were reconnected, and that could be a trigger of X-class flares. Hinode and SDO observed proxies of the magnetic reconnection, such as fast (over 100 km/s) down flow and brightening in the solar corona, over the intruding negative field approximately 2 hours before the X2.2 flare onset. The NLFFF has several small flux ropes that lying along the magnetic polarity inversion line. We found that a part of those flux ropes erupt in our magnetohydrodynamics (MHD) simulation. Therefore, a possibility that the intruding motion of the negative field would drive the flux rope to unstable state. This would cause the X2.2 small eruption. Following the X2.2 eruption, we further found that a new flux rope, which is larger and highly twisted, is formed by the reconnection between another small flux ropes, that shows dramatic eruption. We suggest that this eruption causes the X9.3 flare. In fact, the continuous intruding motion of negative field is observed after the X2.2 flare, therefore it would play an important role in producing the X9.3 flare.

From these results, we propose the scenario that the sequential X2.2 and X9.3 flares were triggered by push-mode-like magnetic reconnection corresponding to the intruding motion of the negative polarity field. We also discuss possibility of another triggering scenario such as emerging flux that has specific features of so-called the reversed shear type.

Infrequent Occurrence of Significant Linear Polarization in H-alpha Solar Flares

*Tomoko Kawate[1], Yoichiro Hanaoka[2]

1. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2. National Astronomical Observatory of Japan

We performed statistical and event studies of linear polarization in the H-alpha line during solar flares. The statistical study revealed that, among 71 H-alpha flares analyzed, including 64 GOES flares, only one event shows significant linear polarization signals. Such an infrequent occurrence of significant linear polarization in solar flares is consistent with the result by Bianda et al. (2005), who studied 30 flares and found no polarization signals. In the event showing the significant polarization, the maximum degree of linear polarization was 1.16±0.06%, and the average direction of the polarization deviated by -142.5±6.0 degrees from the solar north. The observed polarization degrees and the directions are consistent with the preceding reports. These strong linear polarization signals did not appear at major flare ribbons, nor did they correlate with either hard or soft X-ray emissions temporally or spatially. Instead they appeared at a minor flare kernel, which corresponds to one of the footpoints of a coronal loop. The active region caused coronal dimming after the soft X-ray peak. The observed flare show no direct evidence that the linear polarization is produced by high energy particles, which are often considered to generate the polarization. On the other hand, our study suggests the possibility that coronal mass ejections, which have been often observed in flares showing linear polarization signals, play an important role for exciting linear polarization at H-alpha flare kernels.

Statistical study of solar flares simultaneously observed with RHESSI and Nobeyama Radioheliograph

*Satoshi Masuda[1], Sam Krucker[2,3], Stephen White[4]

1. Institute for Space-Earth Environmental Research, Nagoya University, 2. University of Applied Sciences Northwestern Switzerland, 3. University of California, Berkeley, 4. Air Force Research Laboratory

Solar flares give us a unique opportunity to make spatially resolved observations to study magnetic energy release and particle acceleration in space plasmas. The most direct diagnostics of electron acceleration are provided through radio and hard X-ray observations where we observe synchrotron emissions in the GHz range and non-thermal bremsstrahlung emissions above typically 10 keV. The two leading solar dedicated observatories in these two wavelength ranges are the Nobeyama Radioheliograph (NoRH) and the Reuven Ramaty High Energy Solar Spectroscopic Imager (RHESSI).
We present a statistical study of 35 jointly observed big (>GOES M7) flares. Initial results reveal a linear correlation between the hard X-ray flux above 50 keV and the microwave fluxes at 17 and 34 GHz. This result indicates that the population of accelerated electrons emit both of hard X-rays and microwaves. The correlation is too good even if this is true. Because the mechanism of these two emissions (hard X-rays and microwaves) are much different. Hard X-rays are emitted by Bremsstrahlung and its intensity simply depends on the flux of the accelerated electrons precipitating into the chromosphere in the case that the thick-target model is valid. However, microwaves emitted by gyro-synchrotron are a little complex. The microwave source is observed at different location for flare by flare, i.e. near the looptop, at the footpoint region, and in between them. Footpoint region has much stronger magnetic field than the looptop region. Gyro-synchrotron emission is very sensitive to magnetic field strength. Though the microwave intensity may strongly depend on the source location, however, microwave intensity without any selection by source location shows a very good correlation with hard X-rays. Another puzzle is the energy spectrum of accelerated electrons. Roughly speaking, 50 keV hard X-rays are manly emitted by below 100 keV electrons. On the other hand, 17GHz and 34GHz microwaves are typically emitted by ~1 MeV electrons (it depends on the magnetic field strength of the emitting region). Typically accelerated electrons show a power-law spectrum with the power-law index 3 –6. The power-law index is different in flare by flare. When the number of 100 keV electrons is fixed, the number of 1 MeV electrons changes in 3 order of magnitudes with the change of the power-law index from 3 to 6. The microwave intensity is proportional to the number of ~1 MeV electrons. So roughly thinking, the ratio between hard X-rays and microwave intensity easily change with the change of the power-law index. Without considering the spectral information, we choose the events. However, still there is a very good correlation. This is also a hard puzzle.
In order to understand this too good correlation between hard X-ray and microwave intensity, we need further analyses such as source location of hard X-ray and microwaves, hard X-ray spectrum, photospheric magnetic field at the footpoint region, location of the flare on the solar disc, and so on.

Microwave turn-over frequencies and emission temperatures for white-light solar flares

*Kosuke Tsuruda[1], Kyoko Watanabe[1], Satoshi Masuda[2], Säm Krucker[3]

1. National Defense Academy , 2. Institute for Space-Earth Environmental Research, Nagoya University, 3. University of Applied Sciences Northwestern Switzerland, UC Berkeley

It is believed that the origin of white-light enhancement, which is usually associated with large solar flare, is accelerated non-thermal electrons. The relationship between emission measure and temperature of white-light flares (WLFs) supported the existence of strong magnetic field around the acceleration site (Watanabe et al., 2017). Although the field strength at the acceleration site cannot measure directly, it can be estimated by using the turn-over frequency of gyro-synchrotron emission in microwaves (Dulk 1985). Kitagawa (2015, master thesis) suggested the existence of strong magnetic field on WLFs because the turn-over frequencies of WLFs were higher than those of no white-light flares (NWLFs), by the microwave spectra observed with the Nobeyama Radio polarimeters (NoRP).

We performed a statistical analysis of microwave turn-over frequencies for >M3 class flares during the period from January 2011 to December 2017. We found 51 events which were simultaneously observed with white-light (*Hinode*/SOT and/or *SDO*/HMI) and microwave (NoRP), however, we couldn't find any difference in turn-over frequencies for WLF and NWLF. We thought this result might be due to the difference of the location (loop-top or foot-point) of the microwave source in each flare. Then we checked the location of microwave emission by comparing with images of *SDO*/AIA (193Å), Nobeyama Radio heliograph (NoRH, 17GHz), and/or RHESSI (30-80 keV). Finally we found 29 flares (WLF: 17 events, NWLF: 12 events) have a dominant microwave source around the loop-top. When we checked turn-over frequencies for these events, only 7 events (WLF: 4 events, NWLF: 3 events) have higher turn-over frequencies than 17 GHz, and no clear difference was found between WLF and NWLF. Because the turn-over frequency is determined by not only the field strength but also the electron density (Dulk 1985), we have to think about the variation of electron density for this study.
On the other hand, durations of flare were clearly differing in WLF and NWLF, and WLFs are well associated with impulsive flares (Watanabe et al., 2017). However, there are some impulsive flares that do not have any white-light enhancements. In order to check the effect of flare duration (impulsivity) for white-light emission, a statistical analysis of emission temperature for WLFs is one of the effective approaches. So we derive emission temperature from three-color continuum data of *Hinode*/SOT (red, green, and blue) for ~40 events (e.g. Watanabe et al., 2013; Kerr & Fletcher, 2014), and discuss the relationship with flare impulsivity.

Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 4. Planetary Plasma and Atmospheric Research Center, Tohoku University, 5. Department of Complexity Science and Engineering, University of Tokyo, 6. National Astronomical Observatory of Japan

Dynamics of stellar flare is still not well understood compared to that of the sun because of lack of continuous monitoring of distant stars in multiple wavelengths. Here we present a flare event at a close binary system, UX Arietis, monitored with the planetary extreme ultraviolet (EUV) space telescope Hisaki during the coordinated observing campaign with the NICER X-ray Telescope from late 2018 to early 2019. Time variability in the EUV spectrum of the binary was successfully monitored from the begging to the end of flare. Emission power at the EUV wavelengths peaked at ~6x10^24 W, which is comparable with that measured in the previous X-ray observations by e.g., the Advanced Satellite for Cosmology and Astrophysics (ASCA) (Gudel et al., 1999). The EUV spectrum showed emission lines of carbon, nitrogen, oxygen, and silicon ions. Electron temperature and density, emission measure, and ion balance were reduced from the emission lines by EUV spectral diagnostics. Dynamics of the stellar flare will be discussed based on comparison of the reduced plasma parameters with the X-ray spectrum measured with NICER.

Magnetic Flux Cancelation as the Buildup and Trigger Mechanism for CME-Producing Eruptions in two Small Active Regions

*Alphonse Sterling[1], Ronald L Moore[1,2], Navdeep K Panesar[1]

1. NASA/MSFC, 2. CSPAR, University of Alabama Huntsville

We follow two small, magnetically isolated CME-producing solar active regions (ARs) from the time of their emergence until several days later, when their core regions erupt to produce the CMEs. In both cases, magnetograms show: (a) following an initial period where the poles of the emerging regions separate from each other, the poles then reverse direction and start to retract inward; (b) during the retraction period, flux cancelation occurs along the main neutral line of the regions, (c) this cancelation builds the sheared core field/flux rope that eventually erupts to make the CME. In the two cases, respectively 30% and 50% of the maximum flux of the region cancels prior to the eruption. Recent studies indicate that solar coronal jets frequently result from small-scale filaments eruptions (Sterling et al. 2015), with those “minifilament” eruptions also being built up and triggered by cancelation of magnetic flux (Panesar et al. 2016). Together, the small-AR eruptions here and the coronal jet results suggest that isolated bipolar regions tend to erupt when some threshold fraction, perhaps in the range of 50%, of the region’s maximum flux has canceled. Our observed erupting filaments/flux ropes form at sites of flux cancelation, in agreement with previous observations. Thus, the recent finding that minifilaments that erupt to form jets also form via flux cancelation is further evidence that minifilaments are small-scale versions of the long-studied full-sized filaments. (Details are in Sterling et al. 2018, ApJ, 864, 68.) This work was supported by the NASA HGI Program, and the NASA/MSFC NPP program.

Estimation of turbulent pumping in the solar near-surface convection zone

*Haruhisa Iijima[1], Hideyuki Hotta[2], Shinsuke Imada[1]

1. Institute for Space-Earth Environmental Research, Nagoya University, 2. Graduate School of Science, Chiba University

We estimate the turbulent transport coefficients of the mean field model of solar dynamo process using the three-dimensional radiation magnetohydrodynamic simulations. The number of studies has been devoted to investigate the mean field description of the solar dynamo process. Large uncertainty of this model comes from the turbulent transport coefficients like the turbulent diffusion, alpha effect, or turbulent pumping. Although various numerical and observational studies has been estimated the turbulent transport coefficients, very few studies focused on the near-surface values of the vertical transport coefficients. These vertical transport coefficients in the near-surface convection zone is important for characterizing the upper boundary of the solar dynamo models. In this study, we estimate the vertical transport coefficients such as the turbulent diffusion and pumping using the large-eddy numerical simulation. The realistic near-surface convection is modeled by the three-dimensional radiation magnetohydrodynamic simulations. In the presentation, we report the wavenumber dependence of the transport coefficients and suggest a suitable upper boundary condition of the solar dynamo models.

Evaluation of the influence of the next solar cycle by sunspots using surface flux transport model

*Yusaku Watanabe[1], Shinsuke Imada[1], Haruhisa Iijima[1], Yoshizumi Miyoshi[1]

1. Institute for Space–Earth Environmental Research, Nagoya University

Predicting the next solar cycle and finding its schemes are a key for the long-term space weather research. Recent studies suggest that there is the correlation between polar magnetic field at the solar minimum and the next solar activity. Iijima et al. (2017) calculated the polar transport of the sunspots by using the surface flux transport model (SFT) and predicted the polar magnetic field at the solar minimum concluded that next solar cycle is weaker than the present. To evaluate their result, we have calculated the time evolution of the solar magnetic field for specific active region by SFT, and discussed the discrepancy between the model result and observations obtained by Helioseismic and Magnetic Imager (HMI). The peculiar example of the observation data is the active region AR12673 which occurred X9.3 solar flare on September 6, 2017 and played a role of weakening the negative magnetic field in the southern polar region. Meanwhile, AR12674 which appeared at the same time strengthened the positive magnetic field in the northern polar region, so we found the prediction result is different before and after the appearance of these active regions. Regarding the active regions after these, it is thought the influence is small because the transport to the polar region cannot be completed in time to the solar minimum. We confirmed reproducibility of polar transport in the model continuously using the actual magnetic field distribution from 2010 to the end of 2018 and the reproducibility 80 %, and found the activity of the next solar cycle is to be about 5 to 10 % stronger than present.

The image analysis of sunspot sketches in Dalton minimum(the early 1800s)

*SHOMA UNEME[1], Shinsuke Imada[1], Hisashi Hayakawa[2], Yoshizumi Miyoshi[1]

1. Nagoya University Institute for Space Earth for Enviornmental research, 2. Osaka University School of Letters

Solar activity changes periodically in 11 years. Because the solar activity is one of the main origins of the variability of the solar-terrestrial environment, it is important to predict the solar activity especially in the category of space weather study. It is known that the polar magnetic field at the solar minimum is closely correlated with the solar activity at the next solar activity. This correlation was confirmed by observing the current sun precisely. On the other hand, it is not clear whether there was a similar correlation in the past sun. Therefore, the aim of this study is to analyze the past sun spot sketch images to verify whether the polar field value at the solar minimum is also good correlation with the next solar activity. Especially, we focused on the Dalton minimum when sun spots were little in the early 1800s. We extracted latitude and longitude of sun spot from sketches in the early 1800 's. We will discuss the differences between the result obtained in this analysis and the characteristics of current sun. As a future plan, we calculate the surface magnetic flux transport model based on these obtained sun spot information and estimate the value of the polar magnetic field at the solar minimum of the Dalton minimum.

Observations of Photospheric Magnetic Structure below a Solar Dark Filament

*Takaaki Yokoyama[1], Yukio Katsukawa[2], Masumi Shimojo[2]

1. School of Science, The University of Tokyo, 2. National Astronomical Observatory of Japan

The structure of the photospheric vector magnetic field below a dark filament on the Sun is studied using the observations of the Spectro-Polarimeter attached to the Solar Optical Telescope onboard Hinode. Special attention is paid to discriminate the two suggested models, a flux rope or a bent arcade. "Inverse-polarity" orientation is possible below the filament in a flux rope, whereas "normal-polarity" can appear in both models. We study a filament in active region NOAA 10930, which appeared on the solar disk during 2006 December. To know whether it is in the normal orientation or in the inverse one under 180-degree ambiguity of the transverse field, the center-to-limb variation is used for the solution under an assumption that the filament does not drastically change its magnetic structure during the passage. When the filament is near the east limb, we found that the line-of-site magnetic component below is positive, while it is negative near the west limb. This change of sign indicates that the horizontal photospheric field perpendicular to the polarity inversion line beneath the filament has an "inverse-polarity", that is indicating a flux-rope structure of the filament supporting field.

Science Target of Solar-C_EUVST Mission

*Shinsuke Imada[1]

1. Institute for Space-Earth Environmental Research, Nagoya University

Solar-C EUVST (EUV High-Throughput Spectroscopic Telescope) is designed to comprehen- sively understand the energy and mass transfer from the solar surface to the solar corona and interplanetary space, and to investigate the elementary processes that take place universally in cosmic plasmas. The proposed mission is a fundamental step for answering how the plasma universe is created and evolves, and how the Sun influences the Earth and other planets in our solar system. The two primary science objectives for Solar-C EUVST are : I) Understand how fundamental processes lead to the formation of the solar atmosphere and the solar wind, II) Understand how the solar atmosphere becomes unstable, releasing the energy that drives solar flares and eruptions. Solar-C EUVST will, A) seamlessly observe all the temperature regimes of the solar atmosphere from the chromosphere to the corona at the same time, B) resolve elemental structures of the solar atmosphere with high spatial resolution and cadence to track their evolution, and C) obtain spectroscopic information on the dynamics of elementary pro- cesses taking place in the solar atmosphere. In this talk, we will discuss the science target of the Solar-C EUVST.

[P-EM19] Frontiers in the solar physics

convener:Shinsuke Imada(Institute for Space-Earth Environmental Research, Nagoya University), Takaaki Yokoyama(School of Science, University of Tokyo), Toshifumi Shimizu(Institute of Space and Astronautical Science, JAXA), Yukio Katsukawa(National Astronomical Observatory of Japan, National Institute of Natural Sciences), Chairperson:Shinsuke Imada

To date, we have three Japanese satellite missions to observe solar atmosphere, i.e., "Hinotori", "Yohkoh", and "Hinode", and revealed very dynamic nature of the solar atmosphere.These satellite observations allow us to see magnetic activities in the corona in X-ray, which cannot be obtained by ground-based telescopes. Also, thanks to seeing free condition, "Hinode" continuously observes the magnetic field in the photosphere. From these experiences, we have learned following three important requirements for the future missions to solve "coronal heating" and "solar flare" problems;1) seamless and simultaneous observation covering all temperature regimes from the photosphere to the corona, 2) high spatial and temporal resolution to resolve elemental structures and to track their evolution, 3) plasma diagnostic capability to quantify the dynamics of elementary processes. Recently, solar physics community in Japan proposed Solar-C_EUVST mission which is intended to be launched in middle of 2020s. Further, next-generation instruments, such as Parker Solar Probe (PSP), the Daniel K. Inouye Solar Telescope (DKIST), and SUNRISE will appear even before Solar-C_EUVST. Several proposals, e.g., PhoENiX, are also appearing. We will discuss in this session what we should study for further understanding of solar physics from current observations and numerical simulations and what we must prepare before 2020s. We welcome participations and presentations especially from Solar Terrestrial Physics (STP) community.

The Sun-Geospace connection: toward the 25th solar cycle

*Yoshizumi Miyoshi[1], Shinsuke Imada[1]

1. Institute for Space-Earth Environmental Research, Nagoya University

One of the major goals of solar-terrestrial physics is to understand how the transfer of Sun and solar wind energy into the Geospace and vice versa. In the last decade, there have been several flagship missions in Geospace; NASA/THEMIS, Van Allen Probes, and MMS, and JAXA/Arase, making important contributions to our understandings of how the Geospace responds on variations of Sun and solar wind. Solar atmosphere is also observed and monitored by modern satellite, such as Hinode, and Solar Dynamics Observatory. The present solar cycle (cycle 24) is one of the weakest cycles in these 100 years. Existing missions successfully observe several abnormal phenomena during weak solar cycle, such as extremely low-density solar wind, strong asymmetry for solar polar magnetic field, or relatively weak geomagnetic activities. For example, large flux enhancements of the outer belt associated with huge magnetic storms have not observed in cycle 24. Further, a lot of cycle prediction studies suggest that next solar cycle (cycle 25) is also as weak as cycle 24. There are also several preexisting and under-preparing missions which will be flagship missions during solar cycle 25. In this presentation, we briefly review highlights from these missions and discuss what subjects are important for the next decade, i.e, the 25th solar cycle to understand coupling process between Sun and Earth.

Unsolved problems of the solar wind turbulence

*Munehito Shoda[1]

1. Graduate School of Science, University of Tokyo

The solar wind is characterized by fluctuations extending from MHD to kinetic scales and therefore is a unique laboratory of plasma turbulence. Despite a number of spacecraft missions for solar wind observation and numerical simulations, the solar wind turbulence involves several unsolved problems. These problems are related to problems in solar physics, including coronal heating and solar wind acceleration. In this talk, I will review unsolved problems of the solar wind turbulence and the latest understandings on them. Predictions for (and results of) Parker Solar Probe would also be discussed.

The Solar-C_EUVST Epsilon mission

*Toshifumi Shimizu[1]

1. Institute of Space and Astronautical Science, JAXA

Solar-C_EUVST (EUV High-Throughput Spectroscopic Telescope) is a solar physics mission which mission concept proposal has been selected as a candidate for JAXA competitive M-class missions in July 2018. As a fundamental step towards answering how the plasma universe is created and evolves, and how the Sun influences the Earth and other planets in our solar system, the proposed mission is designed to comprehensively understand how mass and energy are transferred throughout the solar atmosphere. The onboard science instrument EUVST is an EUV spectrometerwith slit-jaw imaging system that will simultaneously observe the solar atmosphere from the photosphere/chromosphere up to the corona with seamless temperature coverage, high spatial resolution, and high throughput for the first time. It is designed to provide an answer to the most fundamental questions in solar physics: how fundamental processes lead to the formation of the solar atmosphere and the solar wind, and how the solar atmosphere becomes unstable, releasing the energy that drives solar flares and eruptions. The mission will be launched and installed to a sun-synchronous polar orbit by a JAXA Epsilon vehicle in the first half of 2025. The paper will provide the overall description of the mission concept, science, and the latest status.

Advanced Observations of the Solar Atmosphere by a Balloon-Borne Telescope SUNRISE-3

*Yukio Katsukawa[1], Carlos Quintero Noda[2], Masahito Kubo[1], Hirohisa Hara[1], Toshifumi Shimizu[2]

1. National Astronomical Observatory of Japan, 2. ISAS/JAXA

The solar chromosphere interfacing the solar surface (i.e. photosphere) and the corona is not a simple intermediate atmospheric layer transmitting magnetic energy, but a region where strong non-linearity drives dynamic phenomena, such as turbulence, shocks, and jets. Because the dynamics are likely to be responsible for injection of non-thermal energies into the corona and the solar winds, the chromosphere is one of the most important targets in the solar and stellar physics. It is necessary to quantitatively observe 3D magnetic and velocity fields to cover the dynamics in the chromosphere together with energy generation in the photosphere. We plan to acquire high-quality 3D magnetic and velocity fields for the first time by the SUNRISE-3 balloon-borne solar telescope planned for 2021. We are building a high precision spectro-polarimeter called SCIP (SUNRISE Chromospheric Infrared spectro-Polarimeter) to be installed in SUNRISE-3 for precise spectro-polarimetric observation of near-IR spectral lines sensitive to magnetic fields in the photosphere and the chromosphere. To interpret the SUNRISE-3 data, we are developing numerical modeling of the dynamic phenomenon in the solar atmosphere as well as tools to interpret radiative transfer through the atmosphere. The goal is to understand the conversion process of magnetic energies in the astrophysical plasma based on spatially resolved observations of the Sun.

Radiation magnetohydrodynamic modeling of solar coronal dynamics

*Haruhisa Iijima[1]

1. Institute for Space-Earth Environmental Research, Nagoya University

We present highly dynamic simulations of solar corona that exhibit intermittent heating and brightening based on the radiation magnetohydrodynamic model. The recent development of observational instruments allows us to access a large amount of remote-sensing image of the solar atmosphere. Because of the high nonlinearity of the solar atmosphere, the interpretation of the observational data is becoming more difficult. One approach to overcome this difficulty of the observational interpretation is to compare the observational data with synthesized realistic numerical simulations more directly. Realistic model of the solar corona should take into accout various physical processes like the radiative transfer, non-ideal equation of states, and thermal conduction. Our radiation magnetohydrodynamic model RAMENS is one of such solvers that can model the realistic solar dynamics from the upper convection zone to the corona. Recently, we further develop this code by including the semi-relativistic correction of the Alfven wave and thermal conduction to avoid severe time stepping near the active region. This new code allows us to simulate the highly dynamic solar corona within a moderate numerical cost. In the presentation, we will report our implementation of the semi-relativistic correction and present new energetic coronal simulations.

Detection and energy derivation of nano-flares based on deep learning

*Toshiki Kawai[1], Shinsuke Imada[1]

1. Institute for Space-Earth Environmental Research, Nagoya University

Coronal heating is one of the long-standing problems in solar physics. So far, two primary mechanisms have been proposed to explain how the corona is heated, namely small-scale magnetic reconnection and wave dissipation. To estimate the contribution of small-scale magnetic reconnection, so called nano-flares, to heat the corona is crucial to solve the coronal heating problem. The purpose of this study is to develop a method which can accurately detect nano-flares and estimate their energies. Firstly, we carry out one-dimensional hydrodynamic simulations of coronal loops heated by nano-flares which have wide range of energy ($10^{23} < E < 10^{27}$ erg). Secondly, we calculate the temporal variation of EUV and soft X-ray spectra of coronal loops from the simulation results by using CHIANTI atomic database. We perform these procedures more than 1,000 times with randomized flare energy and occurrence time to produce various datasets. Finally, we train a Deep Neural Network (DNN) by using these datasets to estimate the energy distribution and occurrence times of flares from soft X-ray observation. Moreover, we apply trained DNN to actual soft X-ray observations. As a result, we obtain reasonable occurrence times and energies of flares comparing another method which regards flare energy as change amount of thermal energy of the loop.

[P-AE20] Exoplanet

convener:Masahiro Ikoma(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Norio Narita(University of Tokyo), Chairperson:Norio Narita(University of Tokyo), Masahiro Ikoma(The University of Tokyo)

Exoplanetary science, which began with the discovery of a hot Jupiter in 1995, has reached a major turning point by the discovery of countless super-Earths by the Kepler mission. More recently, planets that are similar in size to the Earth and also receive similar amounts of stellar radiation (namely, located in the so-called habitable zone) have been discovered around nearby stars such as Proxima Centauri and TRAPPIST-1. As a result, not only theoretical, but also observational studies on the atmospheres and surface environments of Earth-like exoplanets have been started. Moreover, the number of planets discovered around early-type and late-type stars has become large enough that the occurrence rate and orbital distribution of planets around a wide variety of host stars have become clear. Thus, new observational insights, which become the basis of pan-planet formation theory, are now gathering. While exoplanets have been mainly targeted for astronomy until recently, it can be said that earth planetary science is finally becoming a research field to make a central contribution. In this session, we aim to share cutting-edge research results in exoplanetary science which is in such a transition period.

Gravitational Microlensing Surveys for Exoplanets

*Daisuke Suzuki[1]

1. Institute of Space and Astronautical Science / Japan Aerospace Exploration Agency

Gravitational microlensing can detect cold planets beyond the snow line. It is sensitive to the planets down to the Earth mass. Thus, it is only microlensing among the current exoplanet detection methods that can probe the outer planets orbiting other stars. In this talk, we present the recent microlensing statistical study which finds a disagreement between the observed planet mass-ratio function and the prediction from the population synthesis models based on the core accretion model. The models predict 7 - 10 times fewer planets at mass-ratios of $10^{-4} < q < 10^{-3}$ than found by the microlensing observations. This implies that the formation of gas giants may involve more complicated processes than assumed by the standard core accretion theory. Or, it implies that the planet formation process may vary significantly as a function of host star mass, because the population synthesis models have been calibrated for planets around solar-type stars while microlensing observations are biased toward lower-mass stars.

We also present recent planet discoveries with mass constraint and/or measurement by using the space-based observations or 10m class telescopes. Finally, we introduce future, infrared microlensing surveys, such as the PRIME (PRime-focus Infrared Microlensing Experiment) project and NASA’s WFIRST (Wide Field Infrared Survey Telescope) microlensing survey.

Doppler planet searches targeting stars in solar neighborhood

*Bunei Sato[1]

1. Tokyo Institute of Technology

A precise Doppler measurement is one of the powerful techniques to detect planets orbiting stars. The technique is applicable to the detection of planets with a wide range of orbital parameters, such as semimajor axis and eccentricity, mass, and host stars. The planets detected by the Doppler surveys can thus help us to gain a general understanding of planet formation and evolution. Furthermore, given the high detection efficiency of planets of the Doppler technique compared to transit ones, it is highly useful to search for planets around stars in solar neighborhood.

We have been conducting Doppler planets searches for planets around nearby giant stars, that is evolved intermediate-mass stars, for about 20 years with 188cm telescope and High Dispersion Echelle Spectrograph (HIDES) of Okayama observatory. We have also started intensive Doppler monitoring of nearby bright solar-type stars at Okayama aiming to explore low-mass planets in their habitable zones. Thanks to refurbishment of the HIDES last year, we can now achieve a Doppler precision better than 1 m/s. In this February, a new planet search program targeting nearby low-mass M-type dwarfs was launched with use of the new InfraRed Doppler instrument (IRD) of Subaru 8.2m telescope. The program aims at detecting earth-mass planets in their habitable zones as well as uncovering population of planets around them. Here we report the latest results from these planet-search programs and discuss future prospects.

Development of MuSCAT3 for ground-based follow-up observations of TESS candidate exoplanets

*Norio Narita[1,2,3], Akihiko Fukui[2], Masahiro Ikoma[2], Motohide Tamura[1,2], Nobuhiko Kusakabe[1], Mayuko Mori[2], Tomoyasu Yamamuro[4]

1. Astrobiology Center, 2. University of Tokyo, 3. JST, 4. OptCraft

NASA's Transiting Exoplanet Survey Satellite (TESS), launched on 2018 April 18, will start its survey for northern sky from 2019 summer. TESS is expected to find a large number of candidate transiting exoplanets after 2019 autumn.
Toward the start of the northern sky survey, we are now developing a 4-color simultaneous camera MuSCAT3 for the 1.2m telescope located in the Fred Lawrence Whipple Observatory on Mt. Hopkins in Arizona, USA. This is a successor of existing multi-color simultaneous cameras MuSCAT1/2 on the 188cm telescope in Okayama, Japan and on the 1.52m telescope in Tenerife, Canaries, Spain. MuSCAT3 will work with MuSCAT1/2 and enable 24-hour multi-color simultaneous imaging/photometry in the northern hemisphere. This is the one and only multi-color transit observation network in the world as of 2019. Thereby, we can conduct intensive ground-based follow-up observations rapidly after TESS's data releases, and can lead in discriminating and finding true interesting transiting planets in the world.
In this presentation, we will introduce the specifications of MuSCAT3 and the 1.2m telescope, and present prospects of MuSCAT3 development and synergies with TESS and MuSCAT1/2.

Effect of metallicity and eddy diffusion on transmission spectra of hazy exoplanet atmospheres

*Yui Kawashima[1], Masahiro Ikoma[2]

1. SRON Netherlands Institute for Space Research, 2. The University of Tokyo

Recently, properties of exoplanet atmospheres have been constrained via multi-wavelength transit observation, which measures an apparent decrease in stellar brightness during planetary transit in front of its host star (called transit depth). Sets of transit depths so far measured at different wavelengths (called transmission spectra) for some exoplanets are featureless or flat, inferring the existence of haze particles in the atmospheres. Previous studies that addressed theoretical modeling of transmission spectra of hydrogen-dominated atmospheres with haze used some assumed distribution and size of haze particles. In Kawashima & Ikoma (2018), we developed new photochemical and microphysical models of the creation, growth, and settling of haze particles for deriving their size and number-density distributions in close-in warm (< 1000 K) exoplanet atmospheres.

In this study, we explore the dependence of the production rate of haze and the resultant transmission spectra on metallicity and eddy diffusion coefficient. We find that the photodissociation rates of the hydrocarbons, which are related to the haze monomer production rate, are basically smaller for higher metallicity in spite of their increased abundances. This is because of the enhanced photon-shielding effect by the major photon absorbers, H_2O, CO, CO_2, and O_2, existing at higher altitudes than the hydrocarbons. Thus, the transmission spectrum for higher metallicity atmosphere is less affected by haze. We also find that the efficient eddy diffusion yields a steep Rayleigh-scattering slope in the optical and more prominent molecular-absorption features, which is the dependence opposite of condensation clouds.

Mineral clouds of fluffy aggregates: how they form in exoplanetary atmospheres and influence transmission spectra

*Kazumasa Ohno[1], Satoshi Okuzumi[1], Ryo Tazaki[2]

1. Department of Earth and Planetary Science, Tokyo Institute of Technology, 2. Astronomical Institute, Tohoku University

Observations of transmission spectra have suggested ubiquity of high-altitude clouds in exoplanetary atmospheres. Recent theoretical studies have examined the formation of high-altitude clouds; however, they usually need to assume vigorous vertical mixing to explain the observations, which is orders of magnitude stronger than that suggested from general circulation models. The discrepancy might be caused by an assumption of the compact spheres for cloud particles adopted in previous studies. Because the hot environment of exoplanets leads to the formation of mineral condensates, they potentially grow into fluffy aggregates with very low sedimentation velocity that can be easily transported to high altitude. In this study, we investigate the influences of the particle porosity on vertical profiles of the clouds using a microphysical model taking into account the vertical transport, particle growth, and porosity evolution of cloud particles. We will demonstrate that the particle density can be lower than the material density by 2–3 orders of magnitude. As a result, the vertical extent of the clouds is potentially much larger than that expected in previous studies. We also calculate synthetic transmission spectra with fluffy-aggregate clouds. The fluffy-aggregate clouds largely obscure molecular signatures in the spectra and produce a characteristic spectral slope in visible to near-infrared wavelength. Finally, we compare the synthetic spectra with the transmission spectrum of GJ1214b, a super-Earth suggested to have clouds at ~0.01mbar in pressure, and find that the observed spectra can be explained by the mineral cloud of fluffy aggregates if atmospheric metallicity is higher than 100 times solar abundance. The predicted high atmospheric metallicity might encapsulate information about the formation process of GJ1214b.

Orbital Architecture of Planetary Systems Formed by Giant Impacts

*Eiichiro Kokubo[1]

1. Division of Theoretical Astronomy, National Astronomical Observatory of Japan

In the standard scenario, the final stage of terrestrial planet formation is giant impacts among protoplanets. In this stage protoplanets gravitationally scatter each other and collide until the system reaches a stable configuration. We investigate the final orbital architecture of planetary systems realized by this process by *N*-body simulation. We find that the ratio between the physical and Hill radii of protoplanets determines the system architecture and it becomes compact and dynamically cold as the ratio increases. We also compare the results with the oribital architecture of exoplanetary systems.

[P-AE20] Exoplanet

convener:Masahiro Ikoma(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Norio Narita(University of Tokyo), Chairperson:Masahiro Ikoma(The University of Tokyo), Norio Narita(University of Tokyo)

Exoplanetary science, which began with the discovery of a hot Jupiter in 1995, has reached a major turning point by the discovery of countless super-Earths by the Kepler mission. More recently, planets that are similar in size to the Earth and also receive similar amounts of stellar radiation (namely, located in the so-called habitable zone) have been discovered around nearby stars such as Proxima Centauri and TRAPPIST-1. As a result, not only theoretical, but also observational studies on the atmospheres and surface environments of Earth-like exoplanets have been started. Moreover, the number of planets discovered around early-type and late-type stars has become large enough that the occurrence rate and orbital distribution of planets around a wide variety of host stars have become clear. Thus, new observational insights, which become the basis of pan-planet formation theory, are now gathering. While exoplanets have been mainly targeted for astronomy until recently, it can be said that earth planetary science is finally becoming a research field to make a central contribution. In this session, we aim to share cutting-edge research results in exoplanetary science which is in such a transition period.

Thermal convection in the mantle of super-Earths

*Takehiro Miyagoshi[1], Masanori Kameyama[2], Masaki Ogawa[3]

1. Japan Agency for Marine-Earth Science and Technology, 2. Ehime University, 3. University of Tokyo

Thermal convection in the mantle of super-Earths is one of the most important issues to understand their thermal history and surface environment. It is also linked to the habitability of planets because it controls the plate motion, material circulation, the vigor of core convection and planetary dynamos, and so on.

One of the most important differences between the Earth’s and super-Earth’s interior is that there is a strong adiabatic compression effect in super-Earths. Usually, this effect is ignored in modelling the dynamics in the mantle of the Earth because the effect is small in the Earth. However, this effect becomes strong as the size of planets increases so it cannot be ignored in large planets. In this paper we introduce our results of numerical simulation studies of thermal convection in super-Earths (up to ten times the Earth’s mass) with this effect (Miyagoshi et al., 2014; 2015; 2017; 2018). We also take account for high Rayleigh number which is relevant for super-Earths, and temperature-dependent viscosity contrast and depth-dependent thermal expansion coefficient.

We found that the activity of ascending hot plumes is lowered as the planetary size increases. In contrast, the activity of cold plumes is not lowered even in large planets. The efficiency of heat transport by thermal convection is significantly lowered compared with the results with Boussinesq approximation in which there is no adiabatic compression and which is often used in models for the Earth. We also found the convective regime diagram in massive super-Earths (ten times the Earth’s mass) and how the threshold between stagnant-lid regime and weak-viscosity-contrast regime is determined.

We also found the effects of adiabatic compression become substantial when the planetary mass exceeds about 4 times the Earth’s mass. The plate thickness increases and the convective velocity is almost constant as the planetary mass increases. These results are in a striking contrast with earlier predictions that are made by the Boussinesq approximation models.

We also explored the thermal evolution process in massive super-Earths (ten times the Earth’s mass). At initial the shallow mantle of the planet is hotter than expected from the adiabatic extrapolation from the deep mantle, as expected when the planet is formed from giant impact. We found that the influences of an initial temperature distribution continue extremely long in massive super-Earths. In our case, transient layered convection caused by the initial temperature distribution continues for as long as several to ten billion years before it yields to a whole layer convection.

Our results suggest that the tectonic activities such as plate motion and hot spot volcanisms hardly occur as planetary size increases. The planetary magnetic field is expected to be not so strong in massive super-Earths because of the weak efficiency of heat transport by the mantle convection. In addition, especially in massive super-Earths, special attention for the extremely long transient stage which is affected by the initial temperature distribution is necessary to discuss details of its interior and tectonic activities.

Atmospheric escape from M-dwarf exoplanets and implications for habitability

*Chuanfei Dong[1]

1. Princeton University

In the last two decades, the field of exoplanets has witnessed a tremendous creative surge. Research in exoplanets now encompasses a wide range of fields ranging from astrophysics to heliophysics and climate science. One of the primary objectives of studying exoplanets is to determine the criteria for habitability, and whether certain exoplanets meet these requirements. The classical definition of the Habitable Zone (HZ) is the region around a star where liquid water can exist on the planetary surface given sufficient atmospheric pressure. However, this definition largely ignores the impact of the stellar wind and stellar magnetic activity on the erosion of an exoplanet's atmosphere. Amongst the many factors that determine habitability, understanding the mechanisms of atmospheric loss is of paramount importance.

We will discuss the impact of exoplanetary space weather on the long-term climate evolution and habitability, which offers fresh insights concerning the habitability of exoplanets, especially those orbiting M-dwarfs, such as Proxima b and the TRAPPIST-1 planets. I will focus on a wide range of atmospheric compositions, ranging from exo-Venus candidates to ocean worlds; the latter being a unique class of planets with water-rich surfaces and atmospheres that do not currently exist in our Solar system. For each of these cases, we will demonstrate the importance of the exoplanetary space weather on atmospheric ion loss and habitability.

Keywords: atmospheric escape, planetary habitability, M-dwarf exoplanets, stellar wind and magnetic activity, Proxima b, the TRAPPIST-1 planets

Theoretical emission spectra of hot rocky super-Earths: Lack of alkali metals due to atmospheric escape

*Yuichi Ito[1,2], Masahiro Ikoma[2]

1. Department of Cosmosciences, Graduate school of Science, Hokkaido University, 2. Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo

Until today, over 1000 exoplanets whose radii are less than 2 Earth radii have been discovered. About 50% of those planets have radiative equilibrium temperatures high enough to melt and vaporize rock. Thus, if rocky like CoRoT-7b, they likely have atmospheres composed of rocky materials (e.g., Schaefer & Fegley 2009, Ito et al.2015). We call such a rocky vapor atmosphere a mineral atmosphere in this study. In addition, previous studies showed that atmospheric loss processes such as atmospheric escape cause selective depletion of Na and K in the atmosphere and magma ocean, because of the high-volatility and low abundance of Na and K in rocks. Also, our new 1-D hydrodynamic model of the highly UV-irradiated mineral atmosphere (Ito & Ikoma, in prep) suggests that the hydrodynamic escape is massive enough to remove completely Na and K during the early stage of the host star. Thus, the detection of a mineral atmosphere would provide definitive evidence that the planet is rocky. Moreover, identifying the mineral atmosphere composition, especially the presence or absence of Na and K, would give constraints on the magma composition which could trace not only the interior but evolution of planets.

In this study, we focus on the temperature-pressure structure and detectability for emission spectra of the mineral atmosphere in hydrostatic equilibrium on a hot rocky super-Earth. Also, we investigate the impact of the selective depletion of Na and K on the thermal structure and emission spectra. In order to investigate it, we use the hydrostatic/radiative/chemical equilibrium atmospheric model for mineral atmospheres (Ito et al. 2015) which calculates the gas-melt equilibrium composition of the mineral atmosphere, vertical thermal structure and secondary eclipse depths. We show our results for higher planetary equilibrium temperature (2500, 3000K) such as CoRoT-7 b and Kepler-10 b. We find that the thermal inversion structure of the mineral atmosphere without Na and K is hotter than that of the atmosphere with Na and K. This is mainly because the atmosphere inefficiently emits photons in visible wavelength region due to the lack of Na and K. Our feasibility assessment demonstrates that identification of mineral atmospheres with and without Na and K on hot rocky super-Earths in secondary transit is possible via observation from space telescopes.

Hot Rocky Super-Earths atmospheres, a revision of gas phase metal chemistry and the relevance of reverse chemistry

*Sebastian Danielache[1,2], Takahashi Yuta[1], Miguel Yamila[3], Simoncini Eugenio[4], Grassi Tommaso[5]

There are approximately 2600 reported exoplanets. Among these celestial bodies there is a class of super-Hearts with an orbit smaller than Mercury (0.387 AU) know as Hot Rocky Super-Earths (HRSE). The proximity of this rocky type of planets to their parent start means that their surface can be similar to Bulk Silicate Earth (BSE) at high temperatures. Currently, there are few attempts to estimate the atmospheric composition and chemistry of a HRSE.

A Climate of tidally locked terrestrial exoplanets

*Takanori Kodama[1]

1. University of Bordeaux

Most of the studies for habitable planets focus on to determine the boundary of the habitable zone. From observation of exoplanet, planets with mass between the Earth and super-Earth around low-temperature star have been discussed. The rotation of such a planet is locked due to the tidal effect from the central star because they locate near the central star.

On most of the previous studies, they used one-dimensional climate models and estimated the habitable zone assuming water-rich planets, like the Earth. Recently, studies of habitable climate using a three-dimensional climate model have begun. They show that the habitable zone estimated by 3D GCM (three-dimensional general circulation model) is greatly different from that by the 1D climate model. The most important difference is the distribution of cloud in the planetary atmosphere. A terrestrial planet with liquid water on the surface around a low-temperature star has clouds in high altitude around the sub-stellar point, leading higher albedo. As a result, it can maintain a warmer climate if it is located out of the habitable zone estimated by a 1D climate model. However, when the rotation period of a planet is short enough, the pattern of the circulation changes to the super-rotation. In this case, no such clouds are formed around the sub-stellar point.

I investigate the pattern of the circulation and habitability for TRAPPIST-1 d and Proxima Centauri b. Additionally, I also investigate the effect of the distribution of water on the planetary surface on the formation of cloud.

Faculty of Science and Technology, Seikei University

The World Space Observatory for Ultraviolet (WSO-UV) is an orbital optical telescope with a 1.7-m diameter primary mirror currently under development. The WSO-UV is aimed to operate in the 115- to 310-nm UV spectral range. Its two major science instruments are UV spectrographs and UV imaging field cameras with filter wheels. The WSO-UV project is currently in the implementation phase, with a tentative launch date in 2023. As designed, the telescope field of view in the focal plane is not fully occupied by instruments. Recently, two additional instruments devoted to exoplanets have been proposed for WSO-UV, which are the focus of this paper. UVSPEX, a UV-spectrograph for exoplanets, aims to determine atomic hydrogen and oxygen abundance in the exospheres of terrestrial exoplanets. The spectral range is 115 to 130 nm, which enables simultaneous measurement of hydrogen and oxygen emission intensities during an exoplanet transit. A study of exosphere transit photometric curves can help differentiate among different types of rocky planets. The exospheric temper- ature of an Earth-like planet is much higher than that of a Venus-like planet because of the low mixing ratio of the dominant coolant (CO2) in the upper atmosphere of the former, which causes a large difference in transit depth at the oxygen emission line. Thus, whether the terrestrial exoplanet is Earth-like, Venus-like, or other can be determined.

An interpretation of exoplanet masses and orbital radii with a theoretical model of gas giant formation

*Kiyoka Murase[1], Hidekazu Tanaka[1]

1. TOHOKU UNIVERSITY

About 4000 exoplanets have been detected and their statistical properties such as mass and orbital distributions become clear. However, the origin of these distributions is still uncertain. In this study, applying a recent core accretion model to data ofexoplanets, we clarify whether it is possible to explain the observed distributions ofmasses and orbital radii, and in what protoplanetary disk they can be explain.
We adopt the following theoretical model of gas giant formation in this study. We use the model of Tanigawa & Tanaka (2016) for the mass growth rate (i.e., the gasaccretion rate onto a planet) and the latest model of Kanagawa et al.(2018) for the planetary migration speed. Those are reliable because of their consistency with severalresults of hydrodynamic simulations. For simplification, interactions among multiple planets are ignored. Since the growth rate and the migration speed of a planet areproportional to the disk surface density nearby, a model for global evolution of protoplanetary disk is also necessary. We adopt self-similar solutions of viscous accretion disks. In the model of the disk surface density, we also include the effect of gas depletion due to the planetary gas capture. Furthermore, we also take account of disk dissipation due to the photoevaporation. Then the rate of disk dissipation due to the photoevaporation is a parameter.
From this model, we obtained evolution curves on the plane of the planet mass and orbital radius (Figure 1). The evolution curves are also expressed in an analytical form. Since both the growth rate and migration speed of a planet are proportional to the disk surface density nearby, the curves do not depend on the detail of the disk model. In Figure 1, we also plotted data of exoplanets. Masses of gas giants are clustered around 2 Jupiter mass (or 0.2% of the central-star mass). Such exoplanets do not migrate much during their formation. Even for the largest exoplanet (of which mass is 2% of the star mass), its orbital radius is reduced moderately (to 1/10). Many gas giants are located at around 2AU from their stars. This can be explained as solid cores are easily formed near snow lines of disks at ~3AU.
The termination of growth of each gas giant planet is mainly determined by the initial disk mass and the disk dissipation rate due to photoevaporation. Thus for a given disk dissipation rate, we can obtain initial disk masses corresponding to each planetary masses. Figure 2 plots the distribution of the initial disk masses obtained from the masses of exoplanets with our theoretical model. We find that the peak of our initial disk mass distribution agrees with the most common disk mass in observations (~0.02 solar masses, Andrews et al. 2010) if the disk dissipation rate is set to be ~3×10^{-9} solar mass per year.

Impact of resonance trapping of planetesimals during planetary migration on metallicities of close-in gas giants

*Sho Shibata[1], Masahiro Ikoma[1]

1. Graduate School of Science, The University of Tokyo

The physical properties of gas giant exoplanets have gradually become clear thanks to a rapid advance in exoplanet observations in recent years. According to some studies combining the internal structural modelling of gas giant planets with transit observations, the gas giant planets generally contain much more heavy elements (elements heavier than hydrogen and helium) than their central star. Such heavy element excess of gas giant planets is thought to have been brought about by the capture of planetesimals during the formation phases, but this hypothesis still has problems.

According to studies estimating the amount of planetesimals captured by a growing protoplanet, the amount of heavy elements captured in this process is at most ten Earth masses. The estimated amount is not large enough to explain the heavy element excess of the gas giant planets shown in the above studies. In order to solve this problem, this study investigates the capture of planetesimals during the planet migration process, which is different from the growth process investigated before. In particular, we focus on the capture of planetesimals by the mean motion resonances of a migrating gas giant planet (resonance trapping). Performing orbital calculations of planetesimals, we quantitatively discuss the effect of the resonance trapping on the capture of planetesimals by a migrating gas giant planet.

Theoretical modeling of hydrogen line emission from accreting gas giants: comparison with observations of LkCa15b and PDS70b

*Yuhiko Aoyama[1], Masahiro Ikoma[1], Gabriel-Dominique Marleau[2], Christoph Mordasini[3]

1. Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 2. Institute for Astronomy and Astrophysics, Eberhard Karls University of Tubingen, 3. Physics Institute, University of Bern

Recent direct imaging observation has detected some forming protoplanets. Although most of such observations used infra-red bands, also visible band observation, which covers H-alpha line, detected two protoplanetary candidates, LkCa15b and PDS70b. The observed luminosities of IR photon from the protoplanets correspond to the emission from the gas of thousands K. This is a reasonable temperature for photosphere of accreting protoplanets. On the other hand, the detected H-alpha luminosities exceed the emission of thousands K and correspond to tens of thousands of K. Such a hot gas originates in shock-heated gas. According to numerical simulations of hydrodynamics around forming planets, gas accreting towards protoplanets goes through several shocks. At some of the shocks, its flow velocity exceeds gas sound speed by several orders of magnitude. Thus, the shock heats the gas to tens of thousands of K, and the shock-heated gas can emit H-alpha of observable intensity. However, such a hot gas rapidly cools by hydrogen line radiation. Since the temperature changes with electron transitions proceeding, the hydrogen electron level distribution, which determines hydrogen line emission and extinction, never reaches its equilibrium state. Therefore, in this study, we modeled hydrodynamics of cooling flow after the shock, radiative transfer of hydrogen lines, and electron level transitions at the same time. Using this model, we estimated hydrogen line intensity as a function of gas velocity and mass flux at the shock. By comparing the results with the observational results, we will discuss the preferred picture of gas accretion towards protoplanets.

Design of a Lyman alpha telescope LAICA2 for exoplanetary exploration

*Toru Muraoka[1], Go Murakami[2], Shingo Kameda[1]

1. Rikkyo University, 2. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency

Recently, small planets, which orbit around small cool stars have gained considerable attentions as objects of Earth-like exoplanetary exploration. These small planets can be detected by the transit observation. Moreover, if their atmospheres are rich in oxygen and receive high extreme ultraviolet (EUV) radiation, their oxygen atmosphere might expand (Kulikov et al., 2007, Tian et al., 2008b). Hence, the transit observation of expanded-oxygen absorption is considered to be effective to detect the Earth-like exoplanets. However, most of the EUV radiation cannot be measured, because it gets absorbed by the interstellar neutral hydrogen. Therefore, in order to estimate the EUV spectrum of the star, we quoted the empirically derived relationships between the total hydrogen Lyman alpha intensity and the EUV spectrum presented in Linsky et al. (2014). The deep space microspacecraft PROCYON is equipped with the Lyman Alpha Imaging Camera (LAICA). Based on LAICA, we designed the telescope LAICA2, which can measure the Lyman alpha intensity from distant stars. The field of view (FoV) of LAICA is wide for observation of widely expanded geocorona but that of LAICA2 is to be narrower for observation of distant stars. Therefore, in LAICA2, the focal length was extended by 1.5 times while maintaining a spot size, by making the primary mirror elliptical; in LAICA, both the primary and secondary mirror have a spherical shape. In addition, the influence of stray light was reduced by designing a baffle that can block the correspondent light path. We evaluated the stray light originated by internal reflection and scattering in the optical system: our analysis indicated that the influence of stray light on LAICA2 observations can be ignored.

We conduct a series of numerical experiments of thermal convection of highly compressible fluids in a two-dimensional rectangular box heated both from within and below, in order to study the mantle convection on super-Earths. The thermal conductivity and viscosity are assumed to exponentially depend on depth and temperature, respectively, while the variations in thermodynamic properties (thermal expansivity and reference density) with depth are taken to be relevant for the super-Earths with 10 times the Earth's. From our experiments we identified a distinct regime of convecting flow patterns induced by the interplay between the adiabatic temperature change and the spatial variations in viscosity and thermal conductivity. That is, for the cases with strong temperature-dependent viscosity and depth-dependent thermal conductivity, a "deep stratosphere" of stable thermal stratification is formed at the base of the mantle, in addition to thick stagnant lids at their top surfaces. In the "deep stratosphere", the fluid motion is insignificant particularly in the vertical direction in spite of smallest viscosity owing to its strong dependence on temperature. Our finding may further imply that some of super-Earths which are lacking in mobile tectonic plates on their top surfaces may have "deep stratospheres" at the base of their mantles.

Environmental factors of crucial importance for exoplanetary habitability include the presence of bodies of liquid surface water, a dense atmosphere, planetary global magnetic field, and internal planetary dynamics . In addition, high-energy radiation due to exoplanetary space weather introduced by magnetic activity of a planet-hosting star can also play a crucial role in the definition of habitability.

Here, we present the first quantitative impact evaluation system of stellar activity on the habitability factors with an emphasis on Stellar Proton Events for several documented exoplanets examining the impact of CO2, H2, N2+O2 –rich atmospheres by introducing starspots of their hoststars, estimated using their rotational periods and lightcurves.

Simulations suggest that the estimated ground level dose for each planet, assuming a terrestrial-level atmospheric thickness, does not exceed the critical dose for complex (multi- cellular) life to persist, even for the planetary surface of Proxima Centauri b, Ross-128b and TRAPPIST-1 e. However when we consider the possible maximum flare for those host stars, at the terrestrial lowest atmospheric depth, the estimated dose reaches fatal levels on TRAPPIST-1 e and Ross-128 b. Continuous XUV radiation higher than that experienced by the Earth induces rapid atmospheric escape for those planetary systems , meaning the atmospheric depth might be substantially less than the Earth. In a scenario where the modelled planetary systems have 1/10 the atmospheric thickness of Earth, the radiation dose at Proxima Centauri b and TRAPPIST-1 e reaches near fatal levels just from relatively minor annually occurring flares from their hoststars.

Studies of atmospheric structure in new very-hot Jupiter with high-resolution transmission spectroscopy

*Kiyoe Kawauchi[1], Bun'ei Sato[1], Norio Narita[2], Teruyuki Hirano[1], Yui Kawashima[3]

1. Tokyo Institute of Technology, 2. Tokyo University, 3. SRON - Netherlands Institute for Space Research

In the last decade, the understanding of exoplanetary atmospheres has advanced considerably through spectroscopic observations during planetary transit events, known as transmission spectroscopy.

Transmission spectroscopy done by Charbonneau et al. (2002) using Hubble Space Telescope first detected Na in the atmosphere of the hot Jupiter HD209458b. Currently, alkali metals have been detected in some hot Jupiter atmospheres. (e.g. Sing et al. 2012) Alkali metal lines are one of the most important key opacity sources because the Na I and K I resonance doublets are thought to be the cause of the generally low albedos, as the alkali metal's wide line wings absorb almost all of the incoming stellar irradiation.

Especially, high-resolution transmission spectroscopy of Na absorption lines can investigate temperature of a thermosphere where temperature is increased by stellar X-ray and EUV irradiation and the atmospheric escape is caused because the depth of Na absorption lines is deep and comparable to that of Hα absorption line which is formed in upper atmosphere (Huang et al. 2017).

We performed high-resolution transmission spectroscopy for WASP-76 with Subaru HDS. For WASP-76b, we detected strong Na D absorption lines and measured an average absorption depth of 0.427 ±0.018% for a 3.0 Åpassband. We derived the temperatures of the upper atmosphere as about 3700 K (Na D1) and 4000 K (Na D2) on the assumption of an atomic layer where an atomic hydrogen is dominated. As the equilibrium temperature is about 2160K, these results suggest the existence of a thermosphere.

Doppler Tomographic Analysis for the Planetary Orbital Precession of WASP-33b

*Noriharu Watanabe[1], Norio Narita[2], Marshall C. Johnson[3]

1. The Graduate University for Advanced Studies, 2. The University of Tokyo, 3. The Ohio State University

The apparent angle between the stellar spin axis and the planetary orbital axis, which is called orbital obliquity (λ), is one of the important parameters for understanding the orbital evolution. If a planet has followed an orbital evolution like those in our solar planets evolve, its orbit will be aligned with the stellar spin. This orbit is called a prograde orbit ($|\lambda| < 90$ deg) and many exoplanets orbit with the direction. However, it is clear that there are few exoplanets with retrograde orbits ($|\lambda| > 90$ deg), which is the opposite case of our solar system. Doppler tomography (DT) is one of the methods to measure λ. In this method, when a planet covers part of the stellar surface during a planetary transit, a planetary shadow appears in the stellar line profile which is broadened by its rapid stellar spin. Then, λ can be derived by the track of the shadow. The distance between the center of the stellar surface, which is called the impact parameter (b), can be measured by DT. Moreover, The planetary shadow appears more easily when the central star spins faster, which makes the measurement of these parameters more easily.

The previous study [1] found that the values of λ and b of the hot Jupiter WASP-33b, which has a 1.2-day period retrograde circular orbit around a rapidly rotating and pulsating A-type star, changed slightly from 2008 and 2014. They detected its orbital precession due to its slightly flattened central star. However, only two observational epochs, from 2008 and 2014, were used in the previous study [1]. We aim to confirm and more precisely measure the precession using not only the dataset of 2008 and 2014 but also a previously unpublished dataset from 2011.

In our research, we used observational data of WASP-33 which was obtained using the High Dispersion Spectrograph (HDS) on the 8.2m Subaru telescope on 19th October 2011 (UT), as well as data sets of the previous study [1] which has already been analyzed up to their line profiles. First, we obtained the average line profile of each exposure from a large number of absorption lines by Least-Squares-Deconvolution (LSD). Subtracting the average stellar line profile of all exposures from the one from each exposure, we got the planetary shadow showing a retrograde orbit and a component from stellar pulsations. In order to make the measurement of the planetary parameters more easily, we extracted only the planetary shadow by Fourier filtering used in the previous study [1].

In order to make the measurement of the planetary parameters, we adopted an MCMC analysis for the three filtered data with our planetary shadow model with Fourier filtering. Considering b and λ of WASP-33b is changeable, our results show that b changed linearly, but the change of λ was not so that λ in 2011 was not intermediate between ones in 2008 and 2014. In the case that λ is fixed but b is changeable, we found that the change of b was comparable to one of the former case. In either case, our results indicated that the orbital precession seems to be different than one from the previous study [1].

TESS Follow-up Observation with IRSF/SIRIUS

*Mayuko Mori[1], Norio Narita[1,2], Jerome Pitogo de Leon[1], Taku Nishiumi[3], Akihiko Fukui[1], Motohide Tamura[1,2], Nobuhiko Kusakabe[2], Kumiko Morihana[4]

1. The University of Tokyo, 2. Astrobiology Center, NINS, 3. Kyoto Sangyo University, 4. Nagoya University

We observed planetary candidates from Transiting Exoplanet Survey Satellite (**TESS**) with **1.4m telescope IRSF** in South Africa, as part of TESS Follow-Up Observing Program (**TFOP**).
Though it is predicted that TESS will find several thousands of exoplanet candidates, a large part of them will be **false positives produced by eclipsing binaries**[1]. In order to distinguish them, follow-up observations from ground-based telescopes are important. IRSF and its simultaneous-3 color infrared imager SIRIUS is suitable for follow-up observation.
Compared to TESS, IRSF/SIRIUS has **higher angular resolution**(0.453arcsec/pix), and it enables us to derive each stars' light curve inside TESS aperture and identify the culprit of brightness variability. Also its **simultaneous photometry in J, H, Ks band** is useful to clarify wavelength dependence of transit depth and then distinguish blended binaries from transiting planets. However, because IRSF/SIRIUS is not originally designed for transit observations, it required a new pipeline to convert raw images into the data and figures for transit analysis.
Our new pipeline can take photometry of all detectable stars inside the field of view, and create each light curve in simple process. It also calculates the separation and the magnitude difference between each stars, and they are useful to eliminate diluted eclipsing binaries. Besides, it can calculate the correlation between brightness variability and the effects from instrument, and fit light curves with a simple linear model of such systematics. The pipeline made us able to submit the observational results to TFOP team within a few days.
The observations were conducted from October to November in 2018. 45 transits of 35 candidates were observed. We reported our results to TFOP team on 8 exoplanets, TOI 125, TOI 142, TOI 157, TOI 174, TOI 178, TOI 179, TOI 193 and TOI212. Our contribution was useful to detect exoplanets and to eliminate eclipsing binaries.
Above all, for **TOI 125**, our observation contributed a lot to eliminate diluted eclipsing binaries. TFOP team detected that TOI 125 is a K dwarf with 2 confirmed sub-Neptune sized planets(2.76R_E, 2.79R_E) and 3 planetary candidates. The ratio of orbital periods between planet c and b is slightly smaller than an 2:1 commensurability, and it makes this system dynamically interesting.
In our poster, we will introduce the details of our pipeline and several observational results.

Status of the Multi-band Cameras for Transiting Exoplanets MuSCAT1,2 and New Results in 2018

*Akihiko Fukui[1], Norio Narita[2], Nobuhiko Kusakabe[2], Motohide Tamura[2,1], Kiyoe Kawauchi[1], John Livingston[1], Jerome de Leon[1], Noriharu Watanabe[3], Yuka Terada[1], Mayuko Mori[1], Taku Nishiumi[4]

1. The University of Tokyo, 2. Astrobiology Center, 3. SOKENDAI, 4. Kyoto Sangyo University

MuSCAT and MuSCAT2 are optical multi-band cameras develped for observing transiting exoplanets. MuSCAT was developed for the Okayama 188cm telescope of NAOJ in 2014, and MuSCAT2 was developed for the TCS 1.52m telescope in Teide observatory, the Canary Islands, Spain, in 2017. MuSCAT and MuSCAT2 have the capabilities of simultaneously obtaining 3- (g-, r-, and z_s-) and 4- (g-, r-, i-, and z_s-) band images, respectively. One of the main purposes of these instruments is to validate and caracterize the planetary candidates discovered by the all-sky transiting planet survey satellite TESS, which was launched in April 2018.

In 2018, there was no much observation with MuSCAT because that it was the transition period of the telescope operation from NAOJ to the user community, and that there were several troubles in the instrument. However, from January 2019 we have observed with MuSCAT for about 1 week per month in average.

As for MuSCAT2, we have observed more than 250 nights in corraboration with the co-researchers in Instituto de Astrofisica de Canarias (IAC) in 2018. We have improved the operation system and remote-observing system to reduce the load of the observers and to make it possible to observe from Japan smoothly.

TESS has observed only the Southern sky in the first year, and there were few TESS planetary candidates that can be observed with MuSCAT and MuSCAT2 in 2018. Instead, in this year we have observed planetary candidates discovered by the Kepler's ecliptic survey or ground-based transit surveys, as well as low-density transiting planets to observe their atmospheres.

In this contribution, we will report the status of the operations of MuSCAT and MuSCAT2 in 2018, and show new results obtained from these instruments.

[P-AE20] Exoplanet

convener:Masahiro Ikoma(Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo), Norio Narita(University of Tokyo)

Exoplanetary science, which began with the discovery of a hot Jupiter in 1995, has reached a major turning point by the discovery of countless super-Earths by the Kepler mission. More recently, planets that are similar in size to the Earth and also receive similar amounts of stellar radiation (namely, located in the so-called habitable zone) have been discovered around nearby stars such as Proxima Centauri and TRAPPIST-1. As a result, not only theoretical, but also observational studies on the atmospheres and surface environments of Earth-like exoplanets have been started. Moreover, the number of planets discovered around early-type and late-type stars has become large enough that the occurrence rate and orbital distribution of planets around a wide variety of host stars have become clear. Thus, new observational insights, which become the basis of pan-planet formation theory, are now gathering. While exoplanets have been mainly targeted for astronomy until recently, it can be said that earth planetary science is finally becoming a research field to make a central contribution. In this session, we aim to share cutting-edge research results in exoplanetary science which is in such a transition period.

An interpretation of exoplanet masses and orbital radii with a theoretical model of gas giant formation

*Kiyoka Murase[1], Hidekazu Tanaka[1]

1. TOHOKU UNIVERSITY

About 4000 exoplanets have been detected and their statistical properties such as mass and orbital distributions become clear. However, the origin of these distributions is still uncertain. In this study, applying a recent core accretion model to data ofexoplanets, we clarify whether it is possible to explain the observed distributions ofmasses and orbital radii, and in what protoplanetary disk they can be explain.
We adopt the following theoretical model of gas giant formation in this study. We use the model of Tanigawa & Tanaka (2016) for the mass growth rate (i.e., the gasaccretion rate onto a planet) and the latest model of Kanagawa et al.(2018) for the planetary migration speed. Those are reliable because of their consistency with severalresults of hydrodynamic simulations. For simplification, interactions among multiple planets are ignored. Since the growth rate and the migration speed of a planet areproportional to the disk surface density nearby, a model for global evolution of protoplanetary disk is also necessary. We adopt self-similar solutions of viscous accretion disks. In the model of the disk surface density, we also include the effect of gas depletion due to the planetary gas capture. Furthermore, we also take account of disk dissipation due to the photoevaporation. Then the rate of disk dissipation due to the photoevaporation is a parameter.
From this model, we obtained evolution curves on the plane of the planet mass and orbital radius (Figure 1). The evolution curves are also expressed in an analytical form. Since both the growth rate and migration speed of a planet are proportional to the disk surface density nearby, the curves do not depend on the detail of the disk model. In Figure 1, we also plotted data of exoplanets. Masses of gas giants are clustered around 2 Jupiter mass (or 0.2% of the central-star mass). Such exoplanets do not migrate much during their formation. Even for the largest exoplanet (of which mass is 2% of the star mass), its orbital radius is reduced moderately (to 1/10). Many gas giants are located at around 2AU from their stars. This can be explained as solid cores are easily formed near snow lines of disks at ~3AU.
The termination of growth of each gas giant planet is mainly determined by the initial disk mass and the disk dissipation rate due to photoevaporation. Thus for a given disk dissipation rate, we can obtain initial disk masses corresponding to each planetary masses. Figure 2 plots the distribution of the initial disk masses obtained from the masses of exoplanets with our theoretical model. We find that the peak of our initial disk mass distribution agrees with the most common disk mass in observations (~0.02 solar masses, Andrews et al. 2010) if the disk dissipation rate is set to be ~3×10^{-9} solar mass per year.

Impact of resonance trapping of planetesimals during planetary migration on metallicities of close-in gas giants

*Sho Shibata[1], Masahiro Ikoma[1]

1. Graduate School of Science, The University of Tokyo

The physical properties of gas giant exoplanets have gradually become clear thanks to a rapid advance in exoplanet observations in recent years. According to some studies combining the internal structural modelling of gas giant planets with transit observations, the gas giant planets generally contain much more heavy elements (elements heavier than hydrogen and helium) than their central star. Such heavy element excess of gas giant planets is thought to have been brought about by the capture of planetesimals during the formation phases, but this hypothesis still has problems.

According to studies estimating the amount of planetesimals captured by a growing protoplanet, the amount of heavy elements captured in this process is at most ten Earth masses. The estimated amount is not large enough to explain the heavy element excess of the gas giant planets shown in the above studies. In order to solve this problem, this study investigates the capture of planetesimals during the planet migration process, which is different from the growth process investigated before. In particular, we focus on the capture of planetesimals by the mean motion resonances of a migrating gas giant planet (resonance trapping). Performing orbital calculations of planetesimals, we quantitatively discuss the effect of the resonance trapping on the capture of planetesimals by a migrating gas giant planet.

Theoretical modeling of hydrogen line emission from accreting gas giants: comparison with observations of LkCa15b and PDS70b

*Yuhiko Aoyama[1], Masahiro Ikoma[1], Gabriel-Dominique Marleau[2], Christoph Mordasini[3]

1. Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo, 2. Institute for Astronomy and Astrophysics, Eberhard Karls University of Tubingen, 3. Physics Institute, University of Bern

Recent direct imaging observation has detected some forming protoplanets. Although most of such observations used infra-red bands, also visible band observation, which covers H-alpha line, detected two protoplanetary candidates, LkCa15b and PDS70b. The observed luminosities of IR photon from the protoplanets correspond to the emission from the gas of thousands K. This is a reasonable temperature for photosphere of accreting protoplanets. On the other hand, the detected H-alpha luminosities exceed the emission of thousands K and correspond to tens of thousands of K. Such a hot gas originates in shock-heated gas. According to numerical simulations of hydrodynamics around forming planets, gas accreting towards protoplanets goes through several shocks. At some of the shocks, its flow velocity exceeds gas sound speed by several orders of magnitude. Thus, the shock heats the gas to tens of thousands of K, and the shock-heated gas can emit H-alpha of observable intensity. However, such a hot gas rapidly cools by hydrogen line radiation. Since the temperature changes with electron transitions proceeding, the hydrogen electron level distribution, which determines hydrogen line emission and extinction, never reaches its equilibrium state. Therefore, in this study, we modeled hydrodynamics of cooling flow after the shock, radiative transfer of hydrogen lines, and electron level transitions at the same time. Using this model, we estimated hydrogen line intensity as a function of gas velocity and mass flux at the shock. By comparing the results with the observational results, we will discuss the preferred picture of gas accretion towards protoplanets.

Design of a Lyman alpha telescope LAICA2 for exoplanetary exploration

*Toru Muraoka[1], Go Murakami[2], Shingo Kameda[1]

1. Rikkyo University, 2. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency

Recently, small planets, which orbit around small cool stars have gained considerable attentions as objects of Earth-like exoplanetary exploration. These small planets can be detected by the transit observation. Moreover, if their atmospheres are rich in oxygen and receive high extreme ultraviolet (EUV) radiation, their oxygen atmosphere might expand (Kulikov et al., 2007, Tian et al., 2008b). Hence, the transit observation of expanded-oxygen absorption is considered to be effective to detect the Earth-like exoplanets. However, most of the EUV radiation cannot be measured, because it gets absorbed by the interstellar neutral hydrogen. Therefore, in order to estimate the EUV spectrum of the star, we quoted the empirically derived relationships between the total hydrogen Lyman alpha intensity and the EUV spectrum presented in Linsky et al. (2014). The deep space microspacecraft PROCYON is equipped with the Lyman Alpha Imaging Camera (LAICA). Based on LAICA, we designed the telescope LAICA2, which can measure the Lyman alpha intensity from distant stars. The field of view (FoV) of LAICA is wide for observation of widely expanded geocorona but that of LAICA2 is to be narrower for observation of distant stars. Therefore, in LAICA2, the focal length was extended by 1.5 times while maintaining a spot size, by making the primary mirror elliptical; in LAICA, both the primary and secondary mirror have a spherical shape. In addition, the influence of stray light was reduced by designing a baffle that can block the correspondent light path. We evaluated the stray light originated by internal reflection and scattering in the optical system: our analysis indicated that the influence of stray light on LAICA2 observations can be ignored.

Numerical experiments on thermal convection of highly compressible fluids: Influences for mantle convection of super-Earths

*Masanori Kameyama[1,2]

1. Geodynamics Research Center, Ehime University, 2. Japan Agency for Marine-Earth Science and Technology

We conduct a series of numerical experiments of thermal convection of highly compressible fluids in a two-dimensional rectangular box heated both from within and below, in order to study the mantle convection on super-Earths. The thermal conductivity and viscosity are assumed to exponentially depend on depth and temperature, respectively, while the variations in thermodynamic properties (thermal expansivity and reference density) with depth are taken to be relevant for the super-Earths with 10 times the Earth's. From our experiments we identified a distinct regime of convecting flow patterns induced by the interplay between the adiabatic temperature change and the spatial variations in viscosity and thermal conductivity. That is, for the cases with strong temperature-dependent viscosity and depth-dependent thermal conductivity, a "deep stratosphere" of stable thermal stratification is formed at the base of the mantle, in addition to thick stagnant lids at their top surfaces. In the "deep stratosphere", the fluid motion is insignificant particularly in the vertical direction in spite of smallest viscosity owing to its strong dependence on temperature. Our finding may further imply that some of super-Earths which are lacking in mobile tectonic plates on their top surfaces may have "deep stratospheres" at the base of their mantles.

Department of Astronomy, Kyoto University, 4. Japan Atomic Energy Agency, 5. NASA / GSFC, 6. Faculty of Agriculture, Kyoto University, 7. Faculty of Engineering, Kyoto University, 8. Faculty of Science, Kyoto University, 9. Interface Analysis Centre, University of Bristol, 10. Astronomical Observatory, Kyoto University

Environmental factors of crucial importance for exoplanetary habitability include the presence of bodies of liquid surface water, a dense atmosphere, planetary global magnetic field, and internal planetary dynamics . In addition, high-energy radiation due to exoplanetary space weather introduced by magnetic activity of a planet-hosting star can also play a crucial role in the definition of habitability.

Here, we present the first quantitative impact evaluation system of stellar activity on the habitability factors with an emphasis on Stellar Proton Events for several documented exoplanets examining the impact of CO2, H2, N2+O2 –rich atmospheres by introducing starspots of their hoststars, estimated using their rotational periods and lightcurves.

Simulations suggest that the estimated ground level dose for each planet, assuming a terrestrial-level atmospheric thickness, does not exceed the critical dose for complex (multi- cellular) life to persist, even for the planetary surface of Proxima Centauri b, Ross-128b and TRAPPIST-1 e. However when we consider the possible maximum flare for those host stars, at the terrestrial lowest atmospheric depth, the estimated dose reaches fatal levels on TRAPPIST-1 e and Ross-128 b. Continuous XUV radiation higher than that experienced by the Earth induces rapid atmospheric escape for those planetary systems , meaning the atmospheric depth might be substantially less than the Earth. In a scenario where the modelled planetary systems have 1/10 the atmospheric thickness of Earth, the radiation dose at Proxima Centauri b and TRAPPIST-1 e reaches near fatal levels just from relatively minor annually occurring flares from their hoststars.

Studies of atmospheric structure in new very-hot Jupiter with high-resolution transmission spectroscopy

*Kiyoe Kawauchi[1], Bun'ei Sato[1], Norio Narita[2], Teruyuki Hirano[1], Yui Kawashima[3]

1. Tokyo Institute of Technology, 2. Tokyo University, 3. SRON - Netherlands Institute for Space Research

In the last decade, the understanding of exoplanetary atmospheres has advanced considerably through spectroscopic observations during planetary transit events, known as transmission spectroscopy.

Transmission spectroscopy done by Charbonneau et al. (2002) using Hubble Space Telescope first detected Na in the atmosphere of the hot Jupiter HD209458b. Currently, alkali metals have been detected in some hot Jupiter atmospheres. (e.g. Sing et al. 2012) Alkali metal lines are one of the most important key opacity sources because the Na I and K I resonance doublets are thought to be the cause of the generally low albedos, as the alkali metal's wide line wings absorb almost all of the incoming stellar irradiation.

Especially, high-resolution transmission spectroscopy of Na absorption lines can investigate temperature of a thermosphere where temperature is increased by stellar X-ray and EUV irradiation and the atmospheric escape is caused because the depth of Na absorption lines is deep and comparable to that of Hα absorption line which is formed in upper atmosphere (Huang et al. 2017).

We performed high-resolution transmission spectroscopy for WASP-76 with Subaru HDS. For WASP-76b, we detected strong Na D absorption lines and measured an average absorption depth of 0.427 ±0.018% for a 3.0 Åpassband. We derived the temperatures of the upper atmosphere as about 3700 K (Na D1) and 4000 K (Na D2) on the assumption of an atomic layer where an atomic hydrogen is dominated. As the equilibrium temperature is about 2160K, these results suggest the existence of a thermosphere.

Doppler Tomographic Analysis for the Planetary Orbital Precession of WASP-33b

*Noriharu Watanabe[1], Norio Narita[2], Marshall C. Johnson[3]

1. The Graduate University for Advanced Studies, 2. The University of Tokyo, 3. The Ohio State University

The apparent angle between the stellar spin axis and the planetary orbital axis, which is called orbital obliquity (λ), is one of the important parameters for understanding the orbital evolution. If a planet has followed an orbital evolution like those in our solar planets evolve, its orbit will be aligned with the stellar spin. This orbit is called a prograde orbit ($|\lambda| < 90$ deg) and many exoplanets orbit with the direction. However, it is clear that there are few exoplanets with retrograde orbits ($|\lambda| > 90$ deg), which is the opposite case of our solar system. Doppler tomography (DT) is one of the methods to measure λ. In this method, when a planet covers part of the stellar surface during a planetary transit, a planetary shadow appears in the stellar line profile which is broadened by its rapid stellar spin. Then, λ can be derived by the track of the shadow. The distance between the center of the stellar surface, which is called the impact parameter (b), can be measured by DT. Moreover, The planetary shadow appears more easily when the central star spins faster, which makes the measurement of these parameters more easily.

The previous study [1] found that the values of λ and b of the hot Jupiter WASP-33b, which has a 1.2-day period retrograde circular orbit around a rapidly rotating and pulsating A-type star, changed slightly from 2008 and 2014. They detected its orbital precession due to its slightly flattened central star. However, only two observational epochs, from 2008 and 2014, were used in the previous study [1]. We aim to confirm and more precisely measure the precession using not only the dataset of 2008 and 2014 but also a previously unpublished dataset from 2011.

In our research, we used observational data of WASP-33 which was obtained using the High Dispersion Spectrograph (HDS) on the 8.2m Subaru telescope on 19th October 2011 (UT), as well as data sets of the previous study [1] which has already been analyzed up to their line profiles. First, we obtained the average line profile of each exposure from a large number of absorption lines by Least-Squares-Deconvolution (LSD). Subtracting the average stellar line profile of all exposures from the one from each exposure, we got the planetary shadow showing a retrograde orbit and a component from stellar pulsations. In order to make the measurement of the planetary parameters more easily, we extracted only the planetary shadow by Fourier filtering used in the previous study [1].

In order to make the measurement of the planetary parameters, we adopted an MCMC analysis for the three filtered data with our planetary shadow model with Fourier filtering. Considering b and λ of WASP-33b is changeable, our results show that b changed linearly, but the change of λ was not so that λ in 2011 was not intermediate between ones in 2008 and 2014. In the case that λ is fixed but b is changeable, we found that the change of b was comparable to one of the former case. In either case, our results indicated that the orbital precession seems to be different than one from the previous study [1].

TESS Follow-up Observation with IRSF/SIRIUS

*Mayuko Mori[1], Norio Narita[1,2], Jerome Pitogo de Leon[1], Taku Nishiumi[3], Akihiko Fukui[1], Motohide Tamura[1,2], Nobuhiko Kusakabe[2], Kumiko Morihana[4]

1. The University of Tokyo, 2. Astrobiology Center, NINS, 3. Kyoto Sangyo University, 4. Nagoya University

We observed planetary candidates from Transiting Exoplanet Survey Satellite (**TESS**) with **1.4m telescope IRSF** in South Africa, as part of TESS Follow-Up Observing Program (**TFOP**).
Though it is predicted that TESS will find several thousands of exoplanet candidates, a large part of them will be **false positives produced by eclipsing binaries**[1]. In order to distinguish them, follow-up observations from ground-based telescopes are important. IRSF and its simultaneous-3 color infrared imager SIRIUS is suitable for follow-up observation.
Compared to TESS, IRSF/SIRIUS has **higher angular resolution**(0.453arcsec/pix), and it enables us to derive each stars' light curve inside TESS aperture and identify the culprit of brightness variability. Also its **simultaneous photometry in J, H, Ks band** is useful to clarify wavelength dependence of transit depth and then distinguish blended binaries from transiting planets. However, because IRSF/SIRIUS is not originally designed for transit observations, it required a new pipeline to convert raw images into the data and figures for transit analysis.
Our new pipeline can take photometry of all detectable stars inside the field of view, and create each light curve in simple process. It also calculates the separation and the magnitude difference between each stars, and they are useful to eliminate diluted eclipsing binaries. Besides, it can calculate the correlation between brightness variability and the effects from instrument, and fit light curves with a simple linear model of such systematics. The pipeline made us able to submit the observational results to TFOP team within a few days.
The observations were conducted from October to November in 2018. 45 transits of 35 candidates were observed. We reported our results to TFOP team on 8 exoplanets, TOI 125, TOI 142, TOI 157, TOI 174, TOI 178, TOI 179, TOI 193 and TOI212. Our contribution was useful to detect exoplanets and to eliminate eclipsing binaries.
Above all, for **TOI 125**, our observation contributed a lot to eliminate diluted eclipsing binaries. TFOP team detected that TOI 125 is a K dwarf with 2 confirmed sub-Neptune sized planets(2.76R_E, 2.79R_E) and 3 planetary candidates. The ratio of orbital periods between planet c and b is slightly smaller than an 2:1 commensurability, and it makes this system dynamically interesting.
In our poster, we will introduce the details of our pipeline and several observational results.

Status of the Multi-band Cameras for Transiting Exoplanets MuSCAT1,2 and New Results in 2018

*Akihiko Fukui[1], Norio Narita[2], Nobuhiko Kusakabe[2], Motohide Tamura[2,1], Kiyoe Kawauchi[1], John Livingston[1], Jerome de Leon[1], Noriharu Watanabe[3], Yuka Terada[1], Mayuko Mori[1], Taku Nishiumi[4]

1. The University of Tokyo, 2. Astrobiology Center, 3. SOKENDAI, 4. Kyoto Sangyo University

MuSCAT and MuSCAT2 are optical multi-band cameras develped for observing transiting exoplanets. MuSCAT was developed for the Okayama 188cm telescope of NAOJ in 2014, and MuSCAT2 was developed for the TCS 1.52m telescope in Teide observatory, the Canary Islands, Spain, in 2017. MuSCAT and MuSCAT2 have the capabilities of simultaneously obtaining 3- (g-, r-, and z_s-) and 4- (g-, r-, i-, and z_s-) band images, respectively. One of the main purposes of these instruments is to validate and caracterize the planetary candidates discovered by the all-sky transiting planet survey satellite TESS, which was launched in April 2018.

In 2018, there was no much observation with MuSCAT because that it was the transition period of the telescope operation from NAOJ to the user community, and that there were several troubles in the instrument. However, from January 2019 we have observed with MuSCAT for about 1 week per month in average.

As for MuSCAT2, we have observed more than 250 nights in corraboration with the co-researchers in Instituto de Astrofisica de Canarias (IAC) in 2018. We have improved the operation system and remote-observing system to reduce the load of the observers and to make it possible to observe from Japan smoothly.

TESS has observed only the Southern sky in the first year, and there were few TESS planetary candidates that can be observed with MuSCAT and MuSCAT2 in 2018. Instead, in this year we have observed planetary candidates discovered by the Kepler's ecliptic survey or ground-based transit surveys, as well as low-density transiting planets to observe their atmospheres.

In this contribution, we will report the status of the operations of MuSCAT and MuSCAT2 in 2018, and show new results obtained from these instruments.

Discussion

Current status and instrument development plan for future lunar exploration missions

*Makiko Ohtake[1]

1. Japan Aerospace Exploration Agency

Currently JAXA is planning a series of lunar exploration missions as a part of the international space exploration program. The goal of this program is to accomplish a Mars human exploration mission(s) after developing the required technology by doing. lunar exploration missions. In the initial stage of the program, JAXA is studying the following two lunar exploration missions.

1) Lunar polar exploration to evaluate the possibility of utilizing lunar polar water ice as a fuel resource for future lunar exploration. This mission will use pinpoint landing technology, which will be developed and demonstrated by the Smart Lander for Investigating the Moon (SLIM), for landing in a very limited and difficult area suitable for polar-ice investigation.

2) A lunar sample return mission (Human Enhanced Robotic Architecture for Lunar Exploration and Science; HERACLES), which will employ a lunar Gateway (Lunar Orbital Platform-Gateway) and will demonstrate the capability to return from the lunar surface that is required for a human landing mission on the Moon. This mission will bring back 15 kg of lunar samples and is capable of exploring tens of kilometers of the lunar surface by rover.

These missions are still before the pre-project phase, and the instruments that will be carried on these missions haven’t been selected. Recently, teams for conducting preliminary study of candidate instruments for the lunar polar exploration mission were selected based on proposals. And JAXA is planning to announce a request for information for the HERACLES instruments. Also, study teams for these missions in JAXA identified several key technologies to realize the missions and started to develop them (e.g., a rover system, a surface-drilling system, and night-survival technology). For efficient and optimal development of these technologies, the requirements and engineering limitations are being discussed among scientists and engineers, and iterative development is fundamental. This presentation will discuss the current status of the lunar polar exploration mission and the HERACLES mission including identified key technologies. A development plan for these technologies will also be discussed to accelerate discussion and interaction among people from different fields.

Development of a Neutral Particle TOF-MS for Future Solar System Explorations

*Daichi Fukuyama[1], Yoshifumi Saito[2], Kazushi Asamura[2], Shoichiro Yokota[3]

1. The university of Tokyo, 2. ISAS/JAXA, 3. Osaka University

In-situ observation is important in solar system exploration because of the difficulty in returning samples from a gravitational celestial body. Especially, in-situ mass spectrometry of celestial surface material is indispensable to understand the evolution of the moon and planets since mass spectra bring us various information such as the isotope composition. For the purpose of in-situ material analysis, mass spectrometers are used for recent planetary explorations. In addition, observations by lunar explorer in recent years reports the result of remote sensing suggesting the existence of H_2O in the moon polar permanent shadow, but the existence is ambiguous since the observations have problems such as difficulty in discriminating between H_2O and OH. The need for a mass spectrometer to demonstrate the presence of water by in situ observation is increasing.

Mass spectrometers on planetary explorers must be compact and lightweight, but mass spectrometers that have both the compactness and high mass resolution have not been developed yet. Therefore, we are developing a compact and moderately high mass resolution TOF-MS (Time-Of-Flight Mass Spectrometer) for measuring neutral particles on the moon and planets.

TOF-MS accelerates ions with an electric field. The accelerated ions fly at a fixed distance and the mass information is obtained from their flight time. In general, the flight path of ions must be long for realizing high mass resolution. In order to increase flight distance without enlarging equipment, a reflectron type TOF- MS, which reflects ions by electric field is adopted. Since the ion trajectory is dispersed as the ion flight distance increases, the detection efficiency decreases when the number of reflection increases. Therefore, our new reflectron type TOF-MS is equipped with a triple reflection mode with high mass resolution and a single reflection mode with high sensitivity. These measurement modes can be switched electrically depending on the observation targets. Simulation results show that the mass resolution is 360 in the triple reflection mode and 180 in the single reflection mode. Currently, we are manufacturing a test model whose size and potential are optimized.
In this presentation we will report the design of our new reflectron type TOF-MS that is optimized by analytical calculation and numerical simulation.

Development of Orbitrap Mass Spectrometer for in-situ measurements in solar system explorations

*Oya Kawashima[1], Satoshi Kasahara[1], Yoshifumi Saito[4], Shoichiro Yokota[2], Masafumi Hirahara[3], Seiji Sugita[1]

1. The university of tokyo, 2. Osaka University, 3. Nagoya University, 4. ISAS / JAXA

Previous mass spectrometry in solar system explorations has advanced our knowledge and understanding on the formation and evolution of planets, as well as the dynamics of space environment surrounding planets, moons, and other small bodies. Nonetheless, there are many important topics remaining to be addressed by higher-resolution mass spectrometry. Here we report our design of Orbitrap, which is a kind of Fourier-transform mass spectrometer, showing high mass resolution (m/dm ~ 10000) based on numerical simulations. We propose a simple and miniaturized ion storage unit in front of the multi-reflectron region, utilizing the potential drop by the electron beam for ionization. Such a high-resolution mass spectrometer will provide significant information on elemental and isotopic compositions in, on, and around planets and other solar system objects. For instance, discrimination between N_2(28.0062 u) and CO(27.9949 u) in the Martian atmosphere, which is essential for discussing atmospheric escape in the present and past, will be enabled.

A high-voltage pulsed power supply for on-site mass spectrometry in future solar system explorations

*Shoichiro Yokota[1], Yosuke Kawai[1], Jun Aoki[1], Yoshifumi Saito[2], Makiko Ohtake[2], Tatsuaki Okada[2]

1. Graduate School of Science, Osaka University, 2. ISAS/JAXA

Isotope-ratio mass spectrometric analyses have been frequently utilized in laboratories for not only the earth planetary science but also other scientific and industrial fields. In the planetary science, such mass analyses of meteorites and returned samples provide detailed information regarding the origin and evolution. Recently on-site measurements by lander and rover missions including high-resolution mass spectrometry have opened the door to a new era of the planetary science. We argue that the on-site mass analysis is capable of directly determining the age of bodies and asteroids and the presence of water. For Japanese future lander and rover missions, we are now developing high-resolution mass spectrometers. Although high-performance mass spectrometers occupy the much room of laboratories, it is possible to develop the mass spectrometers for space applications because the key components including ion optics and electronics are in principle fabricated within the acceptable ranges in terms of the size, weight, and power consumption. In addition, we have already developed several spaceborne mass analyzers for the space plasma observation and have succeeded in mass analyses in space. After conducting the concept design of the mass spectrometers for landers and rovers, we conclude that the feasibilities are enough for the ion optics and almost all the components of the electronics. However, we have estimated relatively low feasibility for the high-voltage pulsed power supply which mostly determine the performance of the time-of-flight mass spectrometers. The laboratory high-voltage pulsed power supplies contain a 'black box' module as the key component that consumes much power. Therefore, we have started reconstructing a high-voltage pulsed power supply for spaceborne time-of-flight mass spectrometers. We have developed evaluation boards of the high-voltage pulsed power supply for reflectron-type multi-turn-type mass spectrometers, which is planned to be utilized in future Japanese landing missions. In this presentation, we will report the instrumentation and test results.

Development of DESTINY$^+$ Dust Analyzer and its expected science return

*Takayuki Hirai[1], Masanori Kobayashi[1], Tomoko Arai[1], Hiroshi Kimura[1], Ralf Srama[2], Harald Krueger[3]

1. Chiba Institute of Technology, Planetary Exploration Research Center, 2. University of Stuttgart, 3. Max Planck Institute for Solar System Research

Demonstration and Experiment of Space Technology for INterplanetary voYage, Phaethon fLyby and dUst Science (DESTINY$^+$) led by Japan Aerospace Exploration Agency, Institute of Space and Astronautical Science (JAXA/ISAS) will be launched in 2023. In addition to its two main engineering missions such as advancement of the electrical propulsion in space and acquisition of the fast flyby technique to the solar system small body, DESTINY$^+$ set two scientific missions to perform fast flyby observation of an active asteroid, 3200 Phaethon, and dust observation during interplanetary cruising and Phaethon flyby phases. In this presentation, we will introduce the dust analyzer for DESTINY$^+$ (DDA) and its expected science return.

DDA is an dust impact detector equipped with time-of-flight mass spectrometer (TOF-MS) which is the technologically advanced model of the dust analyzer (CDA) onboard the NASA's Saturn explorer, Cassini. DDA has been under development by a dust group at University of Stuttgart who developed CDA. Planetary Exploration Research Center at Chiba Institute of Technology (CIT/PERC) plays a role in interface adjustment between the spacecraft and DDA, operation planning, leading the DDA’s dust science, and so on.

Hypervelocity impact, >~1 km/s, of micrometeoroid on the target plate of the DDA sensor generates a plasma cloud composed of positive and negative ions and electrons. The applied electric field inside the sensor separates positive or negative particles from the other according to its polarity, and directs the separated ions into an ion collector. Then one can obtain TOF mass spectra and estimate the chemical composition of detected dust particles. The past dust analyzers had historically employed the positive ion detection mode in which the impact target is positively biased, however, DDA will have two sensor heads tuned for analyzing positive and negative ions respectively in order to reveal the chemical composition of dust particles with a wide variety of atomic and molecular species at the same observation condition. Another upgrade of DDA is a two-axes gimbal for aiming the sensor head towards the direction from which more incident of dust particles is expected.

During the interplanetary cruising phase between Earth and Venus orbit for about 2 years, DDA will observe the interplanetary dust originated from asteroids and comets and the interstellar dust incoming from outside the Solar System. At the Phaethon flyby, DDA will try to detect and analyze the ejected dust particles from Phaethon itself due to bombardment of the interplanetary dust.

We are planning a new solar satellite mission, "*PhoENiX*", for understanding of particle acceleration during magnetic reconnection, which are ubiquitous features exhibited by a wide range of plasmas in the universe. The main observation targets of this mission are solar flares, which are generated by magnetic reconnection and accelerate plasma particles. The sun is a unique target in the sense that it can be investigated in great detail with good spatial, temporal and energy resolutions.
The scientific objectives of this mission are (1) to identify particle acceleration sites, (2) to investigate temporal evolution of particle acceleration, and (3) to characterize properties of accelerated particles, during solar flares. In order to achieve these science objectives, the *PhoENiX* satellite is planned to be equipped with three instruments of (1) Photon-counting type focusing-imaging spectrometer in soft X-rays (up to ~10 keV) to observe the contexts of particle accelerations (e.g., shocks, plasmoids, flows, etc.), (2) Photon-counting type focusing-imaging spectrometer in hard X-rays (up to ~30 keV) to identify the accelerated particles, and (3) Spectropolarimeter in soft gamma-rays (spectroscopy is available in the energy range of from > 20 keV to < 600 keV; spectropolarimetry is available from > 60 keV to < 600 keV) to detect the anisotropy of accelerated particles. We plan to realize *PhoENiX* satellite mission around next solar maximum (around 2025).
The basic developments of key technologies for these instruments have been completed. The soft X-ray imaging spectroscopy is planned to be realized with the combination of high-precision glass-polished X-ray mirrors and high-speed CMOS cameras. The hard X-ray imaging spectroscopy consists of high-precision electroforming X-ray mirrors and CdTe cameras. The soft gamma-ray spectropolarimeter is a redesigned instrument of *Hitomi* / Soft Gamma-ray Detector (SGD) that has Compton cameras with active shields. Some of these technologies required for the X-ray imaging spectroscopy have been demonstrated by *FOXSI* sounding rocket series launched in 2012, 2014 and 2018. The *FOXSI* successfully obtained the focusing imaging spectroscopic data of the solar corona in X-rays (from ~0.5 keV to ~15 keV).
In this presentation, we explain the details of science goal and objectives, and instruments of *PhoENiX* mission.

Development of ion drift velocity analyzer for sounding rocket and low-altitude satellite

*Takumi Abe[1], Shigeto Watanabe[2], Akinori Saito[3]

1. Department of Solar System Sciences, Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2. Hokkaido Information University, 3. Graduate School of Science, Kyoto University

The lower ionosphere is known as a unique region where charged particles and neutral particles co-exist. The charged particles tend to move in a direction different from neutral particles, because of a difference in those behaviors against the electromagnetic force. For example, the dynamo current and polarization electric field existing in this region are attributed to a difference in a collision frequency between ion and electron with neutral particles. Characteristic phenomena such as traveling ionospheric disturbance and equatorial spread F are generated due to the diversity of the particles in this region. The momentum transfer between the charged and neutral particles plays an important role in generating these phenomena. Sounding rocket is the most suitable platform which enables us to make in-situ measurement of the particles in this region because low-altitude satellite cannot be in orbit for a long time period because of the atmospheric drag. Thus, it is desirable to make a direct measurement of charged and neutral particles by using instrument on the sounding rocket to further understand such unresolved phenomena.

Chemical release experiment, such as Lithium Ejection System (LES) or Trimethyl Aluminum (TMA) instruments, have been adapted for sounding rocket experiment to get information on neutral wind in the lower ionosphere. In contrast, no instruments to measure a drift of the ionospheric ions is now available in Japan. Only a few studies on the neutral-ion coupling based on the simultaneous measurements on the rocket are available in the literature. Therefore, our understanding of interaction between charged and neutral particles in the weakly ionized plasma has not made much progress because of a lack of observational data. Unfortunately, it is very difficult to reproduce a coupling between charged and neutral particles on the ground, and direct measurements by sounding rocket or low altitude satellite is only the way to provide quantitative information.

Under such a background, we have started developing an ion drift velocity analyzer which enables us to estimate the ion drift velocity and density in the lower ionosphere. It is well known that Ion Drift Meter (IDM) or Retarding Potential Analyzer (RPA) had been installed on low-altitude satellite, such as Dynamic Explorer-2 and Atmospheric Explorer series. Our instrument will be required to have both of these functions. It will also be possible to make simultaneous measurement of the ion drift and neutral wind in the sounding rocket experiment if the present instrument is successfully developed and installed on the sounding rocket together with chemical release experiment. Then, we will be able to conduct quantitative discussion on the coupling between charged and neutral particles.

As the first step of the instrument development, a numerical simulation to design the internal structure was started. The instrument consists of RPA section in the front and multiple sector anodes in the end. Accuracy to estimate incident direction, speed, and temperature of thermal ions is evaluated from the simulation result. The prototype model is to be manufactured after we obtain a confident prospect that the instrument provides the ion density and velocity in a good accuracy. Then, we will put the prototype instrument in the vacuum chamber and evaluate its performance by generating ion drift. The latest status of our instrument development will be explained in the presentation.

SS-520-3 Sounding Rocket Experiment Targeting the Ion Outflow in the Polar Cusp / Aurora

*Yoshifumi Saito[1], Yasunobu Ogawa[2], Hirotsugu Kojima[3]

1. Department of Solar System Science, Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2. National Institute of Polar Research, 3. Research Institute for Sustainable Humanosphere, Kyoto University

In order to achieve collective understanding of the microphysics and its role (scale coupling) in the global scale to mesoscale phenomena in the polar ionosphere, Japan-Norway sounding rocket experiment program is now in progress. Although Japanese sounding rocket SS-520-3 was planned to be launched from Ny-Ålesund, Svalbard in Spitsbergenin December 2017, the launch was postponed due to mal-function of the timer equipment that was found during the final stage of the integration test. Since the timer equipment problem has already been completely fixed, SS-520-3 Payload Instrument team desires the earliest possible launch of the sounding rocket.

The main objective of this sounding rocket is to understand the particle acceleration processes that cause the ion outflow by making in-situ observation of the wave-particle interactionin the cusp region. SS-520-3 sounding rocket experiment aims to resolve the wave-particle interaction by making in-situ measurements in the polar cusp with newly developed instruments for the satellite mission. Since these wave-particle interactions are predicted to be effective above 800km altitude, a two-stage sounding rocket SS-520 whose apex can be higher than 750km is necessary. The rocket range where SS-520 can be launched targeting the cusp region is only Ny-Ålesund in Svalbard. Since simultaneous ground based optical observation of the cusp aurora is necessary to decide the launch timing, the best launch period is determined from the conditions of both the sunlight and the moonlight. From the sunlight condition, the best launch period is in the winter polar night that is around the winter solstice. On the other hand, two weeks before/after the new moon is the best launch period from the condition of the moonlight. Launch window for each day is 0700UT-1130UT (0800LT-1230LT: 1000MLT-1430MLT) when the cusp is possibly on the same magnetic field line as the trajectory of SS-520-3. SS-520-3 sounding rocket experiment is a part of the comprehensive observation campaign including ground-based radar and optical observations. SS-520-3 sounding rocket experiment is also one of the projects participating in “A Grand Challenge Initiative (GCI) Cusp program” that is a large-scale international collaboration for targeting advancement in the common understanding of cusp region space physics.

Although SS-520-3 Payload Instrument team desires the earliest possible launch of the sounding rocket, the severe budgetary situation at ISAS in 2018 prevented the launch of SS-520-3 in winter 2018-2019. Approaching the solar minimum in this solar cycle, that will be in 2020, the opportunities that satisfy the launch condition will decrease since the latitude of cusp tends to be higher comparing the apex latitude of SS-520-3. In order to overcome this situation, SS-520-3 Payload Instrument team is considering to add possible ion outflow over morning side polar cap aurora or nightside auroral arc as alternative targets of SS-520-3 sounding rocket experiment.

Development of the chip implemented as high-speed current detection circuits for particle sensors

*Motoyuki Kikukawa[2], Takahiro Zushi[2], Hirotsugu Kojima[2], Yoshifumi Saito[1]

1. JAXA, 2. Kyoto University

Plasma filling the space is very rarefied. Ions and electrons in space plasma do not exchange their kinetic energies through their collisions but through plasma waves. This is so-called “wave-particle interaction,” and it is indispensable for understanding space electromagnetic environments. The WPIA (Wave-Particle Interaction Analyzer) is a new sophisticated method that allows us to understand wave-particle interactions quantitatively. The WPIA was initially installed in the Arase satellite. The WPIA processes instantaneous wave vectors observed by a plasma wave receiver and velocity vectors of each particle observed by a plasma instrument. The high relative time precision for detecting vectors of plasma waves and particles is essential in the WPIA. This requires a synchronous performance of plasma wave receivers and particle instruments. We introduce a system that feeds particle detection pulses of particle detectors into plasma wave receivers to achieve the synchronization. This system can use the sampling clocks for waveforms to keep the high relative time precision between instant values of plasma waves and particle detections. The present study focuses on the part of the circuits dedicated to particle detections and feeds of corresponding pulses into plasma wave receivers. We use the ASIC (Application Specific Integrated Circuit) for integrating the above circuits as one small chip. The chip we developed consists of two stages. The first stage is the current-voltage conversion circuit. Outputs of particle detectors are a series of weak electron current pulses with their pulse widths less than a few tens of nanoseconds. The first stage picks up each current pulse and converts into voltage signals with enough amplitudes to drive the second stage. We designed high-speed circuits dedicated to the first stage. The second stage contains comparator and peak-hold circuits. The comparator ensures picking up real signals by setting a threshold level and the peak-hold circuit has a role to keep the level to connect to the next stage. In this study, we set the count rate of 106/s as the target value and we designed the circuits so that it is within 1 μs from the arrival of a particle to the convergence of the detection signal. Conventional circuits are made of discrete electronic parts. That requires large resources in their sizes and weights. However, the chip we developed is small and light-weight. In this study, we integrate detection circuits using ASIC technology and we aim to accommodate at least 16 channels of circuits within 5 mm square chip.

In this presentation, we show the details of the chip designed for the particle detection circuits. We also examine the verification test results in the operation of those circuits. Furthermore, we describe the development plan for future WPIA system integration.

Understanding complex nature of the solar wind interaction with solar system objects such as the Earth’ s magnetosphere, the Martian exosphere, and the Jovian magnetosphere is crucial in planetary physics, heliophysics and astrophysics including exoplanet physics. Remote sensing imaging observations provide global variation of these environments as a function of solar winds as demonstrated about aurora ovals, the terrestrial plasmasphere, and the terrestrial ring current. Such observations are complimentary to in-situ electromagnetic and particle observations. Recently soft X-ray emission (0.1-2.0 keV) generated via charge exchange process of high charge state solar wind ions (O6+, N5+, …) with geocorona is discovered. Numerical simulations predict that this emission must allow us to image dayside solar wind-terrestrial magnetospheric interaction such as the magnetosheaths, the cusps and the shock. GEO-X is a Japanese small satellite mission carrying a novel wide-field of view X-ray telescope and a high speed X-ray detector to demonstrate the X-ray imaging of the Earth’ s magnetosphere. GEO-X aims observations of the dayside boundaries of the Earth’ s magnetosphere in the vicinity of the Moon around the next solar maximum.

Sun. May 26, 2019 1:45 PM - 3:15 PM JST | Sun. May 26, 2019 4:45 AM - 6:15 AM UTC | A01 TOKYO BAY MAKUHARI HALL

[P-CG21] Future Missions and instrumentation for space and planetary science

convener:Mitsunori Ozaki(Faculty of Electrical and Computer Engineering, Institute of Science and Engineering, Kanazawa University), Satoshi Kasahara(The university of Tokyo), Shingo Kameda(School of Science, Rikkyo University), Kazuo Yoshioka(Graduate School of frontier Science, The University of Tokyo), Chairperson:Shingo Kameda, Mitsunori Ozaki(Kanazawa University)

Not only national space agencies but some universities and even companies in the world are now leading a number of space science and exploration missions and also energetically initiating new research activities for satellite and rocket developments and international collaborations in these days because the Earth observations from the space and the space explorations could be achieved much easier than a few decades ago. The deployment to the space, which itself is not purely a scientific purpose but one of methods for better sciences, is vigorously motivating the technical innovation and the educational development. For successful space missions, it is also crucial to research and develop aim-oriented on-board instruments, and the fundamental research and development of observational instrumentation with future perspectives could totally lead space missions in some case. Detailed investigation and evaluation on various on-board instruments are needed during their proposals, selections, and fabrications in order to promote the missions, and inevitably we have to make multi-sided arrangements and evolution at every process and aspect of any type of space missions, independently of their mission sizes. In this session, we focus on these comprehensive research activities in the space and astronomical missions, including the mission integrations and the individual instrumental developments, and we also call many presentations showing the uniqueness and renovation regarding the mission strategy and methodology, and the status and latest results in the related state-of-the-art researches and developments, which would provide all of researchers and developers with invaluable opportunities for active discussion, information sharing, and collaboration toward the realization of more missions for more fruitful space sciences and explorations in nearer future.

Sub-ion (kinetic) scale turbulence has been the main focus of research in space plasmas in the last decade because of the crucial role that those scales play in energy dissipation and thus particle energization (heating or acceleration). These research topics are relevant to many (more distant) astrophysical plasmas that are not accessible to in-situ measurements (e.g., solar corona, ISM or accretion flows). In the solar wind, orbiting spacecraft such as Cluster, Themis and more recently MMS have allowed us to make a significant progress in understanding the problem of turbulence and energy dissipation at sub-ion and electron scales in space plasmas. Yet, key questions cannot be addressed by those missions or by the upcoming ones (e.g., Parker Solar Probe and Solar Orbiter) because of their instrumental limitations. We will discuss some of these scientific questions and instrumental limitations, then present a new multi-spacecraft mission concept, Debye, designed to solve the problem of turbulence and energy dissipation at electron scales in the solar wind. This mission is currently being considered for selection within the ESA/F1-class call released in 2018 with a strong participation from the Japanese space physics community.

'Comet Interceptor' is a proposed mission to the recent European Space Agency (ESA) call for F-class ('fast') missions. This is one of six mission concepts invited to submit detailed proposals. A decision is expected until late July 2019. The purpus of our misson is to characterise a dynamically-new comet or interstellar object like 'Oumuamua, which are visiting the inner Solar System for the first time, including its surface composition, shape, and structure, the composition of its gas coma for the first time. Our mission will launch to the Sun-Earth L2 point, where it will be stayed in a stable L2 halo orbit for a period of up to 2-3 years, until a suitable opportunity for a flyby mission to a dynamically new comet presents itself. Suitable targets will be comets that will have a perihelion distance closer than ~1.2 au and an ecliptic plane crossing time and location reachable with ~1.5 km/s delta-v from L2. Once a target is found, which expected to be within a few years based on predictions for comet discovery rates with the Large Synoptic Survey Telescope (LSST), the spacecraft will depart on an intercept trajectory. Before the flyby, the main spacecraft will resease at least two sub-spacecraft, parallel paths through the coma and past the nucleus to be sampled. This mission will give us a 3D snapshot of the cometary nucleus at the time of the flyby, testing spatial coma inhomogeneity, interaction with the solar wind on many scales, and monitoring of Lyα coma. This mission will be a unique measurement that was not possible with previous missions, in addition to the fact that we will target a dynamicall new comet, which will allow interesting comparisons to be made with the results from Rosetta target comet 67P/Churyumov-Gerasimenko. It is expected that the proposed mission includes contributions from Japan as well as ESA member countries.

"Asteroid In-situ Interior Investigation - 3way" (AI3) defines a mission to investigate the interior of a rubble pile asteroid with three different complementary measurements: radar tomography, determination of the gravity field, and seismic sounding. AI3 has been proposed to ESA F-Class call and passed the first selection.

A mothership serving as communication relay will carry 4 CubeSats in the orbit of asteroid Apophis, observing the PHA during its extremely close approach to earth in 2029, getting as close as 0.1 Lunar distances, which is within the geostationary orbit.

Depending on the elongated shape of Apophis the earth fly by will trigger dynamic events on the asteroid and allow for extremely high data rates during the observation.

Two identical DISCUS satellites will be deployed to leverage the multi-point approach enabled by CubeSat technology, taking radar measurements to reconstruct the interior using computed tomography as well as determining the gravity field and analyzing surface composition using a hyperspectral imager. After completing the characterization phase, one of the DISCUS satellites will descent to the surface and measure the local surface gravity at several points on the asteroid. In the final phase, two impacting CubeSats will generate seismic waves, to be detected by the DISCUS satellite on the surface. The impact will be observed in high spatial and temporal resolution to add important data for impact studies in a before unexplored energy regime.

The concept has recently been invited to submit a detailed proposal to the Phase-2 of the ESA F-Class call.

Observational Techniques for Energy Transport Verification in Space Plasmas and Waves Developed in the FACTORS Mission

*Masafumi Hirahara[1], Hirotsugu Kojima[2], Naritoshi Kitamura[3], Kazushi Asamura[4], Yoshifumi Saito[4]

1. Institute of Space-Earth Environmental Research, Nagoya University, 2. Research Institute of Sustainable Humanosphere, Kyoto University, 3. Graduate School of Science, The University of Tokyo, 4. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency

The Japanese space physics community is now conducting the FACTORS mission, which is the first space exploration mission using a formation flight configuration based on multiple satellites orbiting in the terrestrial polar magnetosphere-ionosphere-thermosphere coupling regions. It is well understood that the in-situ observations integrating the particle, field, wave measurements could bring us with unique opportunities for elucidating the dynamics of the space plasmas and the terrestrial/planetary upper atmospheres. Also in the FACTORS mission as the next community-leading mission after the ERG(Arase) satellite mission, we are planning to realize more advanced integrated measurement system than the ERG(Arase) as well as the unified research framework based on the satellite/ground-based observations and the data analysis/modeling/simulation approaches. One of the science objectives in FACTORS is the demonstrative and quantitative verification on the energy transport mechanisms emerging in the ionospheric ion accelerations in the perpendicular direction to local magnetic fields, which have been frequently observed as transversely accelerated ions(TAIs) by previous/ongoing satellites and sounding rockets at altitudes of several hundreds to a few tens of thousands of km in the terrestrial auroral regions. This type of ion accelerations is quite important not only in our understanding the elemental physical mechanisms in the space plasmas but also in the estimate of the amount of the outflowing/escaping terrestrial plasmas. Although it is definitely evident that the plasma waves excited/propagating in the ionosphere are the exclusive energy source for TAIs according to the statistical analyses of the observational results, it should be noted with a surprise that we have not reached any consensus which mode of plasma waves is dominantly or more effective in the ion accelerations. It should also be noticed that the plasma wave modes responsible for TAIs could change, dependent on the event regions, the ambient ionospheric conditions, and the energy ranges of the accelerated ions, which means the there are some observational difficulties especially in the case of single satellite mission because the observational information obtained by in-situ measurements with a single satellite are too much limited to separate time variations from spatial distributions. In the FACTORS mission, it is required to overcome these observational problems by applying the controllable flight formation and attitude configurations of multiple satellites with an adequate accuracy and additionally developing the innovative observational techniques in the ion and wave measurements. In order to identify the plasma wave modes responsible for TAIs, we utilize several types of advanced formation flight configurations of the multiple satellites for longer plasma waves. As the observational technique for shorter waves, an interferometry method using single electric field probes on each satellite would be applicable. In the ion measurements, it would be essential to develop and install two types of ion energy-mass spectrometers covering from the supra thermal to the low-energy ranges independently with wide and controllable field-of-views and adequate energy/angular resolutions to capture the core ion components by compensating the convective plasma drift motion in the auroral regions or trace the conical pitch-angle distributions of the accelerated and upwelling ions. It could also be a breakthrough to carry a gyrophase-resolving ion energy-mass spectrometer with the similar specification to the low-energy ion spectrometer. This presentation introduces the observational methodology and techniques with which we could demonstratively and

©2019. Japan Geoscience Union. All Right Reserved.

quantitatively address the ionospheric ions accelerations from the viewpoint of wave-particle interaction mechanisms occurring universally in space.

Keywords: wave-particle interaction, upper atmospheric plasma, space plasma wave, integrated satellite observation, formation flight, advanced compact satellite

Today’s Mars is a cold and dry planet, but ancient Mars would have had a large amount of liquid water on the surface. Several billion years ago, Mars could have been similar to the early Earth from which life arose, and life may have also originated on Mars during this period. Although the Viking mission in 1976, which explored life on Mars, did not find evidence for life [1], many findings associated with the possibility of life have been discovered since the Viking mission: past and present aqueous environments, organic compounds, methane, reduced compounds for microorganism energy sources, and so on [2] [3]. These findings suggest that microorganisms might exist on Mars surface.

For searching extant microorganisms, a microscopic instrument would be a powerful tool, which directly images life forms and identify their shapes, sizes, and other morphological structures, but it has not been used in space missions yet. For *in situ* detection of microbial cells, we have proposed the Life Detection Microscope (LDM) which visualizes organic compounds by staining the samples with fluorescent pigments [4]. The LDM scans a volume of 1 mm^3 and detects organic compounds including cells and other biological materials in high sensitivity ($<10^4$ cells per gram clay). The fluorescent pigments have been selected to identify the fundamental features of cells by differentiating among organic compounds surrounded by membranes or enzyme activity. The LDM is also equipped with a high resolution imaging system (1 μm/pixel) which visualizes detailed life forms as well as regolith and dust particles [5]. Our investigation goals are the followings. 1) Identify cell-like structure in which organic compounds are enveloped by membrane, which may represent Martian life. 2) Search for organic compounds in Mars surface samples. The compounds include cells, other biological materials, and abiotic polycyclic aromatic hydrocarbon (PAH). 3) High-resolution characterization of regolith and dust particles. Here we will report the current status of the development of LDM.

Sun. May 26, 2019 3:30 PM - 5:00 PM JST | Sun. May 26, 2019 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_5

[P-CG21] Future Missions and instrumentation for space and planetary science

convener:Mitsunori Ozaki(Faculty of Electrical and Computer Engineering, Institute of Science and Engineering, Kanazawa University), Satoshi Kasahara(The university of Tokyo), Shingo Kameda(School of Science, Rikkyo University), Kazuo Yoshioka(Graduate School of frontier Science, The University of Tokyo)

Not only national space agencies but some universities and even companies in the world are now leading a number of space science and exploration missions and also energetically initiating new research activities for satellite and rocket developments and international collaborations in these days because the Earth observations from the space and the space explorations could be achieved much easier than a few decades ago. The deployment to the space, which itself is not purely a scientific purpose but one of methods for better sciences, is vigorously motivating the technical innovation and the educational development. For successful space missions, it is also crucial to research and develop aim-oriented on-board instruments, and the fundamental research and development of observational instrumentation with future perspectives could totally lead space missions in some case. Detailed investigation and evaluation on various on-board instruments are needed during their proposals, selections, and fabrications in order to promote the missions, and inevitably we have to make multi-sided arrangements and evolution at every process and aspect of any type of space missions, independently of their mission sizes. In this session, we focus on these comprehensive research activities in the space and astronomical missions, including the mission integrations and the individual instrumental developments, and we also call many presentations showing the uniqueness and renovation regarding the mission strategy and methodology, and the status and latest results in the related state-of-the-art researches and developments, which would provide all of researchers and developers with invaluable opportunities for active discussion, information sharing, and collaboration toward the realization of more missions for more fruitful space sciences and explorations in nearer future.

We report science subject, design, development plan and identification of issues to be solved on the visible and ultraviolet imagers for a future satellite mission called FACTORS that aims to understand the coupling processes in the terrestrial magnetosphere/ionosphere/thermosphere and the acceleration and transportation of the space plasma and neutral atmospheric particles. FACTORS stands for Frontiers of Formation, Acceleration, Coupling, and Transport Mechanisms Observed by Outer Space Research System that is proposed as a multi-satellite formation flight mission. This will be a community exploration mission in Japanese apace research after the success of the ERG mission. The working group was approved by ISAS, JAXA this year, and we have started the discussion on detailed science targets, instrumental design, feasibility and so on. We mainly concern on visible and ultraviolet remote imaging of aurora and airglow for this mission. A visible imager (VISAI) on FACTORS will measure small-scale auroral structures at a wavelength of auroral prompt emission line, such as N2 1st PG, with high-time (~0.1s) and high-spatial (~1km) resolutions using a science CMOS or EMCCD. The FOV of 8 x 8 deg covers an area of 400 x 400 km viewed from 3000 km altitude. The high-spatial and high-time resolution imaging data is essential to understand small-scale variations of Alfven aurora, pulsating aurora, etc. Combined with particle and electric/magnetic field data by FACTORS, we will reveal the time and spatial variations of acceleration/scattering process in the complicated magnetosphere-ionosphere coupling system. A far-ultraviolet imager (FUVI) adopts a wide (~40 x 40 deg.) FOV objective mirror system which covers ~2500 x 2500 km area viewed from 3000 km altitude. We plan to adopt a filter wheal in FUV imager to change the wavelength between O 135.6 nm and the N2 LBH band at 140-160 nm. Wide-field multi-wavelength FUV images enable us to examine large-scale auroral dynamics like westward-travelling surge during substorm, omega-bands, and provide us to understand the global thermospheric activity from O/N2 airglow ratio. This year we plan to carry out specific studies for CMOS/EMCCD detectors suited for this mission, and perform radiation tests of detectors.
Related to the future FACTORS mission, we are now carrying out the developments of aural cameras for two sounding rocket projects, G-CHASER (Rocksat-XN) and LAMP. The G-CHASER (Rocksat-XN) rocket was successfully launched from Andøya, Norway on January 13, 2019. We installed an auroral camera (AIC) on this rocket to measure N2 1st PG emission with wide-angle FOV lens(96x75 deg), RG-665 filter, and CCD (WAT-910HX). In addition, we are developing two CMOS cameras AIC2 on the LAMP rocket that is scheduled to be launched at Poker Flat Research Range in winter of 2019. AIC2 will be installed on a despun platform to derotate rocket spin. One CMOS camera AIC2-S1 measures N2 1st PG emission with a narrow FOV lens (F-number=0.95, f=17mm, FOV=27x27deg.), and another CMOS camera AIC-S2

©2019. Japan Geoscience Union. All Right Reserved.

measures OI 844.6nm emission with a wide-angle lens (F-number=1.6, f=3.5mm, FOV=120x120deg.). Both cameras adopt the ZWO ASI 180 MM CMOS detector. AIC2-S1 will take fine structure of PsA in the region more than 100 x 100 km area around the magnetic footprint with a few kilo-meter resolution, while AIC2-S2 will obtain an altitude distribution of pulsating aurora in the F-region as well as distribution of PsA in wide-range. The precise imaging and altitude distribution of PsA are obtained with AIC2 at two wavelengths with 10Hz sampling. The imaging data combined with precipitating electron data in the wide energy range enable us to investigate the relativistic electron precipitation called microbursts that is probably caused by chorus waves in the magnetosphere.

Spatio-temporal analysis of flash aurora using Convolutional Neural Network

*Toki Genda[1], Takumi Inoue[1], Mitsunori Ozaki[1], Satoshi Yagitani[1], Imamura Kousuke[1], Kazuo Shiokawa[2], Yoshizumi Miyoshi[2], Shin-ichiro Oyama[2], Ryuho Kataoka[3], Yusuke Ebihara[4], Keisuke Hosokawa[5]

High energy electrons in the magnetosphere travel along geomagnetic field lines and precipitate into the Earth's atmosphere, then auroras are shown on the ground. We can investigate indirectly the behavior of precipitating electrons in the magnetosphere by deducing auroras on the ground. We focus on flash auroras, which illuminate suddenly at less than 1 s. It is difficult to detect a lot of flash aurora events by visually looking because the duration of flash aurora is very short. In this study, we developed an automatic detection of flash auroral position using Convolutional Neural Network (CNN) and performed statistical analysis of the spatio-temporal variations of flash aurora taken by an EMCCD camera (100 Hz sampling, 256 * 256 pixels) at Gakona (Alaska).

The learning data was obtained by dividing the keogram images (2400 * 720 pixels, 1-minute period) along the north-south direction of all-sky EMCCD data into square blocks (30 * 30 pixels, 750-ms period), then the learning data was visually classified to four classes. Four classes are, "pulsating aurora", "flash aurora", "noise", and "no aurora or noise". We classified the test data using the CNN, its accuracy was 91.2%.

The flash aurora data (about 100 events) are collected by CNN and we extracted flash auroral region using Otsu's method, which is a basic method of contour extraction. We performed statistical analysis about luminous duration, luminous point, spatial size, and spatial extent of flash aurora. The averaged luminescence duration was 0.21±0.08 seconds, and did not depend on magnetic longitudes and latitudes in the field-of-view of camera. We confirmed that most events (about 70%) expand earthward with an average spatial extent of 0.027 Re. We think that the earthward extension can be caused by wave propagation effects of whistler mode waves and the nonuniformity of spatial distribution of loss cones in the magnetosphere.
In this presentation, we will report on our automatic detection method and statistical results of spatio-temporal analysis of flash aurora in detail.

Study on the pulse noise removal technique for Pc1 geomagnetic pulsations on the ground by signal processing

*Fumiya Komase[1], Tomohiro Inoue[1], Mitsunori Ozaki[1], Satoshi Yagitani[1], Kazuo Shiokawa[2], Masahito Nose[2], Tsutomu Nagatsuma[3]

1. Kanazawa Univ., 2. Nagoya Univ., 3. NICT

An electromagnetic ion cyclotron (EMIC) wave, which is a type of plasma waves generated in the magnetosphere, propagates along the geomagnetic field line and we can observe it as the fluctuation in the geomagnetic field on the ground called Pc1 geomagnetic pulsation (0.2 to 5 Hz). We observe Pc1 pulsations at Kapuskasing (Canada). The ground observation is carried out using an induction magnetometer, and the Pc1 pulsations are observed with a high sensitivity and a high time resolution (64 Hz). However, when the observation instrument vibrates due to a strong wind, pulse noise is included in the observed waveforms.
We have been studying an extracting method of Pc1 pulsation by removing the pulse noise included in observed waveform using signal processing technique. Pulse noise shows in a wider frequency range (0.1 to 10 Hz) than the frequency range of Pc1 pulsation and its duration is shorter than the duration of Pc1 pulsation. Pulse noise removal consists of detecting the pulse noise candidate, classifying the pulse noise candidates into pulse noises and others by Neural Network (NN), and interpolating the waveform at the pulse noise domain. In the first step, we set an amplitude threshold for the differential waveform to detect pulse noise candidates. In the second step, as learning data for classification, we use waveform applied a High Pass Filter (HPF) to emphasize pulse noises. In the third step, we use an average energy around the pulse noise in the interpolation. We use random phase, observation phase including the pulse noises, and estimated phase by nonlinear least squares method. For each phase, we evaluated the SNR before and after the pulse noise removal. As a result, the SNR improved with 22dB using the estimated phase, but it requires a huge calculation time.
In this presentation, we will report on the pulse noise removal of Pc1 pulsation using signal processing technique in detail. Conventionally it was necessary to examine and construct the observation environment which suppresses the vibration of the observation equipment as much as possible, we think that our signal processing will be useful for reducing the ground observation costs and a more detailed analysis of Pc1 pulsation.

Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 4. Aichi Steel Corporation, 5. National Institute of Technology, Tokuyama College, 6. National Institute of Technology, Oita College, 7. Research and Development Directorate, Japan Aerospace Exploration Agency

Magneto-impedance (MI) effect was discovered about 25 years ago and a micro-size magnetic sensor that utilizes this effect becomes commercially available. We made some modifications to the commercially available MI sensors as they can cover the range of the geomagnetic field. For the period of March 30 to April 27, 2018, we conducted experimental observations of geomagnetic field variations with the MI sensors at Mineyama observation site, which is located about 100 km north-west of Kyoto. Data obtained with the MI sensors were compared with those from the fluxgate magnetometer that has been working at the site. Results showed that the MI sensor recorded geomagnetic variations with amplitudes of ~1 nT that were also detected with the fluxgate magnetometer. This suggests that MI sensors are useful for researches in geomagnetism or space physics, although they are much less expensive than fluxgate magnetometers.

We consider developing two different kinds of systems to measure the geomagnetic field using the MI sensor: a system for ground-based observation and a system for a sounding rocket. In presentation, we will display observation data from the MI sensors and the fluxgate magnetometers at Mineyama and other observatories. Future plans of the system onboard sounding rocket will be also presented and discussed.

Observation of the Ionospheric Currents by the CubeSat at the Low and Middle Latitude

*Kentarou Kitamura[1], Kazumasa Imai[2], Taku Takada[2], Manabu Shinohara[3], Makoto Wakabayashi[4], KOSEN Space Collaboration Group

1. National Institute of Technology, Tokuyama Collge, 2. National Institute of Technology, Kochi Collge, 3. National Institute of Technology, Kagoshima Collge, 4. National Institute of Technology, Niihama Collge

The ionospheric currents flowing in the dayside ionosphere have been considered as a significant subsequence of Mesosphere-Ionosphere-Magnetosphere coupling. These currents were well detected in the Solar quiet conditions and named Sq currents. In particular, it is well known that the flow pattern of Sq currents shows the north-south hemispheric asymmetry due to the different ionospheric conductivities in the winter and summer hemispheres. This indicates that the asymmetry of the potential must be kept by the energy balance between each hemisphere through the field line.
An InterHemispheric Field Aligned Current (IHFAC) was theoretically predicted by Maeda [1974] and Fukushima [1979, 1991] to interpret the north-south asymmetry in the potential pattern. Several ground magnetic observations and satellite observations suggested an existence of the IHFAC in the noon sector and both the morning and evening terminators. However, the detailed morphology of the IHFAC have not been well understood yet, despite that the direct detection of the IHFAC at Low Earth Orbit (LEO) was reported in the observation by several satellites.
In order to investigate the Sq current system including the IHFAC, the in-situ observation by a CubeSat (2U size satellite emitted from ISS) is proposed in collaboration with 10 national colleges which belong to National Institute of Technology (KOSEN). The fluxgate magnetometer is onboard the CubeSat to observe small perturbations of the magnetic field. After the ejection from the ISS, the CubeSat will gradually glide down to the upper atmosphere due to the strong atmospheric drag and finally burn up in it. The duration of possible observation is estimated for more than 50 days.
The CubeSat can be characterized by the short duration of development (less than 3 years) and low cost (less than 100,000USD). We are considering an actual utilization of this extremely low-cost CubeSat to more realistic science mission. This concept enables us to conduct the multi-satellite in-situ observation in fairly low budget compared to conventional satellite missions.

Basic study on miniaturization of electric field instrument for plasma wave observations by ASIC technology

*Yuya Tokunaga[1], Mitsunori Ozaki[1], Keigo Ishisaka[2], Hirotsugu Kojima[3], Satoshi Yagitani[1], Takahiro Zushi[3]

1. Kanazawa University, 2. Toyama Prefectural University, 3. Kyoto University

We have been measuring electric fields of the plasma waves (a few Hz to several hundred Hz) to understand the magnetospheric dynamics. The spatial resolutions of electric field measurements are not enough because we cannot launch a lot of satellites due to the large size and mass of satellites. Demands of micro satellites like a 1U (10 cubic centimeters) cube satellites are increasing. We need to miniaturize measurement instruments for probing the plasma waves.

This study deals with an electric field instrument in plasma wave observations. We use the electric field instrument for capturing the electric fields detected by wire probe antennas. In this study, the purpose is to miniaturize the electric field instrument with a high radiation tolerance (300 krad) using Application Specific Integrated Circuit (ASIC) technology.

We designed a based amplifier for a new electric field instrument. In the new based amplifier, the equivalent input noise is 50 nV/sqrt(Hz) at 1 kHz, which is 3.9 dB-larger than that of conventional based amplifier (OP-41). The noise performance of new based amplifier is acceptable for capturing the plasma waves. To confirm the radiation tolerance of new based amplifier, we did the radiation tests up to 300 krad using the gamma ray. From the radiation test results, the gain was no change before and after the radiation tests. The output noise was degraded with 5.05 dB at 100 Hz by total ionizing dose effects. However, the based amplifier was not breakdown by the gamma ray. The electric field instrument consisted of new based amplifier could operate with a high radiation tolerance.

We conducted the transient analysis for the new electric field instrument by a circuit simulator (Tanner EDA). In the simulation, rectangular waves of 1 Vpp with 10 Hz input to the new electric field instrument via a sheath impedance (10 MOhms and 100 pF). From the simulation results, the output waveforms of new electric field instrument showed similar output waveforms in comparison with the conventional electric field instrument. The power consumption of new electric field instrument can decrease with approximately 67% than that of the conventional electric field instrument. From the simulation results, we confirmed the basic operations as the electric field instrument for detecting the plasma waves. In the future work, we will need to improve the temperature operating range because the new electric field instrument cannot operate at minus 60 Celsius degrees from the temperature simulation results.

In this presentation, we will present the basic study on electric field instrument for plasma wave observation by ASIC technology in detail.

Evaluation of radiation tolerance of electronics parts used for the ultra-small mission

*Riku Katsuse[1], Kazuo Yoshioka[1], Masaki Kuwabara[2], Reina Hikida[1], Shogo Arao[1], Ichiro Yoshikawa[1]

1. The university of Tokyo , 2. Institute of Space and Astronautical Science

In the space environment, spacecraft is exposed to radiation and degrades the data. For example, the increase of dark current, and change in current consumption.

Recently, the university-made ultra-small spacecraft mission become popular. The mission in this class can reduce the cost and time by using commercial products. However, these commercial products are thought to have no radiation tolerance. Then, it is necessary to be tested with the radiation total dose which is calculated using the Monte Carlo simulation.

We are developing the extreme ultraviolet imager PHOENIX onboard the ultra-small satellite EQUULEUS which will be launched in 2020. Helium ions in the Earth’ s plasmasphere emit extreme ultraviolet light (wavelength of 30.4 nm) through the solar resonance scattering. PHOENIX observes them from the moon (Earth-Moon L2 point).

The radiation tolerance has been evaluated with a gamma irradiation facility with cesium 137. In this presentation, we show the gain characteristics and change of electric noise with respect to radiation of semiconductor elements used in PHOENIX instrument.

A method to quantitatively evaluate Non-evaporable-getter pump for use in space science mission

*Seiya Nishimura[1], Ichiro Yoshikawa[1], Kazuo Yoshioka[1], Shogo Arao[1], Zhang Tianxu[1]

1. The university of tokyo

Observation instruments are known to deteriorate under atmospheric condition. Deterioration are mainly caused by reaction with water vapor and oxygen. To prevent this, observation instruments must be maintained under vacuum. The problem is that the conventional vacuum pump are too heavy to carry to the launching site. The need of continuous power supply makes the transport more difficult. Also the vacuum pump must be removed before the launch. These problems are not only making it difficult to maintain observation instruments under vacuum but also causing extra costs. Non-evaporable-getter (NEG) pumps are able to solve these problems. NEG pumps are light weight, compact, oil free, vibration free, and able to operate without energy supply after activation. Considering the utilization of NEG pump for space science missions, we need to quantitatively evaluate the NEG pump to optimize its size, shape, material, and mounting position for each mission. In this study, a method to measure pumping speed of NEG pump for carbon monoxide (as substitute to water vapor and oxygen) was established by using the orifice method. By using this method, it will be able to develop a NEG pump which best applies the case for each mission.

Interpretation on slight asymmetry of analyzer characteristics of MIA onboard the Mio by means of a model calculation of 3-D potential distribution

*Wataru Miyake[1], Yoshifumi Saito[2], Shoichiro Yokota[3]

1. Tokai University, 2. ISAS, 3. Osaka University

MIA (Mercury Ion Analyzer) on board Mio employs a top-hat electrostatic analyzer, which has axisymmetric toroidal electrodes and is designed to have no dependence in its characteristics on azimuthal direction of incident ions. However, our ground calibration experiments have revealed that it has a slight dependence. We have tried to explain the dependence by means of three dimensional model calculations. We assumes that all parts of electrode are manufactured precisely. Our results shows that a slight relative rotation (or tilt) of electrodes can lead to a slight dependence on incident azimuthal direction similar to that obtained from the ground experiments.

Construction of impact testing machine for small satellites and evaluation of mechanical resistance of MCPs by the impact test

*Junya Fukuba[1]

1. Graduate school of Tokyo

Small satellites have been developed in recent years. Environmental tests at the development stage play an important role in improving reliability of small satellites. These include a vibration test, an impact test, and a thermal vacuum test. Especially, the impact test is one of the most difficult tests and a reliable method has not yet been established. Against such a background, we constructed an impact testing machine for small satellites. Required performance of the impact testing machine is a controllability and a reproducibility. The controllability means the performance of applying a targeted impact level accurately. This is important to avoid applying excessive impacts on a test target. The reproducibility means the performance of applying same impact level repeatedly and this is also important because if it is possible to apply an unintended impact under the same condition, it degrades the test accuracy. Our impact testing machine is designed to be able to easily adjust the impact level and have high reproducibility. Furthermore, we tested for mechanical resistance of the MCP (micro-channel plate) which is used for optical observation instruments. In this test, we used an impact level assuming the EQUULEUS mission which will be launched by NASA’ s rocket in 2020. In my presentation, I will introduce the details of our impact testing machine and the impact test results of MCP.

Innovative design of double-shell type energy analyzer for simultaneous electron and ion measurements in space

*Tomomi Takei[1], Masafumi Hirahara[1]

1. Institute for space-earth environmental research, Nagoya university

It is well known that the terrestrial and planetary magnetospheres and the interplanetary space are filled with charged particles such as electrons and ions, which are so-called the space plasma, and in-situ observations of the space plasmas have been conducted by using satellites carrying particle instruments, such as the top-hat type electrostatic energy analyzer. Essentially, obtaining three-dimensional velocity distributions of the space plasmas or energy-pitch angle distributions help us understand the dynamics of the space plasmas. Because the top-hat type analyzer is cylindrically symmetric and has a 2π-radian planar field of view, it can independently measure the wide angular and energy distributions of incident particles. Also, three-dimensional velocity or energy-pitch angle distributions can be obtained by utilizing the satellite spin motion.
The top-hat type electrostatic energy analyzers can measure the ions when a negative potential is applied to the inner electrode and the electrons by a positive potential with the outer electrode grounded. Therefore, in the prevailing design of the top-hat type analyzer, the sensor heads separate for the ion and electron observations, respectively. Because of the recent miniaturization of the satellites, the weight and space of the instruments mounted on the small and micro satellites are getting severely restricted. However, if two sensors for electron and ion observations are combined into one sensor head, it is possible to save both weight and space on the small and micro satellites. Therefore, we have been developing double-shell type energy analyzer which can simultaneously measure the ions and the electrons with one sensor head.
We designed the shapes of the collimator and the double-layered dome-shaped electrodes so that the electrons and the ions with appropriate energies pass through the inner gap and the outer gap by applying a negative potential to the central electrode with the inner and outer electrodes grounded, respectively. We made the numerical simulations using SIMION which is a charged particle simulator program and investigated the performance and characteristics as the electrostatic analyzer. Consequently, we confirmed that the electrons and the ions can be analyzed with one sensor head by only applying negative high voltage to the electrodes. So far, we consider the detection unit using Time-Of-Flight velocity spectrometer for the discrimination of the ion species as the part where the ions are detected, and an assembly of micro channel plates is expected for the electron detection. The design of TOF-type mass analysis unit as ion mass analysis unit is one of subjects for future work.

Microsatellite Development and Education of Space Science and Technology at Kanazawa University

*Tomohiko Imachi[1], Satoshi Yagitani[1], Daisuke Yonetoku[1], Yoshiya Kasahara[1], Tatsuya Sawano[1], Makoto Arimoto[1], Yoshitaka Goto[1], Mitsunori Ozaki[1], Ryuichi Fujimoto[1]

1. Kanazawa University

At Kanazawa University, researchers from engineering and science are cooperating to promote the "Kanazawa University Satellite Project (Kanazawa-SAT3: Study and Training in Space Science and Technology for Kanazawa Cube-Satellites)". In this project, a microsatellite is being developed by staff and students of Kanazawa University. It is a scientific satellite which will contribute to the elucidation of the mechanism of gravitational wave generation by identifying the source of gravitational wave by detecting the arrival direction of gamma rays and X rays radiated at the same time when a gravitational waves are generated by collision of astronomical objects The satellite will be inserted into a solar synchronous orbit at about 660 km altitude. It is a microsatellite with a total weight of 50 kg or less, and its size is cubic with a side of 50 cm, and it is designed to be a piggyback on an HII-A rocket.

Also related to this project, a space science and engineering course has been newly established in the Graduate School of Natural Sciences in April 2018. This course is based on the 'satellite development by students', and students are actually involved in the design, fabrication, ground tests, and operation of scientific satellites, aiming to train personnel who are familiar with space science and space engineering, with satellite-development skills.

Ground tests with the thermal and structural model of Kanazawa-SAT3 have been completed , and the unit tests for almost all components are being conducted. Currently, we are completing the design of the flight model. In the presentation, we will report the details of Kanazawa-SAT3 and its development status.

Attitude Control System for Kanazawa-SAT3 Microsatellite

Takuya Nakajima[1], Yuuki Yasuda[1], Hirofumi Segawa[1], *Tomohiko Imachi[1], Satoshi Yagitani[1], Yoshiya Kasahara[1], Daisuke Yonetoku[1], Tatsuya Sawano[1], Makoto rimoto[1]

1. Kanazawa University

Kanazawa University has been developing a microsatellite. This satellite is equipped with a device to observe celestial bodies emitting gravitational waves with X rays, and aims to elucidate the mechanism of black hole formation by estimating the time of arrival and direction of arrival of gravitational waves.
In this research, the attitude control system is being developed using GAS (Geomagnetic Aspect Sensor) and MTQ (Magnetic Torque). We have constructed the environment for the unit test of RW (Reaction Wheel) also used for attitude control of the satellite.

MTQ is a device that controls the attitude of the satellite by generating a magnetic torque against the geomagnetic field by applying a voltage (an electric current) to a magnetic coil. GAS is a device for detecting the direction of the geomagnetic vector. OBC (On Board Computer) which controls all devices mounted on the satellite receives the geomagnetic field data detected by GAS, and transmits commands to control MTQ. GAS and MTQ cannot be connected to OBC directly, because OBC has just a digital interface, but the output of GAS and the input to MTQ are analog voltages. Therefore, we have developed a control device for on-board equipment using a microcontroller. For the GAS, the voltages are A/D-converted by the microcontroller and transmitted to the OBC. For the MTQ, OBC transmits control commands to the microcontroller, which generates a PWM (Pulse Width Modulation) signal according to the received command that determines the effective voltage to be given to the MTQ. For the system development and operation tests, a PC is used instead of OBC and we carried out experiments of control equipment. For the GAS, we have confirmed the linearity between the analog magnetic field and the corresponding digital values transmitted to the PC. For the MTQ, we have confirmed that the voltage to be given to MTQ were precisely controlled by the duty ratio of the PWM signal output from the microcontroller.

RW is a device to generate a control torque around the rotation axis by accelerating a rotor by a motor and is controlled by transmitting a command from the OBC via an RS-422 serial communication line. The unit test has been carried out by using a PC as a substitute of OBC, but the cable had a influence on the rotation operation of RW. Therefore, we have constructed a system for wirelessly connecting the RW with the PC via a wireless RS-422 communication. Specifically, commands from the PC are wirelessly transmitted to an Arduino microprocessor by a low-power radio module XBee, and the RW is controlled via an RS-422 transceiver. With this system, we demonstrated the basic functions for command and data between the PC and the Arduino via the wireless RS-422 transceiver.

We plan to construct a system that applies appropriate PWM signals to MTQ according to the value detected by GAS. We will also evaluate RW performance by the unit test using the wireless RS-422 communication system.

Communications System and Antennas for Kanazawa-SAT3 Microsatellite

Teruya Minamoto[1], Koyo Ina[1], Kohei Kawagoshi[1], *Tomohiko Imachi[1], Satoshi Yagitani[1], Yoshitaka Goto[1], Daisuke Yonetoku[1], Yoshiya Kasahara[1], Tatsuya Sawano[1], Makoto Arimoto[1]

1. Kanazawa University

Kanazawa University is developing the first Kanazawa University's microsatellite, named as Kanazawa-SAT3. Kanazawa-SAT3 is planned to be launched within FY2019, and its observation mission is to identify the source of gravitational waves by detecting the occurrence time and arrival direction of the X-rays and gamma rays observed simultaneously with gravity waves from distant astronomical objects.

In this research, we are developing a communications system for Kanazwa-SAT3. Kanazawa-SAT3 has three different communication systems using S band, UHF band and Iridium, and the link design of each of them has generally been completed. We summarize each communication system in detail as the following.

The S-band communication system, will use 2-GHz frequency band. Kanazawa-SAT3 is equipped with two types of antennas: S-band patch antennas and S-beacon antennas. S-band system is a main communication system between the satellite and a ground station, and plays a role of high speed data communication and beacon transmission. On the satellite side, two S-band patch antennas designed for both transmission and reception are mounted on the front and rear panels of the satellite. Two S-beacon antennas for transmission are also mounted on the front and rear panels of the satellite. On the ground side, we will send and receive by the signals using a 2.4-m parabolic dish installed at Kanazawa University.

The UHF communication system will use 400-MHz frequency bands. This system transmits commands from the ground to the satellite and telemetry information from the satellite to the ground. On the satellite side, four inverted-F type antennas we developed are mounted (two for receiving and two for transmitting) on the front and rear panels of the satellite. On the ground side, we will send and receive data by using a Yagi antenna with 14 crossed elements installed at Kanazawa University. We have also constructed an automatic satellite tracking system using the Yagi antenna.

A communication system using the Iridium satellite network uses a frequency band around 1.6 GHz. In this system, communications are performed via Iridium satellite, so that the communication can be established even when our ground station is not visible from the satellite. The data is exchanged between the satellite and the ground by using e-mail. This system can transmit and receive data in almost real time so emergency command and data transmission will be available. On the satellite side, two antennas for both transmission and reception are mounted on the front and rear panels of the satellite. A system has been constructed that exchanges data between a laptop computer simulating an onboard computer (OBC) mounted on a satellite and an iridium satellite.

From now on, for the communication systems using the S band and the UHF band, it is necessary to develop the communication software. For In addition, we need to improve the automatic satellite tracking system of Kanazawa-SAT3. For the communication system using Iridium satellite, it is necessary to implement a system on the OBC and conduct a communication experiment.

Development of micrometeoroid impact sensor within a multi-layered insulation (CLOTH) onboard 6U deep-space explorer EQUULEUS

*Takayuki Hirai[1], Hajime Yano[2], Ritsuko Jitsukawa[3], Eigo Ishioka[3], Haruki Nakano[3], Kazuyoshi Arai[3], Sunao Hasegawa[2]

1. Planetary Exploration Research Center, Chiba Institute of Technology, 2. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 3. Faculty of Science and Engineering, Hosei University

In recent years, the use of CubeSat for deep-space exploration is remarkably expanding. Equilibrium Lunar-Earth point 6U Spacecraft (EQUULEUS) project led by the University of Tokyo and JAXA is one of 13 sub payloads which will be launched by the NASA’ s new rocket, Space Launch System (SLS) in 2019 or later. In addition to the engineering mission of orbital maneuvering, EQUULEUS will perform 3 scientific missions consisted of geo-corona, lunar impact flash, and micrometeoroid observations on the way to the Earth-Lunar libration point 2. Our Cis-Lunar Object detector within THermal Insulation (CLOTH) is a piezoelectric film sensor integrated with the EQUULEUS’ s multi-layer insulation (MLI). CLOTH can detect micrometeoroid which impacts and penetrates the outermost layer of EQUULEUS's MLI. The space flight demonstration of CLOTH will expand the possibility of deep-space exploration by CubeSat. In this presentation, we introduce the concept of CLOTH, i.e. micrometeoroid detector integrated with a spacecraft bus component, and the detection performance estimated by hypervelocity microparticle impact test on the ground.

Breadboard model of asteroid tracking system for DESTINY^{+} mission

*Peng Hong[1], Ko Ishibashi[1], Shunsuke Sato[2], Kazutoshi Takemura[3], Kotaro Fujiwara[4], Kanako Machii[5], Hiroyuki Toyota[2], Kazutaka Nishiyama[2], Masatsugu Otsuki[2], Osamu Okudaira[1], Takeshi Takashima[2]

Department of Applied Mechanics, Graduate School of Fundamental Science and Engineering, Waseda University, 4. Division of Mechanical and Space Engineering, Graduate School of Engineering, Hokkaido University, 5. Department of Mechanical Engineering and Intelligent Systems, Faculty of Informatics and Engineering, The University of Electro-Communications

DESTINY^{+} (Demonstration and Experiment of Space Technology for Interplanetary voYage, Phaethon fLyby and dUst Science) is a mission proposed for JAXA/ISAS Epsilon class small program, currently in the pre-project phase (Phase-A) with a launch targeted for 2023. The mission plans to conduct high-resolution imaging during close flyby of asteroid (3200) Phaethon, which is considered as a parent body of Geminid meteor shower. Two cameras are planned to be onboard DESTINY^{+}, the Telescopic Camera for Phaethon (TCAP) and the Multiband Camera for Phaethon (MCAP). While MCAP is designed for low spatial resolution imaging, TCAP is planned to perform high-resolution imaging, especially from ~40 seconds before to ~9 seconds after the closest approach with an imaging rate of more than 1 frame per second and the surface of Phaethon will be imaged with a spatial resolution up to 3.5 m/px at closest approach. Both cameras will be mounted and installed on the wall of spacecraft bus, thus orientations of the cameras are mainly controlled by the attitude of spacecraft. However, since the relative flyby speed and closest distance to Phaethon are expected to be 30 to 40 km/s and about 500 km, it is significantly difficult to track the asteroid only by the rotation of the spacecraft itself. Therefore, an asteroid tracking system is required for TCAP to obtain unblurred high-resolution images. The tracking system is also required to operate autonomously during the high-speed flyby. We have conducted conceptual studies of the tracking mirror as well as control algorithms to properly navigate the mirror based on feedforward or feedback loop. To realize the designed concept, we have developed a simple breadboard model focusing on the rotating mechanism which is the most important part of tracking mirror. The breadboard model consists of a rotating mirror, a 2-phase stepping motor and its driver, a motor reducer, and a FPGA board to control the driver. Required performances for the breadboard model of tracking system are (1) the rotating mirror should be able to orient a desired direction with an enough accuracy, (2) the mirror should be able to rotate smoothly with an enough accuracy during the exposure of TCAP. We will report the current development status of breadboard model of asteroid tracking system for TCAP and show its initial results of the performance test.

Development of telescopic camera (TENGOO) performance evaluation device in MMX

*Hiroki Kato[1], Shingo Kameda[1], Keigo Enya[2], Osada Naoya[1]

1. Rikkyo University, 2. Japan Aerospace Exploration Agency

Mars has two satellites, Phobos and Deimos, and there are currently two hypotheses for the origin of these satellites. The first of these hypotheses is that the moons are captured primitive asteroids, and the second is that they formed because of a giant impact event on Mars. The Japan Aerospace Exploration Agency (JAXA) is planning the Martian Moon eXploration (MMX) mission, which is a sample-return mission for Phobos, to determine which hypothesis is correct and reveal the origin of these two satellites.

The TElescopic Nadir imager for GeOmOrphology (TENGOO), which will be installed in MMX, has the purpose of measuring the geographical features of Phobos to locate a suitable landing site less influenced by space weathering. The design of TENGOO was optimized for achieving this goal. In the optical design, the instantaneous Field of View (iFoV) is 5.8 μrad/pix and the Modulation Transfer Function (MTF) is 0.3 at the Nyquist frequency.The design performance of the manufactured TENGOO needs to be confirmed. We evaluate the performance of TENGOO by measuring the Point Spread Function (PSF). Therefore, a low divergence collimated light is needed for a ground experiment to obtain the PSF with sufficient accuracy. We succeeded at making a collimated light source with divergence less than 11.6 μrad.

The Full Width of Half Maximum (FWHM) of PSF obtained with this collimated light is approximately 2x2 pixels in TENGOO. Therefore, the sampling interval becomes wider than FWHM of PSF, and the error of PSF estimation due to Gaussian fitting increases. To solve this problem, we measured the Line Spread Function (LSF) with diagonal lines and complemented the measuring points by obtaining multiple PSFs.

Observation Plans in the Cruising-Phase of the Solar Power Sail: OKEANOS

*Takahiro Iwata[1], Shuji Matsuura[2], KOHJI TSUMURA[3], Hajime Yano[1], Takayuki Hirai[4], Ayako Matsuoka[1], Daisuke Yonetoku[5], Tatehiro Mihara[6], Tatsuaki Okada[1], Osamu Mori[1], Toshihiro Chujo[1]

1. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2. Kwansei Gakuin University, 3. Tohoku University, 4. Chiba Institute of Technology, 5. Kanazawa University, 6. RIKEN

The solar power sail mission: OKEANOS (Oversize Kite-craft for Exploration and AstroNautics in the Outer Solar system) is a Japanese candidate deep-space probe that will be powered by hybrid propulsion of solar photon acceleration and ion engines. The main scientific objectives are studies of Trojan asteroids in the Jovian L4 or L5 regions. The long distance and period from the launch to the swing-by at Jupiter will give us a good opportunity to explore the solar system between the Earth and the Jupiter to elucidate the solar system disc structure. We define the cruising-phase sciences of the OKEANOS mission as the scientific theme that will be explored or observed from the launch to the swing-by at Jupiter. Candidates of instruments for the cruising phase are: the EXo-Zodiacal Infrared Telescope (EXZIT), the Arrayed Large-area Dust detectors in INterplanetary space (ALADDIN)-2, the MaGnetic Field experiment (MGF), and the GAmma-ray burst Polarimeter (GAP)-2. In this paper, we report scientific purpose and observation plans of them.

Zodiacal light observed at visible and near-infrared wavelengths is thought to be sunlight scattered by interplanetary dust. The two-dimensional distribution of zodiacal light reflects the three-dimensional structure of interplanetary dust. However, it is still controversial that how the ratio of asteroid-origin to comet-origin changes by the heliocentric distance. Therefore, the comparison of the radial distribution of zodiacal light and the in-situ dust observation will help clarify the distribution and components of solid particles in our solar system. These results are expected to provide precise distribution of the interplanetary dust in our solar-system discs.
The temperature of the solar wind, which depends on the heliocentric distance, has been observed to be greater than that predicted by the adiabatic model. Therefore, the existence of heating processes, such as plasma turbulence or magnetic reconnection, could be predicted. The observation of the magnetic field by the devices separated in the scale of the membrane of the Solar Power Sail provides the resolution of the plasma turbulence on the electron scale. Thus, the intermittent observation of the magnetic field between the Earth and Jupiter would determine the heating mechanism of the solar wind. The synergy of the magnetic field and dust observation may show the interaction between interplanetary dust and solar wind. By analyzing the environments on the dust surface, the chemical evolutions of molecules caused by solar wind and cosmic radiation can be investigated. We are investigating the possibilities to detect gamma-rays and particles from the solar-system shocks.

[P-CG21] Future Missions and instrumentation for space and planetary science

convener:Mitsunori Ozaki(Faculty of Electrical and Computer Engineering, Institute of Science and Engineering, Kanazawa University), Satoshi Kasahara(The university of Tokyo), Shingo Kameda(School of Science, Rikkyo University), Kazuo Yoshioka(Graduate School of frontier Science, The University of Tokyo)

Not only national space agencies but some universities and even companies in the world are now leading a number of space science and exploration missions and also energetically initiating new research activities for satellite and rocket developments and international collaborations in these days because the Earth observations from the space and the space explorations could be achieved much easier than a few decades ago. The deployment to the space, which itself is not purely a scientific purpose but one of methods for better sciences, is vigorously motivating the technical innovation and the educational development. For successful space missions, it is also crucial to research and develop aim-oriented on-board instruments, and the fundamental research and development of observational instrumentation with future perspectives could totally lead space missions in some case. Detailed investigation and evaluation on various on-board instruments are needed during their proposals, selections, and fabrications in order to promote the missions, and inevitably we have to make multi-sided arrangements and evolution at every process and aspect of any type of space missions, independently of their mission sizes. In this session, we focus on these comprehensive research activities in the space and astronomical missions, including the mission integrations and the individual instrumental developments, and we also call many presentations showing the uniqueness and renovation regarding the mission strategy and methodology, and the status and latest results in the related state-of-the-art researches and developments, which would provide all of researchers and developers with invaluable opportunities for active discussion, information sharing, and collaboration toward the realization of more missions for more fruitful space sciences and explorations in nearer future.

We report science subject, design, development plan and identification of issues to be solved on the visible and ultraviolet imagers for a future satellite mission called FACTORS that aims to understand the coupling processes in the terrestrial magnetosphere/ionosphere/thermosphere and the acceleration and transportation of the space plasma and neutral atmospheric particles. FACTORS stands for Frontiers of Formation, Acceleration, Coupling, and Transport Mechanisms Observed by Outer Space Research System that is proposed as a multi-satellite formation flight mission. This will be a community exploration mission in Japanese apace research after the success of the ERG mission. The working group was approved by ISAS, JAXA this year, and we have started the discussion on detailed science targets, instrumental design, feasibility and so on. We mainly concern on visible and ultraviolet remote imaging of aurora and airglow for this mission. A visible imager (VISAI) on FACTORS will measure small-scale auroral structures at a wavelength of auroral prompt emission line, such as N2 1st PG, with high-time (~0.1s) and high-spatial (~1km) resolutions using a science CMOS or EMCCD. The FOV of 8 x 8 deg covers an area of 400 x 400 km viewed from 3000 km altitude. The high-spatial and high-time resolution imaging data is essential to understand small-scale variations of Alfven aurora, pulsating aurora, etc. Combined with particle and electric/magnetic field data by FACTORS, we will reveal the time and spatial variations of acceleration/scattering process in the complicated magnetosphere-ionosphere coupling system. A far-ultraviolet imager (FUVI) adopts a wide (~40 x 40 deg.) FOV objective mirror system which covers ~2500 x 2500 km area viewed from 3000 km altitude. We plan to adopt a filter wheal in FUV imager to change the wavelength between O 135.6 nm and the N2 LBH band at 140-160 nm. Wide-field multi-wavelength FUV images enable us to examine large-scale auroral dynamics like westward-travelling surge during substorm, omega-bands, and provide us to understand the global thermospheric activity from O/N2 airglow ratio. This year we plan to carry out specific studies for CMOS/EMCCD detectors suited for this mission, and perform radiation tests of detectors.
Related to the future FACTORS mission, we are now carrying out the developments of aural cameras for two sounding rocket projects, G-CHASER (Rocksat-XN) and LAMP. The G-CHASER (Rocksat-XN) rocket was successfully launched from Andøya, Norway on January 13, 2019. We installed an auroral camera (AIC) on this rocket to measure N2 1st PG emission with wide-angle FOV lens(96x75 deg), RG-665 filter, and CCD (WAT-910HX). In addition, we are developing two CMOS cameras AIC2 on the LAMP rocket that is scheduled to be launched at Poker Flat Research Range in winter of 2019. AIC2 will be installed on a despun platform to derotate rocket spin. One CMOS camera AIC2-S1 measures N2 1st PG emission with a narrow FOV lens (F-number=0.95, f=17mm, FOV=27x27deg.), and another CMOS camera AIC-S2

©2019. Japan Geoscience Union. All Right Reserved.

measures OI 844.6nm emission with a wide-angle lens (F-number=1.6, f=3.5mm, FOV=120x120deg.). Both cameras adopt the ZWO ASI 180 MM CMOS detector. AIC2-S1 will take fine structure of PsA in the region more than 100 x 100 km area around the magnetic footprint with a few kilo-meter resolution, while AIC2-S2 will obtain an altitude distribution of pulsating aurora in the F-region as well as distribution of PsA in wide-range. The precise imaging and altitude distribution of PsA are obtained with AIC2 at two wavelengths with 10Hz sampling. The imaging data combined with precipitating electron data in the wide energy range enable us to investigate the relativistic electron precipitation called microbursts that is probably caused by chorus waves in the magnetosphere.

High energy electrons in the magnetosphere travel along geomagnetic field lines and precipitate into the Earth's atmosphere, then auroras are shown on the ground. We can investigate indirectly the behavior of precipitating electrons in the magnetosphere by deducing auroras on the ground. We focus on flash auroras, which illuminate suddenly at less than 1 s. It is difficult to detect a lot of flash aurora events by visually looking because the duration of flash aurora is very short. In this study, we developed an automatic detection of flash auroral position using Convolutional Neural Network (CNN) and performed statistical analysis of the spatio-temporal variations of flash aurora taken by an EMCCD camera (100 Hz sampling, 256 * 256 pixels) at Gakona (Alaska).

The learning data was obtained by dividing the keogram images (2400 * 720 pixels, 1-minute period) along the north-south direction of all-sky EMCCD data into square blocks (30 * 30 pixels, 750-ms period), then the learning data was visually classified to four classes. Four classes are, "pulsating aurora", "flash aurora", "noise", and "no aurora or noise". We classified the test data using the CNN, its accuracy was 91.2%.

The flash aurora data (about 100 events) are collected by CNN and we extracted flash auroral region using Otsu's method, which is a basic method of contour extraction. We performed statistical analysis about luminous duration, luminous point, spatial size, and spatial extent of flash aurora. The averaged luminescence duration was 0.21±0.08 seconds, and did not depend on magnetic longitudes and latitudes in the field-of-view of camera. We confirmed that most events (about 70%) expand earthward with an average spatial extent of 0.027 Re. We think that the earthward extension can be caused by wave propagation effects of whistler mode waves and the nonuniformity of spatial distribution of loss cones in the magnetosphere.
In this presentation, we will report on our automatic detection method and statistical results of spatio-temporal analysis of flash aurora in detail.

Study on the pulse noise removal technique for Pc1 geomagnetic pulsations on the ground by signal processing

*Fumiya Komase[1], Tomohiro Inoue[1], Mitsunori Ozaki[1], Satoshi Yagitani[1], Kazuo Shiokawa[2], Masahito Nose[2], Tsutomu Nagatsuma[3]

1. Kanazawa Univ., 2. Nagoya Univ., 3. NICT

An electromagnetic ion cyclotron (EMIC) wave, which is a type of plasma waves generated in the magnetosphere, propagates along the geomagnetic field line and we can observe it as the fluctuation in the geomagnetic field on the ground called Pc1 geomagnetic pulsation (0.2 to 5 Hz). We observe Pc1 pulsations at Kapuskasing (Canada). The ground observation is carried out using an induction magnetometer, and the Pc1 pulsations are observed with a high sensitivity and a high time resolution (64 Hz). However, when the observation instrument vibrates due to a strong wind, pulse noise is included in the observed waveforms.
We have been studying an extracting method of Pc1 pulsation by removing the pulse noise included in observed waveform using signal processing technique. Pulse noise shows in a wider frequency range (0.1 to 10 Hz) than the frequency range of Pc1 pulsation and its duration is shorter than the duration of Pc1 pulsation. Pulse noise removal consists of detecting the pulse noise candidate, classifying the pulse noise candidates into pulse noises and others by Neural Network (NN), and interpolating the waveform at the pulse noise domain. In the first step, we set an amplitude threshold for the differential waveform to detect pulse noise candidates. In the second step, as learning data for classification, we use waveform applied a High Pass Filter (HPF) to emphasize pulse noises. In the third step, we use an average energy around the pulse noise in the interpolation. We use random phase, observation phase including the pulse noises, and estimated phase by nonlinear least squares method. For each phase, we evaluated the SNR before and after the pulse noise removal. As a result, the SNR improved with 22dB using the estimated phase, but it requires a huge calculation time.
In this presentation, we will report on the pulse noise removal of Pc1 pulsation using signal processing technique in detail. Conventionally it was necessary to examine and construct the observation environment which suppresses the vibration of the observation equipment as much as possible, we think that our signal processing will be useful for reducing the ground observation costs and a more detailed analysis of Pc1 pulsation.

National Institute of Technology, Oita College, 7. Research and Development Directorate, Japan Aerospace Exploration Agency

Magneto-impedance (MI) effect was discovered about 25 years ago and a micro-size magnetic sensor that utilizes this effect becomes commercially available. We made some modifications to the commercially available MI sensors as they can cover the range of the geomagnetic field. For the period of March 30 to April 27, 2018, we conducted experimental observations of geomagnetic field variations with the MI sensors at Mineyama observation site, which is located about 100 km north-west of Kyoto. Data obtained with the MI sensors were compared with those from the fluxgate magnetometer that has been working at the site. Results showed that the MI sensor recorded geomagnetic variations with amplitudes of ~1 nT that were also detected with the fluxgate magnetometer. This suggests that MI sensors are useful for researches in geomagnetism or space physics, although they are much less expensive than fluxgate magnetometers.

We consider developing two different kinds of systems to measure the geomagnetic field using the MI sensor: a system for ground-based observation and a system for a sounding rocket. In presentation, we will display observation data from the MI sensors and the fluxgate magnetometers at Mineyama and other observatories. Future plans of the system onboard sounding rocket will be also presented and discussed.

Observation of the Ionospheric Currents by the CubeSat at the Low and Middle Latitude

*Kentarou Kitamura[1], Kazumasa Imai[2], Taku Takada[2], Manabu Shinohara[3], Makoto Wakabayashi[4], KOSEN Space Collaboration Group

The ionospheric currents flowing in the dayside ionosphere have been considered as a significant subsequence of Mesosphere-Ionosphere-Magnetosphere coupling. These currents were well detected in the Solar quiet conditions and named Sq currents. In particular, it is well known that the flow pattern of Sq currents shows the north-south hemispheric asymmetry due to the different ionospheric conductivities in the winter and summer hemispheres. This indicates that the asymmetry of the potential must be kept by the energy balance between each hemisphere through the field line.
An InterHemispheric Field Aligned Current (IHFAC) was theoretically predicted by Maeda [1974] and Fukushima [1979, 1991] to interpret the north-south asymmetry in the potential pattern. Several ground magnetic observations and satellite observations suggested an existence of the IHFAC in the noon sector and both the morning and evening terminators. However, the detailed morphology of the IHFAC have not been well understood yet, despite that the direct detection of the IHFAC at Low Earth Orbit (LEO) was reported in the observation by several satellites.
In order to investigate the Sq current system including the IHFAC, the in-situ observation by a CubeSat (2U size satellite emitted from ISS) is proposed in collaboration with 10 national colleges which belong to National Institute of Technology (KOSEN). The fluxgate magnetometer is onboard the CubeSat to observe small perturbations of the magnetic field. After the ejection from the ISS, the CubeSat will gradually glide down to the upper atmosphere due to the strong atmospheric drag and finally burn up in it. The duration of possible observation is estimated for more than 50 days.
The CubeSat can be characterized by the short duration of development (less than 3 years) and low cost (less than 100,000USD). We are considering an actual utilization of this extremely low-cost CubeSat to more realistic science mission. This concept enables us to conduct the multi-satellite in-situ observation in fairly low budget compared to conventional satellite missions.

Basic study on miniaturization of electric field instrument for plasma wave observations by ASIC technology

*Yuya Tokunaga[1], Mitsunori Ozaki[1], Keigo Ishisaka[2], Hirotsugu Kojima[3], Satoshi Yagitani[1], Takahiro Zushi[3]

1. Kanazawa University, 2. Toyama Prefectural University, 3. Kyoto University

We have been measuring electric fields of the plasma waves (a few Hz to several hundred Hz) to understand the magnetospheric dynamics. The spatial resolutions of electric field measurements are not enough because we cannot launch a lot of satellites due to the large size and mass of satellites. Demands of micro satellites like a 1U (10 cubic centimeters) cube satellites are increasing. We need to miniaturize measurement instruments for probing the plasma waves.

This study deals with an electric field instrument in plasma wave observations. We use the electric field instrument for capturing the electric fields detected by wire probe antennas. In this study, the purpose is to miniaturize the electric field instrument with a high radiation tolerance (300 krad) using Application Specific Integrated Circuit (ASIC) technology.

We designed a based amplifier for a new electric field instrument. In the new based amplifier, the equivalent input noise is 50 nV/sqrt(Hz) at 1 kHz, which is 3.9 dB-larger than that of conventional based amplifier (OP-41). The noise performance of new based amplifier is acceptable for capturing the plasma waves. To confirm the radiation tolerance of new based amplifier, we did the radiation tests up to 300 krad using the gamma ray. From the radiation test results, the gain was no change before and after the radiation tests. The output noise was degraded with 5.05 dB at 100 Hz by total ionizing dose effects. However, the based amplifier was not breakdown by the gamma ray. The electric field instrument consisted of new based amplifier could operate with a high radiation tolerance.

We conducted the transient analysis for the new electric field instrument by a circuit simulator (Tanner EDA). In the simulation, rectangular waves of 1 Vpp with 10 Hz input to the new electric field instrument via a sheath impedance (10 MOhms and 100 pF). From the simulation results, the output waveforms of new electric field instrument showed similar output waveforms in comparison with the conventional electric field instrument. The power consumption of new electric field instrument can decrease with approximately 67% than that of the conventional electric field instrument. From the simulation results, we confirmed the basic operations as the electric field instrument for detecting the plasma waves. In the future work, we will need to improve the temperature operating range because the new electric field instrument cannot operate at minus 60 Celsius degrees from the temperature simulation results.

In this presentation, we will present the basic study on electric field instrument for plasma wave observation by ASIC technology in detail.

Evaluation of radiation tolerance of electronics parts used for the ultra-small mission

*Riku Katsuse[1], Kazuo Yoshioka[1], Masaki Kuwabara[2], Reina Hikida[1], Shogo Arao[1], Ichiro Yoshikawa[1]

1. The university of Tokyo , 2. Institute of Space and Astronautical Science

In the space environment, spacecraft is exposed to radiation and degrades the data. For example, the increase of dark current, and change in current consumption.

Recently, the university-made ultra-small spacecraft mission become popular. The mission in this class can reduce the cost and time by using commercial products. However, these commercial products are thought to have no radiation tolerance. Then, it is necessary to be tested with the radiation total dose which is calculated using the Monte Carlo simulation.

We are developing the extreme ultraviolet imager PHOENIX onboard the ultra-small satellite EQUULEUS which will be launched in 2020. Helium ions in the Earth’ s plasmasphere emit extreme ultraviolet light (wavelength of 30.4 nm) through the solar resonance scattering. PHOENIX observes them from the moon (Earth-Moon L2 point).

The radiation tolerance has been evaluated with a gamma irradiation facility with cesium 137. In this presentation, we show the gain characteristics and change of electric noise with respect to radiation of semiconductor elements used in PHOENIX instrument.

A method to quantitatively evaluate Non-evaporable-getter pump for use in space science mission

*Seiya Nishimura[1], Ichiro Yoshikawa[1], Kazuo Yoshioka[1], Shogo Arao[1], Zhang Tianxu[1]

1. The university of tokyo

Observation instruments are known to deteriorate under atmospheric condition. Deterioration are mainly caused by reaction with water vapor and oxygen. To prevent this, observation instruments must be maintained under vacuum. The problem is that the conventional vacuum pump are too heavy to carry to the launching site. The need of continuous power supply makes the transport more difficult. Also the vacuum pump must be removed before the launch. These problems are not only making it difficult to maintain observation instruments under vacuum but also causing extra costs. Non-evaporable-getter (NEG) pumps are able to solve these problems. NEG pumps are light weight, compact, oil free, vibration free, and able to operate without energy supply after activation. Considering the utilization of NEG pump for space science missions, we need to quantitatively evaluate the NEG pump to optimize its size, shape, material, and mounting position for each mission. In this study, a method to measure pumping speed of NEG pump for carbon monoxide (as substitute to water vapor and oxygen) was established by using the orifice method. By using this method, it will be able to develop a NEG pump which best applies the case for each mission.

Interpretation on slight asymmetry of analyzer characteristics of MIA onboard the Mio by means of a model calculation of 3-D potential distribution

*Wataru Miyake[1], Yoshifumi Saito[2], Shoichiro Yokota[3]

1. Tokai University, 2. ISAS, 3. Osaka University

MIA (Mercury Ion Analyzer) on board Mio employs a top-hat electrostatic analyzer, which has axisymmetric toroidal electrodes and is designed to have no dependence in its characteristics on azimuthal direction of incident ions. However, our ground calibration experiments have revealed that it has a slight dependence. We have tried to explain the dependence by means of three dimensional model calculations. We assumes that all parts of electrode are manufactured precisely. Our results shows that a slight relative rotation (or tilt) of electrodes can lead to a slight dependence on incident azimuthal direction similar to that obtained from the ground experiments.

Construction of impact testing machine for small satellites and evaluation of mechanical resistance of MCPs by the impact test

*Junya Fukuba[1]

1. Graduate school of Tokyo

Small satellites have been developed in recent years. Environmental tests at the development stage play an important role in improving reliability of small satellites. These include a vibration test, an impact test, and a thermal vacuum test. Especially, the impact test is one of the most difficult tests and a reliable method has not yet been established. Against such a background, we constructed an impact testing machine for small satellites. Required performance of the impact testing machine is a controllability and a reproducibility. The controllability means the performance of applying a targeted impact level accurately. This is important to avoid applying excessive impacts on a test target. The reproducibility means the performance of applying same impact level repeatedly and this is also important because if it is possible to apply an unintended impact under the same condition, it degrades the test accuracy. Our impact testing machine is designed to be able to easily adjust the impact level and have high reproducibility. Furthermore, we tested for mechanical resistance of the MCP (micro-channel plate) which is used for optical observation instruments. In this test, we used an impact level assuming the EQUULEUS mission which will be launched by NASA’ s rocket in 2020. In my presentation, I will introduce the details of our impact testing machine and the impact test results of MCP.

Innovative design of double-shell type energy analyzer for simultaneous electron and ion measurements in space

*Tomomi Takei[1], Masafumi Hirahara[1]

1. Institute for space-earth environmental research, Nagoya university

It is well known that the terrestrial and planetary magnetospheres and the interplanetary space are filled with charged particles such as electrons and ions, which are so-called the space plasma, and in-situ observations of the space plasmas have been conducted by using satellites carrying particle instruments, such as the top-hat type electrostatic energy analyzer. Essentially, obtaining three-dimensional velocity distributions of the space plasmas or energy-pitch angle distributions help us understand the dynamics of the space plasmas. Because the top-hat type analyzer is cylindrically symmetric and has a 2π-radian planar field of view, it can independently measure the wide angular and energy distributions of incident particles. Also, three-dimensional velocity or energy-pitch angle distributions can be obtained by utilizing the satellite spin motion.
The top-hat type electrostatic energy analyzers can measure the ions when a negative potential is applied to the inner electrode and the electrons by a positive potential with the outer electrode grounded. Therefore, in the prevailing design of the top-hat type analyzer, the sensor heads separate for the ion and electron observations, respectively. Because of the recent miniaturization of the satellites, the weight and space of the instruments mounted on the small and micro satellites are getting severely restricted. However, if two sensors for electron and ion observations are combined into one sensor head, it is possible to save both weight and space on the small and micro satellites. Therefore, we have been developing double-shell type energy analyzer which can simultaneously measure the ions and the electrons with one sensor head.
We designed the shapes of the collimator and the double-layered dome-shaped electrodes so that the electrons and the ions with appropriate energies pass through the inner gap and the outer gap by applying a negative potential to the central electrode with the inner and outer electrodes grounded, respectively. We made the numerical simulations using SIMION which is a charged particle simulator program and investigated the performance and characteristics as the electrostatic analyzer. Consequently, we confirmed that the electrons and the ions can be analyzed with one sensor head by only applying negative high voltage to the electrodes. So far, we consider the detection unit using Time-Of-Flight velocity spectrometer for the discrimination of the ion species as the part where the ions are detected, and an assembly of micro channel plates is expected for the electron detection. The design of TOF-type mass analysis unit as ion mass analysis unit is one of subjects for future work.

Microsatellite Development and Education of Space Science and Technology at Kanazawa University

*Tomohiko Imachi[1], Satoshi Yagitani[1], Daisuke Yonetoku[1], Yoshiya Kasahara[1], Tatsuya Sawano[1], Makoto Arimoto[1], Yoshitaka Goto[1], Mitsunori Ozaki[1], Ryuichi Fujimoto[1]

1. Kanazawa University

At Kanazawa University, researchers from engineering and science are cooperating to promote the "Kanazawa University Satellite Project (Kanazawa-SAT3: Study and Training in Space Science and Technology for Kanazawa Cube-Satellites)". In this project, a microsatellite is being developed by staff and students of Kanazawa University. It is a scientific satellite which will contribute to the elucidation of the mechanism of gravitational wave generation by identifying the source of gravitational wave by detecting the arrival direction of gamma rays and X rays radiated at the same time when a gravitational waves are generated by collision of astronomical objects The satellite will be inserted into a solar synchronous orbit at about 660 km altitude. It is a microsatellite with a total weight of 50 kg or less, and its size is cubic with a side of 50 cm, and it is designed to be a piggyback on an HII-A rocket.

Also related to this project, a space science and engineering course has been newly established in the Graduate School of Natural Sciences in April 2018. This course is based on the 'satellite development by students', and students are actually involved in the design, fabrication, ground tests, and operation of scientific satellites, aiming to train personnel who are familiar with space science and space engineering, with satellite-development skills.

Ground tests with the thermal and structural model of Kanazawa-SAT3 have been completed , and the unit tests for almost all components are being conducted. Currently, we are completing the design of the flight model. In the presentation, we will report the details of Kanazawa-SAT3 and its development status.

Attitude Control System for Kanazawa-SAT3 Microsatellite

Takuya Nakajima[1], Yuuki Yasuda[1], Hirofumi Segawa[1], *Tomohiko Imachi[1], Satoshi Yagitani[1], Yoshiya Kasahara[1], Daisuke Yonetoku[1], Tatsuya Sawano[1], Makoto rimoto[1]

1. Kanazawa University

Kanazawa University has been developing a microsatellite. This satellite is equipped with a device to observe celestial bodies emitting gravitational waves with X rays, and aims to elucidate the mechanism of black hole formation by estimating the time of arrival and direction of arrival of gravitational waves.
In this research, the attitude control system is being developed using GAS (Geomagnetic Aspect Sensor) and MTQ (Magnetic Torque). We have constructed the environment for the unit test of RW (Reaction Wheel) also used for attitude control of the satellite.

MTQ is a device that controls the attitude of the satellite by generating a magnetic torque against the geomagnetic field by applying a voltage (an electric current) to a magnetic coil. GAS is a device for detecting the direction of the geomagnetic vector. OBC (On Board Computer) which controls all devices mounted on the satellite receives the geomagnetic field data detected by GAS, and transmits commands to control MTQ. GAS and MTQ cannot be connected to OBC directly, because OBC has just a digital interface, but the output of GAS and the input to MTQ are analog voltages. Therefore, we have developed a control device for on-board equipment using a microcontroller. For the GAS, the voltages are A/D-converted by the microcontroller and transmitted to the OBC. For the MTQ, OBC transmits control commands to the microcontroller, which generates a PWM (Pulse Width Modulation) signal according to the received command that determines the effective voltage to be given to the MTQ. For the system development and operation tests, a PC is used instead of OBC and we carried out experiments of control equipment. For the GAS, we have confirmed the linearity between the analog magnetic field and the corresponding digital values transmitted to the PC. For the MTQ, we have confirmed that the voltage to be given to MTQ were precisely controlled by the duty ratio of the PWM signal output from the microcontroller.

RW is a device to generate a control torque around the rotation axis by accelerating a rotor by a motor and is controlled by transmitting a command from the OBC via an RS-422 serial communication line. The unit test has been carried out by using a PC as a substitute of OBC, but the cable had a influence on the rotation operation of RW. Therefore, we have constructed a system for wirelessly connecting the RW with the PC via a wireless RS-422 communication. Specifically, commands from the PC are wirelessly transmitted to an Arduino microprocessor by a low-power radio module XBee, and the RW is controlled via an RS-422 transceiver. With this system, we demonstrated the basic functions for command and data between the PC and the Arduino via the wireless RS-422 transceiver.

We plan to construct a system that applies appropriate PWM signals to MTQ according to the value detected by GAS. We will also evaluate RW performance by the unit test using the wireless RS-422 communication system.

Communications System and Antennas for Kanazawa-SAT3 Microsatellite

Teruya Minamoto[1], Koyo Ina[1], Kohei Kawagoshi[1], *Tomohiko Imachi[1], Satoshi Yagitani[1], Yoshitaka Goto[1], Daisuke Yonetoku[1], Yoshiya Kasahara[1], Tatsuya Sawano[1], Makoto Arimoto[1]

1. Kanazawa University

Kanazawa University is developing the first Kanazawa University's microsatellite, named as Kanazawa-SAT3. Kanazawa-SAT3 is planned to be launched within FY2019, and its observation mission is to identify the source of gravitational waves by detecting the occurrence time and arrival direction of the X-rays and gamma rays observed simultaneously with gravity waves from distant astronomical objects.

In this research, we are developing a communications system for Kanazwa-SAT3. Kanazawa-SAT3 has three different communication systems using S band, UHF band and Iridium, and the link design of each of them has generally been completed. We summarize each communication system in detail as the following.

The S-band communication system, will use 2-GHz frequency band. Kanazawa-SAT3 is equipped with two types of antennas: S-band patch antennas and S-beacon antennas. S-band system is a main communication system between the satellite and a ground station, and plays a role of high speed data communication and beacon transmission. On the satellite side, two S-band patch antennas designed for both transmission and reception are mounted on the front and rear panels of the satellite. Two S-beacon antennas for transmission are also mounted on the front and rear panels of the satellite. On the ground side, we will send and receive by the signals using a 2.4-m parabolic dish installed at Kanazawa University.

The UHF communication system will use 400-MHz frequency bands. This system transmits commands from the ground to the satellite and telemetry information from the satellite to the ground. On the satellite side, four inverted-F type antennas we developed are mounted (two for receiving and two for transmitting) on the front and rear panels of the satellite. On the ground side, we will send and receive data by using a Yagi antenna with 14 crossed elements installed at Kanazawa University. We have also constructed an automatic satellite tracking system using the Yagi antenna.

A communication system using the Iridium satellite network uses a frequency band around 1.6 GHz. In this system, communications are performed via Iridium satellite, so that the communication can be established even when our ground station is not visible from the satellite. The data is exchanged between the satellite and the ground by using e-mail. This system can transmit and receive data in almost real time so emergency command and data transmission will be available. On the satellite side, two antennas for both transmission and reception are mounted on the front and rear panels of the satellite. A system has been constructed that exchanges data between a laptop computer simulating an onboard computer (OBC) mounted on a satellite and an iridium satellite.

From now on, for the communication systems using the S band and the UHF band, it is necessary to develop the communication software. For In addition, we need to improve the automatic satellite tracking system of Kanazawa-SAT3. For the communication system using Iridium satellite, it is necessary to implement a system on the OBC and conduct a communication experiment.

In recent years, the use of CubeSat for deep-space exploration is remarkably expanding. Equilibrium Lunar-Earth point 6U Spacecraft (EQUULEUS) project led by the University of Tokyo and JAXA is one of 13 sub payloads which will be launched by the NASA’ s new rocket, Space Launch System (SLS) in 2019 or later. In addition to the engineering mission of orbital maneuvering, EQUULEUS will perform 3 scientific missions consisted of geo-corona, lunar impact flash, and micrometeoroid observations on the way to the Earth-Lunar libration point 2. Our Cis-Lunar Object detector within THermal Insulation (CLOTH) is a piezoelectric film sensor integrated with the EQUULEUS’ s multi-layer insulation (MLI). CLOTH can detect micrometeoroid which impacts and penetrates the outermost layer of EQUULEUS's MLI. The space flight demonstration of CLOTH will expand the possibility of deep-space exploration by CubeSat. In this presentation, we introduce the concept of CLOTH, i.e. micrometeoroid detector integrated with a spacecraft bus component, and the detection performance estimated by hypervelocity microparticle impact test on the ground.

Keywords: Piezoelectric film, PVDF, Thermal insulation, CubeSat, Micrometeoroid, Hypervelocity impact

Department of Applied Mechanics, Graduate School of Fundamental Science and Engineering, Waseda University, 4. Division of Mechanical and Space Engineering, Graduate School of Engineering, Hokkaido University, 5. Department of Mechanical Engineering and Intelligent Systems, Faculty of Informatics and Engineering, The University of Electro-Communications

DESTINY^{+} (Demonstration and Experiment of Space Technology for Interplanetary voYage, Phaethon fLyby and dUst Science) is a mission proposed for JAXA/ISAS Epsilon class small program, currently in the pre-project phase (Phase-A) with a launch targeted for 2023. The mission plans to conduct high-resolution imaging during close flyby of asteroid (3200) Phaethon, which is considered as a parent body of Geminid meteor shower. Two cameras are planned to be onboard DESTINY^{+}, the Telescopic Camera for Phaethon (TCAP) and the Multiband Camera for Phaethon (MCAP). While MCAP is designed for low spatial resolution imaging, TCAP is planned to perform high-resolution imaging, especially from ~40 seconds before to ~9 seconds after the closest approach with an imaging rate of more than 1 frame per second and the surface of Phaethon will be imaged with a spatial resolution up to 3.5 m/px at closest approach. Both cameras will be mounted and installed on the wall of spacecraft bus, thus orientations of the cameras are mainly controlled by the attitude of spacecraft. However, since the relative flyby speed and closest distance to Phaethon are expected to be 30 to 40 km/s and about 500 km, it is significantly difficult to track the asteroid only by the rotation of the spacecraft itself. Therefore, an asteroid tracking system is required for TCAP to obtain unblurred high-resolution images. The tracking system is also required to operate autonomously during the high-speed flyby. We have conducted conceptual studies of the tracking mirror as well as control algorithms to properly navigate the mirror based on feedforward or feedback loop. To realize the designed concept, we have developed a simple breadboard model focusing on the rotating mechanism which is the most important part of tracking mirror. The breadboard model consists of a rotating mirror, a 2-phase stepping motor and its driver, a motor reducer, and a FPGA board to control the driver. Required performances for the breadboard model of tracking system are (1) the rotating mirror should be able to orient a desired direction with an enough accuracy, (2) the mirror should be able to rotate smoothly with an enough accuracy during the exposure of TCAP. We will report the current development status of breadboard model of asteroid tracking system for TCAP and show its initial results of the performance test.

Development of telescopic camera (TENGOO) performance evaluation device in MMX

*Hiroki Kato[1], Shingo Kameda[1], Keigo Enya[2], Osada Naoya[1]

1. Rikkyo University, 2. Japan Aerospace Exploration Agency

Mars has two satellites, Phobos and Deimos, and there are currently two hypotheses for the origin of these satellites. The first of these hypotheses is that the moons are captured primitive asteroids, and the second is that they formed because of a giant impact event on Mars. The Japan Aerospace Exploration Agency (JAXA) is planning the Martian Moon eXploration (MMX) mission, which is a sample-return mission for Phobos, to determine which hypothesis is correct and reveal the origin of these two satellites.

The TElescopic Nadir imager for GeOmOrphology (TENGOO), which will be installed in MMX, has the purpose of measuring the geographical features of Phobos to locate a suitable landing site less influenced by space weathering. The design of TENGOO was optimized for achieving this goal. In the optical design, the instantaneous Field of View (iFoV) is 5.8 μrad/pix and the Modulation Transfer Function (MTF) is 0.3 at the Nyquist frequency.The design performance of the manufactured TENGOO needs to be confirmed. We evaluate the performance of TENGOO by measuring the Point Spread Function (PSF). Therefore, a low divergence collimated light is needed for a ground experiment to obtain the PSF with sufficient accuracy. We succeeded at making a collimated light source with divergence less than 11.6 μrad.

The Full Width of Half Maximum (FWHM) of PSF obtained with this collimated light is approximately 2x2 pixels in TENGOO. Therefore, the sampling interval becomes wider than FWHM of PSF, and the error of PSF estimation due to Gaussian fitting increases. To solve this problem, we measured the Line Spread Function (LSF) with diagonal lines and complemented the measuring points by obtaining multiple PSFs.

Observation Plans in the Cruising-Phase of the Solar Power Sail: OKEANOS

*Takahiro Iwata[1], Shuji Matsuura[2], KOHJI TSUMURA[3], Hajime Yano[1], Takayuki Hirai[4], Ayako Matsuoka[1], Daisuke Yonetoku[5], Tatehiro Mihara[6], Tatsuaki Okada[1], Osamu Mori[1], Toshihiro Chujo[1]

1. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 2. Kwansei Gakuin University, 3. Tohoku University, 4. Chiba Institute of Technology, 5. Kanazawa University, 6. RIKEN

The solar power sail mission: OKEANOS (Oversize Kite-craft for Exploration and AstroNautics in the Outer Solar system) is a Japanese candidate deep-space probe that will be powered by hybrid propulsion of solar photon acceleration and ion engines. The main scientific objectives are studies of Trojan asteroids in the Jovian L4 or L5 regions. The long distance and period from the launch to the swing-by at Jupiter will give us a good opportunity to explore the solar system between the Earth and the Jupiter to elucidate the solar system disc structure. We define the cruising-phase sciences of the OKEANOS mission as the scientific theme that will be explored or observed from the launch to the swing-by at Jupiter. Candidates of instruments for the cruising phase are: the EXo-Zodiacal Infrared Telescope (EXZIT), the Arrayed Large-area Dust detectors in INterplanetary space (ALADDIN)-2, the MaGnetic Field experiment (MGF), and the GAmma-ray burst Polarimeter (GAP)-2. In this paper, we report scientific purpose and observation plans of them.

Zodiacal light observed at visible and near-infrared wavelengths is thought to be sunlight scattered by interplanetary dust. The two-dimensional distribution of zodiacal light reflects the three-dimensional structure of interplanetary dust. However, it is still controversial that how the ratio of asteroid-origin to comet-origin changes by the heliocentric distance. Therefore, the comparison of the radial distribution of zodiacal light and the in-situ dust observation will help clarify the distribution and components of solid particles in our solar system. These results are expected to provide precise distribution of the interplanetary dust in our solar-system discs.
The temperature of the solar wind, which depends on the heliocentric distance, has been observed to be greater than that predicted by the adiabatic model. Therefore, the existence of heating processes, such as plasma turbulence or magnetic reconnection, could be predicted. The observation of the magnetic field by the devices separated in the scale of the membrane of the Solar Power Sail provides the resolution of the plasma turbulence on the electron scale. Thus, the intermittent observation of the magnetic field between the Earth and Jupiter would determine the heating mechanism of the solar wind. The synergy of the magnetic field and dust observation may show the interaction between interplanetary dust and solar wind. By analyzing the environments on the dust surface, the chemical evolutions of molecules caused by solar wind and cosmic radiation can be investigated. We are investigating the possibilities to detect gamma-rays and particles from the solar-system shocks.

Origin of cosmic dust: Galaxy-scale perspective

*Akio Inoue[1,2]

1. Osaka Sangyo University, 2. Waseda University

Galaxies are the fundamental component of the Universe. In the Milky Way Galaxy and other galaxies in the present (i.e. nearby) Universe, the mass ratio of dust and stars integrated over a galaxy-scale is about 0.1%. On the other hand, in the Universe several hundreds million years after the Big Bang, some galaxies have been detected in dust with ALMA but others haven't. The dust-to-stellar mass ratio integrated in a galaxy-scale is distributed over more than an order of magnitude. In this talk, I will discuss the reason of this diversity in dust mass in the early Universe and the origin of dust in a galaxy-wide scale.

SPICA and future infrared observations of cosmic matters

*Issei Yamamura[1]

1. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency

SPICA (Space Infrared Telescope for Cosmology and Astrophysics) is an ESA-JAXA joint mission for infrared astrophysics. The main goal of the mission is to make significant contribution to answer the essential questions; how the universe has evolved to the current state of being rich in metals and cosmic dust, and how our solar system involving life has formed and developed.
SPICA is equipped with a 2.5 m telescope operated at cryogenic temperature (8 K). Three scientific instruments on board are SPICA Mid-infrared Instrument (SMI), SPICA Far-infrared Instrument (SAFARI) and Magnetic field explorer with Bolometric Polarimeter (B-BOP). SMI covers 18-36 μm with spectral resolutions R~100 or 2000, and 12-18 μm with R~28000 and it is also capable of imaging at 34 μm. SAFARI observes 34-230 μm in four wavelength bands at spectral resolution of R~300 or 2000-11000. B-BOP carries out imaging polarimetry at 100, 200, and 350 μm.
Thanks to the cryogenic telescope and the cutting-edge sensor technique, SPICA will realize sensitivity two orders of magnitude better than that in the previous missions such as Herschel. Significant fraction of the observing time will be open to the committee as proposal-based observations. Various celestial objects can be targets for observation with SPICA. For instance, high-quality spectroscopic data of trans-Neptunian objects and planet-forming circumstellar disks may clarify detailed formation process of our solar system. Observation of circumstellar dust of mass-losing stars at various environments will inform us how the cosmic dust are provided into our universe.
SPICA was selected as one of three candidates for ESA Cosmic Vision M5 mission from 25 proposals in May 2018, and it is currently under conceptual design. JAXA is a major partner, and will provide cryogenic payload module (PLM) and SMI. SAFARI and B-BOP are provided by the European consortia. The final selection of M5 will be in mid 2021, and the launch is expected to be late 2020's.

Engineering first light of a new mid-infrared instrument MIMIZUKU

*Takafumi Kamizuka[1], Takashi Miyata[1], Shigeyuki Sako[1], Ryou Ohsawa[1], Masahito S. Uchiyama[1], Tomohiro Mori[1], Yutaka Yoshida[1]

1. Institute of Astronomy, School of Science, the University of Tokyo

The University of Tokyo is currently constructing an observatory, the University of Tokyo Atacama Observatory (TAO), in the Atacama Desert in Chile. The site is located at the summit of Cerro Chajnantor, whose altitude is 5640 m. The high altitude and the dry climate decrease the water vapor in the atmosphere (Precipitable Water Vapor <0.5 mm) and improve the atmospheric transmittance in the infrared region. Therefore, the site is one of the most ideal places for infrared observations on the ground. By placing a large-aperture telescope (6.5 m in diameter) at the site, we make the TAO a cutting-edge facility for infrared observational astronomy. The Mid-Infrared Multi-field Imager for gaZing at the UnKnown Universe (MIMIZUKU) is the first-generation mid-infrared instrument for the TAO. The main features of MIMIZUKU are: 1) wide wavelength coverage from 2 to 38 microns, 2) high-spatial resolution, and 3) accurate calibration of the atmospheric absorption. The wide wavelength coverage is achieved by installing three optical channels, NIR, MIR-S, and MIR-L, covering 2.0-5.3, 6.8-26, and 24-38 microns, respectively. Each channel can perform imaging and low-resolution spectroscopic observations. The high spatial resolution is achieved by the large-aperture telescope, which determines diffraction-limited spatial resolution. The calibration accuracy of the atmospheric absorption is improved by installing a special optical device called Field Stacker. The Field Stacker has three movable mirrors and is placed on the telescope focal plane. The mirrors pick off the light from two sky regions and combines them into one field. Then, we can observe two different sky regions simultaneously. By using this function, we can perform simultaneous observations of scientific target and reference object. Simultaneous observations allow us to compensate the time variation of the atmospheric absorption and improve accuracy of its calibration. If this function successfully works, we can realize stable and accurate observations even in wavelength regions with low atmospheric transmittance, like ozone absorption region around 9.6 microns and long-wavelength mid-infrared regions in >20 microns.

Ahead of the completion of the TAO, planned around late-2020, engineering observations of MIMIZUKU were carried out at the Subaru telescope in July and December, 2018. In these observations, the functions of the MIR-S channel and the Field Stacker device were tested. As for the imaging functions, the spatial resolutions in the N- and Q-bands were confirmed to be 0.32 and 0.59 arcsec, respectively. It means that MIMIZUKU can achieve diffraction-limited images in the mid-infrared regions. As for the spectroscopic functions, spectral resolutions for the N- and Q-band modes were measured to be 180 and 100, respectively. These are consistent with the designed values. In addition, the effectiveness of the Field Stacker on the calibration of the atmospheric absorption were also confirmed. It was found that we can reduce the photometric uncertainty to a few percent even under the condition where the photometric count varies with >10 % (p-v) due to the atmospheric variation. As for the spectroscopy, Q-band spectroscopic observations, which have been difficult in ground-based observations, were realized. We found that the atmospheric absorption can be calibrated with the Field Stacker and that we can get spectra in 17-24.5 microns with fluctuations less than 5%.

These capabilities enable us to perform wide-wavelength spectroscopic monitoring observations. Such observations are useful to investigate time variation of temperature and amount of dust produced by dust-forming events around evolved stars like red giants and supernovae. In this presentation, we will

Properties and space exposure of Quenched Nitrogen-included Carbonaceous Composite (QNCC)

*Izumi Endo[1], Itsuki Sakon[1], Takashi Onaka[1], Yoko Kebukawa[2], Kensei Kobayashi[2], MITA Hajime[4], Hajime Yano[3]

1. University of Tokyo, 2. Yokohama National University, 3. ISAS/JAXA, 4. Fukuoka Institute of Technology

Organics are abundant in the present universe. However, we have limited knowledge on their origin and how they have contributed to life in solar system. The Unidentified Infrared (UIR) bands are ubiquitously seen in the various astronomical environments and should be important signals to understand how the primitive form of organics has emerged in the universe because the carriers of the bands are generally believed to be organic species. We have, for the first time, succeeded in synthesizing laboratory organics called Quenched Nitrogen-included Carbonaceous Composite (QNCC) whose infrared properties successfully reproduce the characteristics of the UIR bands observed around classical novae. We have found that N/C ratio (atom) of QNCC is 3-5% based on the measurement with Elemental Analyzer/Isotope Ratio Mass Spectrometer (EA/IRMS). X-ray Absorption Near Edge Structure (XANES) analysis of QNCC have indicated that amine (C-N) structures are contained in the QNCC. We have concluded that amine structures contribute to the broad feature around 8μm which characterize the UIR bands observed around classical novae. The broad band around at 8μm seen in infrared absorption spectra of QNCC is also seen in those of insoluble organic matter (IOM) in carbonaceous chondrites. N/C ratio of QNCC is almost consistent with that of IOM (2-5%). Therefore, QNCC is an important material to investigate the origin of primitive organics in solar system.
Based on above results we have launched a new space exposure experiment of QNCC using ExHAM (Exposed Experiment Handrail Attachment Mechanism) on the International Space Station (ISS) / Japanese Experiment Module ‘Kibo’. This space exposure experiment aims to verify the hypothesis that organics which originates in evolved stars have delivered and contributed to primitive organics in solar system by investigating the changing in properties of QNCC exposed in solar neighborhood space environment and comparing with those of organic matter contained in meteorites. In this presentation, we will report the nature of QNCC which is the strong candidate of the carriers of the UIR bands observed around classical novae and the latest progress of space exposure experiment of QNCC.

Shape dependence of dust absorption opacity in the Rayleigh domain

*Ryo Tazaki[1], Hidekazu Tanaka[1]

1. Astronomical Institute, Tohoku University

In various astrophysical environments, dust absorption opacity must be assumed to estimate dust mass by observations. Cosmic dust particles often have radii smaller than FIR or more longer wavelengths, and hence, they are typically in the Rayleigh domain at these observing wavelengths. It is known that absorption opacity in the Rayleigh domain sensitively depends on the shape of dust particles. In this study, we study how dust coagulation alters absorption opacity in the Rayleigh domain by using the T-Matrix Method. We find that higher-order terms of harmonic expansion of the electromagnetic field must be taken into account to reproduce strong field appearing around contact points between monomer particles. As a result, we show that coagulation can enhance dust absorption opacity by a factor of about 2 for silicate and about 5 for carbonaceous particles. We discuss appropriate approximate methods to mimic the shape effect of dust absorption opacity.

Keywords: Non-spherical dust particles, Absorption opacity, T-Matrix Method

Modeling of the H_2 ortho-para spin conversion on grain surfaces in star- and planet-forming regions

*Kenji Furuya[1], W. M. C. Sameera[2], Tetsuya Hama[2], Naoki Watanabe[2], Yuri Aikawa[3]

1. Center for Computer Sciences, University of Tsukuba, 2. Institute of Low Temperature Science, Hokkaido University,, 3. The University of Tokyo

Hydrogen is the most abundant element in the universe. In star- and planet-forming regions, hydrogen is primary present in H_2, which has two nuclear spin configurations, ortho and para. As the internal energy difference between ortho-H_2 and para-H_2 (170 K) is much higher than the typical temperature of star-forming regions (around 10 K), the H_2 ortho-to-para ratio (OPR) can affect the chemical evolution, including deuterium fractionation, significantly.

H_2 molecules form on grain surfaces with the statistical OPR of three. The ortho-para spin conversion proceeds through proton exchange reactions with H^+ and/or with H_3^+ in the gas phase. Laboratory experiments have found that the H_2 spin conversion can also occur on bare grains and on amorphous water ice in laboratory timescales (around a few hours). Given this very short timescale, it has been thought that the spin conversion on surfaces affects the H_2 OPR evolution in star- and planet-forming regions. However, its efficiency in the astronomical conditions remains unclear; almost all H_2 is present in the gas phase rather than on grain surfaces, and thus the spin conversion timescale of overall H_2 (i.e., gas + solid) via the spin conversion on surfaces depends on how efficiently gaseous and solid H_2 interact.

We investigate the efficiency of the H_2 spin conversion on grain surfaces under physical conditions that are relevant to star- and planet forming regions. We utilize the rate equation model that considers adsorption of gaseous H_2 on grain surfaces which have a variety of binding sites with different potential energy depth, thermal hopping and desorption of adsorbed H_2, and the spin conversion. We find that the conversion efficiency depends on H_2 gas density and surface temperature. As a general trend, increased H_2 gas density reduces the conversion efficiency, while the temperature dependence is not monotonic; there is a critical temperature at which the efficiency is maximum. We will discuss whether the spin conversion on surfaces can dominates over that in the gas-phase in star- and planet-forming regions.

Mass-independent oxygen isotope variations of extraterrestrial materials is considered to be a result of oxygen isotope exchange between ^{16}O-rich primitive materials and ^{16}O-poor gaseous reservoirs (Yurimoto & Kuramoto, 2004; Lyons & Young, 2005). Because the isotope exchange rate is controlled by the physicochemical condition of protoplanetary disks, oxygen isotopic compositions of extraterrestrial materials could be a good tracer for the disk conditions. However, little has been known about the kinetics of isotope exchange reaction for oxygen in the disks. We focused on oxygen isotope evolution of amorphous silicate dust, which is recognized as primitive material in protoplanetary disks, and investigated oxygen isotope exchange kinetics between amorphous silicates and water vapor.

A series of oxygen isotope exchange experiments between submicron-sized grains of amorphous silicate with forsterite and enstatite stoichiometry and ^{18}O-enriched water vapor (97% ^{18}O) were carried out at 803–1123 K and water vapor pressure (P_{H2O}) of 0.01–1 Pa using a gold-mirror vacuum furnace equipped with a gas flow system (Yamamoto & Tachibana, 2018). The run products were analyzed with FT-IR (JASCO FT-IR 4200), XRD (Rigaku SmartLab), and FE-SEM (JEOL JSM-7000F). The bulk oxygen isotope composition was determined as an average of multiple measurements for a pelletized sample by SIMS (Cameca ims-6f and -1280HR).

An infrared absorption peak of amorphous silicate at ~10 micron shifted to longer wavelengths with time by annealing with $H_2{}^{18}O$ vapor of 0.3 Pa at 803–883 K for amorphous forsterite and at 923–1003 K for amorphous enstatite, whereas such a shift was not observed for samples annealed in the presence of isotopically normal water vapor of 0.3 Pa. The relative peak shifts of the 10 micron feature of amorphous forsterite and enstatite correlate with their oxygen isotopic compositions, suggesting that the peak shift was caused by the isotope exchange of oxygen between amorphous silicates and $H_2{}^{18}O$ vapor. Temporal change of the degree of isotope exchange under these conditions was governed by diffusive isotope exchange with the isotope exchange rate of D ($m^2\ s^{-1}$) = (1.5 ±1.0) $\times 10^{-19}$exp[−161.5 ±14.1 (kJ mol^{-1}) R^{-1} (1/T−1/1200)] for amorphous forsterite and D ($m^2\ s^{-1}$) = (5.0 ±0.2) $\times 10^{-21}$exp[−161.3 ±1.7 (kJ mol^{-1}) R^{-1} (1/T−1/1200)] for amorphous enstatite. At P_{H2O}= 0.01 Pa, the isotope exchange reaction for amorphous forsterite is controlled by a supply of water vapor at 853 and 883 K, and the supply-controlled isotope exchange rate was evaluated. Crystallization of amorphous forsterite dominated over oxygen isotope exchange at a higher temperature of 1073 K because crystallization precedes the oxygen isotope exchange reaction. The oxygen isotope exchange timescales for amorphous forsterite and enstatite dust under protoplanetary disk conditions suggest that the primary oxygen isotope signatures of amorphous silicate dust would be erased by thermal annealing at temperatures above 500–650 K within the lifetime of protoplanetary disks.
Cometary silicate dust collected by the Stardust mission has ^{16}O-poor isotopic compositions close to the

©2019. Japan Geoscience Union. All Right Reserved.

terrestrial value (McKeegan et al., 2006; Nakamura et al., 2008). If primitive silicate dust in the protosolar disk has the same ^{16}O-rich composition as the Sun, this observation implies that comets accreted silicate dust that was thermally processed at temperature above ~500–650 K in the inner Solar System and transported to the comet formation region (e.g., Nuth, 1999; Ciesla, 2007). This could also explain that presolar silicate grains are not a major component in cometary silicates (Floss et al., 2013). The effective radial transport of inner disk materials to the outer part of protoplanetary disks may provide some constrains on the dynamics of protoplanetary disks prior to planet formation.

Birth-place of comet 17P/Holmes from its mass fractions of minerals

*Shinnaka Yoshiharu[1], Takafumi Ootsubo[2], Hideyo Kawakita[1], Mitsuru Yamaguchi[1], Mitsuhiko Honda[3], Jun-ichi Watanabe[4]

Comets are considered as the most pristine icy small objects in the solar system. They are likely to have kept the information about the solar system formation. Physical properties of cometary dust grains and composition of cometary volatiles are precious clues to physico-chemical conditions of the solar nebula. Comet 17P/Holmes is a Jupiter-family comet with an orbital period of ~7 yrs. Comet Holmes exhibited a great outburst starting on UT 2007 October 23 when the comet was 2.5 au from the Sun and five months after the perihelion passage. Because the observed relative abundance ratios of volatiles with respect to water in comet Holmes are enriched compared with other comets (Dello Russo et al. 2016, Icarus, 278, 301), it is thought that the nucleus of comet Holmes formed at a further distance from the Sun in the solar nebula (SN).

Silicate grains in the interstellar space are considered almost in amorphous form (only a few percent of mass or less is considered as crystalline for silicate; Kemper et al. 2004, ApJ, 609, 826). However, abundant crystalline silicate grains have often been found in cometary grains (up to ~80% by mass with large variety among comets; Hanner et al. 1994, ApJ, 425, 274; Wooden et al. 1999, ApJ, 517, 1034; Ootsubo et al. 2007, P&SS, 55, 1044, and references therein). It is thought that these crystalline silicates in comets formed by annealing of interstellar amorphous silicate grains or by direct condensation of gaseous materials in a hot region of the SN, and incorporated into cometary nuclei after they were transported to the cold comet-forming region (several to 30 au from the Sun). In this scenario, it is expected that mass fraction of the crystalline silicates in cometary dust grains tends to be smaller at further distances from the Sun.

We discuss the possibility that comet Holmes formed in a colder region in the SN rather than other comets based on the mass fraction of crystalline silicates in silicate grains. We derived mineral abundances in comet Holmes by applying the thermal emission model for cometary dust grains (Ootsubo et al. 2007, P&SS, 55, 1044; Shinnaka et al. 2018. AJ, 156, 242) to the mid-infrared spectra of comet Holmes taken with the COMICS on the Subaru Telescope from UT 2007 October 25 to 28. The derived mass fraction ratios of crystalline silicate of comet Holmes (~30%) is the almost smallest among comets studied in previous articles, supporting the hypothesis that comet Holmes formed at a further distance from the Sun in the SN compared with other comets. At such a cold region, hyper volatile ices like CO and amorphous water ices (possible energy sources for explosive sublimation) would be abundant.

Comparison of grain properties in interplanetary dust from different types of parent bodies by mid-infrared spectroscopic observations with AKARI

*Aoi Takahashi[1], Takafumi Ootsubo[2], Hideo Matsuhara[2], Fumihiko Usui[3], Itsuki Sakon[4], Hiroki Chihara[5]

1. The Graduate University for Advanced Studies, 2. Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency, 3. Kobe University, 4. University of Tokyo, 5. Osaka Sangyo University

Interplanetary dust (IPD) diffusely distributes in interplanetary space and is thought to be recently supplied from the inside of primordial planetesimals like asteroids or comets. The IPD’ s grain properties, such as compositions and crystal morphologies, depend on the types of parent bodies and can give us the information on the environment in the proto-solar system. The properties can be investigated in terms of silicate features around 10 μm seen in the zodiacal emission spectra. Since the IPD originating from different types of the parent bodies have different spatial distributions, it is important to survey the silicate features at various sky directions. For example, the asteroidal IPD locally distributes at low specific ecliptic latitudes and observed as band structures near the ecliptic plane. On the other hand, because of the variety of comets' inclinations, the cometary IPD distributes more globally than the asteroidal IPD does. The IPD from theJupiter Family Comets (JFCs) can form the dust cloud with a broad distribution in ecliptic latitudesaround the ecliptic plane, while the IPD from the Oort Cloud Comets (OCCs) is expected to distribute isotropically.

We obtained the high signal-to-noise zodiacal emission spectra at 74 different directions of the sky by using the mid-infrared slit-spectroscopic data obtained with the Infrared Camera on board the Japanese AKARI satellite. They exhibit the excess emission feature at the 9-12 μm range and even some sharp peaks. In order to identify the constituents, we compared the shape of spectral featureswith absorption coefficients of 4 types ofcandidate materials: amorphous with olivine composition, amorphous with pyroxene composition, forsterite (Mg2SiO4, one of olivine crystals), and ortho-enstatite (MgSiO3, one of pyroxene crystals).

The IPD was found to typicallyinclude small silicate crystals, especially enstatite grains with extreme crystal morphologies. We also found that the shape of spectral features slightly changesdependingon the sky directions.As the result of the investigation into peak wavelengths and the excess strength of each peak, the IPD at the higher ecliptic latitudes seems to have lower olivine/(olivine+pyroxene) ratio.At the sky directions toward the asteroidal dust band structures, the feature shapes show a difference which cannot be explained only by the difference in theolivine/(olivine+pyroxene) ratioand may indicate contamination of the hydrated minerals.

We will present the results of the grain properties of the IPD originating from some types of the parent bodies, and give the implications for the environment in the proto-solar system.

Formation of forsterite crystal induced by ultraviolet irradiation of water ice ice on amorphous Mg_2SiO_4 particles

*Akira Kouchi[1], Yuki Kimura[1], Yasuhiro Oba[1], Tetsuya Hama[1], Naoki Watanabe[1], Shogo Tachibana[2], Akira Tsuchiyama[3], Satomi Enju[3], Takafumi Ootsubo[4]

In comets, both crystalline and amorphous silicates have been observed by infrared telescopes. It has been proposed that crystalline silicates were formed by annealing of amorphous silicates, direct condensation in hot region of proto-solar nebula, or heating due to radical recombination in organic refractory mantle. In the present study, we have experimentally investigated another possibility, heating due to radical recombination in water ice by ultraviolet (UV) irradiation.

Three amorphous silicate fine particles made by gas condensation using induction thermal plasma (ITP) were used as starting materials: Mg_2SiO_4, $MgSiO_3$, and GEM-like composition (SiO_2-rich). Amorphous fine particles were put on amorphous Si thin film (5 nm in thickness), and cooled to 10 or 82 K in ultra-high vacuum transmission electron microscope. Amorphous water ice was prepared by vapor-deposition on the sample, and irradiated with a D_2 lamp. During UV irradiation, structural change was observed by electron diffraction.

We observed the formation of forsterite crystals from amorphous Mg_2SiO_4 at 82 K, whereas the crystallization did not occur at 10 K. No crystalline phase was observed for amorphous $MgSiO_3$ and amorphous GEM-like silicate at 10 and 82 K.

These results could be explained by radical-radical recombination reactions following the photodissociation of water molecules by UV-rays, reactions (1) and (2),

$H_2O + UV \rightarrow OH + H.$ (1)

$OH + H \rightarrow H_2O + 4.8$ eV. (2)

The formation of forsterite crystals can be induced by the energy released by reaction (2) only for amorphous Mg_2SiO_4, because the value of 4.8 eV is sufficiently larger than the activation energy for crystallization of amorphous Mg_2SiO_4 (3-4 eV), but smaller than that of amorphous $MgSiO_3$ (9 eV) and amorphous GEM-like silicate. No forsterite formation at 10 K may be explained by the low mobility of H atoms and OH radicals at the ice/Mg_2SiO_4 interface at 10 K, which strongly decrease the efficiency of reaction (2) compared with 82 K.

From these results, we propose a new route for the formation of crystalline forsterite in cometary coma by solar UV irradiation with ice-covered amorphous Mg_2SiO_4 particles. Comparison with observation will be presented.

Condensation experiments in the sytem Fe-Mg-Si-O-S using induction thermal plasma: implication to GEMS forming condition

*Satomi Enju[1], Hayate Kawano[1], Hisashi Komaki[2], Akira Tsuchiyama[1]

1. Department of Earth and Planetary Sciences, Graduate School of Science, Kyoto University, 2. JEOL Ltd.

GEMS (Glass embedded metal and sulfides) are the major component of CP-IDPs, which are thought to be one of the most primitive materials in the solar system [1]. Synthetic experiments based on the condensation model [1] are performed to form GEMS analogue particles [2, 3], but systematic experiments including sulfur are not performed so far. In this study, synthetic experiments are performed in the system Fe-Mg-Si-O-S, with systematic change in redox condition, to understand the GEMS forming condition.

Induction thermal plasma (ITP) system was used for the condensation experiment. This system creates high temperature plasma (up to 10^4 K) which evaporates the starting material, and forms condensates in the rapid cooling environments. Plasma gas is Ar and He, with chamber pressure 70 kPa. Starting material are mixture of powder regents (SiO_2, Si, MgO, Fe, FeS_2) with GEMS mean composition [1]. Redox condition change by SiO_2/Si ratio and feeding rate (fd) of the starting material. 10 experiments are performed in total. Products were analyzed by X-ray diffraction, scanning electron microscope and transmission electron microscope.

Products were composed of fine grained condensates and coarse grained evaporation residues (1-100 μm). All condensates were formed of amorphous silicate (AS) spheres, 10-100 nm in diameter. They coexist with Fe bearing particles (<30 nm), inside and on the surface of the AS. Condensates were categorized into the following five types.

A: Fe-rich AS, including Fe metal particles

B: Fe-rich AS, with FeS particles on the surface

C: Fe-rich AS showing biphasic separation texture, with FeS particles on the surface

D: Fe-poor AS showing biphasic separation texture, with Fe particles coexisting with FeS on the surface

E: Fe-poor AS showing biphasic separation texture, with Fe_3Si (gupeiite) particle coexisting with MgS (niningerite) or FeS particles on the surface

Type A, B and C were observed in the oxidative experiment, type A and D in the intermediate experiment and type E in reductive experiment.

Formation process was considered, taking into account the grain formation process model [4]. As a basic process, AS condensates first, followed by Fe particles and finally formation of sulfides. In oxidative condition, some Fe are taken into AS as FeO (type A, B), and for the lack of Fe in gas, Fe particles did not condensate or minor condensates sulfidated into FeS (Type B, C). If there was abundant Fe in gas, Fe particles condensates on the surface of AS at relatively high temperature above glass transition temperature, and moves inside the melt before sulfidation due to surface energy (type A). In reductive

©2019. Japan Geoscience Union. All Right Reserved.

condition, Fe is scarcely included in AS (type D, E). In type D, Fe metal particles condensates on the surface of the AS glass and partially sulfidized. Type E is the most reductive condition, Fe_3Si occurring instead of Fe metal, with MgS and FeS.

In this study, synthesized condensates had some of the features of GEMS, but condensates completely similar to GEMS (Fe-poor AS including many Fe metal particles, with FeS on the surface) was not observed. Considering the formation model in the study, GEMS is thought to be formed in the redox condition similar to type C-D. In their formation, Fe particles condensates at relatively high temperature on the surface of AS and moves inside the melt (like type A), and condensation of Fe particles continues at the surface of the AS below glass transition temperature, which is followed by sulfidation.

The initial abundance of ^{92}Nb in the outer solar system.

*Yuki Hibiya[1,2], Tsuyoshi Iizuka[2], Hatsuki Enomoto[2]

1. Japan Agency for Marine-Earth Science and Technology, 2. The University of Tokyo

Introduction: The *p*-process radionuclide niobium-92 (^{92}Nb) decays to zirconium-92 (^{92}Zr) by electron capture with a half-life of 37 million years (Ma). The system is a promising chronometer for addressing the early solar system evolution and planetary differentiation [1, 2]. Thus, the initial abundance of ^{92}Nb and its distribution in the early solar system provide valuable constraints on the time-scale of our solar system evolution, and on the origin of *p*-process nuclides. The initial ^{92}Nb abundance at the solar system formation was previously determined to be $(^{92}Nb/^{93}Nb)_0 = (1.7 \pm 0.6) \times 10^{-5}$, applying the internal isochron approach to the NWA 4590 angrite (U–Pb age: 4557.93 ±0.36 Ma) [2]. This value is consistent with those obtained from eucrites, ordinary chondrites, and mesosiderites [1, 3], indicating that ^{92}Nb was homogeneously distributed among their source regions. Yet, all samples previously studied for ^{92}Nb are thought to have originated from the inner solar system. Here we report internal Nb–Zr isochron dating of Northwest Africa (NWA) 6704.
NWA 6704 is a primitive achondrite having a fresh igneous texture [4] with a U–Pb age of 4562.76 ±0.30 Ma [6]. This meteorite underwent melting above liquidus temperature and subsequent rapid cooling ($> 10^{-1}$ °C/yr; [4]), making the effect of differing closure temperatures between the U–Pb and Nb–Zr systems insignificant. Furthermore, this meteorite has $\Delta^{17}O$, $\varepsilon^{50}Ti$, $\varepsilon^{54}Cr$ and $\varepsilon^{84}Sr$ values similar to those of carbonaceous chondrites [4-6], indicating that it samples the same reservoirs in the solar nebula as the carbonaceous chondrite parent bodies (i.e., the outer solar system). Thus, NWA 6704 enables us to evaluate the distribution of ^{92}Nb between the inner and outer solar system for the first time.

Results & Discussion: We prepared mineral and whole rock fractions from five fragments of NWA 6704. All Nb–Zr isotopic data were obtained by the ICP mass spectrometry. The isochron defines an initial $^{92}Nb/^{93}Nb$ of $(2.8 \pm 0.3) \times 10^{-5}$ at the time of NWA 6704 formation. By combining this value with the U–Pb age of NWA 6704, an initial $^{92}Nb/^{93}Nb$ of $(3.0 \pm 0.3) \times 10^{-5}$ at the time of solar system formation is derived. The obtained value is distinctly higher than the initial value in the inner solar system of $(1.7 \pm 0.6) \times 10^{-5}$ [2]. This indicates that ^{92}Nb was heterogeneously distributed in the protoplanetary disk before the formation of NWA 6704, and was relatively enriched in the outer solar system. The difference between these two initial values causes the apparent Nb–Zr age difference of ~30 Ma, demonstrating that the current canonical value of $(^{92}Nb/^{93}Nb)_0 = (1.7 \pm 0.6) \times 10^{-5}$ should not be used for the Nb–Zr dating of planetary materials from the outer solar system. The newly obtained initial $^{92}Nb/^{93}Nb$ value is clearly higher than the expected value in the model of ^{92}Nb synthesis by Type Ia supernova (SNIa) [7]. Thus, our results require another production site to be invoked for selectively producing ^{92}Nb. At the moment, only the ν-process in Type II supernova (SNII) [8] satisfies such requirement. If so, our finding suggests that the time-interval from the last SNII explosion to the formation of our solar system needs be <100 My and that nuclides synthesized by the last SNII were preferentially implanted or preserved in the outer solar system. Such enrichment of the last SNII components in the outer solar system may account for the isotopic dichotomy between carbonaceous and non-carbonaceous meteorites [e.g., 9].

Sun. May 26, 2019 3:30 PM - 5:00 PM JST | Sun. May 26, 2019 6:30 AM - 8:00 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_6

[P-CG23] Origin and evolution of materials in space

convener:Hitoshi Miura(Graduate School of Natural Sciences, Department of Information and Basic Science, Nagoya City University), Hideko Nomura(Department of Earth and Planetary Sciences, Tokyo Institute of Technology), Takafumi Ootsubo(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Aki Takigawa(Division of Earth and Planetary Science, Kyoto University)

Recent progresses of astronomical observations, laboratory experiments, solar-system exploration, and theoretical work have enabled us to attempt to understand the origin and evolution of materials (dust and gas) in space in the context of material science. It is thus important to link further planetary material science and astronomy for comprehensive understanding of dust and gas in space and their role in evolution of galaxies, stars, and planetary systems. In this session, based on latest results on astronomical observations, experiments, and theoretical studies on materials in space, we discuss next steps in science for materials in space.

Infrared spectrum of planetary-nebula analyzed by pure-carbon graphene molecule

*Norio Ota[1]

1. University of Tsukuba,Graduate school of pure and applied sciences

Planetary nebula is an important candidate to produce many dusts in the space. Especially, carbon-stars as like Tc1 and Lin49 show featured infrared spectrum IR [1]. It was understood that carbon fullerene (C60 and C70) could reproduce similar spectrum [2]. However, there are many extra-bands, still not identified by fullerene. We can see many graphene molecules during synthesis of fullerene in laboratory, which bring an idea to study a possibility of graphene by the first principles calculation.

We tried the quantum chemical calculation starting from model molecule of (C24) having seven carbon-hexagons using the Gaussian09 program. We applied two astrophysical conditions. One is a void creation by high speed proton, another photo-ionization by the central star. Best calculated result was obtained by graphene (C23) molecule having one carbon pentagon combined with six hexagons. Ionized states were sum of neutral, mono- and di-cations.

By an astronomical observation, we can see 16 infrared bands in a wavelength range of 5~25 micrometer [1]. Experimentally confirmed bands of fullerene (sum of C60 and C70) were 8 bands, half numbers of observed bands. In case of graphene (C23), calculated result shows that all of observed 16 bands can be reproduced very well by this calculation [3]. The reason may be high productivity of graphene from carbon gas as reported from laboratory experiments. We can suggest that graphene plays an important role in the atmosphere of the carbon-star.

Theory of Self-induced Desorption of Molecules from Cold Dust Surface

Tetsuo Yamamoto[1], *Hitoshi Miura[2], Osama M. Shalabiea[3]

1. Hokkaido University, 2. Graduate School of Natural Sciences, Department of Information and Basic Science, Nagoya City University, 3. Cairo University

The observations of interstellar molecular clouds show the presence of various species of molecules in the gas phase. Recent observations have revealed the existence of complex organic molecules and terrestrial-type organic species such as methyl formate and dimethyl ether in cold dense cores and pre-stellar cores. On the other hand, it has been pointed out that the molecules in the gas must have benn lost from the gas phase by accretion onto dust surfaces in the time shorter than the life time of dense cold clouds. This is called a freeze-out paradox. The accretion timescale is ~$10^9/n$(H) yrs, where n(H) is number density of hydrogen. This indicates that there must be some desorption mechanism to maintain the observed gas-phase abundances. Several mechanisms have been proposed so far such as temperature elevation by grain-grain collisions (d'Hedecourt et al., 1982; Schutte & Greenberg, 1991; Shalabiea & Greenberg, 1994), heating by cosmic ray, X ray and UV photons (Leger et al., 1985, Ivrev et al. 2015), and so on.

We propose a new mechanism that is necessarily associated with exothermic reactions of molecules on grain surfaces even in cold environments like cold dense cores of molecular clouds. This mechanism consists of three steps that occur on the grain surface: (1) formation of new molecules by an exothermal grain-surface reaction, (2) heating of the dust surface due to release of the heat of formation, and (3) desorption of the newly formed molecules into the gas phase.

We formulate the desorption probability of molecules newly formed by exothermic reaction by calculating the temperature distribution on the grain surface as a function of the distance from the reaction site and time. Our formula of desorption probability P is a function of heat of formation Q, desorption energy E_d of a molecule from a substrate, and molecular weight μ of a desorbing molecule. We compare P with the experiments for reactions of various Q, E_d, and μ for three substrates of oxidized HOPG, nonporous amorphous water ice, and amorphous silicate. Here, we used the compilation of the experimental data by Minissale et al. (2016). We also show a method developed for the comparison of our theory with the experiments. Discussion is given on the comparison of our theory with other two theories of desorption (Garrod et al., 2007; Minissale et al., 2016).

GEMS (Glass with Embedded Metal and Sulfide) are main component in interplanetary dust particles with cometary origin (CP-IDPs) (Keller and Messenger, 2011). GEMS is regarded as one of the most primitive material in solar system, and thus it is important to elucidate its formation conditions and process to understand the origin of solar system. The origin of GEMS is still under debate, and several theories are proposed; formation by irradiation in interstellar region (Bradley and Dai, 2004) and condensation from gas in circumstellar regions around late-type stars or in the solar nebula (Keller and Messenger, 2011). Condensation experiments which simulate condensation process of interstellar gas have been conducted in the previous studies, and fine particles similar to GEMS have been formed (Matsuno, 2015; Kim et al., 2017; Kawano, 2019). Particularly, Kawano (2019) carried out experiments with major elements in the system Mg-Fe-Si-S-O, and showed systematical change of run product by changing redox condition. In this study, we conducted new condensation experiments in the system Mg-Fe-Si-S-Al-Ca-Ni-O, which is closer to the natural system, by adding Al, Ca, and Ni for further understanding of GEMS formation.

The experiments were performed using induction thermal plasma (ITP) system (Kyoto univ., TP-40020NPS, JEOL). As the starting materials, powders of chemical regents were mixed to make GEMS average compositions (Keller and Messenger, 2011). Three kinds of sample were made with different Si/SiO_2 ratios to change redox condition. Powder X-ray diffraction (XRD), scanning electron microscope (SEM), Fourier transform infrared spectroscopy (FT-IR), and transmission electron microscope (TEM) were used for analysis.

In XRD, halo patterns due to amorphous silicates were observed. In addition, and the peaks of different crystalline phases were observed depending on the redox conditions. Absorption due to amorphous silicate was also observed in the IR spectrum. Based on the SEM observation, the run products were divided into two types, condensates composed of fine particles (about 10-100 nm) and coarse grained evaporation residues (>1 μm). For this reason, the condensates were analyzed in detail with TEM/STEM-EDS.

Under all experimental conditions, condensates were composed by aggregates of spherical amorphous silicates particles about 10-100 nm in daiameter, which contain nanoparticles of Fe and Ni <~10 nm in size. These texturtes are similar to those of Kawano (2019) and roughly resemble natural GEMS. However, the chemical compositions of amorphous silicates and nanoparticle inclusion phases varied according to the redox conditions. In oxidizing condition, amorphous silicates were relatively Fe-rich, and (Fe, Ni) metal and Ni-rich Fe,Ni sulfide formed as nanoinclusions. In reducing condition, in contrast, amorphous silicates are poor in Fe, and Fe_3Si and FeS including minor amounts of Ni formed. Al and Ca did not form any independent phases but were homogeneously distributerd in the amorphous silicates.

Natural GEMS consists of Fe-poor amorphous silicates with Fe,Ni metal and sulfide nanoinclusions. In this experiments, any product which has exactly the same texture and mineral assembladge as GEMS was not obtained. It is expected that natural GEMS formed in an evironment between the oxidizing and reducing conditions in the present experiments.

Laboratory Detection of New Absorption Bands of Interstellar-Molecule Candidate Thiophenoxy Radical

Haruka Sato[1], Mayu Negishi[1], *Mitsunori Araki[1], Takahiro Oyama[1], Koichi Tsukiyama[1]

1. Department of Chemistry, Faculty of Science Division I, Tokyo University of Science

Diffuse Interstellar Bands (DIBs) are absorption bands detected in diffuse clouds by optical observations. Although ~600 DIBs have been found so far, only the five bands were assigned to the fullerene cation and the other bands are not identified yet. Recently, benzonitrile (C_6H_5CN) was detected in interstellar space by radio as the first aromatic compound [1]. Thus, thiophenoxy radical (C_6H_5S) is received much attentions as a candidate of DIBs, because sulfur is a dominant element of interstellar molecules. For this molecule, the origin band, which is a pure electronic transition without effects of molecular vibrations, was observed as the strongest band of the $^2A_2$–X^2B_1 electronic transition [2,3]. However, our previous measurement of phenoxy radical (C_6H_5O) showed the strong vibronic bands with effects of molecular vibrations [4]. Thus, strong vibronic bands of C_6H_5S are expected because of similarity of the two molecules. We investigated the vibronic bands in the 473 –519 nm region by Cavity Ring Down spectroscopy and detected them. The strongest vibronic band at 4850 Åwas assigned to the $6a_0^2 + 6b_0^1$ transition. This band is thought to be a candidate of DIB.

Structure and dynamics of interface between forsterite glass and amorphous ice

*Ayane Kubo[1], Junya Nishizawa[1], Tomoko Ikeda-Fukazawa[1]

1. Department of Applied Chemistry, Meiji University, Japan

Forsterite (Mg_2SiO_4) glass exists as dust grains in interstellar molecular clouds [1]. In interstellar molecular clouds, elements such as hydrogen, oxygen, carbon, and nitrogen deposit on the dust grains, and form various molecules (e.g., H_2O, CO, CO_2, NH_3, CH_4, H_2CO, CH_3OH, and so on) [2]. These molecules undergo chemical evolutions to organic molecules through various processes on the surface of dust grains [2]. The structure of forsterite glass is one of the important factors governing the chemical evolutions in interstellar molecular clouds. However, there are few studies for effects of coexisting molecules on the structure and properties of forsterite glass. To investigate the structure and dynamics of interface between forsterite glass and amorphous ice, molecular dynamics (MD) calculations were performed.

The MD calculations were performed using an atom-atom potential model with MXDORTO program [3]. The potential parameters were empirically determined by constraining the structure to reproduce the experimental results of density, thermal expansion coefficient, and bulk modulus [4, 5]. A fundamental orthorhombic cell consisting of 1176 Mg_2SiO_4 with two-dimensional periodic boundary conditions was used. The glass structure was prepared by quenching the liquid phase from 3000 to 10 K with 2 K/fs in rate. Then, an amorphous ice layer with 9–1580 H_2O, which was prepared by quenching a liquid phase from 290 to 10 K, was adsorbed on the glass surface. The MD code was run using NTP ensemble with constant area for the surface directions. The pressure was maintained at 0.1 MPa.

The result shows that the atomic displacement parameter (ADP) of each atomic species in forsterite (i.e., Mg, Si, and O) in the interface decreases as the number of H_2O molecules increases. For the forsterite glass without water adsorption, the ADP values of the surface layer are higher than those of internal part due to existence of dangling bonds in the surface layer [6]. To investigate the mechanisms of ADP decrease observed in the interface with amorphous ice, the structure of interface between forsterite glass and amorphous ice was analyzed. The result shows that MgO_xH_y units exist in the interface due to formation of covalent bonds between Mg and O in H_2O. The amplitude of thermal vibration of Mg decreases as the coordination number increases. The present results have important implications for the role of forsterite glass in chemical evolutions in the universe.

Effect of Space Weathering on Identification of Organic Matter on Celestial Body Surface Using Ultraviolet Wavelength Region Spectrum

*Shogo Arao[1], Ichiro Yoshikawa[2], Kazuo Yoshioka[2], Itsuki Sakon[1], Reina Hikida[1], Izumi Endo[1], Riku Katsuse[2]

Analysis of reflection spectrum has been considered to be a conventional means for identifying compositions of the celestial body’s surface, but in the ultraviolet region, it has rarely been conducted. There are a few reports which suggest the existence of polycyclic aromatic hydrocarbon (PAH) in interstellar dust and on the surface of Mars’ moon Phobos on the basis of analytical results of their absorption or reflection spectrum, but the replication study is insufficient. A comparison of the spectrum of mixtures including various PAHs which exist on the earth with that of interstellar dust or the Phobos surface suggests that there are similarly shaped absorption bands at wavelengths of 210 nm and 217.5 nm respectively. This similarity of the shapes of absorption bands is the basis of the hypothesis that PAHs are present in interstellar dust and on the Phobos surface. However, considering the gap of peak wavelength, there are also many negative opinions on the hypothesis that is based on the doubtful similarity. Thus, there has been no definitive conclusion until now. One of the phenomena that may have a description for this problem is change in the absorption spectrum due to space weathering. The absorption band of PAHs around the wavelength of 210 nm is caused by the transition of aromatic π electrons. This band appears significantly in the absorption spectrum of molecules which have many bound aromatic rings, so that those orbital area of aromatic π electrons is broad. If the hydrogen atoms bonded to the aromatic rings of PAH molecules are desorbed by space weathering, it is suggested theoretically that the orbital area of aromatic π electrons is broadened and the absorption band’s peak wavelength may approach 217.5 nm. In our study, to evaluate the influence of space weathering on the optical properties of PAHs, we prepared several PAH samples which had been exposed to the space environment for about 1 year on orbit of the International Space Station (ISS). These were several of the samples loaded onto ISS’s exposure facility, ExHAM, of the Japanese experiment module, Kibo, as a research agenda, “Empirical Study on Space Weathering of Carbonaceous Solid Fine Particles and Organic Evolution”. Then, we compared the reflection characteristics of these samples with those of non-exposure samples in a wavelength region of 100-300 nm. As a result, some samples experienced space weathering tended to reflect the light in 210-300 nm wavelength region more weekly. In the presentation, evaluation and consideration of this result will be the focal points of the discussion.

Detection of CH_3CN in Envelope around Sagittarius B2(N)

*Mitsunori Araki[1], Shuro Takano[2], Takahiro Oyama[1], Nobuhiko Kuze[3], Kazuhisa Kamegai[4], Koichi Tsukiyama[1]

1. Tokyo University of Science, 2. Nihon University, 3. Sophia University, 4. National Astronomical Observatory of Japan

Traditionally used model of evolution of molecular clouds in interstellar space is described as increasing of cloud gas density from diffuse to dense conditions, i.e., from an atomic-gas cloud to a star-forming region via a diffuse cloud and a dense cloud. However, recently “reverse evolution” of molecular clouds is suggested by Price *et al.* [1]. For example, outflow from a star-forming region makes a relatively-low-density cloud. To find a clue of reverse evolution, investigation of chemical composition of relatively-low-density clouds is necessary. Absorption of CH_3CN can be observed by the hot axis effect, which shows special rotational distributions of CH_3CN in a relatively-low-density cloud [2]. In our previous work, CH_3CN was detected via absorption of the $J = 4–3$ rotational transition in the envelope of Sagittarius B2(M) core in the Galactic Center region by using Nobeyama 45-m telescope [3]. In this work, using ALMA data archive [4], we investigated absorption of the $J = 5–4$ and $6–5$ rotational transitions of CH_3CN in the envelope of Sagittarius B2(N) core, which is an adjacent core of the (M) core. The column density of CH_3CN in the envelope of the (N) core is derived to be $(1.0 \pm 0.2) \times 10^{15}$ cm^{-2}, which is 7 times larger than that in the envelope of the (M) core, while the (N) core has an 11-times larger column density than the (M) core [5]. Similar abundance relation was found in a case of HC_3N. Thus, as chemical compositions of relatively-low-density clouds, it was found that an abundant core has an abundant envelope and vice versa.

Sun. May 26, 2019 5:15 PM - 6:30 PM JST | Sun. May 26, 2019 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_9

[P-CG23] Origin and evolution of materials in space

convener:Hitoshi Miura(Graduate School of Natural Sciences, Department of Information and Basic Science, Nagoya City University), Hideko Nomura(Department of Earth and Planetary Sciences, Tokyo Institute of Technology), Takafumi Ootsubo(Institute of Space and Astronautical Science, Japan Aerospace Exploration Agency), Aki Takigawa(Division of Earth and Planetary Science, Kyoto University)

Recent progresses of astronomical observations, laboratory experiments, solar-system exploration, and theoretical work have enabled us to attempt to understand the origin and evolution of materials (dust and gas) in space in the context of material science. It is thus important to link further planetary material science and astronomy for comprehensive understanding of dust and gas in space and their role in evolution of galaxies, stars, and planetary systems. In this session, based on latest results on astronomical observations, experiments, and theoretical studies on materials in space, we discuss next steps in science for materials in space.

Infrared spectrum of planetary-nebula analyzed by pure-carbon graphene molecule

*Norio Ota[1]

1. University of Tsukuba,Graduate school of pure and applied sciences

Planetary nebula is an important candidate to produce many dusts in the space. Especially, carbon-stars as like Tc1 and Lin49 show featured infrared spectrum IR [1]. It was understood that carbon fullerene (C60 and C70) could reproduce similar spectrum [2]. However, there are many extra-bands, still not identified by fullerene. We can see many graphene molecules during synthesis of fullerene in laboratory, which bring an idea to study a possibility of graphene by the first principles calculation.

We tried the quantum chemical calculation starting from model molecule of (C24) having seven carbon-hexagons using the Gaussian09 program. We applied two astrophysical conditions. One is a void creation by high speed proton, another photo-ionization by the central star. Best calculated result was obtained by graphene (C23) molecule having one carbon pentagon combined with six hexagons. Ionized states were sum of neutral, mono- and di-cations.

By an astronomical observation, we can see 16 infrared bands in a wavelength range of 5~25 micrometer [1]. Experimentally confirmed bands of fullerene (sum of C60 and C70) were 8 bands, half numbers of observed bands. In case of graphene (C23), calculated result shows that all of observed 16 bands can be reproduced very well by this calculation [3]. The reason may be high productivity of graphene from carbon gas as reported from laboratory experiments. We can suggest that graphene plays an important role in the atmosphere of the carbon-star.

Theory of Self-induced Desorption of Molecules from Cold Dust Surface

Tetsuo Yamamoto[1], *Hitoshi Miura[2], Osama M. Shalabiea[3]

1. Hokkaido University, 2. Graduate School of Natural Sciences, Department of Information and Basic Science, Nagoya City University, 3. Cairo University

The observations of interstellar molecular clouds show the presence of various species of molecules in the gas phase. Recent observations have revealed the existence of complex organic molecules and terrestrial-type organic species such as methyl formate and dimethyl ether in cold dense cores and pre-stellar cores. On the other hand, it has been pointed out that the molecules in the gas must have benn lost from the gas phase by accretion onto dust surfaces in the time shorter than the life time of dense cold clouds. This is called a freeze-out paradox. The accretion timescale is ~$10^9/n$(H) yrs, where n(H) is number density of hydrogen. This indicates that there must be some desorption mechanism to maintain the observed gas-phase abundances. Several mechanisms have been proposed so far such as temperature elevation by grain-grain collisions (d'Hedecourt et al., 1982; Schutte & Greenberg, 1991; Shalabiea & Greenberg, 1994), heating by cosmic ray, X ray and UV photons (Leger et al., 1985, Ivrev et al. 2015), and so on.

We propose a new mechanism that is necessarily associated with exothermic reactions of molecules on grain surfaces even in cold environments like cold dense cores of molecular clouds. This mechanism consists of three steps that occur on the grain surface: (1) formation of new molecules by an exothermal grain-surface reaction, (2) heating of the dust surface due to release of the heat of formation, and (3) desorption of the newly formed molecules into the gas phase.

We formulate the desorption probability of molecules newly formed by exothermic reaction by calculating the temperature distribution on the grain surface as a function of the distance from the reaction site and time. Our formula of desorption probability P is a function of heat of formation Q, desorption energy E_d of a molecule from a substrate, and molecular weight μ of a desorbing molecule. We compare P with the experiments for reactions of various Q, E_d, and μ for three substrates of oxidized HOPG, nonporous amorphous water ice, and amorphous silicate. Here, we used the compilation of the experimental data by Minissale et al. (2016). We also show a method developed for the comparison of our theory with the experiments. Discussion is given on the comparison of our theory with other two theories of desorption (Garrod et al., 2007; Minissale et al., 2016).

Structure and dynamics of interface between forsterite glass and amorphous ice

*Ayane Kubo[1], Junya Nishizawa[1], Tomoko Ikeda-Fukazawa[1]

1. Department of Applied Chemistry, Meiji University, Japan

Forsterite (Mg_2SiO_4) glass exists as dust grains in interstellar molecular clouds [1]. In interstellar molecular clouds, elements such as hydrogen, oxygen, carbon, and nitrogen deposit on the dust grains, and form various molecules (e.g., H_2O, CO, CO_2, NH_3, CH_4, H_2CO, CH_3OH, and so on) [2]. These molecules undergo chemical evolutions to organic molecules through various processes on the surface of dust grains [2]. The structure of forsterite glass is one of the important factors governing the chemical evolutions in interstellar molecular clouds. However, there are few studies for effects of coexisting molecules on the structure and properties of forsterite glass. To investigate the structure and dynamics of interface between forsterite glass and amorphous ice, molecular dynamics (MD) calculations were performed.

The MD calculations were performed using an atom-atom potential model with MXDORTO program [3]. The potential parameters were empirically determined by constraining the structure to reproduce the experimental results of density, thermal expansion coefficient, and bulk modulus [4, 5]. A fundamental orthorhombic cell consisting of 1176 Mg_2SiO_4 with two-dimensional periodic boundary conditions was used. The glass structure was prepared by quenching the liquid phase from 3000 to 10 K with 2 K/fs in rate. Then, an amorphous ice layer with 9–1580 H_2O, which was prepared by quenching a liquid phase from 290 to 10 K, was adsorbed on the glass surface. The MD code was run using NTP ensemble with constant area for the surface directions. The pressure was maintained at 0.1 MPa.

The result shows that the atomic displacement parameter (ADP) of each atomic species in forsterite (i.e., Mg, Si, and O) in the interface decreases as the number of H_2O molecules increases. For the forsterite glass without water adsorption, the ADP values of the surface layer are higher than those of internal part due to existence of dangling bonds in the surface layer [6]. To investigate the mechanisms of ADP decrease observed in the interface with amorphous ice, the structure of interface between forsterite glass and amorphous ice was analyzed. The result shows that MgO_xH_y units exist in the interface due to formation of covalent bonds between Mg and O in H_2O. The amplitude of thermal vibration of Mg decreases as the coordination number increases. The present results have important implications for the role of forsterite glass in chemical evolutions in the universe.

Effect of Space Weathering on Identification of Organic Matter on Celestial Body Surface Using Ultraviolet Wavelength Region Spectrum

*Shogo Arao[1], Ichiro Yoshikawa[2], Kazuo Yoshioka[2], Itsuki Sakon[1], Reina Hikida[1], Izumi Endo[1], Riku Katsuse[2]

Analysis of reflection spectrum has been considered to be a conventional means for identifying compositions of the celestial body’s surface, but in the ultraviolet region, it has rarely been conducted. There are a few reports which suggest the existence of polycyclic aromatic hydrocarbon (PAH) in interstellar dust and on the surface of Mars’ moon Phobos on the basis of analytical results of their absorption or reflection spectrum, but the replication study is insufficient. A comparison of the spectrum of mixtures including various PAHs which exist on the earth with that of interstellar dust or the Phobos surface suggests that there are similarly shaped absorption bands at wavelengths of 210 nm and 217.5 nm respectively. This similarity of the shapes of absorption bands is the basis of the hypothesis that PAHs are present in interstellar dust and on the Phobos surface. However, considering the gap of peak wavelength, there are also many negative opinions on the hypothesis that is based on the doubtful similarity. Thus, there has been no definitive conclusion until now. One of the phenomena that may have a description for this problem is change in the absorption spectrum due to space weathering. The absorption band of PAHs around the wavelength of 210 nm is caused by the transition of aromatic π electrons. This band appears significantly in the absorption spectrum of molecules which have many bound aromatic rings, so that those orbital area of aromatic π electrons is broad. If the hydrogen atoms bonded to the aromatic rings of PAH molecules are desorbed by space weathering, it is suggested theoretically that the orbital area of aromatic π electrons is broadened and the absorption band’s peak wavelength may approach 217.5 nm. In our study, to evaluate the influence of space weathering on the optical properties of PAHs, we prepared several PAH samples which had been exposed to the space environment for about 1 year on orbit of the International Space Station (ISS). These were several of the samples loaded onto ISS’s exposure facility, ExHAM, of the Japanese experiment module, Kibo, as a research agenda, “Empirical Study on Space Weathering of Carbonaceous Solid Fine Particles and Organic Evolution”. Then, we compared the reflection characteristics of these samples with those of non-exposure samples in a wavelength region of 100-300 nm. As a result, some samples experienced space weathering tended to reflect the light in 210-300 nm wavelength region more weekly. In the presentation, evaluation and consideration of this result will be the focal points of the discussion.

Detection of CH_3CN in Envelope around Sagittarius B2(N)

*Mitsunori Araki[1], Shuro Takano[2], Takahiro Oyama[1], Nobuhiko Kuze[3], Kazuhisa Kamegai[4], Koichi Tsukiyama[1]

Traditionally used model of evolution of molecular clouds in interstellar space is described as increasing of cloud gas density from diffuse to dense conditions, i.e., from an atomic-gas cloud to a star-forming region via a diffuse cloud and a dense cloud. However, recently “reverse evolution” of molecular clouds is suggested by Price *et al.* [1]. For example, outflow from a star-forming region makes a relatively-low-density cloud. To find a clue of reverse evolution, investigation of chemical composition of relatively-low-density clouds is necessary. Absorption of CH_3CN can be observed by the hot axis effect, which shows special rotational distributions of CH_3CN in a relatively-low-density cloud [2]. In our previous work, CH_3CN was detected via absorption of the $J = 4–3$ rotational transition in the envelope of Sagittarius B2(M) core in the Galactic Center region by using Nobeyama 45-m telescope [3]. In this work, using ALMA data archive [4], we investigated absorption of the $J = 5–4$ and $6–5$ rotational transitions of CH_3CN in the envelope of Sagittarius B2(N) core, which is an adjacent core of the (M) core. The column density of CH_3CN in the envelope of the (N) core is derived to be $(1.0 \pm 0.2) \times 10^{15}$ cm^{-2}, which is 7 times larger than that in the envelope of the (M) core, while the (N) core has an 11-times larger column density than the (M) core [5]. Similar abundance relation was found in a case of HC_3N. Thus, as chemical compositions of relatively-low-density clouds, it was found that an abundant core has an abundant envelope and vice versa.

Assimilation of Wind Profiling Radar Data in GRAPES-MESO Model System

*Dan Wang[1], Zhen Ruan[2]

1. Numerical Weather Prediction Center, China Meteorological Administration, 2. Chinese Academy of Meteorological Sciences

Based on observational datasets of the wind profiling radars (WPR) in China during July 2015, a two-step quality control procedure for the WPR data is developed. Firstly, we start from the five-beam radial velocity, and recalculate the horizontal winds. After a series of processes including the spatial consistency check, time consistency averaging and vertical wind shear check, the hourly-resolution wind datasets were finally generated with quality indicator (QI) labels. We then use the ECMWF reanalysis data and radiosonde data to evaluate the newly generated WPR data. Results show that the method used for the QI labeling performs well. When its value is greater than 50, the root mean square error of u and v components are 2.29m/s and 2.37m/s respectively. This is consistent with previous research conclusions, and confirms the reliability of the pre-processing algorithm. Secondly, a second-round quality control based on the data assimilation is conducted. This procedure includes (1) removing the wind filed data located below the GRAPES model terrain, (2) configuring the effective height, (3) background check and (4) vertical thinning. The distributions of the innovations corresponding to observations after the QC are more close to a Gaussian distribution. The WPR observations after the QC were used in one-month continuous experiments based on the GRAPES modeling system. Results show that the assimilation of wind profiling radar data can effectively improve the wind state in the initial conditions. The corresponding 0-24h forecast of wind performs better. An analysis of 6-hourly verification scores like ETS and BIAS of the precipitation field suggests that the assimilation of wind profiling radar data makes a positive contribution to the rainfall forecast, especially in the short-range forecasting within 12 hours. The impact of assimilating WPR data on the case of typhoon “Linfa” is also investigated in this study. Results show that assimilating WPR data can effectively adjust the dynamic structure and water vapor conditions over the typhoon precipitation area, forming more favorable conditions for development of convective system and improving the forecast skill of precipitation.

Exploring aerosol-cloud interaction using satellite retrievals

*Xiaoyan Ma[1], hailing Jia[1], Johannes Quaas[2]

1. Nanjing University of Information Science and Technology, 2. Universität Leipzig

Long term MODIS level 3 data (MYD08_D3) from 2003 to 2016 was employed to investigate the correlation between aerosol and cloud properties over three major industrial regions in northern hemisphere (NH) and their adjacent oceans. Statistical analysis indicate that for liquid cloud, strong positive correlation between aerosol optical depth (AOD) and cloud effective radius (CER) is found over east China, i.e. CER increases with AOD, but becomes weak over east US and obscure over west Europe. In contrast, consistent negative correlation (i.e. CER decreases with AOD) is found over three adjacent oceans. Cloud properties such as cloud fraction (CF), cloud optical depth (COD), and liquid water path (LWP) and their relations with AOD were also examined. To understand the mechanisms leading to these findings, the ERA-interim reanalysis data was employed to investigate the impacts of lower tropospheric stability, vertical velocity, and precipitable water on the correlations between AOD and cloud properties. Possible explanations were discussed.

Analysis of an EF4 supercell thunderstorm mesoscale structure

*HaiGuang Zhou[1]

1. Chinese Academy of Meteorological Sciences

The Enhanced Fujita 4 (EF4) Scale tornado outbroken in Funing county on 23 June 2016, was the strongest tornado in Jiangsu province since 1961. This paper addressed the synoptic environment, the thermodynamic condition, and the three-dimensional fine scale structure of the tornadic supercell thunderstorm. This thunderstorm developed under a convectively unstable environmental condition. The environmental wind vertical shear was intense at the low and middle level. Convergence lines and a γ -mesoscale cyclone were observed on the surface. The supercell thunderstorm was a left-moving supercell with a hook echo and an inflow notch at the low level. A strong mesocyclone, located in the top of the hook echo, was observed clearly in Doppler radar image at the low and middle level. It lasted for more than 90 minutes. The tornado vortex signature (TVS) lasted for 12 volume scans, which was 46 minutes before the tornado occurred. In the period of tornado formation and intensification, the center of the storm mass, the storm top, and the height of the maximum reflectivity rose remarkably. The vertical integrated liquid (VIL) of the storm increased, too. The tornado occurred in the first time of the above-mentioned parameters decreased synchronously. The dual-Doppler retrieval wind fields revealed a mesocyclone at the low level of the convective storm. This mesocyclone was situated at the low and middle level of the hook echo high-reflectivity region. Moreover, a weaker anticyclonic circulation was located on the south of mesocyclone. The vertical vorticity couplets played an important role in the tornado formation, intensification, and maintenance.

A Case Study of Seeding Condition Potential Forecast Using Cloud Resolving Model

*Yueqin SHI[1]

1. Chinese Academy of Meteorological Sciences

The cloud precipitation explicit forecast system (CPEFS_V1.0) was used to forecast the seeding condition potential on celebrating activities for the 70th anniversary of the founding of Inner Mongolia Autonomous Region. The results showed that due to eastward movement of short wave trough and low-level shear line, water vapor condition in Hohhot region was better, unstable energy was higher, and convective weather was easy to trigger. In the morning of Aug. 8, 2017, convective clouds were appeared in the northwest direction of the core zone. Convective clouds rapidly developed and moved eastward and southward to the core zone. Lifetime of convective clouds was about 1.5-3 hours, and horizontal scale was about tens of kilometers. The generation time of convective clouds of forecast was 1-2 hours later than the observation, and moving direction was consistent with observation. Moving speed was 10-20 $km \cdot h^{-1}$ slower. Convective clouds had vertical structure of cold-warm mixed clouds, with large updraft, high content of snow and graupel, low cloud water content in warm regions, cloud top height of 10 km, cloud bottom height of 3 km, 0℃ height of 4.3 km, maximum content of supercooled water of 0.7 $g \cdot kg^{-1}$, less ice crystals in areas with rich supercooled water, these characteristics were consistent with satellite, radar and airborne detection. In the afternoon of Aug. 7, key defense zone was chosen to the west of the core zone. AgI over-seeding would be implemented during 5100 –7000 m height. In the morning of Aug. 8, the aircraft would carry out detection in weak echo area of the first defense line. Ground operations would focus on the implementation of over-seeding in the initial stage of convective clouds in the third defense line to achieve the goal of mitigation rainfall. Based on forecast, additional five sets of ground mobile seeding equipment had been added temporarily to reinforce the capability of rain mitigation operated on Aug. 8. Seeding condition for the 70th anniversary celebration was better forecast.

Route planning and communication of drone fleet for microscale weather observation ×

*Yuichi Yaguchi[1], Shuzo Nakano[3], Akira Sasaki[6], Masayuki Itaha[4], Tatsuya Iyobe[5], Kazuhiko Yamagishi[2]

1. The University of Aizu, 2. e-Robotics Fukushima Co., Ltd., 3. East-Japan Accounting Center Co., Ltd., 4. Japan Environment Research Co., Ltd., 5. Iyobe Shoji Ltd., 6. GClue Inc.

This research considers the operation and communication of the drone in the case of actually carrying out microscale fixed point observation using the drone fleet. In the case of using multiple drones at the same time, some applications were proposed in the field of entertainment and already commercialized such as the Intel 500. In these entertainment drone fleet has 1% to 5% of the drone will not crash, take off or may be unintentionally briefly beneath. In order to avoid unforeseen circumstances caused by these, in addition to miniaturization, such as 500 g or less in these drone, countermeasures such as attaching a frame are carried out. However, when the plane flying at a height of 1000 m to 2000 m where clouds can be formed, it is not necessary to use a large drone with a wind resistance of about 20 m / s, and in the assumed coastal area measurement, the sea will be directly below. In these situations, we need to design a system that guarantees the drones' completeness, but can return safely if there is a deficiency.

When sending 27 drones to a fixed point of 3 x 3 x 3, even if there are problems to crash and drop in the middle of the process, the flight path management should be excluding the two-dimensional intersection. We consider these kind of path planning which the drones are safe to flight all process from the taking off to landing. The requirement of the takeoff sequence, the drones should be enough to tight to set small area, but it should not affect propeller wind such as from 3 to 4 m lattice form. Also, we should divide the flight group because to make safety. A drone group should away from the Knight-jump and take off for each group. From there we moved to a pool that opened horizontally in a row and we aimed at the destination from there so that we avoided two dimensional intersections at long drone flight.

In addition, for the long range telemetry system of drones, we constructed a 920 MHz power saving small radio using the LoRa modulation scheme, define the data payload, aggregate each data once per second While allowing commands such as feedback from the ground station to be entered. This telemetry system can obtain the information such as the latitude, longitude, and altitude of the current position of the drone from the GPS of the drone body, the data payload includes data on wind direction, wind power, temperature, pressure and humidity acquired from the weather observation device, and any additional sensor with reservation data section corresponding to 20 bits is provided.

In this fiscal year's verification, at the Fukushima Robot Test Field, we verified whether 3 x 3 x 3 row flight is possible at intervals of 40 m, 70 m, 100 m at 30 m intervals, up to an altitude of 100 m. As a result, while occasionally there was a drone descending due to the turbulence of the airflow, we were able to hover at a fixed point while maintaining a sufficiently safe airspace. With respect to communication, if the distance is about 150 m straight, the collision due to the carrier sense in only 1 channel in a one second period when spreading at a spreading factor of 7 and frequency band of 500 kHz and performing communication for 28 units is 10% or less is there. When it is replaced with a distance of about 3 km in a straight line, communication with radio wave intensity of 20 mW is possible for each single unit, but since the communication speed problem arises, it is necessary to try with the radio wave intensity of 250 mW in the next fiscal year.

Wind speed estimation by low-cost visibility meter network

*Yui Kobayashi [1,2], Kyoya Watanabe[1,3], Nobuyasu Naruse[1,4], Yukihiro Takahashi[1,5]

1. Global Science Campus, Hokkaido University, 2. Faculty of Science, Tohoku University, 3. School of Engineering, Hokkaido University, 4. Faculty of Medicine, Shiga University of Medical Science, 5. Graduate School of Science, Hokkaido University

Poor-visibility with the blowing snow sometimes causes serious troubles such as car crashes. Previously we reported the development of a low-cost visibility meter, which estimates visibility quantitatively, measuring the reduction of laser intensity caused by the laser blocking by snow particles. Those laser intensity data together with ambient temperature are sent to a personal computer via a wireless network. The remarkable characteristic of this apparatus is a very compact body, achieving enough length of the light path by reflecting laser light three times by mirrors facing each other. We confirmed the performance as poor-visibility meter, by investigating the correlation between the reduction of laser intensity and the visibility simultaneously recorded by the conventional video system.
In regard to wind speed, which is essential in order to predict poor-visibility caused by blowing snow, conventional propeller-type anemometer has been used up to now. However, such propeller anemometer has moving parts so that the low-cost type lacks durability. On the other hand, the hot-wire and thermocouple type anemometer needs relatively high-power consumption. In this study we developed a new methodology for wind speed measurement using densely placed visibility meters, making use of the time difference between the snow particle passing at different apparatus. Experiments were performed using a wind tunnel at Cryospheric Environment Simulator of the Shinjo Branch (Snow and Ice Research Center, National Research Institute for Earth Science and Disaster Resilience). The three units of the visibility meter were set at an interval of 4-5 m in the wind tunnel and connected with a computer for data collections by wireless communication. The time interval of data sampling was set to 0.5 s. The propeller type anemometer to measure the wind speed as a reference was set downstream of the three observation units. The wind speed can be measured by detecting the delay time for snow particles to move from one unit to the next one. The wind speed obtained by our system was 8.8 m s^{-1}, being averaged for data obtained at three points, while the wind speed measured by the anemometer was 9.1 m s^{-1}. These results mean only with this poor-visibility meter network we can estimate the wind velocity with an accuracy of 3 percent.

Regional characteristics of periodic variations of temperature and wind in Tokyo under wintertime nocturnal clear and weak wind conditions

*Nakajima Ko[1,2], Hideo Takahashi[2], Nobumitsu Tsunematsu[1]

1. Tokyo Metropolitan Research Institute for Environmental Protection, Tokyo Environmental Public Service Corporation, 2. Tokyo Metropolitan University

Intermittent turbulence on time scales of a few minutes to 1 h is often observed in the nocturnal boundary layers. Previous observations were limited to one location (Yokoyama et al. 1981), or to homogeneous topographies within hundreds of square meters (Sun et al. 2015). The regional characteristics of these wavelike motions are unclear in metropolitan areas or in heterogeneous rural-urban areas that can be characterized by different surface conditions. Fujibe (2018) showed the climatological features of surface air temperature variations using 1 min data of the Automated Meteorological Data Acquisition System (AMeDAS) in Japan at horizontal intervals of approximately 17 km. In the Tokyo special wards, 1 min temperature and wind data have been recorded by the Air Pollution Monitoring Systems (APMS) at horizontal intervals of approximately 4.7 km. Therefore, these data can be used to analyze the characteristics of temperature and wind variations on time scales of 1 h or less and expected to investigate the regional characteristics of the variations in this area. The purpose of this study is to elucidate the temporal variations of temperature and wind and their regional characteristics over the Tokyo metropolitan area.

One-minute temperature, wind direction, and wind speed data from November 2016 to February 2017 obtained from the 44 APMS stations were used in this study. Additionally, the hourly wind speed, wind direction, cloud amounts, and precipitation data at the Tokyo District Meteorological Observatory (Kitanomaru) were used. We selected 17 clear and weak wind nights over the observation period using observational data at Kitanomaru by the same process as Nakajima et al. (2018).

The periodic variations of temperature and wind developed at several observational stations in several clear and weak winds nights. Especially, the periodic variations clearly developed on January 11-12, 2017. The winds and temperature fluctuated periodically in the western part of the Tokyo special wards from January 11 23:00 to 02:00 JST. The cycles of the variations were estimated as 20-50 mins from the wavelet analysis and were 5-10 times longer than that of the Brunt-Vaisala oscillation. This ratio agrees with the previous observational results (Yokoyama et al. 1981). On the contrary, the periodic variations were unclear in the central of the Tokyo special wards area such as Chiyoda ward.

In order to examine the regional characteristics of temporal variation of temperature, 20-50 mins band-pass filter was used to the temperature time series from 18:00 to 06:00 JST in each clear and weak wind night. The amplitudes of the band-passed filtered temperature variations in the non-urban area tended to be larger than 0.2˚C. However, the amplitudes in the urban area tended to be smaller than those in a non-urban area.

The difference of the temporal variations between the urban area and the non-urban area implies that the difference of the atmospheric stability between the urban area and the non-urban area. Over a non-urban area at nighttime, ground-based inversion layer grows. However, over an urban area, the atmospheric stability tends to be near neutral (Oke et al. 2017). Small turbulence might produce a large temperature variation under a strong inversion layer, whereas the amplitude is expected to be small under a weak inversion layer (Fujibe 2018). Therefore, the smaller amplitude over urban area might develop under near neutral atmospheric stability.

Exploring aerosol-cloud interaction using satellite retrievals

*Xiaoyan Ma[1], hailing Jia[1], Johannes Quaas[2]

1. Nanjing University of Information Science and Technology, 2. Universität Leipzig

Long term MODIS level 3 data (MYD08_D3) from 2003 to 2016 was employed to investigate the correlation between aerosol and cloud properties over three major industrial regions in northern hemisphere (NH) and their adjacent oceans. Statistical analysis indicate that for liquid cloud, strong positive correlation between aerosol optical depth (AOD) and cloud effective radius (CER) is found over east China, i.e. CER increases with AOD, but becomes weak over east US and obscure over west Europe. In contrast, consistent negative correlation (i.e. CER decreases with AOD) is found over three adjacent oceans. Cloud properties such as cloud fraction (CF), cloud optical depth (COD), and liquid water path (LWP) and their relations with AOD were also examined. To understand the mechanisms leading to these findings, the ERA-interim reanalysis data was employed to investigate the impacts of lower tropospheric stability, vertical velocity, and precipitable water on the correlations between AOD and cloud properties. Possible explanations were discussed.

Analysis of an EF4 supercell thunderstorm mesoscale structure

*HaiGuang Zhou[1]

1. Chinese Academy of Meteorological Sciences

The Enhanced Fujita 4 (EF4) Scale tornado outbroken in Funing county on 23 June 2016, was the strongest tornado in Jiangsu province since 1961. This paper addressed the synoptic environment, the thermodynamic condition, and the three-dimensional fine scale structure of the tornadic supercell thunderstorm. This thunderstorm developed under a convectively unstable environmental condition. The environmental wind vertical shear was intense at the low and middle level. Convergence lines and a γ -mesoscale cyclone were observed on the surface. The supercell thunderstorm was a left-moving supercell with a hook echo and an inflow notch at the low level. A strong mesocyclone, located in the top of the hook echo, was observed clearly in Doppler radar image at the low and middle level. It lasted for more than 90 minutes. The tornado vortex signature (TVS) lasted for 12 volume scans, which was 46 minutes before the tornado occurred. In the period of tornado formation and intensification, the center of the storm mass, the storm top, and the height of the maximum reflectivity rose remarkably. The vertical integrated liquid (VIL) of the storm increased, too. The tornado occurred in the first time of the above-mentioned parameters decreased synchronously. The dual-Doppler retrieval wind fields revealed a mesocyclone at the low level of the convective storm. This mesocyclone was situated at the low and middle level of the hook echo high-reflectivity region. Moreover, a weaker anticyclonic circulation was located on the south of mesocyclone. The vertical vorticity couplets played an important role in the tornado formation, intensification, and maintenance.

A Case Study of Seeding Condition Potential Forecast Using Cloud Resolving Model

*Yueqin SHI[1]

1. Chinese Academy of Meteorological Sciences

The cloud precipitation explicit forecast system (CPEFS_V1.0) was used to forecast the seeding condition potential on celebrating activities for the 70th anniversary of the founding of Inner Mongolia Autonomous Region. The results showed that due to eastward movement of short wave trough and low-level shear line, water vapor condition in Hohhot region was better, unstable energy was higher, and convective weather was easy to trigger. In the morning of Aug. 8, 2017, convective clouds were appeared in the northwest direction of the core zone. Convective clouds rapidly developed and moved eastward and southward to the core zone. Lifetime of convective clouds was about 1.5-3 hours, and horizontal scale was about tens of kilometers. The generation time of convective clouds of forecast was 1-2 hours later than the observation, and moving direction was consistent with observation. Moving speed was 10-20 $km \cdot h^{-1}$ slower. Convective clouds had vertical structure of cold-warm mixed clouds, with large updraft, high content of snow and graupel, low cloud water content in warm regions, cloud top height of 10 km, cloud bottom height of 3 km, 0℃ height of 4.3 km, maximum content of supercooled water of 0.7 $g \cdot kg^{-1}$, less ice crystals in areas with rich supercooled water, these characteristics were consistent with satellite, radar and airborne detection. In the afternoon of Aug. 7, key defense zone was chosen to the west of the core zone. AgI over-seeding would be implemented during 5100 –7000 m height. In the morning of Aug. 8, the aircraft would carry out detection in weak echo area of the first defense line. Ground operations would focus on the implementation of over-seeding in the initial stage of convective clouds in the third defense line to achieve the goal of mitigation rainfall. Based on forecast, additional five sets of ground mobile seeding equipment had been added temporarily to reinforce the capability of rain mitigation operated on Aug. 8. Seeding condition for the 70th anniversary celebration was better forecast.

Route planning and communication of drone fleet for microscale weather observation ×

*Yuichi Yaguchi[1], Shuzo Nakano[3], Akira Sasaki[6], Masayuki Itaha[4], Tatsuya Iyobe[5], Kazuhiko Yamagishi[2]

1. The University of Aizu, 2. e-Robotics Fukushima Co., Ltd., 3. East-Japan Accounting Center Co., Ltd., 4. Japan Environment Research Co., Ltd., 5. Iyobe Shoji Ltd., 6. GClue Inc.

This research considers the operation and communication of the drone in the case of actually carrying out microscale fixed point observation using the drone fleet. In the case of using multiple drones at the same time, some applications were proposed in the field of entertainment and already commercialized such as the Intel 500. In these entertainment drone fleet has 1% to 5% of the drone will not crash, take off or may be unintentionally briefly beneath. In order to avoid unforeseen circumstances caused by these, in addition to miniaturization, such as 500 g or less in these drone, countermeasures such as attaching a frame are carried out. However, when the plane flying at a height of 1000 m to 2000 m where clouds can be formed, it is not necessary to use a large drone with a wind resistance of about 20 m / s, and in the assumed coastal area measurement, the sea will be directly below. In these situations, we need to design a system that guarantees the drones' completeness, but can return safely if there is a deficiency.

When sending 27 drones to a fixed point of 3 x 3 x 3, even if there are problems to crash and drop in the middle of the process, the flight path management should be excluding the two-dimensional intersection. We consider these kind of path planning which the drones are safe to flight all process from the taking off to landing. The requirement of the takeoff sequence, the drones should be enough to tight to set small area, but it should not affect propeller wind such as from 3 to 4 m lattice form. Also, we should divide the flight group because to make safety. A drone group should away from the Knight-jump and take off for each group. From there we moved to a pool that opened horizontally in a row and we aimed at the destination from there so that we avoided two dimensional intersections at long drone flight.

In addition, for the long range telemetry system of drones, we constructed a 920 MHz power saving small radio using the LoRa modulation scheme, define the data payload, aggregate each data once per second While allowing commands such as feedback from the ground station to be entered. This telemetry system can obtain the information such as the latitude, longitude, and altitude of the current position of the drone from the GPS of the drone body, the data payload includes data on wind direction, wind power, temperature, pressure and humidity acquired from the weather observation device, and any additional sensor with reservation data section corresponding to 20 bits is provided.

In this fiscal year's verification, at the Fukushima Robot Test Field, we verified whether 3 x 3 x 3 row flight is possible at intervals of 40 m, 70 m, 100 m at 30 m intervals, up to an altitude of 100 m. As a result, while occasionally there was a drone descending due to the turbulence of the airflow, we were able to hover at a fixed point while maintaining a sufficiently safe airspace. With respect to communication, if the distance is about 150 m straight, the collision due to the carrier sense in only 1 channel in a one second period when spreading at a spreading factor of 7 and frequency band of 500 kHz and performing communication for 28 units is 10% or less is there. When it is replaced with a distance of about 3 km in a straight line, communication with radio wave intensity of 20 mW is possible for each single unit, but since the communication speed problem arises, it is necessary to try with the radio wave intensity of 250 mW in the next fiscal year.

Wind speed estimation by low-cost visibility meter network

*Yui Kobayashi [1,2], Kyoya Watanabe[1,3], Nobuyasu Naruse[1,4], Yukihiro Takahashi[1,5]

1. Global Science Campus, Hokkaido University, 2. Faculty of Science, Tohoku University, 3. School of Engineering, Hokkaido University, 4. Faculty of Medicine, Shiga University of Medical Science, 5. Graduate School of Science, Hokkaido University

Poor-visibility with the blowing snow sometimes causes serious troubles such as car crashes. Previously we reported the development of a low-cost visibility meter, which estimates visibility quantitatively, measuring the reduction of laser intensity caused by the laser blocking by snow particles. Those laser intensity data together with ambient temperature are sent to a personal computer via a wireless network. The remarkable characteristic of this apparatus is a very compact body, achieving enough length of the light path by reflecting laser light three times by mirrors facing each other. We confirmed the performance as poor-visibility meter, by investigating the correlation between the reduction of laser intensity and the visibility simultaneously recorded by the conventional video system.
In regard to wind speed, which is essential in order to predict poor-visibility caused by blowing snow, conventional propeller-type anemometer has been used up to now. However, such propeller anemometer has moving parts so that the low-cost type lacks durability. On the other hand, the hot-wire and thermocouple type anemometer needs relatively high-power consumption. In this study we developed a new methodology for wind speed measurement using densely placed visibility meters, making use of the time difference between the snow particle passing at different apparatus. Experiments were performed using a wind tunnel at Cryospheric Environment Simulator of the Shinjo Branch (Snow and Ice Research Center, National Research Institute for Earth Science and Disaster Resilience). The three units of the visibility meter were set at an interval of 4-5 m in the wind tunnel and connected with a computer for data collections by wireless communication. The time interval of data sampling was set to 0.5 s. The propeller type anemometer to measure the wind speed as a reference was set downstream of the three observation units. The wind speed can be measured by detecting the delay time for snow particles to move from one unit to the next one. The wind speed obtained by our system was 8.8 m s^{-1}, being averaged for data obtained at three points, while the wind speed measured by the anemometer was 9.1 m s^{-1}. These results mean only with this poor-visibility meter network we can estimate the wind velocity with an accuracy of 3 percent.

Regional characteristics of periodic variations of temperature and wind in Tokyo under wintertime nocturnal clear and weak wind conditions

*Nakajima Ko[1,2], Hideo Takahashi[2], Nobumitsu Tsunematsu[1]

1. Tokyo Metropolitan Research Institute for Environmental Protection, Tokyo Environmental Public Service Corporation, 2. Tokyo Metropolitan University

Intermittent turbulence on time scales of a few minutes to 1 h is often observed in the nocturnal boundary layers. Previous observations were limited to one location (Yokoyama et al. 1981), or to homogeneous topographies within hundreds of square meters (Sun et al. 2015). The regional characteristics of these wavelike motions are unclear in metropolitan areas or in heterogeneous rural-urban areas that can be characterized by different surface conditions. Fujibe (2018) showed the climatological features of surface air temperature variations using 1 min data of the Automated Meteorological Data Acquisition System (AMeDAS) in Japan at horizontal intervals of approximately 17 km. In the Tokyo special wards, 1 min temperature and wind data have been recorded by the Air Pollution Monitoring Systems (APMS) at horizontal intervals of approximately 4.7 km. Therefore, these data can be used to analyze the characteristics of temperature and wind variations on time scales of 1 h or less and expected to investigate the regional characteristics of the variations in this area. The purpose of this study is to elucidate the temporal variations of temperature and wind and their regional characteristics over the Tokyo metropolitan area.

One-minute temperature, wind direction, and wind speed data from November 2016 to February 2017 obtained from the 44 APMS stations were used in this study. Additionally, the hourly wind speed, wind direction, cloud amounts, and precipitation data at the Tokyo District Meteorological Observatory (Kitanomaru) were used. We selected 17 clear and weak wind nights over the observation period using observational data at Kitanomaru by the same process as Nakajima et al. (2018).

The periodic variations of temperature and wind developed at several observational stations in several clear and weak winds nights. Especially, the periodic variations clearly developed on January 11-12, 2017. The winds and temperature fluctuated periodically in the western part of the Tokyo special wards from January 11 23:00 to 02:00 JST. The cycles of the variations were estimated as 20-50 mins from the wavelet analysis and were 5-10 times longer than that of the Brunt-Vaisala oscillation. This ratio agrees with the previous observational results (Yokoyama et al. 1981). On the contrary, the periodic variations were unclear in the central of the Tokyo special wards area such as Chiyoda ward.

In order to examine the regional characteristics of temporal variation of temperature, 20-50 mins band-pass filter was used to the temperature time series from 18:00 to 06:00 JST in each clear and weak wind night. The amplitudes of the band-passed filtered temperature variations in the non-urban area tended to be larger than 0.2˚C. However, the amplitudes in the urban area tended to be smaller than those in a non-urban area.

The difference of the temporal variations between the urban area and the non-urban area implies that the difference of the atmospheric stability between the urban area and the non-urban area. Over a non-urban area at nighttime, ground-based inversion layer grows. However, over an urban area, the atmospheric stability tends to be near neutral (Oke et al. 2017). Small turbulence might produce a large temperature variation under a strong inversion layer, whereas the amplitude is expected to be small under a weak inversion layer (Fujibe 2018). Therefore, the smaller amplitude over urban area might develop under near neutral atmospheric stability.

[A-AS06] Progress in dense observation and numerical modeling of micro-scale meteorology

convener:Junshi Ito(Atmosphere and Ocean Research Institute, The University of Tokyo), Kentaro Araki(Meteorological Research Institute), Jun-ichi Furumoto(Research Institute for Sustainable Humanosphere, Kyoto University), Kuniaki Higashi(Research Institute for Sustainable Humanosphere, Kyoto University Metroweather Co., Ltd.), Chairperson:Junshi Ito(The University of Tokyo), Kentaro Araki(Meteorological Research Institute)

Recent progresses in observations and numerical simulations enable to unveil details in micro- or sub-kilometer scale meteorology. Low level convergences and heat island effects in the micro-scale may be sometimes associated with extreme atmospheric phenomena such as wind gusts and torrential rainfalls. Numerical simulations with very fine resolution may even predict occurrences of such phenomena. This session is welcome to researches and future scopes in the field of micro-scale meteorology.

A Linear Array of Wind and Pressure Sensors for High Resolution in situ Measurements in Winter Tornadoes

*Kusunoki Kenichi[1], Hanako Inoue[1], Naoki Ishitsu[2], Chusei Fujiwara[3]

1. Meteorological Research Institute, 2. Alpha-denshi Co., Ltd. / Meteorological Research Institute, 3. East Japan Railway Company

The Shonai area railroad weather project has investigated fine-scale structure of wind gust dynamics and kinetics such as tornadoes, downbursts, and gust fronts. As part of the project, in order to improve our understanding of near-surface tornadic features, we developed a linear array of wind and pressure sensors (**LAWPS**: **L**inear **A**rray of **W**ind and **P**ressure **S**ensors) for high resolution in situ measurements in winter tornado cores. The wind and pressure sensors were deployed along a 1.2-km-long linear array that is located parallel to and about 100m from the shoreline. Wind data are obtained using 12 two-dimensional fast-response ultrasonic anemometers placed at a height of 5 m at intervals of 100 m. Pressure data are obtained using 25 barometers placed at a height of 50cm at intervals of 50 m. The pressure ports are designed and loaded to the barometers to reduce the dynamic pressure associated with wind and turbulence. Sampling intervals for both wind and pressure measurements are 100 msec and the sampling are synchronized by the external trigger from data logging computer. In this presentation, the system overview and the measurement technique will be described.

Mesoscale fixed point weather observation architecture by Drone fleet

*Yuichi Yaguchi[1], Masayuki Itaha[4], Shuzo Nakano[3], Kazuhiko Yamagishi[2], Tatsuya Iyobe[5]

1. The University of Aizu, 2. e-Robotics Fukushima Co., Ltd., 3. East-Japan Accounting Center Co., Ltd., 4. Japan Environment Research Co., Ltd., 5. Iyobe Shoji Ltd.

To know the generation mechanism of low clouds in the troposphere, we need to place a weather sensor with a certain density in the space of the radius from 2 to 20 km and from 1000 to 2000 meters altitude as the mesoscale meteorological observations. Such the studies of meteorological observations such as Mesonets (Rezaul. MAHMOOD, et. al., 2017) in the United States, and also studied in Japan (Kazuo SAITO, 2012), measure the weather information from the ground and satellites as the mesoscale meteorological observations. For practically, this information is used as a high-precision weather forecast with simulation (Kazuo SAITO, 2016). However, SODAR and LIDAR used for observation from the ground have limitations on the degree to measure wind direction and wind power (Dimitrios V. KANELLOPOULOS, 2016, Yoshiki ITO, 2009). Radiosonde is possible to measure the wind direction and force, but it has also limitation to sense from 2000 to 10000 meters because it cannot be placed directly at a specific point and can only obtain point information in chronological order. Although observations using aircraft can obtain temperature and humidity, it is difficult to correctly obtain wind direction and force based on the moving speed of the aircraft and turbulence of air current caused by the aircraft itself. The satellite sensor is one of the strong tool for large-scale meteorological measurement, but the spatial resolution is about 1.5 km and it is very difficult to sense a small area (Ryosuke NIWA, 2009).

In this research, in order to solve these problems by direct measurement, we propose a technique to measure using unmanned aerial vehicles at the same time. Specifically, six-propellers multicopter, generally called a drone which can hover for about 30 minutes per one and has a wind resistance of 20 m/s is manufactured, and a portable weather observation device utilizing ultrasonic wave is installed here. This meteorological observation device calculates the wind direction and wind force by calculating biaxial wind force by using ultrasonic waves. In addition, we install atmospheric temperature, humidity and barometer on weather observation equipment, and store on the payload computer a drone a measurement that is equal to or higher than the radiosonde. This meteorological observation device is raised by a mast to a height that does not affect disturbance of draft airflow measured in advance and measures it. In addition, the data accumulated in the payload computer are organized at about once every second, and it is transmitted to the ground from the 920 MHz compact power-saving radio station based on the LoRa modulation method and it is possible to display in real time. We can sense weather information at a fixed point on the mesoscale by aggregating this data at the same time at multiple sites through the Internet. In addition, since multi-copiers are out of the category of light aircraft of the aeronautical law up to 25 kg weight, we can easily skip to the altitude prescribed by the aeronautical law at the present time. However, since the altitude aimed for this research is to fly at a height where the clouds can reach from 1000 m to 2000 m, it is necessary to negotiate with the Ministry of Land, Infrastructure and Transport and air traffic control in advance.

As an actual demonstration, it was verified whether the drone of a single machine can be raised to an altitude of 500 m, 1000 m, 1500 m, 2000 m, respectively, and real time measurement can be performed. In the experiment conducted between 6:30 and 7:00 in the morning on 20, 21, 22 December 2018, the wind speed on the ground was about 3 to 5 m/s, but at the altitude of 1500 m it was 13 m / s For the first time. In addition, we confirmed that such information is transmitted to the ground in real time and can be

©2019. Japan Geoscience Union. All Right Reserved.

viewed directly. Moreover, using another drone equipped with the equivalent system, 27 drones flying into mesh type of 3 x 3 x 3 at intervals of 30 m in a space up to 100 m in height, verified to stay at the fixed point, succeeded doing. Using these combinations makes it possible to observe a fixed point in a wide area.

Potential of dense weather event observation using surface optical fiber cable and DAS technology

*Tsunehisa KIMURA[1]

1. Schlumberger

Distributed acoustic sensing (DAS) technology is introduced in the oil and gas industry from around 2011 for monitoring pipelines and sensing intruders. In recent years, application of the latest optical fiber sensing technology using differential phase data called heterodyne distributed vibration sensing (hDVS) has made it possible to acquire the seismic data including the Vertical Seismic Profile (VSP)[1)]. Three-dimensional imaging can also be performed by a 3DVSP method[2)]. We have described the observation of natural earthquakes and waves, targeting the detection of tsunamis, using the hDVS device at recent JpGU and the seismological society of Japan (SSJ)[3)].

In September 2017, in cooperation with the Engineering Advancement Association of Japan (ENAA), we conducted a demonstration experiment of DAS technology including earthquake observation using optical fiber cable buried at depth of about 20 cm. Of the 400 m long optical fiber cables, 300 m was set back and forth in a 100 m long trench and the remaining 100 m was made to run along the ground surface, and then connected to a hDVS Tier-3 acquisition device. In other words, the optical fiber cable of about 50 m section that caused the ground to travel was under an environment susceptible to changes in weather. On the second day of the 4-day observation period, there was also a time zone in which rain fell and occasionally intense. Especially during the nighttime, continuous observation was carried out, so the fiber optic cable that crawled on the ground surface has not only accidental phenomena such as car traffic ground noise and natural earthquake, but also stationary phenomenon which seems to be the influence of rain fall was recorded. An example is shown in Fig 1.

This suggests that DAS technology using optical fiber as a vibration sensor may be used for weather observation. The hDVS/DAS records with GPS time stamp; the maximum observation length is depending on the type and state of fiber, but using low-loss single mode fiber a range of 40 km is achievable. If we can observe meteorological conditions over a range of tens of kilometers with a resolution of several tens of meters with a single device, we could issue more detailed warnings.

Installation of optical fiber for communication in Japan is often installed in the air such as utility pole and iron tower, except for the trunk communication network in the metropolitan area. Such optical fibers are directly influenced by rain and wind, however influence of noise sources generated on the surface such as vehicles, railways, factories, etc. is small. In other words, if you connect an hDVS/DAS device to an optical fiber on a transmission line called OPGW (optical fiber composite overhead ground wire), there is a possibility that weather network can be constructed in a short period of time. In the case of rain, when the rain is calm, the rate at which rain strikes the OPGW decreases, vibration or the dynamic strain of the optical fiber appears less, that is, the signal of hDVS/DAS is small. When the rain intensifies, the rate at which rain hits OPGW increases, vibration appears greatly, the signal of hDVS/DAS is large. So, it is possible to quantitatively observe local rainfall at intervals of several tens of meters. It would be possibly quantifying the size of rain drops as well as state of rain drops whether liquid or icy.

If rainfall and wind volume are large and change at the same time as a typhoon, it will be possible to take a method to separate each event. In the case of rain, raindrops collide with the fiber-optic cable, causing

©2019. Japan Geoscience Union. All Right Reserved.

vibration, which is supposed to be more microscopic vibration and the frequency range of vibration is higher. On the other hand, in the case of wind, it seems that the frequency range is low due to macro vibration which affects the entire fiber optic cable between towers. When observing the ocean bottom earthquake using JAMSTEC owned submarine optical fiber cable, we observed the wave at the same time, but it is possible to separate two different events by changing the gauge length, which was presented at SSJ 2018[4]. Reprocessing the raw data for different gauge length is a capability that is unique to hDVS amongst the available DAS techniques. Real-time simultaneous observation of rainfall and wind will be possible by improving the hDVS system.

By connecting hDVS to underground, ocean floor, and terrestrial optical fiber networks, the possibility of constructing a comprehensive disaster prevention observation network of earthquakes, volcanoes, tsunamis, and observation of typhoons and Guerrilla rainstorm, has come to be seen.

Acknowledgements: We thank ENAA for permission to show recorded the hDVS data.

Case study of environmental conditions and cloud microphysical properties of winter convective clouds developed in the Kanto plain

*Kentaro Araki[1], Shinsuke Satoh[2], Takuya Tajiri[1]

1. Meteorological Research Institute, 2. National Institute of Information and Communications Technology

In winter, convective clouds sometimes develop and cause local snowfalls and lightning strikes in the Kanto plain in Japan. To understand and forecast these winter convective clouds, detailed observations of environmental conditions and cloud microphysical properties are required. In this study, we performed a case study on the winter convective clouds on 26 January 2019, and examined the temporal variation of environmental conditions and properties of cloud and precipitation by using Japan Meteorological Agency (JMA) analysis data, dense surface meteorological observation data, Himawari-8 data, JMA operational radar data, photograph data of precipitation particles derived from citizen science, disdrometer and microwave radiometer data obtained at the Meteorological Research Institute in the Tsukuba, Ibaraki.

On 26 January, the surface pressure pattern was the winter monsoon type and the upper cold vortex moved to the northern Japan. Since the Kanto plain was located on the southeastern side of the cold vortex, synoptic condition was favorable for convection development in the Kanto plain. In respect of the mesoscale environments, the low-level convergence line was formed in the Kanto plain by west-northwesterly and northerly airflows that crossed the mountain areas. The Himawari-8 infrared images captured the cloud street associated with the convergence line from 13:30 JST (=UTC+9h), and radar echoes of convective clouds were observed by JMA Tokyo radar from 14:40 JST. Two convective clouds developed in the convergence line and passed over Tsukuba from about 15:30 to 16:30 JST. From the results of one-dimensional variational (1DVAR) analysis combined with numerical weather model and microwave radiometer data, it was found that thermodynamic environments significantly got unstable at 15 JST because of increases of low-level atmospheric temperature and influence of upper cold air flow.

Disdrometer in Tsukuba observed precipitation of two convective clouds from 15:34 to 15:44 JST and from 16:03 to 16:32 JST. Results of zenith-looking observation by micro rain radar showed the existence of echo at the altitude of 3-5 km 5-10 minutes before the surface precipitation at 15:34. Liquid water path (LWP) derived by the microwave radiometer significantly increased about 20 minutes before the surface precipitation by the first convective cloud, and the value of LWP in the case of second convective cloud was smaller than that of the first one. Results of disdrometer observation showed characteristics of the precipitation particles were similar to that of typical lump graupel, and fall velocity of the particles from the first convective cloud was significantly greater than that of second one. Photograph data by citizen science revealed that the graupel particles from the first convective cloud had densely rimed structures compared with those of second one. These differences of cloud microphysical properties would be due to the difference of the life stages of the convective clouds.

Numerical simulation of the urban effect on the atmospheric boundary layer structure in Tokyo using the SPUC urban canopy scheme

*Naoko Seino[1]

1. Meteorological Research Institute

Seino et al. (2018) investigated the influence of urbanization in the Tokyo area and showed that about one degree temperature rise in the central urban area in Tokyo can lead to 10% precipitation increase in August. We examined new method of the initial temperature field preparation in the model simulation, in which previously predicted temperatures of urban canopy elements were used as their initial temperatures in the succeeding simulation. Simulation results for one month in summer showed that the implementation of this forecast-cycle procedure improved the surface air temperature representation. On the other hand, comparisons with the winter observation results indicated that the atmospheric boundary layer height was underestimated in the model results. We will validate the model performance in other observation cases for the better understanding of finer scale features of urban effect.

Surface layer model for instantaneous wind speeds designed by deep learning

*Junshi Ito[1,2], Hideaki Mouri[2]

1. Atmosphere and Ocean Research Institute, The University of Tokyo , 2. Meteorological Research Institute

parameterizations consider the Monin-Obukhov similarity law for diagnosing momentum transports between the lowest atmosphere and ground. This law was found in the relations between temporally averaged (typically periods of 10 minutes) wind speeds and momentum fluxes. We have suggested that it is inappropriate to apply the law for the parameterization in large eddy simulations in which turbulence fluctuation is involved in resolved wind speed at each grid point. However, we do not know a good alternative to the law.

In this study, we perform a preliminary attempt to apply the deep learning technique for the parameterization. Results of wind tunnel experiments are used for the date to be learned: the relationship between wind speeds and momentums fluxes in a short time scale (1 second, typically) was obtained in the condition with steady external winds and neutral stratification over ten hours.

Nine-tenth of the wind tunnel data for three kinds of different external wind speeds was inputted to the routine of the TensorFlow library. Then the validation is performed by the left of the data. The result shows that diagnoses of the momentum fluxes through the trained network show far better performances than those of the misused Monin-Obukhov law.

If the wind speed is inputted in training, the network overfits the other wind speed that has not been used for the training. It would be better to consider normalize wind speeds for the training to apply a wide range of wind speeds.

Model Spectra for Turbulence Below and Above the Ozmidov Wavenumber

*Eric L Kunze[1]

1. NorthWest Research Associates Redmond

A model spectrum is constructed to describe both anisotropic stratified turbulence below and isotropic turbulence above the Ozmidov wavenumber using dimensional and dynamical scaling in terms of a cascade (or dissipation) rate ε, Coriolis frequency f, buoyancy frequency N and horizontal wavenumber k. The Ozmidov wavenumber $(N^3/\varepsilon)^{1/2}$ is the lowest wavenumber for which turbulence can overcome stratification to produce density overturns. The model reproduces observed spectral shapes and behavior in ocean and atmosphere measurements, specifically the −1 vertical wavenumber spectral slope in the invariant saturated spectrum band and +1/3 horizontal wavenumber spectral slope in the several decades immediately below the Ozmidov wavenumber. Aspect ratios become increasingly anisotropic below the Ozmidov wavenumber until reaching ~O(f/N). It is argued that geophysical turbulence can arise from anisotropic instability of the internal-wave field at wavenumbers well below the Ozmidov then cascade energy forward into isotropic turbulence, in contrast to the conventional wisdom that isotropic turbulence arises directly from vertical instability injecting energy at or above the Ozmidov wavenumber. Thus, anisotropic and isotropic turbulence are manifestations of the same forward energy cascade to dissipation.

A new parameterization of turbulent mixing caused by tidal flow over abyssal rough bathymetry

*Toshiyuki Hibiya[1]

1. Department of Earth and Planetary Science, Graduate School of Science, The University of Tokyo

It is believed that tidal interaction with abyssal rough bathymetry can create mixing hotspots extending upward from the ocean bottom. Although there exist parameterizations of bottom-enhanced tidal mixing, they do not take into account that the internal waves generated by tide-topography interactions transform from *internal tidal waves* to *quasi-steady internal lee waves* as $k_H U_0 / \omega$ increases and exceeds unity (k_H is the horizontal wavenumber of the bottom topography; U_0 is the amplitude of the tidal flow; ω is the tidal frequency) (Mohri et al., 2010).

In this study, we formulate a new parameterization of tidal mixing over abyssal rough bathymetry in which the vertical decay scale of the energy dissipation rate (ε) is estimated by multiplying the theoretically obtained vertical group velocity of the *internal tidal wave* or the *quasi-steady internal lee wave* by the time scale of its nonlinear interaction (induced diffusion) with the background Garrett-Munk (GM) internal wave field (McComas and Müller, 1981). The resulting parameterization explicitly shows that the vertical decay scale of ε becomes independent of U_0 but inversely proportional to k_H squared when $k_H U_0 / \omega < 1$ and independent of k_H but proportional to U_0 squared when $k_H U_0 / \omega > 1$.

It is confirmed that the formulated parameterization predicts the vertical distribution of ε in agreement with that obtained from the eikonal calculation for the *internal tidal wave* or the *quasi-steady internal lee wave* propagating from the ocean bottom up into the background GM internal wave field (Iwamae et al., 2009; Hibiya et al., 2017).

Development of CTD-attached microstructure measurements and basin-scale turbulence distribution in the North Pacific

*Ichiro Yasuda[1], Yasutaka Goto[2], Maki Nagasawa[1], Koenjong Lee[1], Toshiya Nakano[2], Shinya Kouketsu[3]

1. Atmosphere and Ocean Research Institute, The University of Tokyo, 2. Japan Meterolorogical Agency, 3. Japan Agency of Marine-Earth Science and Technology

A new efficient microstructure measurement with fast-response thermistors attached to CTD as common ship-based observational platforms were elaborated. This revealed cross-Pacific top-bottom turbulence distributions. Vertical distribution of turbulent energy dissipation is found to be proportional with local squared buoyancy frequency N^2(representing density vertical gradient) and local internal tide energy generation and dissipation, indicating that main part of energy dissipation of tide-induced turbulence occurs in the main thermocline. These contribute to revising models of tide-induced three-dimensional distribution used in ocean/climate models, which will contribute to reproducing ocean meridional overturning circulation and oceanic heat/material circulation.

The deep Pacific meridional overturning circulation simulated by a low-resolution ocean model

*Takao Kawasaki[1], Hiroyasu Hasumi[1]

1. Atmosphere and Ocean Research Insitutute, the University of Tokyo

The deep Pacific meridional overturning circulation (PMOC) is composed by the northward transport of deep water originated from the Southern Ocean and upwelling of deep water. Tidal mixing is an important process for maintenance of the upwelling of deep water. Several previous modeling studies suggested that geothermal heating at the sea floor also has a significant impact on the strength of deep PMOC. Many previous modeling studies employed distributions of the tidal mixing enhanced near the ocean bottom (local mixing). A previous modeling study suggested that tidally-induced mixing far from the ocean bottom (remote mixing) significantly influences the strength and structure of PMOC. It is pointed out that the mixing energy depends on the ocean stratification by microscale vertical temperature profiles. In this study, we try to reproduce the PMOC by using the distribution of remote mixing based on the recent observation and geothermal heating.

The model employed in this study is an ocean general circulation model (COCO). Its horizontal grid size is 1 degree (non-eddy-resolving model). The horizontal distributions of local and remote tidal mixing energies are estimated by a tide model. The local mixing energy is enhanced near the bottom and decayed with height. The vertical profile of remote mixing depends on the ocean stratification, which is suggested by many observational and theoretical studies. The heating of bottom water is added based on the horizontal map of geothermal heating.
The strength of deep PMOC is increased by using the stratification-dependent tidal energy of the remote mixing. The geothermal heating also significantly enhances the deep PMOC. The northward volume transport of deep water originated from the Southern Ocean is smaller than an observational estimate by the one-time 17-month moorings. We additionally calculated the isotope ratio of radiocarbon (seawater age) for validation of the strength of the modeled PMOC. When both remote mixing and geothermal heating are applied, the age of seawater in the deep Pacific Ocean is consistent with observation.

The Role of Mixing and Geothermal Heating in Altering AABW and NADW Pathways

*Qianjiang Xing[1], Stephanie Downes[1], Kate Snow[2]

1. IMAS, Univ of Tasmania, AU, 2. School of GeoSciences, Univ of Edinburgh, UK

Antarctic Bottom Water (AABW) and North Atlantic Deep Water (NADW) constitute the deep Meridional Overturning Circulation (MOC). Surface mechanisms such as wind forcing, heat and freshwater fluxes have been identified as drivers of the deep-water mass formation. However, the interior drivers help transport NADW and AABW across ocean basins. Using sensitivity experiments in an Atlantic sector model, we diagnosed the influence of two poorly understood interior drivers on AABW and NADW, namely geothermal heating and vertical mixing, both as individual drivers and combined. We found that both enhanced mixing and geothermal heating increased the temperature and decreased the density of AABW and NADW. The meridional overturning circulation of NADW changed minimally (less than 3%) in all perturbations, while enhanced mixing and geothermal heating individually strengthened the AABW cell by 31.6% and 26.3%, respectively. The combined effect of the two mechanisms prompted a decrease in the MOC of the AABW cell by 21.1%. A diagnostic of Water Mass Transformation was applied to quantify the all transformations between water masses over time. The total transformation between AABW and NADW in the perturbations were estimated to be strengthened in the Atlantic sector model due to enhanced mixing and geothermal heating except a weakening water mass transformation from NADW into AABW posed by mixing and geothermal heating combined effect in the basin of south of 30S. The largest water mass transformation changes occurred in the Southern Ocean, where deep ocean property changes were remarkable throughout the water column.

Longterm changes in heat content, salinity and stratification over the Pacific Arctic and Subarctic continental shelves

*Seth L Danielson[1]

1. University of Alaska Fairbanks

The recent century of increasing North Pacific marine temperatures culminated with a still ongoing multi-year marine heat wave over the Bering and Chukchi continental shelves. Relative to the modern observational record, 2014-2018 is characterized by anomalously elevated heat contents and temperatures, advanced spring sea ice retreat, delayed winter sea ice onset, and shifts in the timing and location of sea ice melt. To provide oceanic context to the satellite-derived sea ice concentration record, we construct a simple heat budget for the Chukchi shelf using atmospheric reanalysis model estimates of ocean-air heat fluxes (ECMWF ERA-Interim), lateral advection northward into the Arctic through Bering Strait, and in situ hydrographic profiles. We construct a new CTD climatology for the region, using a compilation of over 10^5 hydrographic profiles collected between 1950 and the present. Sea surface temperature analysis shows that 2014 was a transition year into a series of consecutive years for which the mean surface temperature exceeds 2 standard deviations from the longterm mean. Subsurface temperatures also exhibit steadily increasing temperatures over 2014 to 2018. Relative to 1979 to 2013, the most recent five years exhibits an acceleration of the Chukchi shelf heat engine: absorbing more incoming solar radiation in the spring and losing more latent and sensible heat to the atmosphere in the fall. On an annual basis the Chukchi shelf’ s rate of heat loss has modestly increased, but the Bering shelf is losing less heat to the atmosphere on an annual basis. However, the modeled heat flux changes are not temporally uniform over the course of the year and the anomalies exhibit spatial structure that is closely linked to the location of the sea ice cover. Our estimates suggest that the delivery of Pacific origin heat to the Arctic basin has appreciably increased in recent years. The analyses highlight the importance of the oceanic heat capacity, the heat loss rates of the cooling fall and winter, ice thickness, and tightly coupled positive feedbacks in heat exchanges between the ocean, ice and atmosphere. Understanding the new hydrograhic status quo is important for anticipating future physical and biological conditions on the Bering-Chukchi shelves. To the extent that ecosystem structure may be disrupted by altered seasonality, specie distributions, metabolic rates, and trophic exchange transfer efficiencies, we can use this work to better understand how the changing thermal environment may trigger a cascade of nonlinear reactions by the region’ s sympagic, pelagic and benthic communities.

Important roles of marginal seas and intermediate water for micro- and macro-nutrients circulation in the North Pacific

*Jun Nishioka[1], Hajime Obata[2], Hiroshi Ogawa[2], Ichiro Yasuda[2]

1. Hokkaido University, Institute of low temperature sciences, 2. The University of Tokyo, Atmosphere and Ocean research institute

The North Pacific is recognized as an end of the deep ocean conveyor belt circulation, and has been vaguely perceived as a place where deep high nutrient water rises to the surface. Details of the mechanism by which macro-nutrients are supplied from the deep layer to the surface layer, however, have not been properly described. Additionally, basin-scale micro-nutrient (iron) supply process for controlling biological production in this high nutrient region is still not completely understood. Here we report basin scale micro- and macro-nutrients circulation in the North Pacific. We compiled observed dissolved iron and nutrients dataset with other water properties in the North Pacific, as well as in the marginal seas and around the island chains. Judging from the isopycnal analysis of the dataset, a zonal gradient of dissolved iron concentration in the subarctic Pacific is constructed by iron rich water propagating from the Okhotsk Sea intermediate waters to the wide area of the upper-intermediate waters on the western North Pacific. While, high macro-nutrient water is discharged from the Bering Sea and spread in wide density range of the intermediate layer of the whole subarctic area. Two to three orders higher upward turbulent fluxes of the macro-nutrients were observed around the marginal sea islands chains, indicating that a part of macro-nutrients are supplied to surface and are returned and pooled to the intermediate layer through the biological production and microbial degradation of organic substances. These results highlighted an important roles of the marginal seas and the intermediate water for circulating micro- and macro-nutrients at the end of ocean conveyor belt.

An insight into chemical speciation of dissolved iron in the intermediate water of the North Pacific

*Youhei Yamashita[1], Jun Nishioka[2], Hajime Obata[3], Hiroshi Ogawa[3]

1. Faculty of Environmental Earth Science, Hokkaido University, 2. Institute of Low Temperature Science, Hokkaido University, 3. Atmosphere and Ocean Research Institute, The University of Tokyo

Iron has known to be one of the important factors controlling phytoplankton growth and nitrogen fixation by diazotrophs in large areas of the open ocean. Iron is less soluble in oxic seawater, therefore, external inputs of iron, which are spatially and/or temporally sporadic, regulate ocean primary productivity. The stability of iron in seawater, which is mainly controlled by organic ligands, is a contributing factor to its long-distance transport from external point sources to remote areas. Siderophores, saccharides, and humic substances have been considered to be probable iron-binding organic ligands in marine environments. Among these, bio-refractory humic substances can be the more important iron carriers in the intermediate waters, because siderophores and saccharides have known to be easily degradable by microbes.

Although sedimentary iron from continental margins has been considered to have a strong impact on iron distribution in the open ocean. In the North Pacific, it has been pointed out that sedimentary iron from the shelf region of the Sea of Okhotsk is widely distributed via circulation of the dense shelf water, the Okhotsk Sea Intermediate Water, the North Pacific Intermediate Water. However, the chemical species of iron contributing long-distance transport by the circulation of intermediate waters have not been clarified.

We determined a transect of concentration of dissolved iron together with levels of humic-like fluorescent dissolved organic matter, as a tracer of iron species, from the Sea of Okhotsk to the subtropical gyre of the western North Pacific. In this presentation, we will discuss possible chemical species of dissolved iron contributing to long-distance transport through the circulation of intermediate waters in the North Pacific.

Change in lower trophic level ecosystem and its complex mechanism in the North Pacific

Naomi Harada[1], Fujiki Tetsuichi[1], *Maki Noguchi Aita[1], Makio Honda[1], Minoru Kitamura[1], Takuhei Shiozaki[1], Yoshihisa Mino[3], Akira Kuwata[2], Kazuaki Tadokoro[2], Osamu Seki[4], Megumi Chikamoto[5]

International Pacific Research Center, University of Hawaii at Manoa

The principal aims of this study is to understand how primary and secondary producers response on the several potential nutrient supply processes associated with physical mechanisms such as atmospheric dynamics, vertical mixing and ocean current in the western North Pacific where is the most active biological drawdown area of sea surface pCO_2 in the world. Here we present the latest three results:

1) Mechanism of spring bloom of major phytoplankton, diatoms in the Oyashio region

The pelagic Oyashio region, western North Pacific is one of the world’s richest fishing ground. Massive diatom blooms occur extensively every spring in this region, suggesting that these blooms could support high biological productivity in this region. For spring blooming of diatoms in this region, two processes; supply of sufficient nutrients (including N, P, Si and Fe) and seeding of active diatom cells have been recognized to be essential. We have elucidated mechanism of the spring diatom blooms in the Oyashio region, focusing on seeding and growth processes of blooming diatoms. We examined conditions of spring diatom blooms and population dynamics of key diatom species in this area by analysis of long-term monitoring data of physico-chemical parmaters and diatom communities along a transect known as the “A-line” in the Oyashio off the southeast coast of Hokkaido, Japan.

2) Seasonal variation in eukaryotic phytoplankton from surface to the abyssopelagic zone

Eukaryotic phytoplankton is also important primary producer. Recent molecular techniques have revealed highly diverse species, but little is known about their dynamics. We examined size-fractionated eukaryotic phytoplankton communities by a 18S rRNA gene sequencing analysis from surface to abyssopelagic zone throughout one year at St. S1 (30°N, 145°E). The spring bloom was triggered not only by autochtonous community but also by phytoplankton delivered from outside regions. The allochthonous phytoplankton included many coastal origin taxa, and would significantly contribute to the biological pump at St.S1. Furthermore, our results show the taxa which efficiently export to deep waters in addition to well-known taxa having the “ballasting effect” such as coccolithophores and diatoms. Of particular interest is Prasinophytes putative *Pseudoscourfieldia marina*, *Ostreococcus*, *Micromonas*, and *Bathycoccus*, which sank to the abyssopelagic zone when they bloomed. Our molecular survey unveiled that the previously-overlooked species would significantly contribute to the subtropical biogeochemical cycles.

3) Sinking velocities of particles in the subarctic and subtropical regions of the western North Pacific Organic compounds produced by phytoplankton bloom settle into deeper layer as sinking particles. We have investigated the sinking velocities of particles to understand how biogeochemical cycle works after the production in the surface. Sinking particles were collected by drifting sediment traps at 100-200 m at

©2019. Japan Geoscience Union. All Right Reserved.

two observation sites K2 (47°N, 160°E) and S1 and were fractionated in 5 ranges of sinking velocities between 5 and 1000 m d^{-1} using an elutriation system. The averaged sinking velocities (w_{POC}) calculated from the velocity distributions of POC were faster at S1. For S1 particles, a positive correlation was found between w_{POC} and $CaCO_3$ content. This indicates that particles containing large amounts of denser $CaCO_3$ sink faster than those containing large amounts of organic matter with low densities. Particles at K2, mainly composed of opal and organic matter, did not exhibit a clear relationship between w_{POC} and the denser opal. Instead, w_{POC} had a positive correlation with $\delta^{15}N$ of the sinking particles and was small (large) when the surface layer was stratified (well-mixed). These results implied that the upper water stability/mixing would influence the growth/fragmentation of aggregates as well as chemical composition of them, thereby affecting w_{POC}.

Department of Earth System Science, University of California at Irvine

Iron is an essential micronutrient for the marine phytoplankton growth. The deficiency of iron limits the primary productivity in the subarctic North Pacific, and also controls the production of nitrogen fixers in the subtropical region. Therefore, the understanding of iron cycle is key to understand biogeochemical cycling in the whole North Pacific. In this study, we used a regional ocean model (ROMS) coupled with a marine biogeochemical cycle model (BEC) configured to a quarter degree horizontal resolution to investigate iron cycle in the North Pacific. The model showed that iron supplied from shelf sediments are extensively distributed through the intermediate layer, and the transport is supported by adsorption/aggregation to and desorption/disaggregation from slowly sinking particles that prolongs residence time of iron in seawater. It is suggested that the iron supplied from shelf sediments of the Okhotsk and Bering Seas are exported to the Pacific Ocean, implying the biogeochemical linkage between the marginal seas and the ocean basin. Iron distributed in the intermediate layer is supplied to the surface water through diapycnal mixing around the Straits connecting the marginal seas. We will present the importance of the diapycnal mixing on primary productivity in the western subarctic region from the results of iron budget analysis.

Influence of tide on the growth and migration of walleye pollock (*Gadus chalcogrammus*) in the Oyashio region

*Shin-ichi Ito[1], Zi-jian Wang[1], Hatsumi Nishikawa[3], Humio Mitsudera[3], Mitsuhiro Ishino[2]

1. Atmosphere and Ocean Research Institute, The University of Tokyo, 2. Fisheries Research and Education Agency Japan, 3. Hokkaido University

A bioenergetics model of walleye pollock (*Gadus chalcogrammus*) coupled with a lower trophic level nutrient-phytoplankton-zooplankton model was developed to investigate environmental effects on the pollock growth in the Oyashio region. The bioenegertics model was coupled to was coupled to a migration model of pollock based on the environments calculated by an ocean general circulation model (CCSR (Center for Climate System Research) Ocean Component Model: COCO) coupled to a simple nutrient cycle model. In the growth-migration model, two physical environment conditions (with and without tidal forcing) were applied to investigate the tidal effects on the growth and migration of pollock. With tidal effect, warm water supply through the Tsugaru Strait to the southwestern coast of Hokkaido increased and a strong temperature front was formed along the southwestern coast of Hokkaido. Coastal current associated with the temperature front advected the pollock larvae to the Cape Erimo and pollock successfully settled to the bottom layer. Comparing the result without tidal forcing, tide potentially provide optimal temperature condition for growth and higher possibility to settle near coast. On the contrary, tide potentially provide lower nutrient supply with increasing nutrient poor water through the Tsugaru Strait. Therefore, the pollock growth itself did not change between with and without tidal forcing.

What can horizontal stirring tell us about vertical mixing?

*Sylvia T Cole[1]

1. Woods Hole Oceanographic Institution

Basin-scale tracer distributions are influenced by horizontal stirring and eddy diffusivity. Eddy diffusivity estimated from Argo temperature and salinity profiles together with ECCO-2 eddy kinetic energy has been updated to include additional years of data, finer horizontal resolution, and a formal error estimate. Assumptions related to vertical mixing inherent in the method for estimating eddy diffusivity are tested. Near the surface, thermohaline structure is influenced by the atmosphere more so than either horizontal stirring or vertical mixing. Locally, vertical mixing is responsible for setting thermohaline structure where large-scale horizontal gradients are weak. The equatorial regions are particularly influenced by these imprints of vertical mixing. Implications for ocean dynamics and numerical modeling are discussed.

Acoustic remote sensing of ocean mixing

*Tetjana Ross[1], Andone Lavery[2], Doris Leong[3], Rolf Lueck[4]

1. Institute Of Ocean Sciences, Fisheries and Oceans Canada, 2. Woods Hole Oceanographic Institution, 3. British Columbia Ministry of Forests, Lands, Natural Resource Operations and Rural Development, 4. Rockland Scientific International

Based on data collected in a number of environments, from coastal fjords to the north Atlantic, from the laboratory to Antarctica, we present evidence for sound scattering from turbulent and double diffusive microstructure in the ocean. We discuss the advantages of using acoustics to observe ocean mixing (i.e. inexpensive, fast and remote). We also discuss the limitations (e.g. ambiguity in source of scattering) and some methods for dealing with it. We illustrate how one of these ambiguities can even be turned into a strength for observing zooplankton in turbulence, through the use of broadband acoustics.

Assessment of the effectiveness of the global ocean state estimation using tide-induced mixing parameterizations

*Satoshi Osafune[1], Shuhei Masuda[1], Nozomi Sugiura[1], Doi Toshimasa[1], Tadashi Hemmi[1]

1. JAMSTEC

Recent data synthesis experiments showed that adjusting mixing coefficients through data assimilation approach is a promising way to reduce a global misfit between a model simulation and ocean observations, while mixing coefficients should satisfy constraints from energetics. Aiming for a data synthesis experiment that is energetically consistent with the known constraint on the ocean energy budget and can assimilate turbulence observation data, we have developed a new quasi-global four-dimensional variational dataassimilation system using two parameterizations for tidally induced vertical mixing. As a preliminary preparation of the synthesis experiment, we optimally estimated their parameters along with other physical parameters based on the Green’ s function method. The simulation using the optimal parameters well reproduces temperature and salinity in the deep Pacific Ocean. Using this simulation as the first guess field, we are conducting a long-term data synthesis experiment. We will present some preliminary results of the synthesis experiment to assess the effectiveness of our new system.

Keywords: vertical mixing, tide, data assimilation

Energetics of Eddy-Mean Flow Interactions in Western Boundary Currents: The Kuroshio and the Gulf Stream

*Enrique N Curchitser[1], Dujuan Kang[1], Xiaomei Yan[2]

1. Rutgers University New Brunswick, 2. Institute of Oceanology, Chinese Academy of Sciences

Mesoscale eddies are most energetic along Western Boundary Currents, such as the Gulf Stream in the North Atlantic and the Kuroshio in the North Pacific. A better understanding of the eddy dynamics and variability is essential for prediction of ocean states and evaluating the ocean contributions to the climate system and interactions with the ecosystem. We derive a full set of eddy energetics analysis framework that provides quantitative description of the energy sources, sinks, and exchanges among different energy reservoirs. We perform detailed energetics analysis of the Kuroshio eddies using the OFES quasi-global ocean simulation and compare it to high-resolution simulations of the Gulf Stream region. Through the combination of theoretical and numerical analysis, we investigate eddies' generation, spatio-temporal variability and the underlying dynamics in these two eddy-prominent Western Boundary Current regions.

In order to understand the vertical mixing processes in the Kuroshio, we carried out field observations in the Luzon Strait, east of Taiwan, outer shelf region of the East China Sea, and Tokara Strait in the past several years. The strong vertical mixing mainly due to interaction between the Kuroshio and seamounts were found in the areas east of Taiwan and Tokara Strait, while that mainly due to internal tides was found in the Luzon Strait and outer shelf region of the East China Sea. The nitrate flux associated with the strong vertical mixing in the Kuroshio was estimated using simultaneously measured nitrate concentration and vertical eddy diffusivity coefficient. The influences of vertically supplied nitrate on the phytoplankton and zooplankton were examined by field observations and laboratory experiments. In addition to the vertical mixing, the supply of nutrients from coastal waters was also observed and that due to horizontal and vertical advections were also diagnosed from results of a numerical model for a purpose of fully understanding on the nutrient dynamics along the Kuroshio.

Very strong turbulent mixing over 30-km and 200-m lateral and vertical scales in the Kuroshio near the continental slope in Hyuganada Sea

*Takeyoshi Nagai[1], Silvana Duran[2], Diego Otero[2], Yasutaka Mori[1], Naoki Yoshie[3], Kazuki Ohgi[3], Daisuke Hasegawa[4], Ayako Nishina[5], Toru Kobari[5]

1. Department of Ocean Sciences, Tokyo University of Marine Science and Technology, 2. Facultad de Pesquería, Universidad Nacional Agraria La Molina, Peru, 3. Center for Marine Environmental Studies, Ehime University, 4. Tohoku National Fisheries Research Institute, Japan Fisheries Research and Education Agency, 5. Faculty of Fisheries Kagoshima University

The Kuroshio carries nutrients in its subsurface layer as a nutrient stream, which flows along the southern coast of Japan. The nutrients in the dark subsurface layers of the Kuroshio, however, are not available for phytoplankton unless they are supplied through diapycnal mixing processes and/or adiabatic upwelling to sunlit surface layers. It has been unclear whether and how these nutrients are supplied to euphotic zone on the continental shelves. In this study, using a state-of-the-art tow-yo microstructure profiler, it is shown that the very strong turbulence occurs over a scale of 30-km and 200-m along lateral and vertical direction, respectively, near the Kuroshio, which flows on the continental slope in Hyuganada Sea, southeast of Kyushu. The observed turbulent kinetic energy dissipation rates are O(10^{-7} Wkg^{-1}) near the Kuroshio over a distance of 30-km, which corresponds to O(10^{-3} m^2s^{-1}) of eddy diffusivity. Turbidity data suggest that this strong turbulence at the shelf edge provides sediment resuspension from the bottom to 50 m depth. Nitrate diffusive flux is estimated as large as 1-10 mmol N m^2day^{-1} at the base of euphotic zone.

Correction method of fast-response thermistors data to estimate turbulence intensity

*kimura shino[1], Yasutaka Goto[2], Koenjong Lee[1], Ichiro Yasuda[1]

1. The Univercity of Tokyo, 2. Meteorological Agency

Fast-response thermistors (FP07) can be used to estimate turbulent energy dissipation rate ε and temperature dissipation rate χ. However, correction is necessary because the insufficient response of FP07 causes underestimate for relatively strong turbulence and individual FP07 sensors have different response. In this study, using simultaneously observed shear probe and FP07 data from a free fall microstructure profiler descending at the speed of 0.6-0.7 m/s, ε_T from various FP07 are compered with ε_S from shear probe to estimate how much correction is necessary for FP07 data. For 3 (7) msec time constant of FP07 for double-pole (single-pole) correction, ε_T is consistent with ε_S within a factor of 3 in the range of ε_S =10^-10 ~10^-7 W/kg. In the presentation we also discuss the impact of correction on χ and the validity of ε_T under double diffusion.

Observation of turbulent mixing using a deep float with microstructure sensors

*Shuo Zhai[1], Ichiro Yasuda[1], Masaaki Kikuchi[1], Yasutaka Goto[1], Koenjong Lee[1], Takahiro Tanaka[2], Ken Yamaki[3], Yutaka Imamura[4]

1. Atmosphere and Ocean Research Institute, The University of Tokyo, 2. Japan Fisheries Research Agency, 3. TSK Tsurumi-Seiki Co., Ltd., 4. Aomori Prefectural Industrial Thechnology Research Center, Fisheries Research Insititute

Automated microstructure obsevation method using a deep float (DeepNINJA) with velocity shear probe and fast-response thermistor is being elaborated. From the field test observation in August 2016, availability of shear probe data was tested by comparing turbulent dissipation rates from thermistor. Shear probe data were found to be worse by vibration from motor operartions at buoyancy adjustment and by noise at slow ascending speed of the float. Vertical profiles of turbulent energy dissipation rate could be obtained with the hybrid use of shear probe and thermistor data by correcting time-constant of the termistor with reliable shear probe data and filling gaps of unavailable shear probe data. Data will be reported for the deep float which was deployed on December 12, 2018, in the western slope of Japan Trench off Aomori. The float is observing 0 - 4000 m turbulence profile every 10 days and will be recovered in April R/V Shinsei-maru cruise.

Evaluation of the underwater glider flight model using the electromagnetic current sensor

*Takahiro Tanaka[1], Daisuke Hasegawa[1], Takeshi Okunishi[1], Ichiro Yasuda[2]

1. Tohoku National Fisheries Research Institute, Japan Fisheries Research and Education Agency, 2. Atmosphere and Ocean Research Institute, University of Tokyo

Turbulence measurement by underwater gliders has become more common in recent years. For the accurate estimation of energy dissipation rates, the accurate measurement of the fall rate and gliding path angle is necessary. The gliding path angle should take the angle of attack (AOA) into account, which is the difference between the gliding path angle and the pitch angle. AOA calculation has been done by using the so-called flight model assuming dynamical force balance in the quasi-steady state. Due to the difficulty in measuring AOA directly, the validity of AOA derived from the flight model and the flight model itself has not been adequately evaluated so far. In this study, we put the electromagnetic current sensor (EM sensor) on the turbulence package to obtain AOA directly and to compare the AOA from EM sensor with that from the flight model. Using the dataset obtained by a Slocum glider in Jul. - Aug. 2017, we found that AOA from the EM sensor during descent and ascent has a mean (standard deviation) of 0.7 (1.2) deg. and -0.7 (1.1) deg., respectively, while AOA from the flight model is 4.9 (0.4) deg. and -4.5 (0.5) deg., respectively. In order to know what cause this difference, we discuss the validity of parameters given in the flight model. It is suggested that a drag coefficient due to parasite drag given in the flight model may be somewhat larger than that calculated using the EM sensor.

Mixing processes observed by a slocum glider at the Oyashio-TWC front

*Daisuke Hasegawa[1], Takahiro Tanaka[1], Takeshi Okunishi[1], Ichiro Yasuda[2]

1. Tohoku National Fisheries Research Institute, Japan Fisheries Research and Education Agency, 2. Atmosphere and Ocean Research Institute, The University of Tokyo

In order to grasp the detailed mixing processes along the frontal region between the Oyashio and the Tsugaru Warm Current (TWC), we conducted a zigzag survey crossing the front several times from the merging region of the two current systems to the down stream by an underwater glider (Slocum G2 Glider) equipped with a turbulence sensor, from July 24thto August 29thin 2017. The observed frontal structure indicated the subduction and the intrusion processes of the cold and fresh Oyashio water under the warm and salty TWC water, along layer between 26.5 to 26.8 sigma-theta, which resulted the favorable conditions to the salt finger convection at the upper interface along the 26.5 sigma-theta, and the diffusive convection at the lower interface along the 26.8 sigma-theta where the fresh and cold Oyashio water lying above the warm and salty water. The strong turbulence intensity is observed around the intruded layer, and the mean temperature and the salinity in the layer became warmer and saltier with the increase of the distance from the front, which suggested the time evolution of the vertical mixing driven by double diffusive convections between the three different water masses. Though the strongest turbulence intensity was observed around the frontal region, which may suggest the importance of the cabbeling effect as the additional source of the turbulent mixing.

Keywords: double diffusion, mixing, cabbeling

Impact of the astronomical lunar 18.6-yr tidal cycle on El-Niño and Southern Oscillation

*Ichiro Yasuda[1]

1. Atmosphere and Ocean Research Institute, The University of Tokyo

Even though El-Niño and Southern Oscillation (ENSO) has a tremendous impact on global climate and society, its long-term forecast remains difficult. In this study, we discovered a statistically significant relationship between ENSO timing and the 18.6-year period lunar tidal cycle in the mature-phase (December –February) ENSO time-series during 1867–2015 and extending back to 1706 with proxy data. It was found that El-Niño tended to occur in the 1st, 10th, and 13th years after the maximum diurnal tide in the 18.6-yr cycle, and La-Niña tended to occur in the 3rd, 12th, and 16th years. These tendencies were also confirmed by corresponding sea-surface temperature (SST) and sea-level pressure (SLP) distributions; particularly Pacific SST and SLP spatial patterns in the third La-Niña and the tenth El-Niño year well resemble those of Pacific Decadal Oscillation (PDO). These findings contribute to understanding and forecasting long-term ENSO variability.

The effect of 18.6-year period lunar nodal cycle on Pacific Decadal Oscillation (PDO)

*Masaki Hamamoto[1], Ichiro Yasuda[1]

1. Atmosphere and Ocean Research Institute, The University of Tokyo

Pacific Decadal Oscillation (PDO) is the most dominant decadal-inter-decadal ocean-climate variability over the North Pacific; however, the periodicity and cause have not been fully understood. Previous studies suggested that 18.6-year period lunar tidal cycle ($T_{18.6}$) regulate bi-decadal PDO variability through changes in the strength of diapycnal mixing of ocean around the Kuril Islands to result in ocean variability, together with air-sea interactions in the mid-latitude North Pacific and/or equatorial Pacific. In the present study, 297yr-long reconstructed PDO timeseries was re-examined, and 27.9yr (3/2 times 18.6-yr, henceforth, $T_{27.9}$) period variability was significantly detected, and the zero-crossing from minus to plus was found to occur simultaneously with $T_{18.6}$ variability in the interval of 55.4 years (3 times $T_{18.6}$). In the PDO spectrum, a broad multi-decadal 50-80-yr peak (corresponding to 3-5 times $T_{18.6}$, henceforth T_M) was also detected with the zero-crossing synchronized with $T_{18.6}$; this is the extension of previous studies during 1900-2000 back to 1700s on the synchronous changes of bi-decadal and penta-decadal variabilities. These $T_{18.6}$, $T_{27.9}$ and T_M explain 71% of the 10-year low-passed PDO variability. These imply that the 27.9-yr and the multi-decadal variabilities could be related to $T_{18.6}$ tide-induced variability, and may be excited by $T_{18.6}$ tidal forcing, considering that external periodic forcing for delayed oscillator models could excite 3 times period of the external forcing and some non-linear processes may make the half-period variability.

Keywords: 18.6-year period lunar nodal cycle, Pacific Decadal Oscillation

A comparison of ocean deoxygenation between CMIP5 models and an observational dataset

*Yumi Abe[1], Shoshiro Minobe[1,5], Takamitsu Ito[2], Curtis Deutsch[3], Matthew C. Long[4]

1. Department of Natural History Sciences, Graduate School of Science,Hokkaido University, Sapporo, Japan, 2. School of Earth and Atmospheric Sciences, Georgia Institute of Technology, Atlanta, Georgia, USA, 3. School of Oceanography, University of Washington, Seattle, Washington, USA, 4. Climate and Global Dynamics Laboratory, National Center for Atmospheric Research, Boulder, Colorado, USA, 5. Department of Earth and Planetary Sciences, Faculty of Science, Hokkaido University, Sapporo, Japan

Recent studies revealed that the ocean deoxygenation has been accelerating since the 1980s over the global oceans (Schmidtko et al. 2017; Ito et al. 2017), and the observed trend in the last half-century appears to be much larger than the model simulations conducted for CMIP5 (Bopp et al. 2013). This discrepancy is an important issue of the ocean deoxygenation researches as highlighted by a review paper published in the last year (Oschlies et al. 2018).

In order to understand better the relations of oxygen variations between CMIP5 models and observations, we compare oxygen concentration simulated by CMIP5 models and gridded oxygen anomaly dataset used by Ito et al. (2017). For the global oceans, the observed oxygen reduction rate for the historical experiment period appears to be within uncertainty of the models, though this result can be sensitive to the choice of the analysis period associated with the rapid recent oxygen reduction. We also closely examined the two basins that are relatively well sampled, i.e., the North Pacific and the North Atlantic. It is found that the observed North Pacific oxygen reduction is much stronger than the simulated ones, but such a strong reduction of observed oxygen does not occur in the North Atlantic. These results suggest that there are substantial spatio-temporal variations of oxygen concentration on decadal timescales and their mechanism in each basin should be explored in future studies.

Pacific Ocean State Estimation and Clarification of Mechanism of Ocean Circulation by Data Synthesis of Global Observations

*Shuhei Masuda[1]

1. Japan Agency for Marine-Earth Science and Technology

Our aim is to synthesize pre-existing ocean data with newly-acquired turbulence data using state-of-art assimilation technique. Available observations of turbulence strength in the ocean, will be “blended” with pre-existing ocean data applying dynamically self-consistent state estimation approach with 4D-VAR adjoint system. We propose some new techniques and schemes to assimilate turbulence data, which tends to include unique features. The obtained state estimation will provide improved description of ocean circulation, its heat and salt transports, and oceanic ecosystem at lower trophic level.

Impact of Tidal Vertical Mixing to Barotropic Water Exchange between the Sea of Okhotsk and Pacific through Diffusive Adjustment with Turbulent Closure Scheme

*Hung Wei Chou[1], Humio Mitsudera[1], Hatsumi Nishikawa[1], Kaihe Yamazaki[2]

1. Hokkaido University, Institute of Low Temperature Science, 2. Hokkaido University, Graduate School of Environmental Science

The pattern of exchange flow between the Sea of Okhotsk and Pacific is a system composed by an Okhotsk-ward inflow through Kruzenshtern strait in north and a Pacific-ward outflow through Bussol strait in south. One of major theories for explaining the dynamic of water exchange through Kuril Island Chain is the turbulence induced by tidal vertical mixing. Turbulence is an important physical process in geostrophic boundary layer, and because of the complexity of topographic in Kuril island chain, the breaking of internal tides in island coast area leads to increase the thickness of surface mixing layer and causes tilting of isopycnal layer in vicinity. The tilting of isopycnal layer around islands forms a clockwise flow along the shore by geostrophic adjustment. However, above process is majorly broclinicly, and how can it impact to barotropic component is still unknown.

By setting the tidal force as a controlled variable, results from realistic OGCM model COCO show only the case with tidal forcing can consistent with the exchange flow pattern as historical observation (Fig.1). Besides, the vertical diffusivity values also show the magnitude difference in summer time, which the flow in north strait in non-tidal case is opposite to tidal one (Fig.2). Therefore, we designed four experiments for understanding the impact of tidal diffusive adjustment in summer: 1. install vertical diffusivity value generated by tidal case into non-tidal run; 2. install vertical diffusivity value generated by non-tidal case into tidal run; 3. set the vertical diffusivity value as zero in tidal case and 4. in non-tidal case as well. Further, for preventing the underestimates the depth of the mixing layer in Mellor-Yamada turbulence closure scheme, two more experiments with the larger vertical diffusivity mask are applied in both tidal and non-tidal case. After calculating the fraction of baroclinic and barotropic components in either north strait or southern strait, results show the vertical mixing dose influence the strength of volume transported but not the direction as original tidal and non-tidal case shows. Hence, for further understanding the impact of vertical diffusivity, we start a tidal forcing run with non-tidal initial conditions to detect the relationship between the flow direction and magnitiude of vertical diffusivity values by time developing. But the baroclinic result implies that the vertical mixing might not be the main reason to control the flow direction (Fig.3).

This study also implies the tidal impacts in OGCM is not only the vertical mixing, but other geostrophic fluid dynamics might occur, especially the interaction of topography with tidal waves. Therefore, for reproducing the real ocean phenomena, movement of tidal waves should be considered.

Distributions of organic Fe-binding ligands in the eastern and western subarctic North Pacific

*Yoshiko Kondo[1,2], Yudai Sunahara[2], Jun Nishioka[3], Hajime Obata[4], Shigenobu Takeda[1,2]

1. Graduate School of Fisheries and Environmental Sciences, Nagasaki University, 2. Faculty of Fisheries, Nagasaki University, 3. Institute of Low Temperature Science, Hokkaido University, 4. Atmosphere and Ocean Research Institute, The University of Tokyo

Iron (Fe) is well known as a key parameter for primary productivity in the ocean. To understand the distributions and biogeochemical cycle of Fe in the ocean, we need to investigate the sources and sinks of Fe. A recent study has demonstrated a concentration gradient of dissolved Fe in the North Pacific Intermediate Water (NPIW) between western and eastern areas (Nishioka and Obata, 2017), suggesting that Fe-rich intermediate water was transported laterally across the western subarctic gyre. Moreover, it has been demonstrated that most dissolved Fe in seawater is complexed with natural organic ligands. Since bioavailability of Fe in seawater depends on its species, the chemical speciation of Fe is needed to evaluate the nutrient status for phytoplankton. However, the distribution of natural organic ligands has not been revealed yet in the subarctic North Pacific. In this study, vertical distributions of organic Fe-binding ligands were investigated in the eastern and western subarctic North Pacific to clarify its impact on Fe cycle. Seawater samples were obtained through the whole water column during GEOTRACES-Japan cruise KH-17-03 using trace metal clean technique to avoid metal contaminations. Filtered seawater samples (<0.2 μm) for organic Fe-binding ligands analysis were collected in acid-washed bottles inside a laminar-flow clean booth, then they were stored at -20°C until just before analysis. The organic Fe-binding ligands' concentration and their conditional stability constants were determined by competitive ligand equilibration-adsorptive cathodic stripping voltammetry (CLE-ACSV) method using salicylaldoxime (Abualhaija and van den Berg, 2014). The concentration and conditional stability constants of organic ligands ranged from 0.7 nM to 5.9 nM and from $10^{10.1}$ M^{-1} to $10^{12.3}$ M^{-1}, respectively. The concentrations of organic ligands exceeded those of dissolved Fe concentration more than 1 nM in all samples except for the surface (10-m) at the Oyashio-Kuroshio transition zone station; consequently >99% of dissolved Fe was estimated to be complexed with these natural organic ligands. At the western station, high concentrations of organic ligands were observed in the intermediate layers (400 –600 m), which hydrographic data (27.2 σ_θ –27.3 σ_θ) were corresponding to the lower NPIW (Yasuda et al., 2004), suggesting that organic Fe-binding ligands might be transported within the lower NPIW.

Chemical and physical speciation of copper in the subarctic North Pacific

*Kuo Hong Wong[1], Hajime Obata[1], Taejin Kim[2], Yoshiko Kondo[3], Jun Nishioka[4]

1. Atmosphere and Ocean Research Institute, The University of Tokyo, 2. Seoul National University, Korea, 3. Nagasaki University, 4. Institute of Low Temperature Science, Hokkaido University

Organic complexation of Cu in seawater plays a major role in controlling the toxicity and bioavailability of Cu for marine microorganism. In this study, we determined the concentrations of Cu and its organic ligands in the soluble and dissolved phases in the subarctic North Pacific. Samples were taken from three stations in the subarctic NorthPacific, CL-2 (western), CL-5 (central) and CL-16 (eastern), during summer 2017.

Concentrations of total dissolved and soluble Cu ranged from 1.28 nM –4.82 nM, and 0.47 nM –2.75 nM, respectively, in the subarctic North Pacific. At both CL-2 and CL-16, soluble Cu accounted for 30% - 100% of total dissolved Cu. The proportion of the soluble Cu fraction was low in surface waters, increased a maximum in the intermediate waters, and decreased slightly in deep waters. Two classes of organic ligands were detected in the surface and intermediate waters of CL-5 and CL-16, and in the intermediate waters of CL-2. In all other depths, only one class of ligand was detected. Concentrations of the stronger ligand (L_1) and weaker ligand (L_2) ranged from 1.02 nM –2.95 nM, and 0.77 nM –8.78 nM, respectively. The distributions of L_1 followed closely that of total dissolved Cu in the surface waters, and no clear trend was observed in the intermediate waters. At CL-2, L_1 mainly existed in the soluble phase, whereas for CL-16, soluble L_1 accounted for 50% - 100% of total dissolved L_1. Concentrations of L_2 were relatively constant throughout the water column but elevated concentrations were detected in the surface waters of CL-5 and in the surface and intermediate waters of CL-16. On the other hand, there were a slight depletion of L_2 in the intermediate waters of CL-2.

Latitudinal and temporal variations in phytoplankton size structure within mesoscale eddies from space

*Hisatomo Waga[1], Toru Hirawake[1], Ueno Hiromichi[1]

1. Hokkaido University

Phytoplankton plays a critical role in a number of key ocean processes. One of the most important functions of phytoplankton is to determine the energy transfer efficiency in marine ecosystems. Although the energy flow from the base of the food web to higher trophic levels depends on both the biomass and size structure of phytoplankton community, phytoplankton size structure is particularly important because energy flow in marine pelagic food webs is largely based on size specific predator-prey relationships. Therefore, spatiotemporal dynamics in size structure of phytoplankton community can trigger changes in the ecosystem’ s functioning through trophic cascade effects in the trophic chain. With the development of remote sensing techniques, mesoscale eddies, nearly ubiquitous features of the World Ocean, has been recognizing as important feature for the distribution of phytoplankton not only the direct transport of phytoplankton and eddy trapping, but also the vertical flux of nutrients. Recent studies have examined regional variations in the influence of mesoscale eddies on phytoplankton community. Namely, phytoplankton production is enhanced in cyclonic eddies (CEs) than that of anticyclonic eddies (ACEs) because of upwelling inside the eddy; this view, on the other hand, does not hold for a substantial portion of eddies within oceanic subtropical gyres, the largest ecosystems in the ocean. However, previous efforts have focused mainly on variations in chl*a*, whereas quite a few studies have worked on that in the size structure of phytoplankton community because remote estimations of phytoplankton size structure are newly established techniques during the last decade. Here we improved a chl*a* size distribution (CSD) model which estimates the synoptic size structure of phytoplankton community, to assess the impact of mesoscale eddies on spatiotemporal variations in phytoplankton size structure. Original CSD model was based on the spectral features of the phytoplankton absorption coefficient ($a_{ph}(\lambda)$), which estimation accuracy becomes poor in areas of the low productivity, such as subtropical gyres. To avoid this, we used not only $a_{ph}(\lambda)$ but also chl*a* to improve estimation accuracy of the CSD model. The resulting estimation error of the improved CSD model was the median absolute percent difference of 26.0% between the measured and satellite-matched values, and global distribution of the phytoplankton size structure was reliable even in subtropical gyres. The phytoplankton size structure showed a clear latitudinal variation: larger and smaller assemblages in temperate (>30˚S and >30˚N) and low latitudes (30˚S–30˚N) latitudes, respectively. When comparing the phytoplankton size structure within ACEs and CEs, a larger phytoplankton size structure was found in ACEs especially in low latitudes. This result was consistent with a previous report that ACEs are more productive than CEs in subtropical gyres because of winter mixing. In addition, we found increasing trends ($p < 0.05$) in differences between the phytoplankton size structure within ACEs and CEs in low latitudes for the years 2003–2014, suggesting a growing importance of ACEs for phytoplankton and in turn marine ecosystem. Consequently, this study demonstrates significant advantages of satellite remote sensing for biogeochemical and ecological studies.

Structure and impact of the Kuroshio nutrient stream

*Kosei Komatsu[1,2], Yutaka Hiroe[3]

1. Graduate School of Frontier Sciences, The University of Tokyo, 2. Atmosphere and Ocean Research Institute, The University of Tokyo, Kashiwa, Japan, 3. Seikai National Fisheries Research Institute, Japan Fisheries Research and Education Agency, Nagasaki, Japan

Recently the Kuroshio has drawn attention as an important supply route of nutrients in the western North Pacific. However, it is unknown whether nutrient concentrations are enhanced along the jet on isopycnal surfaces, as is the case for the “nutrient stream” along the Gulf Stream. We aim to ascertain the structure of nutrient concentration enhancement along the Kuroshio jet and to estimate the impact of nutrient transport downstream to the Kuroshio-Oyashio interfrontal zone (KOIZ), which is a highly productive region and a major global fishing ground. Recent multiple- transects and retrospective analyses of historic hydrographic data have revealed that the along-jet maximum nitrate concentration appears only in spring on the isopycnal surface $25<\sigma_\theta<26$ in the downstream region of the Kuroshio. The Kuroshio nutrient stream contributes significantly to productivity in the euphotic layer along its downstream trajectory, in conjunction with enhanced vertical turbulence. Analysis of the budget of epipycnal nitrate transport across transects that enclosed the KOIZ suggests that the Kuroshio nutrient stream has a non-negligible potential to significantly impact high productivity in the KOIZ.

Enhanced nutrient supply and biogeochemical impacts induced by internal waves in the oligotrophic northern South China Sea

*Chin-chang Hung[1], Dewang Li[2], Wen-Chen Chou[3], Yung-Yen Shih[1,4], Guan-Yu Chen[1]

1. Department of Oceanography, National Sun Yat Sen University, Kaohsiung, Taiwan, 2. Second Institute of Oceanography, State Oceanic Administration, Hangzhou, PRC, 3. Institute of Marine Environmental Chemistry and Ecology, National Taiwan Ocean University, Taiwan, 4. Department of Applied Science, R.O.C Naval Academy, Kaohsiung, Taiwan

To understand nutrient supply and the biogeochemical response induced by internal waves in the deep basin of the northern South China Sea (NSCS), nitrate, chlorophyll *a* (Chl *a*), particulate organic carbon (POC) fluxes were measured during the passage of large internal waves using drifting sediment traps attached with hydrographic sensors. Results revealed large variations in temperature, nitrate and chlorophyll *a* (Chl *a*) concentrations during and after internal waves, suggesting that cold nutrient-replete waters may be brought to the euphotic zone in the dissipation zone during and after the passage of internal wave packets, resulted in phytoplankton flourished in oligotrophic water. The result reveals that ocean mixing triggered by internal waves in warm water of the NSCS may be important for phytoplankton species composition. Most importantly, POC fluxes (110.9±10.7 mg C m^{-2} d^{-1}) were significantly enhanced after internal waves compared to non-internal wave area (32.6–73.0 mg C m^{-2} d^{-1}) in the NSCS. Such elevated POC fluxes may be induced by downward flourished biogenic particles, particle aggregation or converged particles from mixed layer triggered by internal waves.

Mixing over the eastern ridge in the Luzon Strait caused by high-mode internal waves

*Akie Sakai[1], Tomoharu Senjyu[2], Eisuke Tsutsumi[2], Takeshi Matsuno[2], Takahiro Endo[2], Ichiro Yasuda[3], Daigo Yanagimoto[3]

The Luzon Strait has two parallel ridges running from north to south, which is known to create large amplitude internal tides. To investigate the mixing processes accompanied by the internal tides, we carried out repeated observations with XBT, XCTD, CTD, and ADCP in the cruise of R/V Hakuho-maru KH-17-5, Leg-2, in November 2017 as part of the OMIX project. We obtained 6 cross sections around the eastern ridge between 121° 30’ E and 122° 10’ E along the line of 21° N.

The cross sections showed wavy structures of isopycnals over the ridge, with 4-7 km of horizontal scale and about 50 m of vertical scale. Velocity distributions by the shipboard ADCP showed strong vertical shear over the ridge, suggesting high-mode internal waves. Froude number of the high-mode internal waves exceeds unity around two summits of the ridge during the periods of strong tidal flow. This suggests that the high-mode internal waves stay over the ridge.

Many temperature inversions, especially large inversions ($\theta > 0.05$ °C) were formed near the ridge (figure). Therefore, energy dissipation rate and vertical diffusivity assuming the model of Osborn (1980) were estimated by calculating Thorpe scale from the temperature profiles. Relatively large energy dissipation rate and vertical diffusivity were distributed over the ridge from surface to the bottom, as well as unstable regions of $Ri < 0.25$. These results reflect strong mixing over the ridge due to the high-mode internal waves.

From the Luzon Strait to the Tsushima Strait: Water masses and nutrient transports approached using ^{137}Cs

*Siteng Zhu[1], JING ZHANG[1], Shota Kambayashi[2], Takeshi Matsuno[3], Eisuke Tsutsumi[3], Shigenobu Takeda[4], Seiya Nagao[5], Hiroshi Inoue[5], Hiroshi Ogawa[6], Ichiro Yasuda[6]

1. University of Toyama, 2. Fukushima university, 3. Kyushu university, 4. Nagasaki university, 5. Kanazawa university, 6. The University of Tokyo

More than 95% of the water flowing into the Sea of Japan comes from the Tsushima Strait, and 80% of it is Kuroshio Intimidate Water (KIW), which is rich in nutrients compared with Kuroshio surface Water and Kuroshio Tropical Water. However, there is a lack of direct evidence based on surveys or measurement data. ^{137}Cs in the subtropical mode water (STMW) that originated in the Fukushima Dai-ichi Nuclear Power Plant (FNPP1) accident is an excellent tracer which can be transported from the Kuroshio upstream to the Sea of Japan crossing the shelf edge of the East China Sea (ECS) via the KIW. It is also useful for research on the transport of nutrients from the KIW.

Data and water samples were collected during the Hakuho-Maru KH-17-5 Cruise and the Nagasaki-Maru 464 Cruise in November and July 2017, respectively. Data from the KH-17-5 Cruise was used for the study of the area around the Luzon Strait and those of the Nagasaki-maru 464 Cruise was used for the study of area around the outer shelf region of the East China Sea and the Tsushima Strait. The ^{137}Cs active concentration was analyzed by γ-Ray spectrometry after preconcentration. The turbulence intensity was measured using TurboMAP and VMP2000.

The maximum ^{137}Cs concentration shows the existence of the subtropical mode water (STMW) in the Luzon Strait, the ECS and the Tsushima Strait, respectively, at the similar density (25.2-25.7 kg/m^3), temperature (15-17℃) and salinity (34.60-34.75). Although their depth changes from 400 m in the Luzon Strait to 150 m at the shelf edge of the ECS and 100m in the East Channel of the Tsushima Strait, they can all be identified as the KIW because of the similar density. It is noteworthy that around Luzon Strait, the distribution of ^{137}Cs is influenced by strong vertical mixing. The percentage of nutrients transported to the Sea of Japan by KIW is estimated and this is meaningful to the ecosystem of the Sea of Japan.

Impact of cyclonic eddies and typhoons on biogeochemistry in the oligotrophic ocean based on time-series observation at the western Pacific subtropical station KEO

*Makio Honda[1], Yoshikazu Sasai[1], Eko Siswanto[1], Akira Kuwano-Yoshida[2], Hidenori AIKI[3], Meghan Cronin[4]

1. Japan Agency for Marine-Earth Science and Technology, 2. Disaster Prevention Laboratory, Kyoto University, 3. Nagoya University, 4. NOAA Pacific Marine Environmental Laboratory

In 2014, a sediment trap mooring experiment started adjacent to station Kuroshio Extension Observatory (KEO)' s National Ocean and Atmosphere Administration (NOAA) surface mooring. Two-years long sediment trap data show that biogenic material fluxes at ~ 5000 m increased between late winter (March) and late spring (June). Based on sea surface temperature and upper ocean water temperature profiles, from the NOAA surface buoy, and satellite-based surface chlorophyll-a , this increase was likely due to an increase of ocean productivity in early spring (March) that was supported by nutrients supplied by winter mixing. On the other hand, biogenic material fluxes also increased in October 2014, and between late December 2014 and January 2015 when concentrations of nutrients near the surface typically are low. Sea surface height anomalies and vertical profiles of water temperature in the upper 500 m showed cyclonic eddies passing station KEO and causing upwelling of middle-layer water in late July–early August 2014 and November 2014. It appears that these events supplied nutrients to the upper layer, which then caused ocean productivity in the subsurface layer to temporally increase, resulting in increased deep biogenic material fluxes in autumn and winter. This interpretation of the data is consistent with a simple 3D physical-biological model simulation that shows meso-scale cyclonic eddies can supply nutrient to support new production at KEO. During the 2-year-long sediment trap deployments, several typhoons also passed near station KEO and near-inertial internal waves were observed near the nitracline depth after the typhoons passed. Although turbulent mixing caused by near-inertial internal wave could have possibly supplied nutrient to upper oligotrophic euphotic layer, numerical simulations of the turbulent nutrient supply indicate that enhanced turbulent diffusion across the nutrient concentration gradient did not supply enough nitrate to support the increase in biogenic material flux in autumn.

Island-mass effect on the phytoplankton and zooplankton community in south of Japan

*Kiyotaka Hidaka[1], Kazuaki Tadokoro[1], Hiroomi Miyamoto[1], Tadafumi Ichikawa[1]

1. Japan Fisheries Research and Education Agency

The Izu Ridge brings high plankton production via its island-mass effect, which brings up subsurface nutrients to surface layer. Previous reports on island-mass effect around the ridge have been based on observation in the summer-early autumn and reports in spring, when many small pelagic fish species spawn, are scarce. As the Kuroshio flow through the ridge, island-mass effect on zooplankton, which takes more time to glow than phytoplankton, should be appear in eastern (downstream) area. Thus wider area around the ridge should be examined for the effect on zooplankton. In the present study, we examined island-mass effect of the Izu-Ridge on phytoplankton and zooplankton, based on satellite data and zooplankton data in the broad area south of the Honshu.
The Sea surface chlorophyll concentration (SSChl, MODIS-Aqua) in the area bounded by 135.5-142.0 E and 30.0-37.0 N was examined for the grids with depths of > 500 m. Zooplankton samples were collected by vertical tow (0-150 m) of the NORPAC net with 0.335 mm mesh in the area south of Honshu in February to March of 1963-2017. Samples were fixed in 5% formalin-sea water and copepod biomass was estimated in the laboratory by Bench-top Video Plankton Recorder. The relationships between plankton biomass and distance to the Honshu coast and to the Izu Ridge were examined.
The SSChl declined as distance to the Honshu coast increased. But high SSChl was observed in several areas 150-250 km away to the coast. These areas were mainly located around the Izu Ridge, 32-33.5N, and interpreted as caused by island-mass effect when the Kuroshio flowed in offshore path. The copepod biomass was high around the Honshu coast (<50 km). Stations with high copepod biomass were observed in the 100-200 km north-east (downstream) of the Izu Ridge, but they were located near the Honshu, around the Boso peninsula. Island-mass effect of the Izu-ridge on zooplankton biomass thus cannot be distinguished from the coastal effect and the effect should be examined by rate process (spawning rate and/or growth rate) in species level.

Influence of enhanced deep circulation due to geothermal heat on biogeochemical cycle in the Pacific Ocean

*Shogo Urakawa[1], Hideyuki Nakano[1], Hiroyuki Tsujino[1], Kei Sakamoto[1], Takahiro Toyoda[1], Goro Yamanaka[1]

1. Meteorological Research Institute, Japan Meteorological Agency

There exists heat conduction from the oceanic lithosphere to the abyssal ocean. Its heat flux amounts to about 0.1 W m^{-2} in the global average. It is much smaller than the heat exchange between the atmosphere and ocean in the order of 10 W m^{-2}. However, it is known that this geothermal heat significantly enhances the deep circulation especially in the Pacific Ocean. For example, Adcroft et al. (2001) conduct numerical experiments with/without geothermal heating using an ocean general circulation model and report that constant heat flux at the sea bottom by 0.05 W m^{-2} results in enhancement of the Pacific meridional overturning circulation (PMOC) by 25 %. Other studies also report that the geothermal heat significantly enhances the oceanic deep circulation (e.g., Emile-Geay and Madec, 2009; Urakawa and Hasumi, 2009; Downes et al., 2016). The importance of the geothermal heat seems to be robust from the viewpoint of ocean dynamics but it has not been investigated to what extent the geothermal heat influences the biogeochemical cycle of the ocean. Here, we conduct two numerical experiments with/without the geothermal heat using an ocean general circulation model developed for the CMIP6 and investigate the effect of the geothermal heat on the biogeochemical tracer fields.
The geothermal heating enhances PMOC at 30º S by 17 % in this model, which leads to stronger ventilation in the North Pacific Ocean. This stronger ventilation results in increase of delta ^{14}C by more than 10 per mille, which means younger water masses, at the bottom of the North Pacific. The stronger PMOC also results in higher dissolved oxygen in the abyss especially in the eastern tropical Pacific. The geothermal heat leads to dissolved oxygen increase by more than 10 micro mol L^{-1} there, which corresponds to 10–70 % of hypoxic water in the control experiment without geothermal heating. This oxygenation near the sea bottom affects the oxygen-deficient water in the surface of the eastern tropical Pacific. Its thickness becomes thinner by around 100 m. The geothermal heat also plays an important role in the biogeochemical cycle in the Pacific Ocean.

The Parameterization of the Pressure-Strain Correlations in the Stably or Unstably Stratified Ocean Surface Layer.

*Yusuke Ushijima[1], Yutaka Yoshikawa[1]

1. Graduate School of Science, Kyoto University

Turbulence in the ocean surface layer mixes momentum, heat, and nutrient vertically. It is therefore important for air-sea interaction, phytoplankton blooming, and other oceanic processes (e.g., Roxy et al. 2013; Obata et al. 1996). However, large-scale models such as ocean general circulation models cannot explicitly resolve small-scale turbulence because of their coarse resolution. For this reason, the vertical mixing should be parameterized using the turbulent closure scheme that successfully parameterizes the turbulent mixing. Recently, attention is paid to pressure-strain correlations, which redistribute stress due to fluctuating pressure, in the parameterization scheme used for engineering purposes (Jakilic and Hanjalic 2013). In the present study, therefore, the validity of the pressure-strain correlation parameterization used in the ocean (or atmosphere) (Rotta 1951, Gibson and Launder 1978, Gertski et al. 1992) was examined. To this end, we performed Large-eddy simulations of ocean surface boundary layer to simulate pressure-strain correlations and compared it with parameterized correlations. Here, we focused on the effects of stratification on the correlations, because the stratification is an essential factor in the ocean and atmospheric boundary layers but previous schemes did not include the stratification effects sufficiently. Results show that the parameterizations of the pressure-strain correlations had systematic errors depending on the stability (or stratification). It was also found that the error can be reduced by introducing new parameters related to the stability into the scheme.

Numerical studies on asymmetric responses of the upper ocean to tropical cyclone

*Daiki Okura[1], Yutaka Yoshikawa[1]

1. Graduate School of Science, Kyoto University

Tropical cyclones (TCs) decrease sea surface temperature (SST), and the decreased SST weakens TC intensity. This SST decrease is asymmetric with respect to the TC track, known as “rightward bias”. Preceding numerical studies suggested that this asymmetry may influence on the course of the TC. The interaction between TC and the upper ocean is one of key ingredients for precisely predicting TC's development, and the upper ocean response to TC should also be clarified.
The SST decrease during TC passage is mainly caused by two processes; vertical turbulent mixing and advection (Ekman suction). The rightward bias is associated with the mixing which is more intense on the right side of the TC track due to resonant inertial currents with winds. Magnitude and distribution of SST decrease induced by the mixing should vary with parameters characterizing TC; transition speed U_T, radius of maximum wind R_{max}, the friction velocity U_*, and the Coriolis coefficient f. However, detailed physical processes of the mixing and its dependence on these parameters have not been well quantified, because of lack of in-situ data and complicated processes involved in the mixing.

The present study focuses on the vertical turbulent mixing effects on asymmetric SST response. To this aim, vertically one-dimensional model was used in which the vertical turbulent mixing was parameterized with the Nakanishi-Niino-Mellor-Yamada scheme modified by Kitamura (2010). We considered TC-like wind stress of magnitude U_*^2 at radius R_{max} from the TC center moving with transition speed U_T and investigated the mixing on both sides of TC track at distance *r*. Experiments with several friction velocities U_*, maximum wind radii R_{max}, transition speeds U_T and distances *r* were performed. No surface heat flux was considered for simplicity.
The results showed that the rightward bias of the SST response depended on these parameters. The location of the largest SST decrease moved away from the axis as U_T increased, but it depended less on U_*. The SST decreased more with larger U_* and smaller U_T. These results can be explained by energy flux at the surface. In our model configuration, the energy flux depends on two non-dimensional parameters, U_T/fR_{max} and U_*/U_T, and the energy flux had maximum and turbulent kinetic energy penetrated deeper at larger U_*/U_T and at U_T/fR_{max}~1, suggesting the resonance between wind and the inertial current. The SST decrease corresponded with the energy flux, but it depended largely on U_*/U_T, implying importance of wind forcing duration.
Thus, the asymmetric SST response due to the vertical turbulent mixing can be characterized with U_T/fR_{max} and U_*/U_T. Additional advection effects on the SST response will be discussed at the conference using three-dimensional simulation in which the advection as well as the mixing are fully included.

Influence of the distortion of the internal wave field on estimates of turbulent mixing using fine-scale parameterizations

*Anne Takahashi[1], Toshiyuki Hibiya[1], Alberto C. Naveira Garabato[2]

1. Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo, 2. National Oceanography Centre, University of Southampton

Although the Southern Ocean is one of the turbulent mixing hotspots, we have not yet clarified quantitatively the turbulent mixing processes in this region, where the Antarctic Circumpolar Current (ACC) coexists with near-inertial internal waves generated by wind forcing and internal lee waves radiated by the impingement of eddy flows on topography.

Fine-scale parameterizations, based on the theory of energy cascade from internal waves to turbulence, are most widely used to estimate the turbulent dissipation rate, ε. It has been reported, however, that these fine-scale parameterizations tend to overestimate ε in the ACC (Waterman et al. 2014). Although Takahashi and Hibiya (2019) have suggested that "the distorted fine-scale shear and strain spectra" caused by the existence of eddies trapping near-inertial waves or upward-propagating internal lee waves might be responsible for the overestimates, the problem remains unresolved.

In this study, we use "eikonal" simulations (Henyey et al. 1986), which trace the propagation, refraction and breaking of test waves within a background internal wave field, to assess the evolution of the energy cascade in vertical wavenumber space. Our objective is to examine how the distortion of the vertical wavenumber spectrum affects the performance of fine-scale parameterizations.

In our simulations, in contrast to high vertical wavenumber test waves that are efficiently Doppler-shifted to their breaking limit, low vertical wavenumber test waves are not subject to dissipation processes. In the existing fine-scale parameterizations, however, the energy flux to dissipation scale is estimated using the integrated vertical wavenumber spectral values. This means that, if the range of this integration includes a spectral bump at the low-wavenumber end of the spectrum, the estimated energy flux and hence the resulting ε might be overestimated by these fine-scale parameterizations.

From the simulation results, it is confirmed that fine-scale parameterizations significantly overestimate ε in spectra with a low-wavenumber bump, in particular as the internal wave energy level becomes large and the shear/strain ratio becomes small. These results are supported by the microstructure and fine-structure dataset from the SOFine experiment carried out in the Kerguelen Plateau.

[E] Poster | A (Atmospheric and Hydrospheric Sciences)：A-OS Ocean Sciences & Ocean Environment

Sun. May 26, 2019 5:15 PM - 6:30 PM JST | Sun. May 26, 2019 8:15 AM - 9:30 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_11

[A-OS09] Ocean Mixing Processes: Impact on Biogeochemistry, Climate and Ecosystem

convener:Ichiro Yasuda(Atmosphere and Ocean Research Institute, The University of Tokyo), Toshiyuki Hibiya(Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo), Jun Nishioka(Hokkaido University, Institute of low temperature sciences), Shin-ichi Ito(Atmosphere and Ocean Research Institute, The University of Tokyo)

The interdisciplinary study on ocean diapycnal mixing and its impacts (Ocean Mixing Processes: Impact on Biogeochemistry, Climate and Ecosystem (OMIX) 2015-2020) is opening the integrated sciences from physical, chemical, biological oceanography to climate and fisheries sciences. In this section, results during the four years of OMIX projects and other related presentations are all welcome to be summarized and to facilitate plans of next projects.

Correction method of fast-response thermistors data to estimate turbulence intensity

*kimura shino[1], Yasutaka Goto[2], Koenjong Lee[1], Ichiro Yasuda[1]

1. The Univercity of Tokyo, 2. Meteorological Agency

Fast-response thermistors (FP07) can be used to estimate turbulent energy dissipation rate ε and temperature dissipation rate χ. However, correction is necessary because the insufficient response of FP07 causes underestimate for relatively strong turbulence and individual FP07 sensors have different response. In this study, using simultaneously observed shear probe and FP07 data from a free fall microstructure profiler descending at the speed of 0.6-0.7 m/s, ε_T from various FP07 are compered with ε_S from shear probe to estimate how much correction is necessary for FP07 data. For 3 (7) msec time constant of FP07 for double-pole (single-pole) correction, ε_T is consistent with ε_S within a factor of 3 in the range of ε_S =10^-10 ~10^-7 W/kg. In the presentation we also discuss the impact of correction on χ and the validity of ε_T under double diffusion.

Observation of turbulent mixing using a deep float with microstructure sensors

*Shuo Zhai[1], Ichiro Yasuda[1], Masaaki Kikuchi[1], Yasutaka Goto[1], Koenjong Lee[1], Takahiro Tanaka[2], Ken Yamaki[3], Yutaka Imamura[4]

1. Atmosphere and Ocean Research Institute, The University of Tokyo, 2. Japan Fisheries Research Agency, 3. TSK Tsurumi-Seiki Co., Ltd., 4. Aomori Prefectural Industrial Thechnology Research Center, Fisheries Research Insititute

Automated microstructure obsevation method using a deep float (DeepNINJA) with velocity shear probe and fast-response thermistor is being elaborated. From the field test observation in August 2016, availability of shear probe data was tested by comparing turbulent dissipation rates from thermistor. Shear probe data were found to be worse by vibration from motor operartions at buoyancy adjustment and by noise at slow ascending speed of the float. Vertical profiles of turbulent energy dissipation rate could be obtained with the hybrid use of shear probe and thermistor data by correcting time-constant of the termistor with reliable shear probe data and filling gaps of unavailable shear probe data. Data will be reported for the deep float which was deployed on December 12, 2018, in the western slope of Japan Trench off Aomori. The float is observing 0 - 4000 m turbulence profile every 10 days and will be recovered in April R/V Shinsei-maru cruise.

Evaluation of the underwater glider flight model using the electromagnetic current sensor

*Takahiro Tanaka[1], Daisuke Hasegawa[1], Takeshi Okunishi[1], Ichiro Yasuda[2]

1. Tohoku National Fisheries Research Institute, Japan Fisheries Research and Education Agency, 2. Atmosphere and Ocean Research Institute, University of Tokyo

Turbulence measurement by underwater gliders has become more common in recent years. For the accurate estimation of energy dissipation rates, the accurate measurement of the fall rate and gliding path angle is necessary. The gliding path angle should take the angle of attack (AOA) into account, which is the difference between the gliding path angle and the pitch angle. AOA calculation has been done by using the so-called flight model assuming dynamical force balance in the quasi-steady state. Due to the difficulty in measuring AOA directly, the validity of AOA derived from the flight model and the flight model itself has not been adequately evaluated so far. In this study, we put the electromagnetic current sensor (EM sensor) on the turbulence package to obtain AOA directly and to compare the AOA from EM sensor with that from the flight model. Using the dataset obtained by a Slocum glider in Jul. - Aug. 2017, we found that AOA from the EM sensor during descent and ascent has a mean (standard deviation) of 0.7 (1.2) deg. and -0.7 (1.1) deg., respectively, while AOA from the flight model is 4.9 (0.4) deg. and -4.5 (0.5) deg., respectively. In order to know what cause this difference, we discuss the validity of parameters given in the flight model. It is suggested that a drag coefficient due to parasite drag given in the flight model may be somewhat larger than that calculated using the EM sensor.

Mixing processes observed by a slocum glider at the Oyashio-TWC front

*Daisuke Hasegawa[1], Takahiro Tanaka[1], Takeshi Okunishi[1], Ichiro Yasuda[2]

1. Tohoku National Fisheries Research Institute, Japan Fisheries Research and Education Agency, 2. Atmosphere and Ocean Research Institute, The University of Tokyo

In order to grasp the detailed mixing processes along the frontal region between the Oyashio and the Tsugaru Warm Current (TWC), we conducted a zigzag survey crossing the front several times from the merging region of the two current systems to the down stream by an underwater glider (Slocum G2 Glider) equipped with a turbulence sensor, from July 24thto August 29thin 2017. The observed frontal structure indicated the subduction and the intrusion processes of the cold and fresh Oyashio water under the warm and salty TWC water, along layer between 26.5 to 26.8 sigma-theta, which resulted the favorable conditions to the salt finger convection at the upper interface along the 26.5 sigma-theta, and the diffusive convection at the lower interface along the 26.8 sigma-theta where the fresh and cold Oyashio water lying above the warm and salty water. The strong turbulence intensity is observed around the intruded layer, and the mean temperature and the salinity in the layer became warmer and saltier with the increase of the distance from the front, which suggested the time evolution of the vertical mixing driven by double diffusive convections between the three different water masses. Though the strongest turbulence intensity was observed around the frontal region, which may suggest the importance of the cabbeling effect as the additional source of the turbulent mixing.

Impact of the astronomical lunar 18.6-yr tidal cycle on El-Niño and Southern Oscillation

*Ichiro Yasuda[1]

1. Atmosphere and Ocean Research Institute, The University of Tokyo

Even though El-Niño and Southern Oscillation (ENSO) has a tremendous impact on global climate and society, its long-term forecast remains difficult. In this study, we discovered a statistically significant relationship between ENSO timing and the 18.6-year period lunar tidal cycle in the mature-phase (December –February) ENSO time-series during 1867–2015 and extending back to 1706 with proxy data. It was found that El-Niño tended to occur in the 1st, 10th, and 13th years after the maximum diurnal tide in the 18.6-yr cycle, and La-Niña tended to occur in the 3rd, 12th, and 16th years. These tendencies were also confirmed by corresponding sea-surface temperature (SST) and sea-level pressure (SLP) distributions; particularly Pacific SST and SLP spatial patterns in the third La-Niña and the tenth El-Niño year well resemble those of Pacific Decadal Oscillation (PDO). These findings contribute to understanding and forecasting long-term ENSO variability.

The effect of 18.6-year period lunar nodal cycle on Pacific Decadal Oscillation (PDO)

*Masaki Hamamoto[1], Ichiro Yasuda[1]

1. Atmosphere and Ocean Research Institute, The University of Tokyo

Pacific Decadal Oscillation (PDO) is the most dominant decadal-inter-decadal ocean-climate variability over the North Pacific; however, the periodicity and cause have not been fully understood. Previous studies suggested that 18.6-year period lunar tidal cycle ($T_{18.6}$) regulate bi-decadal PDO variability through changes in the strength of diapycnal mixing of ocean around the Kuril Islands to result in ocean variability, together with air-sea interactions in the mid-latitude North Pacific and/or equatorial Pacific. In the present study, 297yr-long reconstructed PDO timeseries was re-examined, and 27.9yr (3/2 times 18.6-yr, henceforth, $T_{27.9}$) period variability was significantly detected, and the zero-crossing from minus to plus was found to occur simultaneously with $T_{18.6}$ variability in the interval of 55.4 years (3 times $T_{18.6}$). In the PDO spectrum, a broad multi-decadal 50-80-yr peak (corresponding to 3-5 times $T_{18.6}$, henceforth T_M) was also detected with the zero-crossing synchronized with $T_{18.6}$; this is the extension of previous studies during 1900-2000 back to 1700s on the synchronous changes of bi-decadal and penta-decadal variabilities. These $T_{18.6}$, $T_{27.9}$ and T_M explain 71% of the 10-year low-passed PDO variability. These imply that the 27.9-yr and the multi-decadal variabilities could be related to $T_{18.6}$ tide-induced variability, and may be excited by $T_{18.6}$ tidal forcing, considering that external periodic forcing for delayed oscillator models could excite 3 times period of the external forcing and some non-linear processes may make the half-period variability.

A comparison of ocean deoxygenation between CMIP5 models and an observational dataset

*Yumi Abe[1], Shoshiro Minobe[1,5], Takamitsu Ito[2], Curtis Deutsch[3], Matthew C. Long[4]

1. Department of Natural History Sciences, Graduate School of Science,Hokkaido University, Sapporo, Japan, 2. School of Earth and Atmospheric Sciences, Georgia Institute of Technology, Atlanta, Georgia, USA, 3. School of Oceanography, University of Washington, Seattle, Washington, USA, 4. Climate and Global Dynamics Laboratory, National Center for Atmospheric Research, Boulder, Colorado, USA, 5. Department of Earth and Planetary Sciences, Faculty of Science, Hokkaido University, Sapporo, Japan

Recent studies revealed that the ocean deoxygenation has been accelerating since the 1980s over the global oceans (Schmidtko et al. 2017; Ito et al. 2017), and the observed trend in the last half-century appears to be much larger than the model simulations conducted for CMIP5 (Bopp et al. 2013). This discrepancy is an important issue of the ocean deoxygenation researches as highlighted by a review paper published in the last year (Oschlies et al. 2018).

In order to understand better the relations of oxygen variations between CMIP5 models and observations, we compare oxygen concentration simulated by CMIP5 models and gridded oxygen anomaly dataset used by Ito et al. (2017). For the global oceans, the observed oxygen reduction rate for the historical experiment period appears to be within uncertainty of the models, though this result can be sensitive to the choice of the analysis period associated with the rapid recent oxygen reduction. We also closely examined the two basins that are relatively well sampled, i.e., the North Pacific and the North Atlantic. It is found that the observed North Pacific oxygen reduction is much stronger than the simulated ones, but such a strong reduction of observed oxygen does not occur in the North Atlantic. These results suggest that there are substantial spatio-temporal variations of oxygen concentration on decadal timescales and their mechanism in each basin should be explored in future studies.

Pacific Ocean State Estimation and Clarification of Mechanism of Ocean Circulation by Data Synthesis of Global Observations

*Shuhei Masuda[1]

1. Japan Agency for Marine-Earth Science and Technology

Our aim is to synthesize pre-existing ocean data with newly-acquired turbulence data using state-of-art assimilation technique. Available observations of turbulence strength in the ocean, will be “blended” with pre-existing ocean data applying dynamically self-consistent state estimation approach with 4D-VAR adjoint system. We propose some new techniques and schemes to assimilate turbulence data, which tends to include unique features. The obtained state estimation will provide improved description of ocean circulation, its heat and salt transports, and oceanic ecosystem at lower trophic level.

Impact of Tidal Vertical Mixing to Barotropic Water Exchange between the Sea of Okhotsk and Pacific through Diffusive Adjustment with Turbulent Closure Scheme

*Hung Wei Chou[1], Humio Mitsudera[1], Hatsumi Nishikawa[1], Kaihe Yamazaki[2]

1. Hokkaido University, Institute of Low Temperature Science, 2. Hokkaido University, Graduate School of Environmental Science

The pattern of exchange flow between the Sea of Okhotsk and Pacific is a system composed by an Okhotsk-ward inflow through Kruzenshtern strait in north and a Pacific-ward outflow through Bussol strait in south. One of major theories for explaining the dynamic of water exchange through Kuril Island Chain is the turbulence induced by tidal vertical mixing. Turbulence is an important physical process in geostrophic boundary layer, and because of the complexity of topographic in Kuril island chain, the breaking of internal tides in island coast area leads to increase the thickness of surface mixing layer and causes tilting of isopycnal layer in vicinity. The tilting of isopycnal layer around islands forms a clockwise flow along the shore by geostrophic adjustment. However, above process is majorly broclinicly, and how can it impact to barotropic component is still unknown.

By setting the tidal force as a controlled variable, results from realistic OGCM model COCO show only the case with tidal forcing can consistent with the exchange flow pattern as historical observation (Fig.1). Besides, the vertical diffusivity values also show the magnitude difference in summer time, which the flow in north strait in non-tidal case is opposite to tidal one (Fig.2). Therefore, we designed four experiments for understanding the impact of tidal diffusive adjustment in summer: 1. install vertical diffusivity value generated by tidal case into non-tidal run; 2. install vertical diffusivity value generated by non-tidal case into tidal run; 3. set the vertical diffusivity value as zero in tidal case and 4. in non-tidal case as well. Further, for preventing the underestimates the depth of the mixing layer in Mellor-Yamada turbulence closure scheme, two more experiments with the larger vertical diffusivity mask are applied in both tidal and non-tidal case. After calculating the fraction of baroclinic and barotropic components in either north strait or southern strait, results show the vertical mixing dose influence the strength of volume transported but not the direction as original tidal and non-tidal case shows. Hence, for further understanding the impact of vertical diffusivity, we start a tidal forcing run with non-tidal initial conditions to detect the relationship between the flow direction and magnitiude of vertical diffusivity values by time developing. But the baroclinic result implies that the vertical mixing might not be the main reason to control the flow direction (Fig.3).

This study also implies the tidal impacts in OGCM is not only the vertical mixing, but other geostrophic fluid dynamics might occur, especially the interaction of topography with tidal waves. Therefore, for reproducing the real ocean phenomena, movement of tidal waves should be considered.

Distributions of organic Fe-binding ligands in the eastern and western subarctic North Pacific

*Yoshiko Kondo[1,2], Yudai Sunahara[2], Jun Nishioka[3], Hajime Obata[4], Shigenobu Takeda[1,2]

1. Graduate School of Fisheries and Environmental Sciences, Nagasaki University, 2. Faculty of Fisheries, Nagasaki University, 3. Institute of Low Temperature Science, Hokkaido University, 4. Atmosphere and Ocean Research Institute, The University of Tokyo

Iron (Fe) is well known as a key parameter for primary productivity in the ocean. To understand the distributions and biogeochemical cycle of Fe in the ocean, we need to investigate the sources and sinks of Fe. A recent study has demonstrated a concentration gradient of dissolved Fe in the North Pacific Intermediate Water (NPIW) between western and eastern areas (Nishioka and Obata, 2017), suggesting that Fe-rich intermediate water was transported laterally across the western subarctic gyre. Moreover, it has been demonstrated that most dissolved Fe in seawater is complexed with natural organic ligands. Since bioavailability of Fe in seawater depends on its species, the chemical speciation of Fe is needed to evaluate the nutrient status for phytoplankton. However, the distribution of natural organic ligands has not been revealed yet in the subarctic North Pacific. In this study, vertical distributions of organic Fe-binding ligands were investigated in the eastern and western subarctic North Pacific to clarify its impact on Fe cycle. Seawater samples were obtained through the whole water column during GEOTRACES-Japan cruise KH-17-03 using trace metal clean technique to avoid metal contaminations. Filtered seawater samples (<0.2 μm) for organic Fe-binding ligands analysis were collected in acid-washed bottles inside a laminar-flow clean booth, then they were stored at -20°C until just before analysis. The organic Fe-binding ligands' concentration and their conditional stability constants were determined by competitive ligand equilibration-adsorptive cathodic stripping voltammetry (CLE-ACSV) method using salicylaldoxime (Abualhaija and van den Berg, 2014). The concentration and conditional stability constants of organic ligands ranged from 0.7 nM to 5.9 nM and from $10^{10.1}$ M^{-1} to $10^{12.3}$ M^{-1}, respectively. The concentrations of organic ligands exceeded those of dissolved Fe concentration more than 1 nM in all samples except for the surface (10-m) at the Oyashio-Kuroshio transition zone station; consequently >99% of dissolved Fe was estimated to be complexed with these natural organic ligands. At the western station, high concentrations of organic ligands were observed in the intermediate layers (400 –600 m), which hydrographic data (27.2 σ_θ –27.3 σ_θ) were corresponding to the lower NPIW (Yasuda et al., 2004), suggesting that organic Fe-binding ligands might be transported within the lower NPIW.

Chemical and physical speciation of copper in the subarctic North Pacific

*Kuo Hong Wong[1], Hajime Obata[1], Taejin Kim[2], Yoshiko Kondo[3], Jun Nishioka[4]

1. Atmosphere and Ocean Research Institute, The University of Tokyo, 2. Seoul National University, Korea, 3. Nagasaki University, 4. Institute of Low Temperature Science, Hokkaido University

Organic complexation of Cu in seawater plays a major role in controlling the toxicity and bioavailability of Cu for marine microorganism. In this study, we determined the concentrations of Cu and its organic ligands in the soluble and dissolved phases in the subarctic North Pacific. Samples were taken from three stations in the subarctic NorthPacific, CL-2 (western), CL-5 (central) and CL-16 (eastern), during summer 2017.

Concentrations of total dissolved and soluble Cu ranged from 1.28 nM –4.82 nM, and 0.47 nM –2.75 nM, respectively, in the subarctic North Pacific. At both CL-2 and CL-16, soluble Cu accounted for 30% - 100% of total dissolved Cu. The proportion of the soluble Cu fraction was low in surface waters, increased a maximum in the intermediate waters, and decreased slightly in deep waters. Two classes of organic ligands were detected in the surface and intermediate waters of CL-5 and CL-16, and in the intermediate waters of CL-2. In all other depths, only one class of ligand was detected. Concentrations of the stronger ligand (L_1) and weaker ligand (L_2) ranged from 1.02 nM –2.95 nM, and 0.77 nM –8.78 nM, respectively. The distributions of L_1 followed closely that of total dissolved Cu in the surface waters, and no clear trend was observed in the intermediate waters. At CL-2, L_1 mainly existed in the soluble phase, whereas for CL-16, soluble L_1 accounted for 50% - 100% of total dissolved L_1. Concentrations of L_2 were relatively constant throughout the water column but elevated concentrations were detected in the surface waters of CL-5 and in the surface and intermediate waters of CL-16. On the other hand, there were a slight depletion of L_2 in the intermediate waters of CL-2.

Latitudinal and temporal variations in phytoplankton size structure within mesoscale eddies from space

*Hisatomo Waga[1], Toru Hirawake[1], Ueno Hiromichi[1]

1. Hokkaido University

Phytoplankton plays a critical role in a number of key ocean processes. One of the most important functions of phytoplankton is to determine the energy transfer efficiency in marine ecosystems. Although the energy flow from the base of the food web to higher trophic levels depends on both the biomass and size structure of phytoplankton community, phytoplankton size structure is particularly important because energy flow in marine pelagic food webs is largely based on size specific predator-prey relationships. Therefore, spatiotemporal dynamics in size structure of phytoplankton community can trigger changes in the ecosystem’ s functioning through trophic cascade effects in the trophic chain. With the development of remote sensing techniques, mesoscale eddies, nearly ubiquitous features of the World Ocean, has been recognizing as important feature for the distribution of phytoplankton not only the direct transport of phytoplankton and eddy trapping, but also the vertical flux of nutrients. Recent studies have examined regional variations in the influence of mesoscale eddies on phytoplankton community. Namely, phytoplankton production is enhanced in cyclonic eddies (CEs) than that of anticyclonic eddies (ACEs) because of upwelling inside the eddy; this view, on the other hand, does not hold for a substantial portion of eddies within oceanic subtropical gyres, the largest ecosystems in the ocean. However, previous efforts have focused mainly on variations in chl*a*, whereas quite a few studies have worked on that in the size structure of phytoplankton community because remote estimations of phytoplankton size structure are newly established techniques during the last decade. Here we improved a chl*a* size distribution (CSD) model which estimates the synoptic size structure of phytoplankton community, to assess the impact of mesoscale eddies on spatiotemporal variations in phytoplankton size structure. Original CSD model was based on the spectral features of the phytoplankton absorption coefficient ($a_{ph}(\lambda)$), which estimation accuracy becomes poor in areas of the low productivity, such as subtropical gyres. To avoid this, we used not only $a_{ph}(\lambda)$ but also chl*a* to improve estimation accuracy of the CSD model. The resulting estimation error of the improved CSD model was the median absolute percent difference of 26.0% between the measured and satellite-matched values, and global distribution of the phytoplankton size structure was reliable even in subtropical gyres. The phytoplankton size structure showed a clear latitudinal variation: larger and smaller assemblages in temperate (>30˚S and >30˚N) and low latitudes (30˚S–30˚N) latitudes, respectively. When comparing the phytoplankton size structure within ACEs and CEs, a larger phytoplankton size structure was found in ACEs especially in low latitudes. This result was consistent with a previous report that ACEs are more productive than CEs in subtropical gyres because of winter mixing. In addition, we found increasing trends ($p < 0.05$) in differences between the phytoplankton size structure within ACEs and CEs in low latitudes for the years 2003–2014, suggesting a growing importance of ACEs for phytoplankton and in turn marine ecosystem. Consequently, this study demonstrates significant advantages of satellite remote sensing for biogeochemical and ecological studies.

Structure and impact of the Kuroshio nutrient stream

*Kosei Komatsu[1,2], Yutaka Hiroe[3]

1. Graduate School of Frontier Sciences, The University of Tokyo, 2. Atmosphere and Ocean Research Institute, The University of Tokyo, Kashiwa, Japan, 3. Seikai National Fisheries Research Institute, Japan Fisheries Research and Education Agency, Nagasaki, Japan

Recently the Kuroshio has drawn attention as an important supply route of nutrients in the western North Pacific. However, it is unknown whether nutrient concentrations are enhanced along the jet on isopycnal surfaces, as is the case for the “nutrient stream” along the Gulf Stream. We aim to ascertain the structure of nutrient concentration enhancement along the Kuroshio jet and to estimate the impact of nutrient transport downstream to the Kuroshio-Oyashio interfrontal zone (KOIZ), which is a highly productive region and a major global fishing ground. Recent multiple- transects and retrospective analyses of historic hydrographic data have revealed that the along-jet maximum nitrate concentration appears only in spring on the isopycnal surface $25<\sigma_\theta<26$ in the downstream region of the Kuroshio. The Kuroshio nutrient stream contributes significantly to productivity in the euphotic layer along its downstream trajectory, in conjunction with enhanced vertical turbulence. Analysis of the budget of epipycnal nitrate transport across transects that enclosed the KOIZ suggests that the Kuroshio nutrient stream has a non-negligible potential to significantly impact high productivity in the KOIZ.

Enhanced nutrient supply and biogeochemical impacts induced by internal waves in the oligotrophic northern South China Sea

*Chin-chang Hung[1], Dewang Li[2], Wen-Chen Chou[3], Yung-Yen Shih[1,4], Guan-Yu Chen[1]

1. Department of Oceanography, National Sun Yat Sen University, Kaohsiung, Taiwan, 2. Second Institute of Oceanography, State Oceanic Administration, Hangzhou, PRC, 3. Institute of Marine Environmental Chemistry and Ecology, National Taiwan Ocean University, Taiwan, 4. Department of Applied Science, R.O.C Naval Academy, Kaohsiung, Taiwan

To understand nutrient supply and the biogeochemical response induced by internal waves in the deep basin of the northern South China Sea (NSCS), nitrate, chlorophyll *a* (Chl *a*), particulate organic carbon (POC) fluxes were measured during the passage of large internal waves using drifting sediment traps attached with hydrographic sensors. Results revealed large variations in temperature, nitrate and chlorophyll *a* (Chl *a*) concentrations during and after internal waves, suggesting that cold nutrient-replete waters may be brought to the euphotic zone in the dissipation zone during and after the passage of internal wave packets, resulted in phytoplankton flourished in oligotrophic water. The result reveals that ocean mixing triggered by internal waves in warm water of the NSCS may be important for phytoplankton species composition. Most importantly, POC fluxes (110.9±10.7 mg C m^{-2} d^{-1}) were significantly enhanced after internal waves compared to non-internal wave area (32.6–73.0 mg C m^{-2} d^{-1}) in the NSCS. Such elevated POC fluxes may be induced by downward flourished biogenic particles, particle aggregation or converged particles from mixed layer triggered by internal waves.

Mixing over the eastern ridge in the Luzon Strait caused by high-mode internal waves

*Akie Sakai[1], Tomoharu Senjyu[2], Eisuke Tsutsumi[2], Takeshi Matsuno[2], Takahiro Endo[2], Ichiro Yasuda[3], Daigo Yanagimoto[3]

1. Department of Earth System Science and Technology, Interdisciplinary Graduate School of Engineering Sciences, Kyushu University, 2. Research Institute for Applied Mechanics , 3. Atmosphere and Ocean Reserch Institute The University of Tokyo

The Luzon Strait has two parallel ridges running from north to south, which is known to create large amplitude internal tides. To investigate the mixing processes accompanied by the internal tides, we carried out repeated observations with XBT, XCTD, CTD, and ADCP in the cruise of R/V Hakuho-maru KH-17-5, Leg-2, in November 2017 as part of the OMIX project. We obtained 6 cross sections around the eastern ridge between 121° 30’ E and 122° 10’ E along the line of 21° N.

The cross sections showed wavy structures of isopycnals over the ridge, with 4-7 km of horizontal scale and about 50 m of vertical scale. Velocity distributions by the shipboard ADCP showed strong vertical shear over the ridge, suggesting high-mode internal waves. Froude number of the high-mode internal waves exceeds unity around two summits of the ridge during the periods of strong tidal flow. This suggests that the high-mode internal waves stay over the ridge.

Many temperature inversions, especially large inversions ($\theta > 0.05$ °C) were formed near the ridge (figure). Therefore, energy dissipation rate and vertical diffusivity assuming the model of Osborn (1980) were estimated by calculating Thorpe scale from the temperature profiles. Relatively large energy dissipation rate and vertical diffusivity were distributed over the ridge from surface to the bottom, as well as unstable regions of $Ri < 0.25$. These results reflect strong mixing over the ridge due to the high-mode internal waves.

From the Luzon Strait to the Tsushima Strait: Water masses and nutrient transports approached using ^{137}Cs

*Siteng Zhu[1], JING ZHANG[1], Shota Kambayashi[2], Takeshi Matsuno[3], Eisuke Tsutsumi[3], Shigenobu Takeda[4], Seiya Nagao[5], Hiroshi Inoue[5], Hiroshi Ogawa[6], Ichiro Yasuda[6]

1. University of Toyama, 2. Fukushima university, 3. Kyushu university, 4. Nagasaki university, 5. Kanazawa university, 6. The University of Tokyo

More than 95% of the water flowing into the Sea of Japan comes from the Tsushima Strait, and 80% of it is Kuroshio Intimidate Water (KIW), which is rich in nutrients compared with Kuroshio surface Water and Kuroshio Tropical Water. However, there is a lack of direct evidence based on surveys or measurement data. ^{137}Cs in the subtropical mode water (STMW) that originated in the Fukushima Dai-ichi Nuclear Power Plant (FNPP1) accident is an excellent tracer which can be transported from the Kuroshio upstream to the Sea of Japan crossing the shelf edge of the East China Sea (ECS) via the KIW. It is also useful for research on the transport of nutrients from the KIW.

Data and water samples were collected during the Hakuho-Maru KH-17-5 Cruise and the Nagasaki-Maru 464 Cruise in November and July 2017, respectively. Data from the KH-17-5 Cruise was used for the study of the area around the Luzon Strait and those of the Nagasaki-maru 464 Cruise was used for the study of area around the outer shelf region of the East China Sea and the Tsushima Strait. The ^{137}Cs active concentration was analyzed by γ-Ray spectrometry after preconcentration. The turbulence intensity was measured using TurboMAP and VMP2000.

The maximum ^{137}Cs concentration shows the existence of the subtropical mode water (STMW) in the Luzon Strait, the ECS and the Tsushima Strait, respectively, at the similar density (25.2-25.7 kg/m^3), temperature (15-17℃) and salinity (34.60-34.75). Although their depth changes from 400 m in the Luzon Strait to 150 m at the shelf edge of the ECS and 100m in the East Channel of the Tsushima Strait, they can all be identified as the KIW because of the similar density. It is noteworthy that around Luzon Strait, the distribution of ^{137}Cs is influenced by strong vertical mixing. The percentage of nutrients transported to the Sea of Japan by KIW is estimated and this is meaningful to the ecosystem of the Sea of Japan.

Impact of cyclonic eddies and typhoons on biogeochemistry in the oligotrophic ocean based on time-series observation at the western Pacific subtropical station KEO

*Makio Honda[1], Yoshikazu Sasai[1], Eko Siswanto[1], Akira Kuwano-Yoshida[2], Hidenori AIKI[3], Meghan Cronin[4]

1. Japan Agency for Marine-Earth Science and Technology, 2. Disaster Prevention Laboratory, Kyoto University, 3. Nagoya University, 4. NOAA Pacific Marine Environmental Laboratory

In 2014, a sediment trap mooring experiment started adjacent to station Kuroshio Extension Observatory (KEO)' s National Ocean and Atmosphere Administration (NOAA) surface mooring. Two-years long sediment trap data show that biogenic material fluxes at ~ 5000 m increased between late winter (March) and late spring (June). Based on sea surface temperature and upper ocean water temperature profiles, from the NOAA surface buoy, and satellite-based surface chlorophyll-a , this increase was likely due to an increase of ocean productivity in early spring (March) that was supported by nutrients supplied by winter mixing. On the other hand, biogenic material fluxes also increased in October 2014, and between late December 2014 and January 2015 when concentrations of nutrients near the surface typically are low. Sea surface height anomalies and vertical profiles of water temperature in the upper 500 m showed cyclonic eddies passing station KEO and causing upwelling of middle-layer water in late July–early August 2014 and November 2014. It appears that these events supplied nutrients to the upper layer, which then caused ocean productivity in the subsurface layer to temporally increase, resulting in increased deep biogenic material fluxes in autumn and winter. This interpretation of the data is consistent with a simple 3D physical-biological model simulation that shows meso-scale cyclonic eddies can supply nutrient to support new production at KEO. During the 2-year-long sediment trap deployments, several typhoons also passed near station KEO and near-inertial internal waves were observed near the nitracline depth after the typhoons passed. Although turbulent mixing caused by near-inertial internal wave could have possibly supplied nutrient to upper oligotrophic euphotic layer, numerical simulations of the turbulent nutrient supply indicate that enhanced turbulent diffusion across the nutrient concentration gradient did not supply enough nitrate to support the increase in biogenic material flux in autumn.

Island-mass effect on the phytoplankton and zooplankton community in south of Japan

*Kiyotaka Hidaka[1], Kazuaki Tadokoro[1], Hiroomi Miyamoto[1], Tadafumi Ichikawa[1]

1. Japan Fisheries Research and Education Agency

The Izu Ridge brings high plankton production via its island-mass effect, which brings up subsurface nutrients to surface layer. Previous reports on island-mass effect around the ridge have been based on observation in the summer-early autumn and reports in spring, when many small pelagic fish species spawn, are scarce. As the Kuroshio flow through the ridge, island-mass effect on zooplankton, which takes more time to glow than phytoplankton, should be appear in eastern (downstream) area. Thus wider area around the ridge should be examined for the effect on zooplankton. In the present study, we examined island-mass effect of the Izu-Ridge on phytoplankton and zooplankton, based on satellite data and zooplankton data in the broad area south of the Honshu.
The Sea surface chlorophyll concentration (SSChl, MODIS-Aqua) in the area bounded by 135.5-142.0 E and 30.0-37.0 N was examined for the grids with depths of > 500 m. Zooplankton samples were collected by vertical tow (0-150 m) of the NORPAC net with 0.335 mm mesh in the area south of Honshu in February to March of 1963-2017. Samples were fixed in 5% formalin-sea water and copepod biomass was estimated in the laboratory by Bench-top Video Plankton Recorder. The relationships between plankton biomass and distance to the Honshu coast and to the Izu Ridge were examined.
The SSChl declined as distance to the Honshu coast increased. But high SSChl was observed in several areas 150-250 km away to the coast. These areas were mainly located around the Izu Ridge, 32-33.5N, and interpreted as caused by island-mass effect when the Kuroshio flowed in offshore path. The copepod biomass was high around the Honshu coast (<50 km). Stations with high copepod biomass were observed in the 100-200 km north-east (downstream) of the Izu Ridge, but they were located near the Honshu, around the Boso peninsula. Island-mass effect of the Izu-ridge on zooplankton biomass thus cannot be distinguished from the coastal effect and the effect should be examined by rate process (spawning rate and/or growth rate) in species level.

Influence of enhanced deep circulation due to geothermal heat on biogeochemical cycle in the Pacific Ocean

*Shogo Urakawa[1], Hideyuki Nakano[1], Hiroyuki Tsujino[1], Kei Sakamoto[1], Takahiro Toyoda[1], Goro Yamanaka[1]

1. Meteorological Research Institute, Japan Meteorological Agency

There exists heat conduction from the oceanic lithosphere to the abyssal ocean. Its heat flux amounts to about 0.1 W m^{-2} in the global average. It is much smaller than the heat exchange between the atmosphere and ocean in the order of 10 W m^{-2}. However, it is known that this geothermal heat significantly enhances the deep circulation especially in the Pacific Ocean. For example, Adcroft et al. (2001) conduct numerical experiments with/without geothermal heating using an ocean general circulation model and report that constant heat flux at the sea bottom by 0.05 W m^{-2} results in enhancement of the Pacific meridional overturning circulation (PMOC) by 25 %. Other studies also report that the geothermal heat significantly enhances the oceanic deep circulation (e.g., Emile-Geay and Madec, 2009; Urakawa and Hasumi, 2009; Downes et al., 2016). The importance of the geothermal heat seems to be robust from the viewpoint of ocean dynamics but it has not been investigated to what extent the geothermal heat influences the biogeochemical cycle of the ocean. Here, we conduct two numerical experiments with/without the geothermal heat using an ocean general circulation model developed for the CMIP6 and investigate the effect of the geothermal heat on the biogeochemical tracer fields.
The geothermal heating enhances PMOC at 30º S by 17 % in this model, which leads to stronger ventilation in the North Pacific Ocean. This stronger ventilation results in increase of delta ^{14}C by more than 10 per mille, which means younger water masses, at the bottom of the North Pacific. The stronger PMOC also results in higher dissolved oxygen in the abyss especially in the eastern tropical Pacific. The geothermal heat leads to dissolved oxygen increase by more than 10 micro mol L^{-1} there, which corresponds to 10–70 % of hypoxic water in the control experiment without geothermal heating. This oxygenation near the sea bottom affects the oxygen-deficient water in the surface of the eastern tropical Pacific. Its thickness becomes thinner by around 100 m. The geothermal heat also plays an important role in the biogeochemical cycle in the Pacific Ocean.

The Parameterization of the Pressure-Strain Correlations in the Stably or Unstably Stratified Ocean Surface Layer.

*Yusuke Ushijima[1], Yutaka Yoshikawa[1]

1. Graduate School of Science, Kyoto University

Turbulence in the ocean surface layer mixes momentum, heat, and nutrient vertically. It is therefore important for air-sea interaction, phytoplankton blooming, and other oceanic processes (e.g., Roxy et al. 2013; Obata et al. 1996). However, large-scale models such as ocean general circulation models cannot explicitly resolve small-scale turbulence because of their coarse resolution. For this reason, the vertical mixing should be parameterized using the turbulent closure scheme that successfully parameterizes the turbulent mixing. Recently, attention is paid to pressure-strain correlations, which redistribute stress due to fluctuating pressure, in the parameterization scheme used for engineering purposes (Jakilic and Hanjalic 2013). In the present study, therefore, the validity of the pressure-strain correlation parameterization used in the ocean (or atmosphere) (Rotta 1951, Gibson and Launder 1978, Gertski et al. 1992) was examined. To this end, we performed Large-eddy simulations of ocean surface boundary layer to simulate pressure-strain correlations and compared it with parameterized correlations. Here, we focused on the effects of stratification on the correlations, because the stratification is an essential factor in the ocean and atmospheric boundary layers but previous schemes did not include the stratification effects sufficiently. Results show that the parameterizations of the pressure-strain correlations had systematic errors depending on the stability (or stratification). It was also found that the error can be reduced by introducing new parameters related to the stability into the scheme.

Numerical studies on asymmetric responses of the upper ocean to tropical cyclone

*Daiki Okura[1], Yutaka Yoshikawa[1]

1. Graduate School of Science, Kyoto University

Tropical cyclones (TCs) decrease sea surface temperature (SST), and the decreased SST weakens TC intensity. This SST decrease is asymmetric with respect to the TC track, known as “rightward bias”. Preceding numerical studies suggested that this asymmetry may influence on the course of the TC. The interaction between TC and the upper ocean is one of key ingredients for precisely predicting TC's development, and the upper ocean response to TC should also be clarified.
The SST decrease during TC passage is mainly caused by two processes; vertical turbulent mixing and advection (Ekman suction). The rightward bias is associated with the mixing which is more intense on the right side of the TC track due to resonant inertial currents with winds. Magnitude and distribution of SST decrease induced by the mixing should vary with parameters characterizing TC; transition speed U_T, radius of maximum wind R_{max}, the friction velocity U_*, and the Coriolis coefficient f. However, detailed physical processes of the mixing and its dependence on these parameters have not been well quantified, because of lack of in-situ data and complicated processes involved in the mixing.

The present study focuses on the vertical turbulent mixing effects on asymmetric SST response. To this aim, vertically one-dimensional model was used in which the vertical turbulent mixing was parameterized with the Nakanishi-Niino-Mellor-Yamada scheme modified by Kitamura (2010). We considered TC-like wind stress of magnitude U_*^2 at radius R_{max} from the TC center moving with transition speed U_T and investigated the mixing on both sides of TC track at distance *r*. Experiments with several friction velocities U_*, maximum wind radii R_{max}, transition speeds U_T and distances *r* were performed. No surface heat flux was considered for simplicity.
The results showed that the rightward bias of the SST response depended on these parameters. The location of the largest SST decrease moved away from the axis as U_T increased, but it depended less on U_*. The SST decreased more with larger U_* and smaller U_T. These results can be explained by energy flux at the surface. In our model configuration, the energy flux depends on two non-dimensional parameters, U_T/fR_{max} and U_*/U_T, and the energy flux had maximum and turbulent kinetic energy penetrated deeper at larger U_*/U_T and at U_T/fR_{max}~1, suggesting the resonance between wind and the inertial current. The SST decrease corresponded with the energy flux, but it depended largely on U_*/U_T, implying importance of wind forcing duration.
Thus, the asymmetric SST response due to the vertical turbulent mixing can be characterized with U_T/fR_{max} and U_*/U_T. Additional advection effects on the SST response will be discussed at the conference using three-dimensional simulation in which the advection as well as the mixing are fully included.

Influence of the distortion of the internal wave field on estimates of turbulent mixing using fine-scale parameterizations

*Anne Takahashi[1], Toshiyuki Hibiya[1], Alberto C. Naveira Garabato[2]

1. Department of Earth and Planetary Science, Graduate School of Science, University of Tokyo, 2. National Oceanography Centre, University of Southampton

Although the Southern Ocean is one of the turbulent mixing hotspots, we have not yet clarified quantitatively the turbulent mixing processes in this region, where the Antarctic Circumpolar Current (ACC) coexists with near-inertial internal waves generated by wind forcing and internal lee waves radiated by the impingement of eddy flows on topography.

Fine-scale parameterizations, based on the theory of energy cascade from internal waves to turbulence, are most widely used to estimate the turbulent dissipation rate, ε. It has been reported, however, that these fine-scale parameterizations tend to overestimate ε in the ACC (Waterman et al. 2014). Although Takahashi and Hibiya (2019) have suggested that "the distorted fine-scale shear and strain spectra" caused by the existence of eddies trapping near-inertial waves or upward-propagating internal lee waves might be responsible for the overestimates, the problem remains unresolved.

In this study, we use "eikonal" simulations (Henyey et al. 1986), which trace the propagation, refraction and breaking of test waves within a background internal wave field, to assess the evolution of the energy cascade in vertical wavenumber space. Our objective is to examine how the distortion of the vertical wavenumber spectrum affects the performance of fine-scale parameterizations.

In our simulations, in contrast to high vertical wavenumber test waves that are efficiently Doppler-shifted to their breaking limit, low vertical wavenumber test waves are not subject to dissipation processes. In the existing fine-scale parameterizations, however, the energy flux to dissipation scale is estimated using the integrated vertical wavenumber spectral values. This means that, if the range of this integration includes a spectral bump at the low-wavenumber end of the spectrum, the estimated energy flux and hence the resulting ε might be overestimated by these fine-scale parameterizations.

From the simulation results, it is confirmed that fine-scale parameterizations significantly overestimate ε in spectra with a low-wavenumber bump, in particular as the internal wave energy level becomes large and the shear/strain ratio becomes small. These results are supported by the microstructure and fine-structure dataset from the SOFine experiment carried out in the Kerguelen Plateau.

Sun. May 26, 2019 1:45 PM - 3:15 PM JST | Sun. May 26, 2019 4:45 AM - 6:15 AM UTC | Poster Hall International Exhibition Hall8, Makuhari Messe_3

[A-OS21] Physical, biogeochemical, and ecological aspects and their mutual relations in the Indian Ocean

convener:Yukio Masumoto(Graduate School of Science, The University of Tokyo), Hiroaki Saito(Atmosphere and Ocean Research Institute, The University of Tokyo), Iwao Ueki(JAMSTEC Japan Agency for Marine-Earth Science and Technology)

Recent discovery of new climate modes and development of basin-scale and regional
observing systems in the Indian Ocean advance researches on physical, biogeochemical,
and ecological aspects of ocean variations. In addition, international and interdisciplinary
research programs in the Indian Ocean, such as IIOE-2 and EIOURI, are now being
conducted in earnest, under which the R/V Hakuho-maru cruise in the eastern Indian
Ocean will be took place in Nov./Dec. 2018, for better understanding of eastern Indian
Ocean conditions through multi-disciplinary approaches. This session invites papers on
physical, biogeochemical, and ecological aspects in the Indian Ocean and relations
among these elements of the ocean variations, to facilitate integrated understanding of
the Indian Ocean variability, as well as to stimulate collaborative researches among the
relevant scientists. Preliminary results from observation campaigns, a new perspective
on research collaboration, and/or sharing information on future observing activities are
also welcome.

Freshening of Indonesian Upper Water and Salinification of Indonesian Intermediate Water in the Indian Ocean during the last decade

*ISKANDAR MOCHAMAD RIZA[1], Toshio Suga[1]

1. Graduate School of Sciences, Tohoku University

The Indonesian region, also known as a central part of the “Maritime Continent” is located at the tropical region between the Pacific Ocean and the Indian Ocean. The water in Indonesian seas mostly consists of North Pacific waters (North Pacific Intermediate Water, NPIW and North Pacific Subtropical Water, NPSW) with the small fraction of South Pacific waters (South Pacific Intermediate Water, SPIW and South Pacific Subtropical Water, SPSW). During transit through the Indonesian seas, the saltier NPSW is modified due to atmospheric and oceanic forcing, i.e., evaporation/precipitation and tidal mixing, becoming fresher water.

The water from Indonesian seas can be distinguished in the Indian Ocean as low salinity water from the surface to the thermocline, called with Indonesian Throughflow water (ITW) or Indonesian Upper Water (IUW) and intermediate low salinity water known as Banda Seawater (BSW) or Indonesian Intermediate Water (IIW). Temporal variations of properties of these water masses in the South Eastern Indian Ocean over the last decade is investigated by using the gridded monthly mean of Argo dataset, MOAA-GPV and profile dataset in World Ocean Database (WOD). The freshening trend of the Indonesian Upper Water (IUW, 23 $\sigma\ \theta$) and salinification trend of the Indonesian Intermediate Water (IIW, 27.3 $\sigma\ \theta$) are detected. These trends are opposite with the salinification trend of North Pacific Subtropical Water (NPSW) and freshening trend of North Pacific Intermediate Water (NPIW) in the Pacific inflow region of ITF. The opposite trends between the inflow and outflow of ITF are at least partly explained as follows.

The freshening in the IUW is consistent with the low E-P within Indonesia region. High freshwater input in the Indonesian Seas from E-P on the last decade was proposed as one of the contributors to the freshening of IUW. Using simple Lagrangian estimation, as much as one to two third freshening are coming from this freshwater input. The salinification of IIW is drawn roughly by vertical salinity convergence due to vertical mixing between the top (400m) and bottom (1200m) of the intermediate layer. The enhanced vertical mixing due to salinification of water just above IIW is proposed as a major contributor to the salinification of IIW.

Characteristics in the upper ocean physical properties associated with 2018 Ningaloo Nina observed during R/V Hakuho-Maru KH-18-6 cruise

*Yukio Masumoto[1], Iwao Ueki[2], Kentaro Ando[2], Takanori Horii[2], Motoki Nagura[2], Shuhei Matsugishi[1], Shoichiro Kido[1], Takuro Matsuta[1]

1. Graduate School of Science, The University of Tokyo, 2. Japan Agency for Marine-Earth Science and Technology

R/V Hakuho-maru cruise, KH-18-6 Leg3, was conducted in December 2018 in a region between Indonesia and Australia. A relatively strong Ningaloo Nina took place during the cruise, showing negative sea surface temperature anomaly of the order of few degrees with strong southerly surface winds off northwest Australia. This presentation summarizes subsurface physical conditions observed during the cruise on a rare occasion, focusing on anomalies associated with the Ningaloo Nina and their relation with a large scale circulations and variations.

[A-OS21] Physical, biogeochemical, and ecological aspects and their mutual relations in the Indian Ocean

convener:Yukio Masumoto(Graduate School of Science, The University of Tokyo), Hiroaki Saito(Atmosphere and Ocean Research Institute, The University of Tokyo), Iwao Ueki(JAMSTEC Japan Agency for Marine-Earth Science and Technology)

Recent discovery of new climate modes and development of basin-scale and regional
observing systems in the Indian Ocean advance researches on physical, biogeochemical,
and ecological aspects of ocean variations. In addition, international and interdisciplinary
research programs in the Indian Ocean, such as IIOE-2 and EIOURI, are now being
conducted in earnest, under which the R/V Hakuho-maru cruise in the eastern Indian
Ocean will be took place in Nov./Dec. 2018, for better understanding of eastern Indian
Ocean conditions through multi-disciplinary approaches. This session invites papers on
physical, biogeochemical, and ecological aspects in the Indian Ocean and relations
among these elements of the ocean variations, to facilitate integrated understanding of
the Indian Ocean variability, as well as to stimulate collaborative researches among the
relevant scientists. Preliminary results from observation campaigns, a new perspective
on research collaboration, and/or sharing information on future observing activities are
also welcome.

Freshening of Indonesian Upper Water and Salinification of Indonesian Intermediate Water in the Indian Ocean during the last decade

The Indonesian region, also known as a central part of the “Maritime Continent” is located at the tropical region between the Pacific Ocean and the Indian Ocean. The water in Indonesian seas mostly consists of North Pacific waters (North Pacific Intermediate Water, NPIW and North Pacific Subtropical Water, NPSW) with the small fraction of South Pacific waters (South Pacific Intermediate Water, SPIW and South Pacific Subtropical Water, SPSW). During transit through the Indonesian seas, the saltier NPSW is modified due to atmospheric and oceanic forcing, i.e., evaporation/precipitation and tidal mixing, becoming fresher water.

The water from Indonesian seas can be distinguished in the Indian Ocean as low salinity water from the surface to the thermocline, called with Indonesian Throughflow water (ITW) or Indonesian Upper Water (IUW) and intermediate low salinity water known as Banda Seawater (BSW) or Indonesian Intermediate Water (IIW). Temporal variations of properties of these water masses in the South Eastern Indian Ocean over the last decade is investigated by using the gridded monthly mean of Argo dataset, MOAA-GPV and profile dataset in World Ocean Database (WOD). The freshening trend of the Indonesian Upper Water (IUW, 23 $\sigma\ \theta$) and salinification trend of the Indonesian Intermediate Water (IIW, 27.3 $\sigma\ \theta$) are detected. These trends are opposite with the salinification trend of North Pacific Subtropical Water (NPSW) and freshening trend of North Pacific Intermediate Water (NPIW) in the Pacific inflow region of ITF. The opposite trends between the inflow and outflow of ITF are at least partly explained as follows.

The freshening in the IUW is consistent with the low E-P within Indonesia region. High freshwater input in the Indonesian Seas from E-P on the last decade was proposed as one of the contributors to the freshening of IUW. Using simple Lagrangian estimation, as much as one to two third freshening are coming from this freshwater input. The salinification of IIW is drawn roughly by vertical salinity convergence due to vertical mixing between the top (400m) and bottom (1200m) of the intermediate layer. The enhanced vertical mixing due to salinification of water just above IIW is proposed as a major contributor to the salinification of IIW.

R/V Hakuho-maru cruise, KH-18-6 Leg3, was conducted in December 2018 in a region between Indonesia and Australia. A relatively strong Ningaloo Nina took place during the cruise, showing negative sea surface temperature anomaly of the order of few degrees with strong southerly surface winds off northwest Australia. This presentation summarizes subsurface physical conditions observed during the cruise on a rare occasion, focusing on anomalies associated with the Ningaloo Nina and their relation with a large scale circulations and variations.
